12d Model Reference Manual

This book is the reference manual for the software product 12d Model.

First Release Dates of Software and Manual

V2.0	July 1990
V3.0	October 1995
V4.0	April 1999
V5.0	December 2000
V6.0	September 2002
V7.0	January 2005
V8.0	March 2007
V9.0	May 2009
V10.0	April 2012
V11.0	October 2014

Disclaimer

12d Model is supplied without any express or implied warranties whatsoever.

No warranty of fitness for a particular purpose is offered.

No liabilities in respect of engineering details and quantities produced by 12d Model are accepted.

Every effort has been taken to ensure that the advice given in this manual and the program 12d Model is correct, however, no warranty is expressed or implied by 12d Solutions Pty Ltd.

Copyright

1 Preface

1.1 Introduction

12d Model is an object oriented, interactive graphics program designed to process survey data, quickly build terrain, conceptual and detail design models. It is used in constructing the design, doing quality check and collecting as-constructed data.

So ***12d Model*** is used in all stages of the civil planning, design and construction.

Data is easily read in, triangulated and contoured to build an initial terrain model. Roads, platforms, channels or other design features can be added interactively and a merged model containing the initial terrain and the new design features formed to produce conceptual design models.

All Models can be examined in plan, section or perspective views. The number and type of views displayed on the screen is totally user defined.

By using a mouse and flexible on-screen menus,***12d Model*** is easy to use and requires a minimum of training.

This document is the ***12d Model Reference*** manual.

1.2 Reference Manual in PDF Form

12d Model 11 has a Help available from within ***12d Model*** for most panels and menus.

However, because Microsoft's Help system only allows individual topics to be printed, the entire 12d Model Reference manual has also been supplied as a PDF file. The PDF file can be used to print out large sections of the manual. Adobe's PDF format can be read by Adobe Acrobat or the free Acrobat Reader

The PDF file for the ***12d Model*** *Reference* manual is called

12dm_ref.pdf

and is in the folder on the ***12d Model*** *Installation* DVD called

Documentation\Reference_Manual

If you do not have an *Acrobat* Reader installed, it is available on the ***12d Model*** *Installation* DVD under **Install**.

1.3 Getting Started Manuals and Data

12d Model is supplied with a very comprehensive on -line Reference manual which describes the function of each menu option in detail. However it is a Reference manual and makes no attempt to describe how to use 12d for production surveying and civil engineering work.

The ***12d Model*** *installation* DVD also contains two (2) Training manuals:

Getting Started for Design manual

Getting Started for Surveying manual

The ***Getting Started for Design*** manual is available as a printed manual and as a PDF file on the ***12d Model*** *Installation* DVD.

The ***Getting Started for Surveying*** has the first seven chapters in common with the *Getting Started for Design* manual (installing ***12d Model***, on-line help and basic modelling) but then diverts to cover topics from the direction of a Surveying whereas the *Getting Started for Design* manual continues on with alignment design techniques.

The *Getting Started for Surveying* manual is available as a printed manual and as a PDF file on the ***12d Model*** *Installation DVD*.

As well as the ***Getting Starte***d manuals, there are videos on a DVD which also work through all the material in the ***Getting Started*** manuals.

The ***Getting Started*** tutorials assumes that a series of files are already on your hard disk. These tutorial files are automatically installed from the DVD during installation of the ***12d Model*** software

1.3.1 Training Courses

There is a wide range of ***12d Model*** *Training* Courses given by official ***12d Model*** training centres.

Each training course usually has its own set of training files, manual in pdf form and videos going through the training course. This material is distributed on DVDs.

1.3.2 Using the Practise and Small Versions of 12d Model

The Practise version of ***12d Model*** is limited to a maximum of 5,000 points. Following the procedures as stated in the training manuals may create projects with more than 5,000 points.

Where appropriate, the text will suggest how to vary the input for each instruction so that the example feature can be completed within the limits of the ***12d Model*** Practise version.

The number of points used at any time in the Practise and small release versions can be displayed by the option

Projects => Check points

The easiest way to reduce the current point count is to delete any unwanted models with

Models => Delete

The installed icon on your desktop for running the practise version of 12d with these training files is labelled ***12d 11 Practise Training***.

Please Note: Projects created by Practise versions of ***12d Model*** cannot be accessed by Release versions of ***12d Model*** and vice-versa.

2 Installation of 12d Model 11 Release Version

The *12d Model 11 Installation DVD* can be used to install the *Release* and *Practise* versions of ***12d Model 11***.

The *Practise* version is limited to a maximum of 5,000 points and creates projects that cannot be accessed by the *Release* versions of *12d Model* and vice-versa. However the Practise version can be used free of charge by *12d Solutions* customers and registered Practise Users.

These notes are for installing the ***Release*** *version* of *12d Model 11*. There are separate notes for installing the Practise version.

For a new installation of the Release version of *12d Model 11*, the user is provided with

(a) one *12d Model* dongle

(b) one *12d Model 11 Installation DVD*

(c) an email with the *12d Model 11* authorization file *nodes.12d11n* attached, or a folder wit the *12d Model 11* authorization file *nodes.12d11n* or *nodes.4d* in it.

Please check that you have all three items before commencing the installation.

For existing *12d Model 11* users, the user is provided with

(a) one *12d Model 11 Installation DVD*

(b) an email with the *12d Model 11* authorization file *nodes.12d11n* attached, or a folder with the *12d Model 11* authorization file *nodes.12d11n* or *nodes.4d* in it.

For existing users, the dongle you already have for *12d Model 11* will work with the new version of *12d Model 11 once you have the new nodes file for 12d Model 11*. If *12d Model 11* is **already** running on your computer, please **uninstall** it before installing a new version of *12d Model 11*.

Important Note on *Nodes.12d11n* and *Nodes.4d*

The *12d Model 11* ***nodes.12d11n*** file will normally be emailed to you.

During the installation of *12d Model 11*, an association is created for files ending in ***.12d11n*** so after the installation, opening the ***nodes.12d11n*** will automatically copy it to the required area (normally *C:\12d\11.00*) and rename it to ***nodes.4d***.

If you do not have the ***nodes.12d11n*** attached to an email but instead have it in a folder, clicking on the ***nodes.12d11n*** file after installing *12d Model 11* will also automatically copy it to the required area (normally *C:\12d\11.00*) and rename it to ***nodes.4d***. Or if the *12d Model 11* icon is clicked on, the **Project Selection** panel will be brought up and clicking on the **Nodes** button will allow the ***nodes.12d11n*** or ***nodes.4d*** file to be selected and then processed.

Please **do not change** the **name** of the created ***nodes.4d*** file. ***12d Model*** will only search for an authorization file called *nodes.4d.*

Extra Notes for All Installations

1. A three-button mouse is essential.
2. The *12d Model Installation DVD* contains extra information other than just the installation version of 12d Model. For example, documentation, source to macros and plot parameter files.

   The extra data can be copied from the *12d Model Installation DVD* but the copied files may only have a “read only” attribute set. This means that the files can not be edited or modified in any way.

   To change the attribute so that a file can be modified, select the file in Explorer, bring up the *Properties* sheet and under the *General* tab sheet change the “read only” box so that it is not ticked on.

   Selecting ***OK*** or ***Apply*** will then modify the attribute of the file.

2.1 12d Model 11 - 32 bit or 64 bit Version ?

Microsoft has a 32 bit Windows and a 64 bit Windows operating system.

So when installing **12d Model 11**, you need to select either the 64 bit 12d installation or the 32 bit installation.

In 64 bit Windows, Microsoft have allowed for both 32 bit and 64 bit versions of the same software to coexist on the same computer, so you could install both the 32 bit and the 64 bit version of **12d Model 11**.

The 64 bit **12d Model 11** only runs on 64 bit Windows and supports any of the **12d Mode**l point sizes from 5K through to 5M and 250M.

The 32 bit **12d Model 11** runs on both 32-bit and 64 bit Windows and supports any of the **12d Mode**l point sizes from 5K through to 5M.

So if you require **12d Model 11** for 250M then you must run 64 bit **12d Model 11** on 64 bit Windows.

2.2 Installing the Release Version of 12d Model 11

These notes are for installing the Release version of *12d Model 11.* There are separate notes for installing the Practise version.

A. Disk Space required for installing 12d Model 11

Approximately 2 Gigabytes of disc space will be required for the installation to succeed. Before installing from the DVD

For Windows 2000, XP, Vista, Windows 7:

It is usually best to reboot the PC **before** installing **12d Model** from the DVD and have no other applications running.
Your login must have Administrator privileges.

B. Do not attach the 12d dongle before installing dongle drivers

USB dongles must **NOT be attached** to the computer before the dongle drivers are installed.

C. Using the email with the *nodes.12d11n* file attached to it

The *12d Model 11* ***nodes.12d11n*** file will normally be emailed to you.

During the installation of *12d Model 11*, an association is created for files ending in ***.12d11n*** so after the installation, opening the ***nodes.12d11n*** will automatically copy it to the required area (normally *C:\12d\11.00*) and rename it to ***nodes.4d***.

If you do not have the ***nodes.12d11n*** attached to an email but instead have it in a folder, clicking on the ***nodes.12d11n*** file after installing *12d Model 11* will also automatically copy it to the required area (normally *C:\12d\11.00*) and rename it to ***nodes.4d***. Or if the *12d Model 11* icon is clicked on, the **Project Selection** panel will be brought up and clicking on the **Nodes** button will allow the ***nodes.12d11n*** or ***nodes.4d*** file to be selected and then processed.

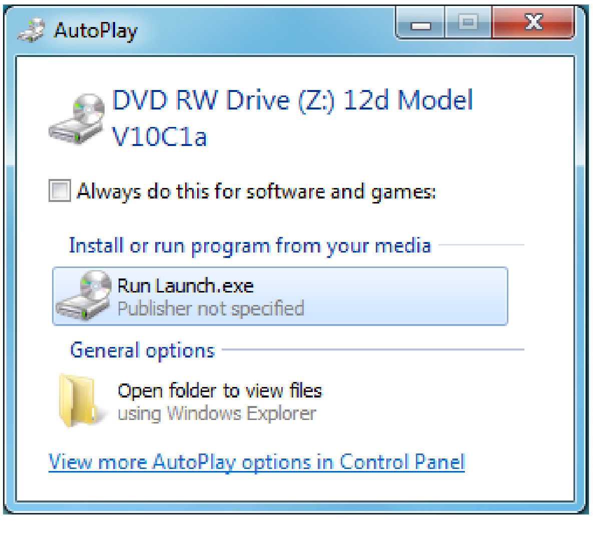
D. Starting the Installation of *12d Model 11*

Insert the ***12d Model 11 Installation DVD*** into the DVD drive.

On inserting the DVD, the ***12d Model Installation*** program automatically begins.

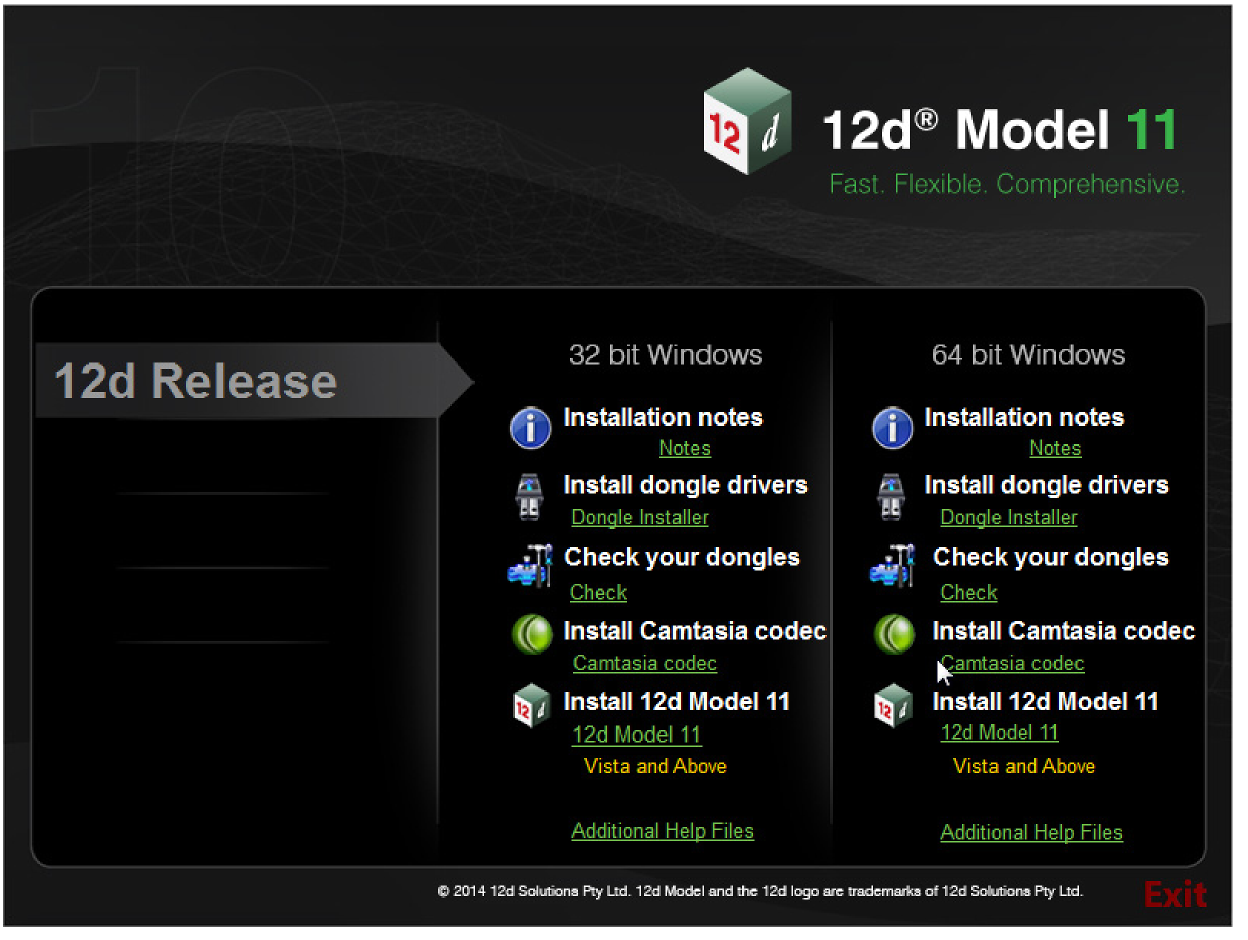
If it doesn't, simply double click on the program ***Launch.exe*** on the DVD.

Depending on the Windows operating system and your settings, you may be asked to allow *Launch.exe* to run. If so, click on ***Run Lauch.exe***.



E. Installing

The *12d Model Release* screen will appear.



The Steps on the ***12d Release*** tab of the *12d Model Installation DVD* will lead you through the installation of the Release version of *12d Model*. The sequence on the left is for installing on 32 bit Windows, and the sequence on the right is for installing on 64 bit Windows.

For running 12d Model 11 on 32 bit Windows:

If you are running 12d Model on 32 bit Windows, then you need to install the *12d Model* 32 bit 12d.exe and 32 bit dongle drivers. So go down the options on the left hand side of the screen.

Note- the 32 bit 12d.exe will run point versions **up to 5M**. The 250M version of *12d Model* is only available as the 64 bit *12d Model* and it only runs on a Windows 64 bit operating system.

For running 12d Model 11 on 64 bit Windows:

If you are running 12d Model on 64 bit Windows, then you need to install the *12d Model* 64 bit 12d.exe and 64 bit dongle drivers. So go down the options on the right hand side of the screen.

The 64 bit 12d.exe runs all point versions up to and including 250M.

For each installation, ***Installation Notes*** in pdf format can be viewed by clicking on ***Notes*** under the ***Installation notes*** heading. If ***Videos*** also appears then a video to guide you through the installation process can be viewed by clicking on ***Videos*** under the ***Installation notes*** heading.

NOTE - If the correct dongle drivers and the Camtasia codec are already installed on your computer then you can proceed to Step 4. Installing 12d Model 11 Release Program files

Step 1. Install the Wibu or Codemeter Drivers

You need to have System Administrator rights to install the drivers.

Installing Dongle Drivers:

On the *12d Model Release* screen, under *Install Dongle Drivers*, click on ***Drivers*** to bring up the **Dongle Drivers** panel:

Depending on the Windows operating system and your privileges (you need Administrator rights to install the drivers), the **User Account Control** panel may appear and you will be asked *Do you want the following program to make changes to your computer? If so, click on **Yes**.*

The **Dongle Drivers** panel will then appear.

If you only have one type of dongle Wibu (green USB, translucent green USB) or Codemeter (variety of colours and sizes) then you only need to install the drivers for those dongles.

If you have both *Codemeter* and *Wibu* dongles then both sets of drivers ***must*** be installed.

(a) If you have both **Wibu** and **Codemeter** ticked on then clicking on **Install** will first install the Wibu drivers and then continue on to installing the Codemeter drivers.

Go to Installing the Wibu Drivers:.

(b) If you have only **Wibu** ticked on then clicking on **Install** will install the Wibu drivers.

Go to Installing the Wibu Drivers:.

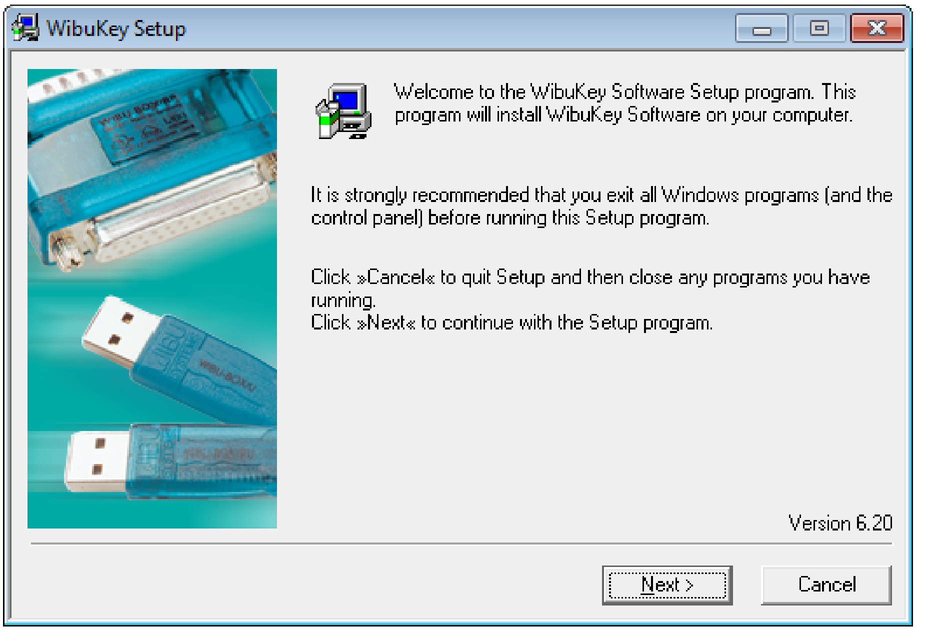
(c) If you have only **Codemeter** ticked on then clicking on **Install** will install the Codemeter drivers.

Go to Installing the Codemeter Drivers:

Installing the Wibu Drivers:

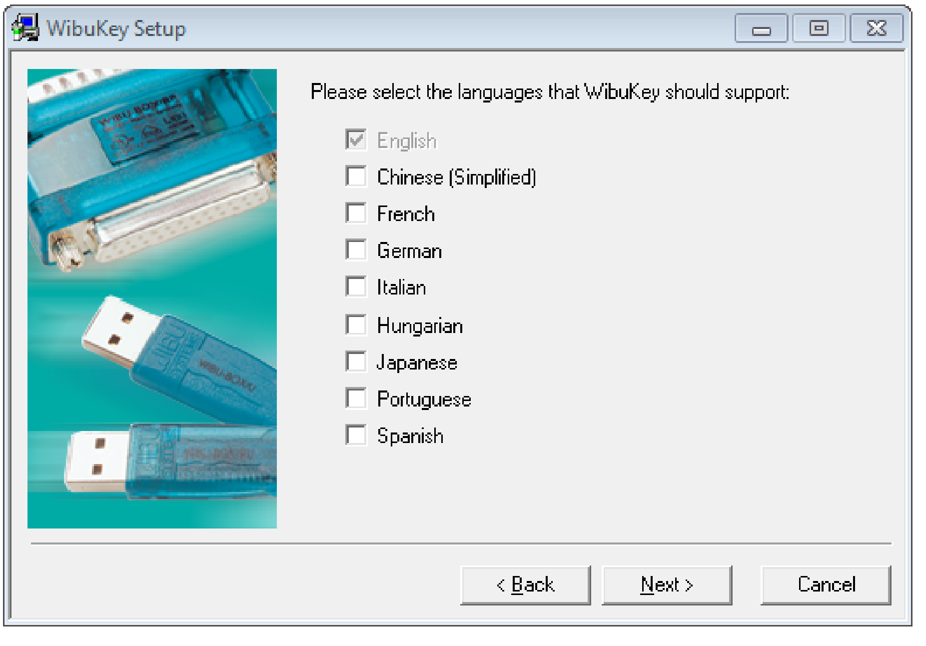
The script to install the **Wibu** dongle drivers begins.

WIBU-KEY Setup *Welcome to WIBU-KEY Software Setup*



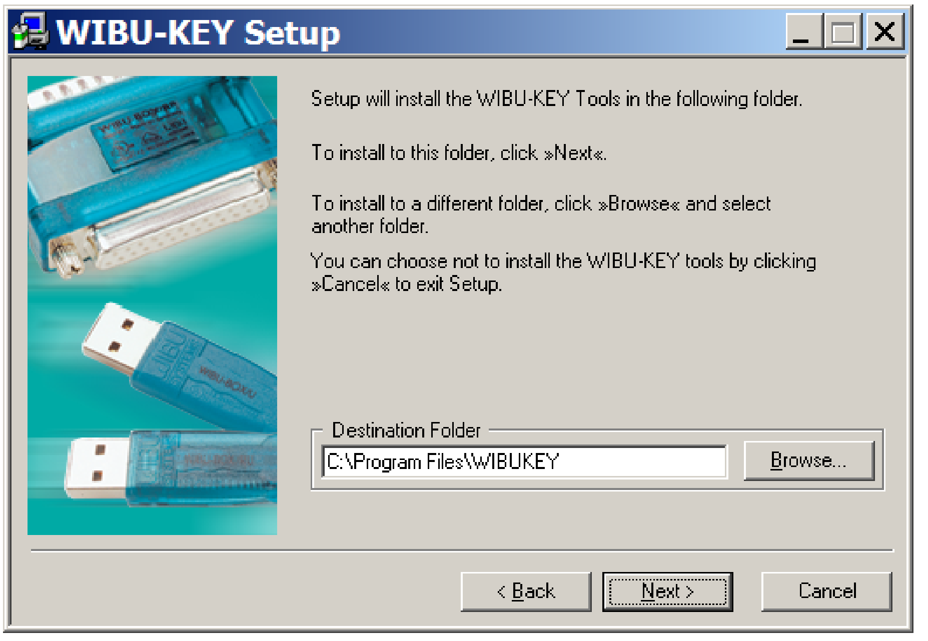
select ***Next*** to continue

WIBU-KEY Setup *Language Selection*



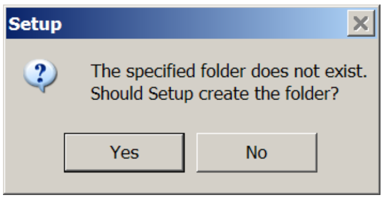
tick your language and then select ***Next*** to continue

WIBU-KEY Setup *Installation folder*



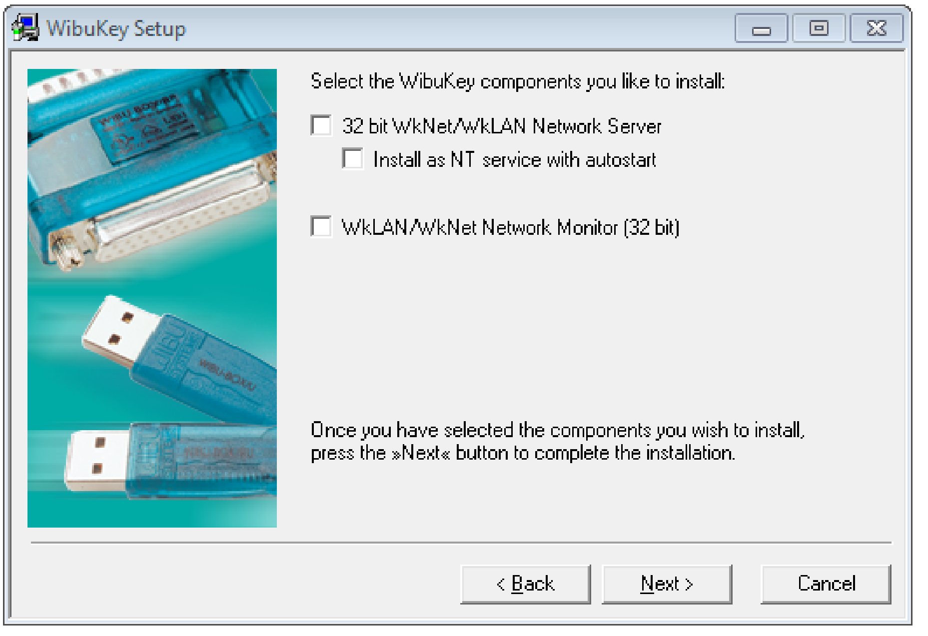
select ***Next*** to continue

WIBU-KEY Setup *Installation folder doesn't exist*



click Yes to continue

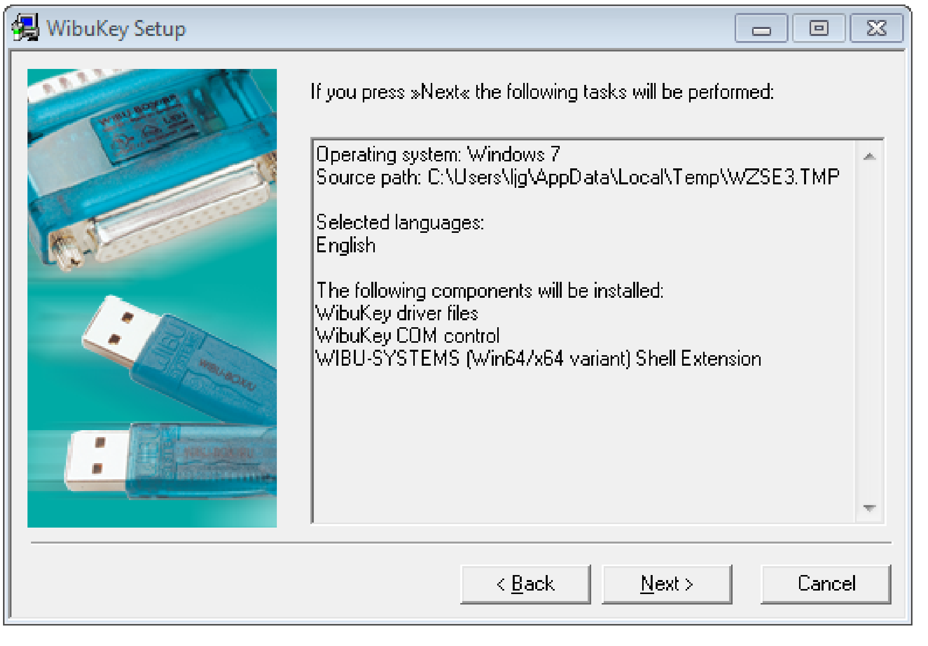
WIBU-KEY Setup *Component Selection*



For a standard install, nothing needs to be ticked on (the WibuKey components are for monitoring a Wibu network dongle).

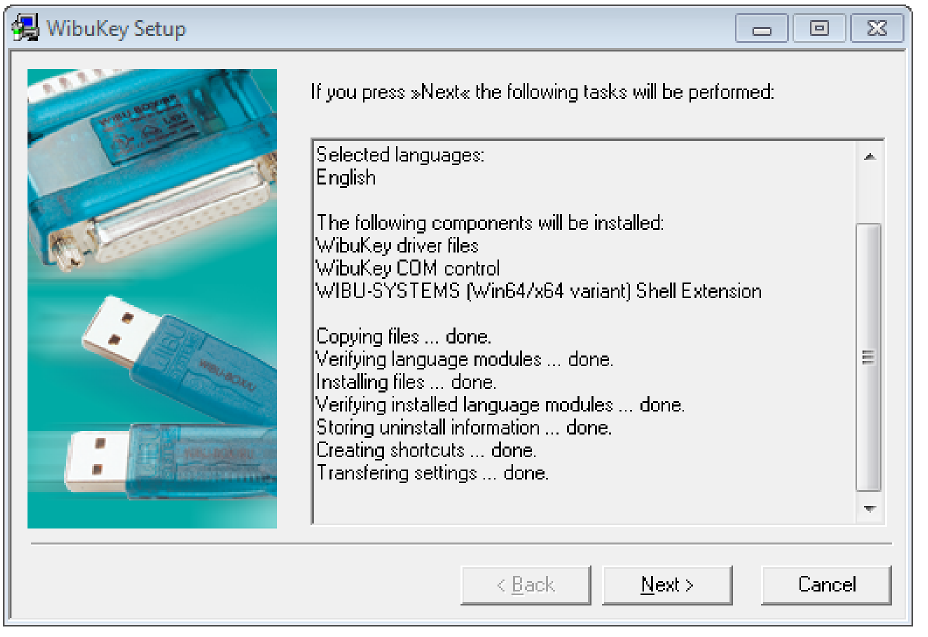
make sure nothing is ticked and then select ***Next*** to continue

WIBU-KEY Setup *Tasks to be Performed*



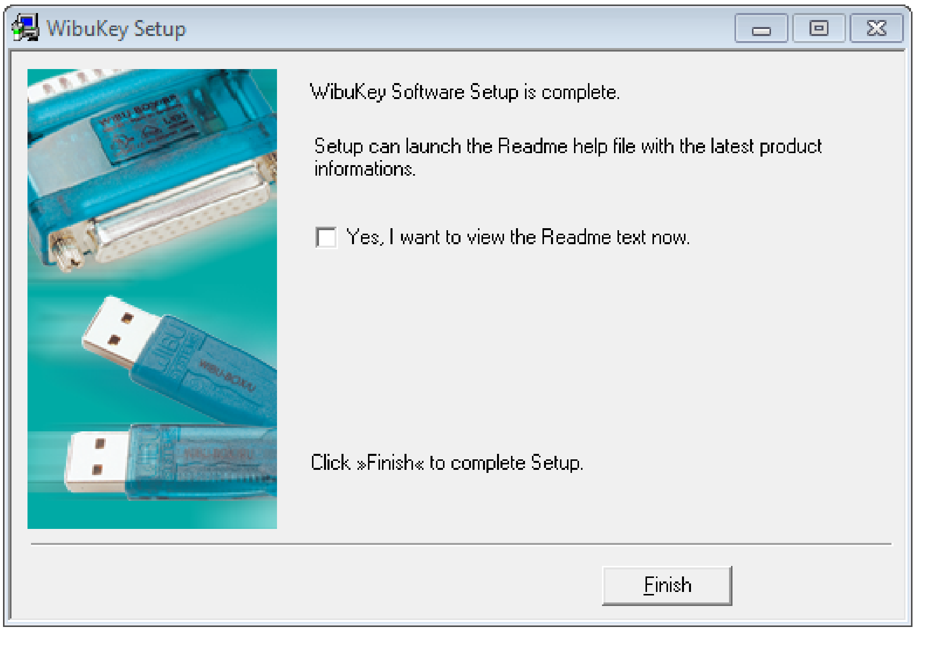
select ***Next*** to continue

WIBU-KEY Setup *Tasks done*



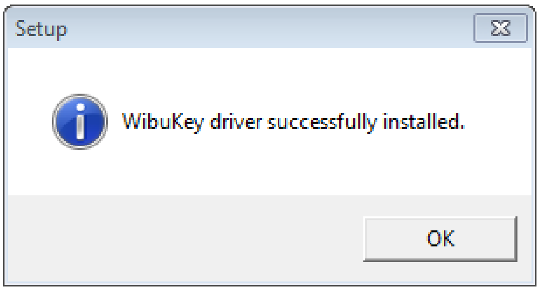
select ***Next*** to continue

WIBU-KEY Setup *Setup Complete*



leave **Yes, I want to view the Readme text now** unticked and select ***Finish***

Setup OK *Setup OK*

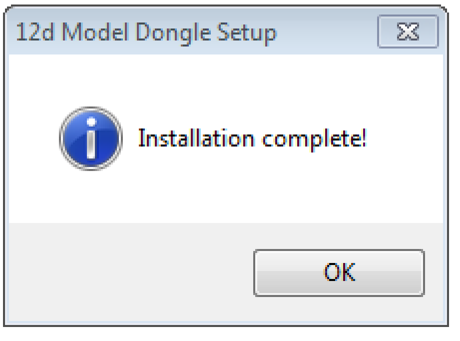


click ***OK***

The WIBU dongle drivers have now been installed

If both **Wibu** and **Codemeter** were ticked on then the installation of the Codemeter drivers will then begin. See Installing the Codemeter Drivers:,

Otherwise the **12d Model Dongle Setup** screen will appear.



click ***OK***

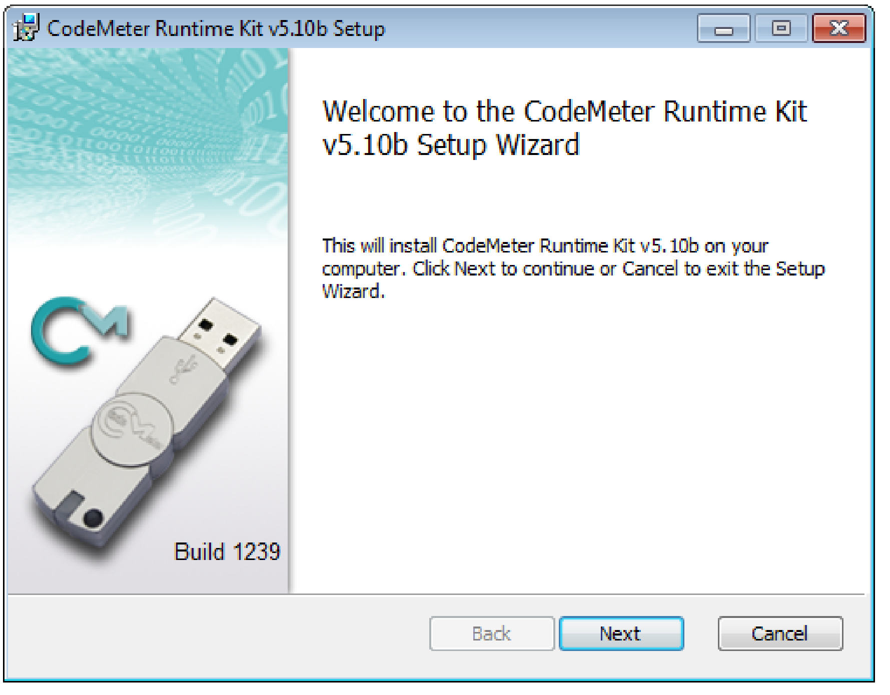
The *12d Model Release* screen will then reappear.

Continue to Step 2. Check the dongle.

Installing the Codemeter Drivers:

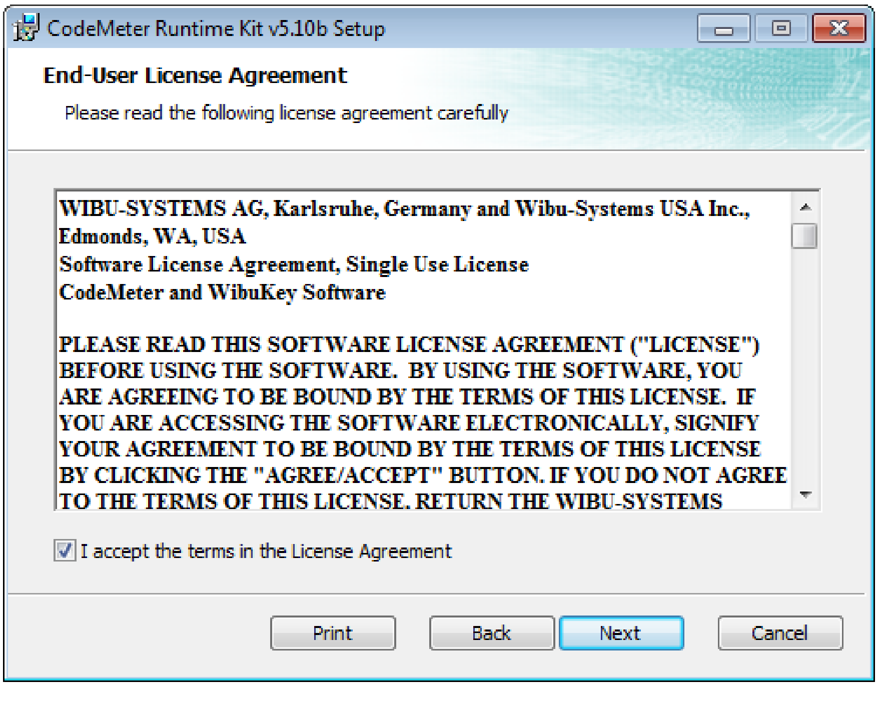
The script to install the **Codemeter** dongle drivers begins.

Codemeter Setup *Codemeter Runtime Kit Setup*



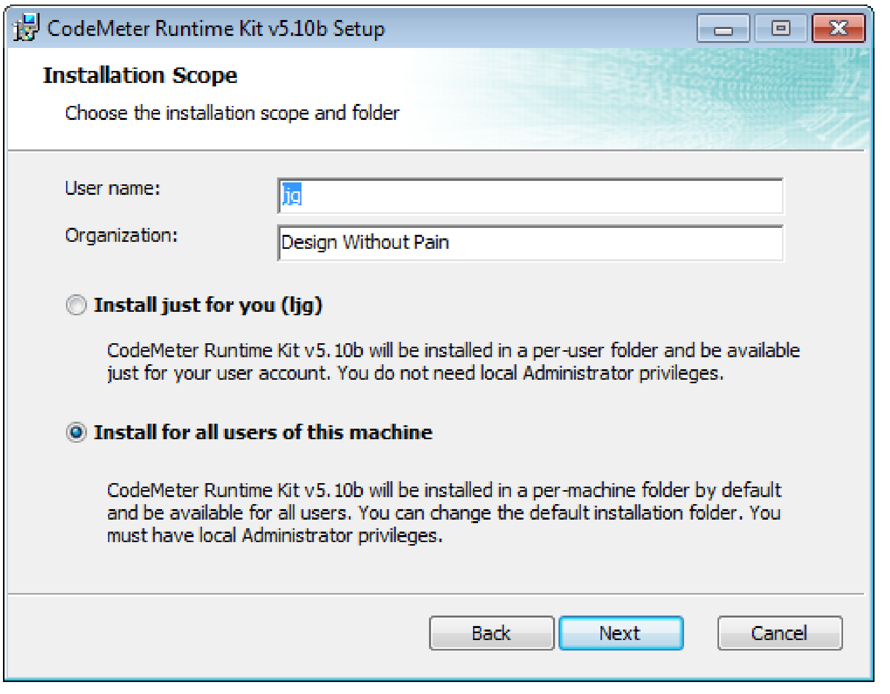
Select ***Next*** to continue

End-User License Agreement *Codemeter Runtime Kit Setup*



Read the License Agreement and if you are happy with it,
tick I accept the terms in the License Agreement and then select ***Next*** to continue

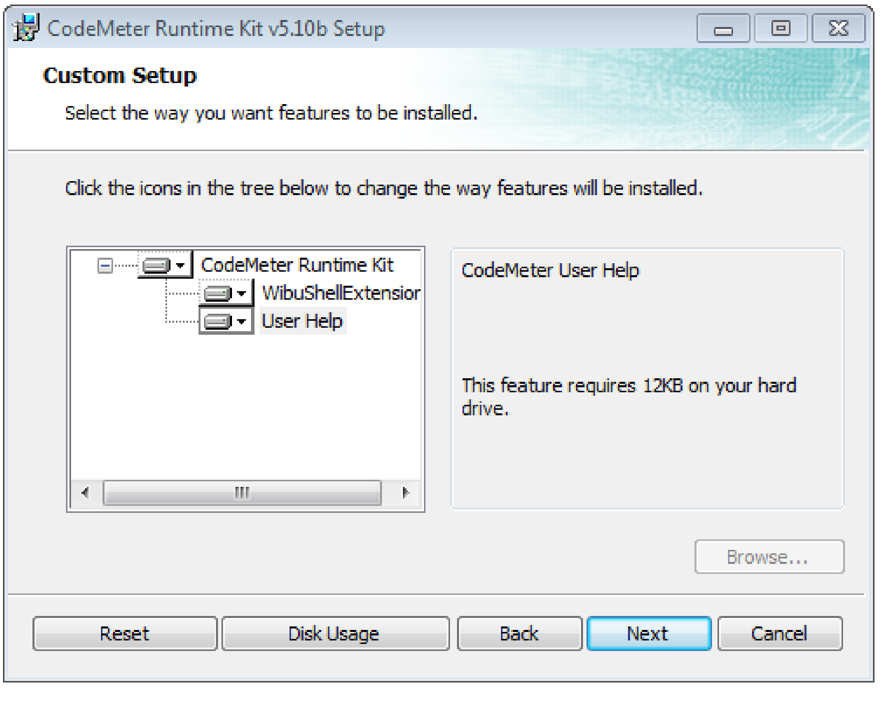
Installation Scope *Codemeter Runtime Kit Setup*



Enter your **User name** and **Organisation**.

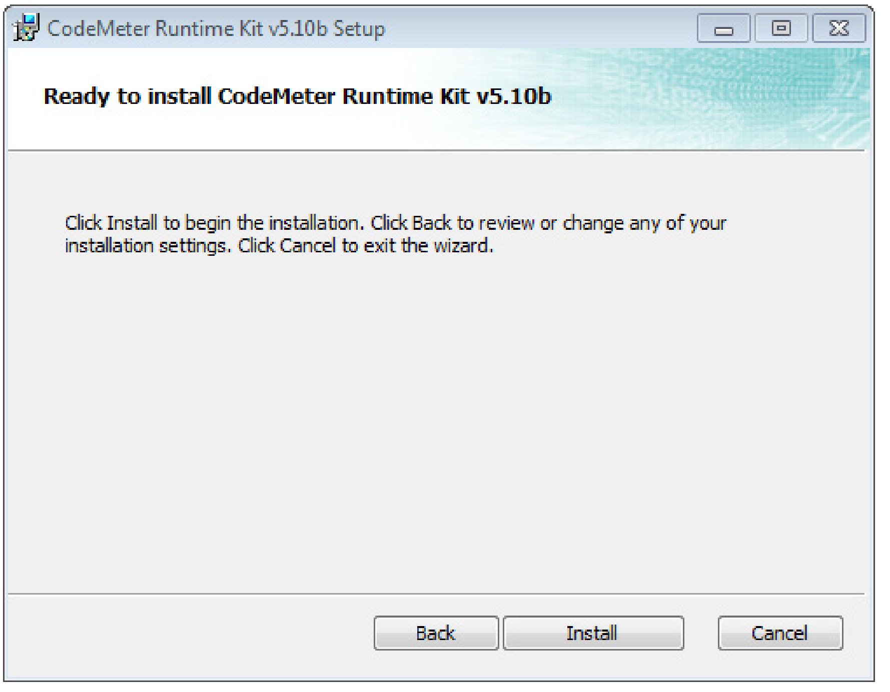
tick either **Install just for you** or **Install for all users of this machine** and then select ***Next*** to continue

Custom Setup *Codemeter Runtime Kit Setup*



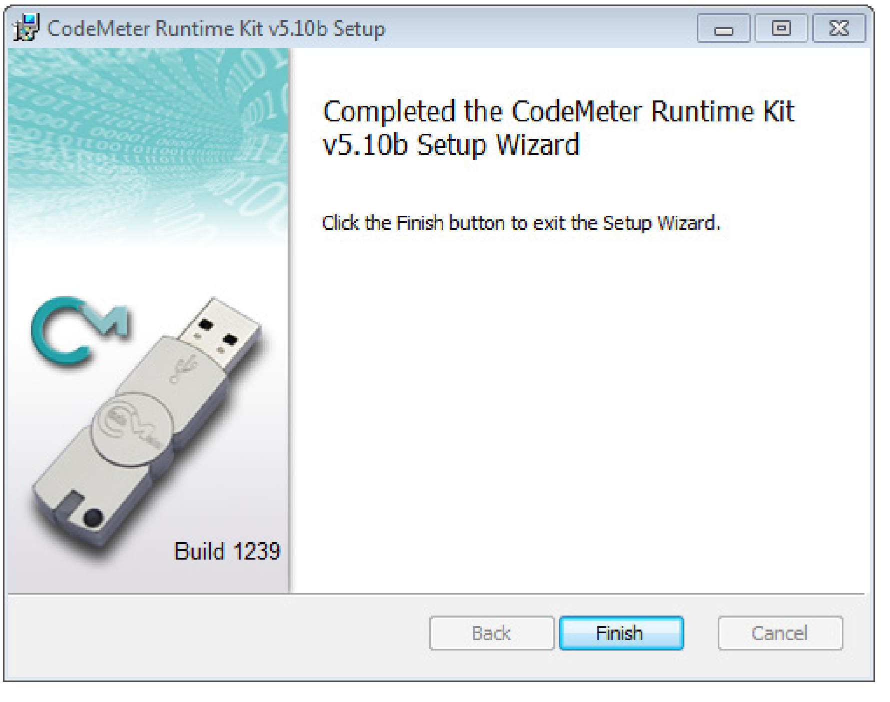
Select ***Next*** to continue

Ready to Install *Codemeter Runtime Kit Setup*

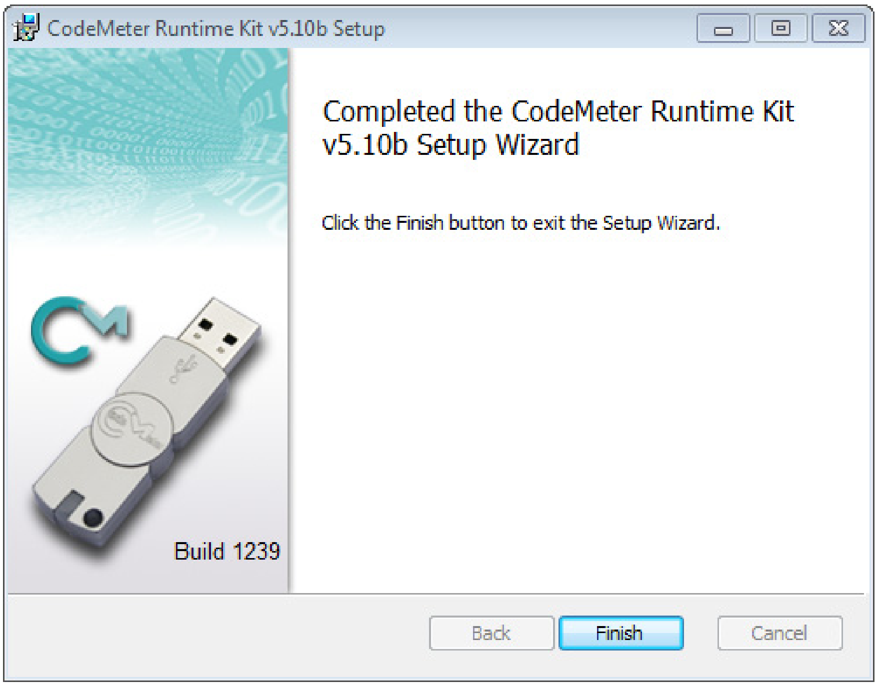


Select ***Install*** to continue

Installing *Codemeter Runtime Kit Setup*

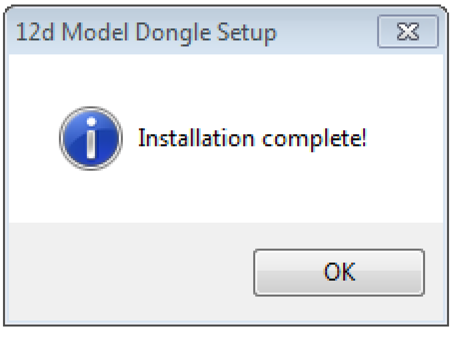


Completed *Codemeter Runtime Kit Setup*



Select ***Finish*** to end

The **Codemeter** dongle drivers have now been installed and the **12d Model Dongle Setup** screen will appear.



click ***OK***

The *12d Model Release* screen will then reappear.

Continue to Step 2. Check the dongle.

Step 2. Check the dongle

NOT YET UPDATED FOR V11

The 12d Model dongle (Wibu or Codemeter) can now be attached to the computer.

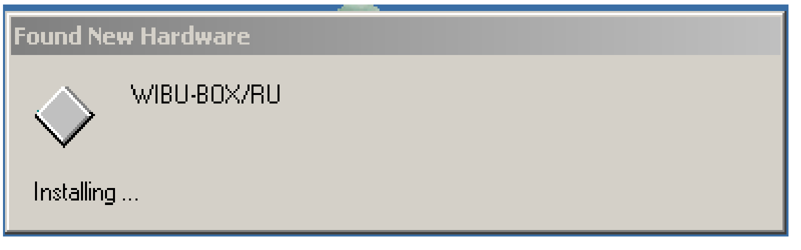
For USB dongles:

Warning: you must have System Administrations rights the first time you attach a USB dongle to any USB port:

When a USB dongle is attached for the first time to any USB port, Windows will detect that it is new hardware and needs to load the dongle drivers for that USB port - this will require System Administration rights.

Since the dongle drivers have already been loaded onto your computer, when the USB dongle is attached to a new USB port, it will be recognised as new hardware

and Windows should automatically install the correct dongle driver.



IMPORTANT NOTE IF THE WIBU DONGLE IS NOT RECOGNISED:

If the WIBU dongle is not recognised and you get the **Found New Hardware** screen

please go to the section on how to find the Wibu drivers

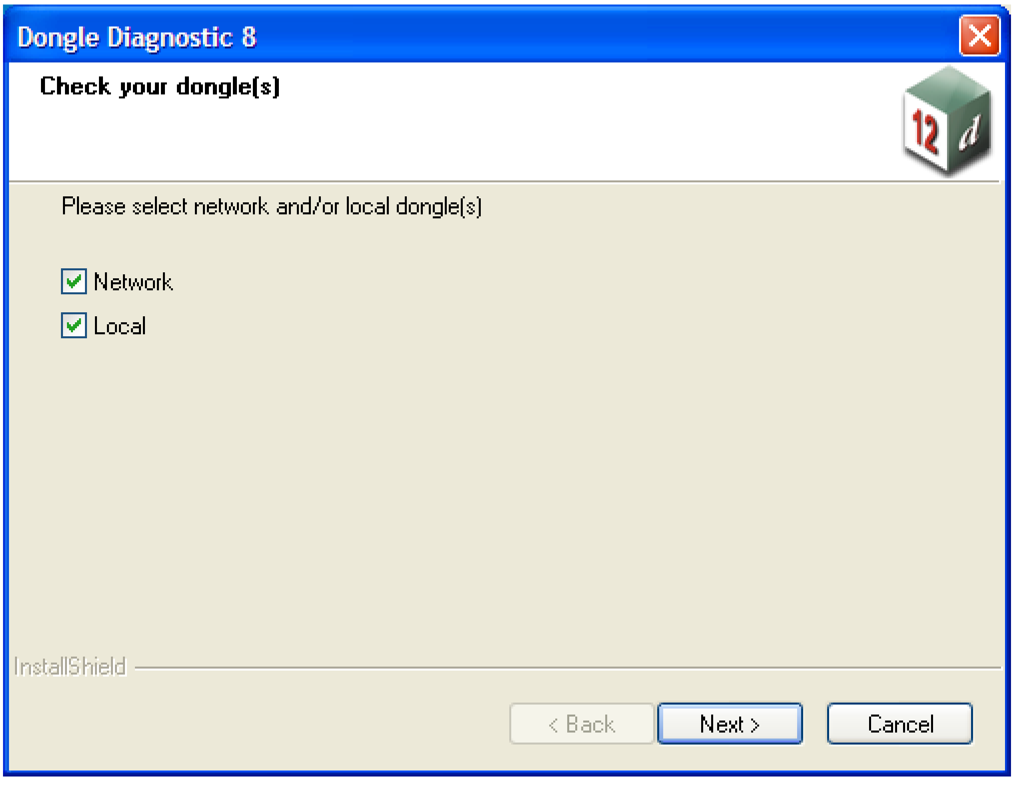
NOTE - even though your dongle is working on one USB port, if you try and attach the dongle to a new USB port, the dongle drivers will need to be installed for the new USB port. You will need System Administration rights to install the dongle drivers on the ***new*** USB port.

The dongle must be attached to the USB port at all times, otherwise 12d Model will stop running.

On the *12d Model Release* screen, click on *Check*:

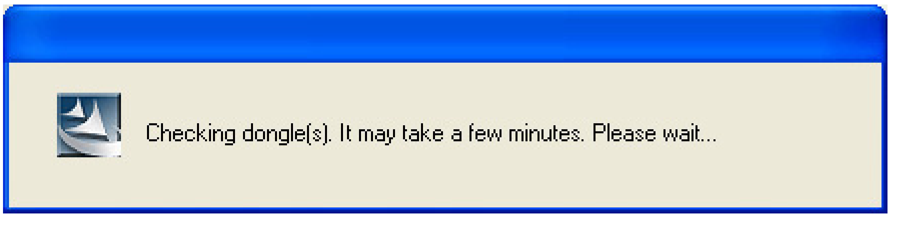
The dongle checking program begins.

Installation *Installation message*

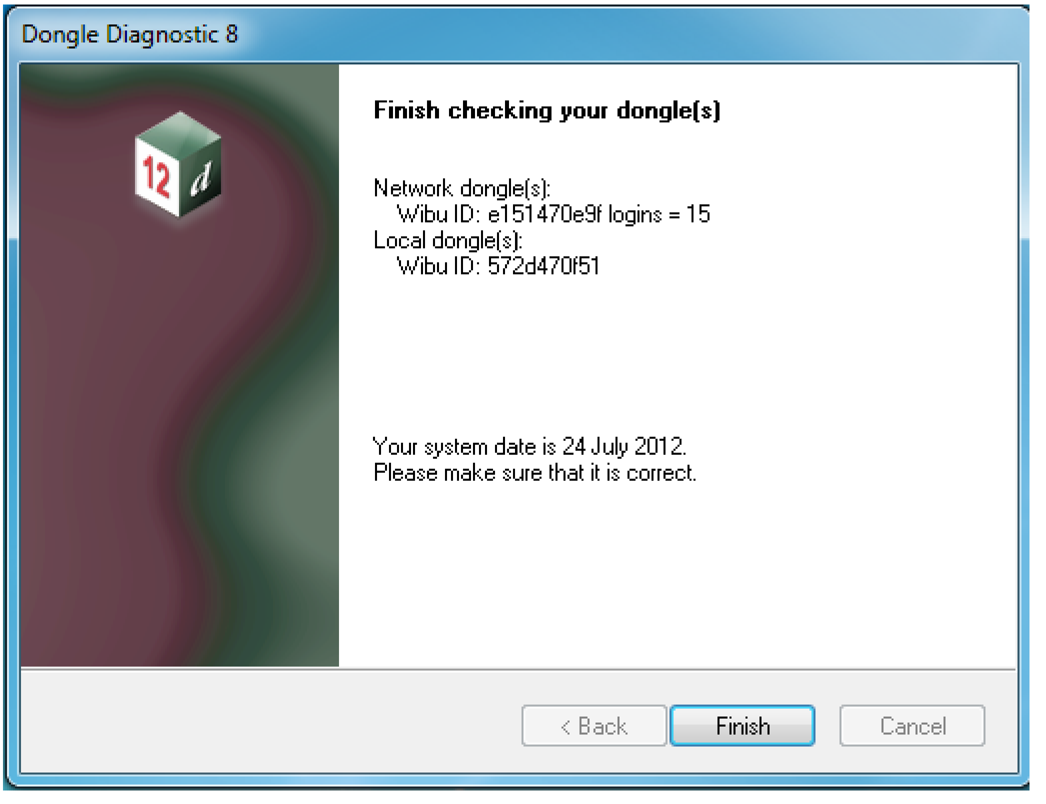


Tick **Local** and select ***Next***

The computer/network will be checked for *12d dongles* and also for your *System Date*.



Check Report



The correct dongle number should be displayed and also a check on the date in the computer is correct.

select ***Finish***

This completes the dongle *Check*.

The *12d Model Release* screen will then appear.

Continue to Step 3. Install Camtasia Codec.

Step 3. Install Camtasia Codec

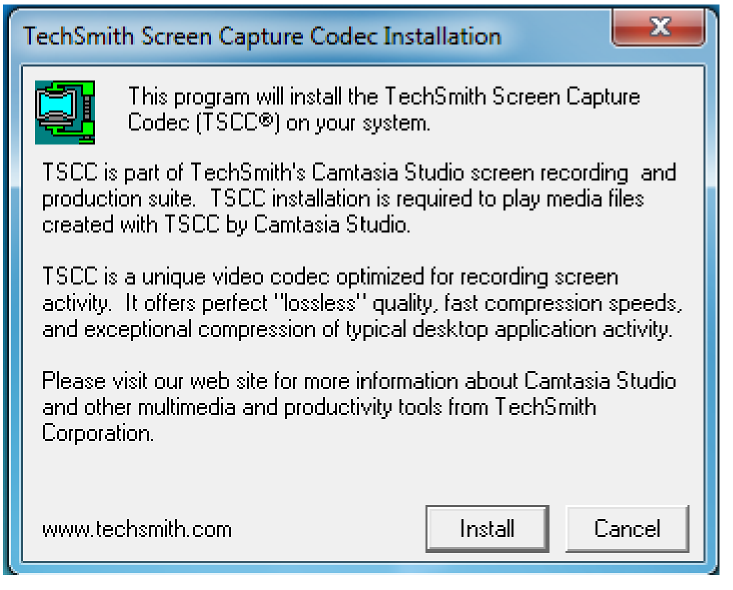
The Camtasia Codec is used for displaying the images on the *12d Model Training* CDs and DVDs.

You need to have System Administrator rights to install the Camtasia Codec.

On the *12d Model Release* screen, under *Install Camtasia codec*, click on *Camtasia Codec*:

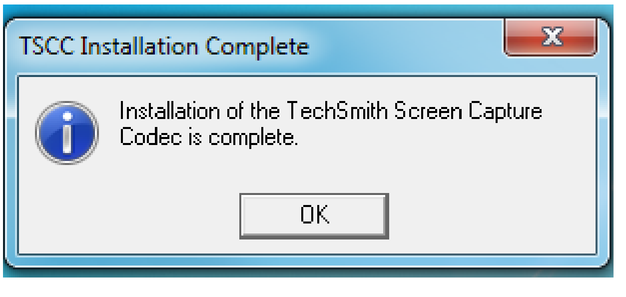
The Camtasia Codec installation begins.

Installation *Installation message*



Select ***Install*** to continue with the installation

Installation Complete



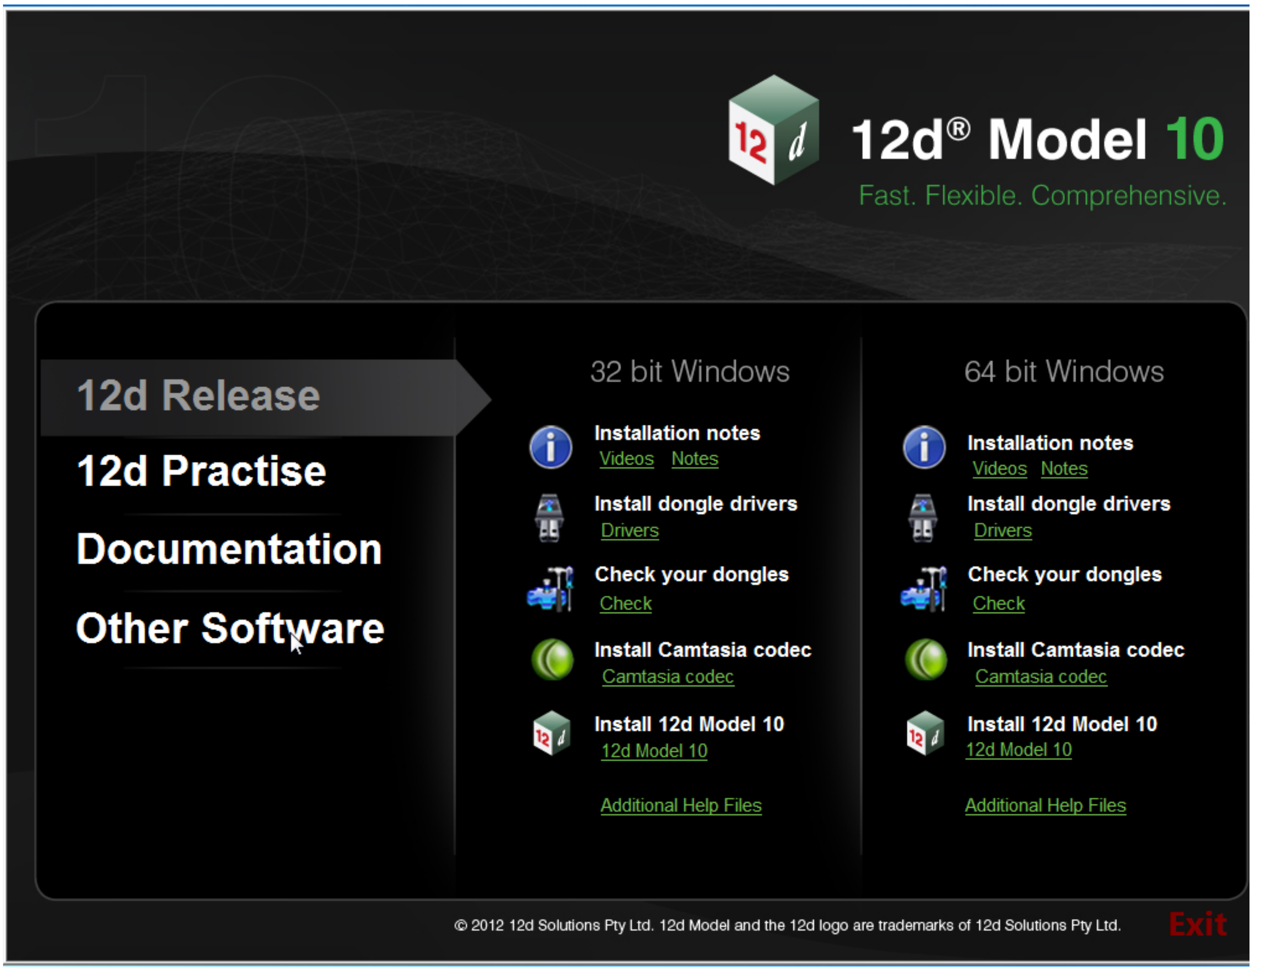
Select ***OK***.

This completes the installation of the *Camtasia Codec*.

The *12d Model Release* screen will then appear.

Continue to Step 4. Installing 12d Model 11 Release Program files.

Step 4. Installing 12d Model 11 Release Program files



For running 12d Model 11 on 32 bit Windows:

If you are running 12d Model on 32 bit Windows, then you need to install the *12d Model* 32 bit 12d.exe and 32 bit dongle drivers. So go down the options on the left hand side of the screen.

Note- the 32 bit 12d.exe will run point versions **up to 5M**. The 250M version of *12d Model* is only available as the 64 bit *12d Model* and it only runs on a Windows 64 bit operating system.

For running 12d Model 11 on 64 bit Windows:

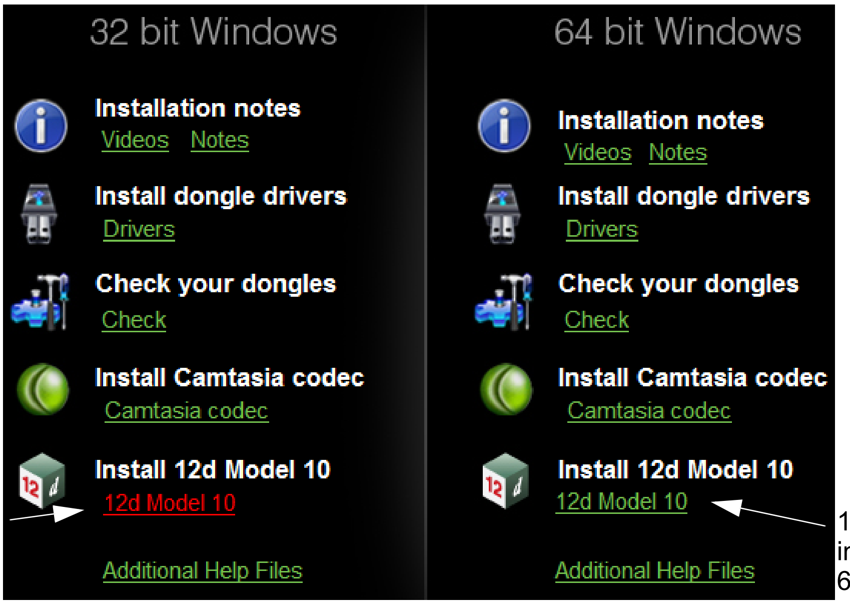
If you are running 12d Model on 64 bit Windows, then you need to install the *12d Model* 64 bit 12d.exe and 64 bit dongle drivers. So go down the options on the right hand side of the screen.

The 64 bit 12d.exe runs all point versions up to and including 250M.

So if you are installing on 32 bit Windows, then select the ***12d Model 11*** under ***Installing 12d Model 11*** under the ***left*** hand column.

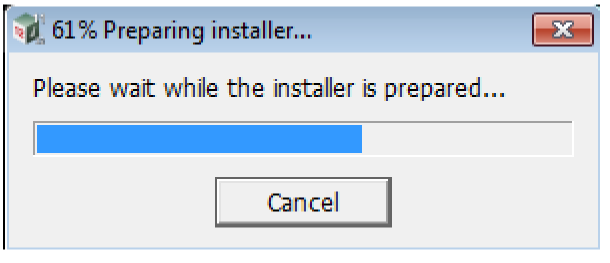
If you are installing on 64 bit Windows, then select the ***12d Model 11*** under ***Installing 12d Model 11*** under the ***right*** hand column.

12d Model 11
install for
32 bit Windows



12d Model 11
install for
64 bit Windows

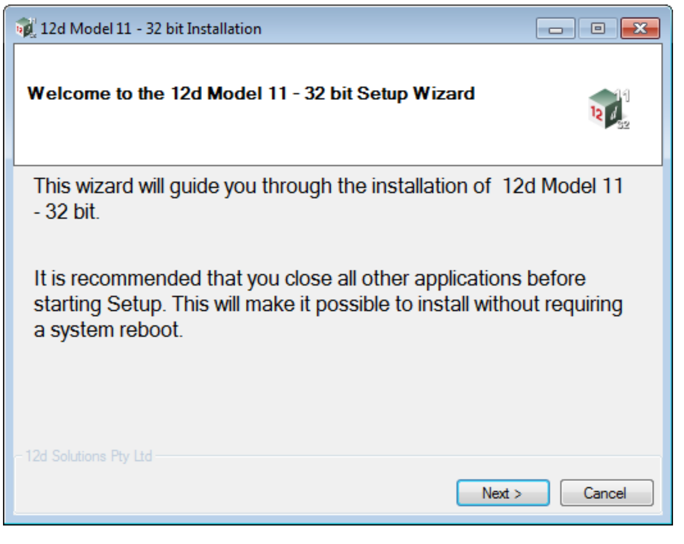
The ***12d Model 11*** installation begins.



Note - the following screens are for the 64 bit install but the 32 bit install is identical except the words **64 bit** are replaced by **32 bit**.

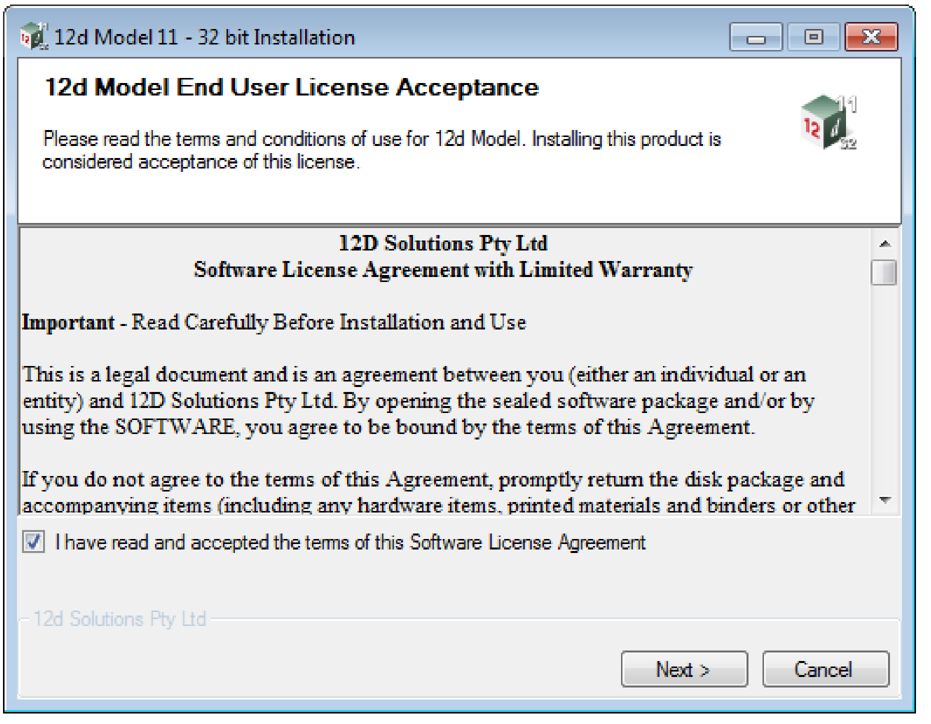
Welcome

Welcome message



Select ***Next*** to continue with the installation

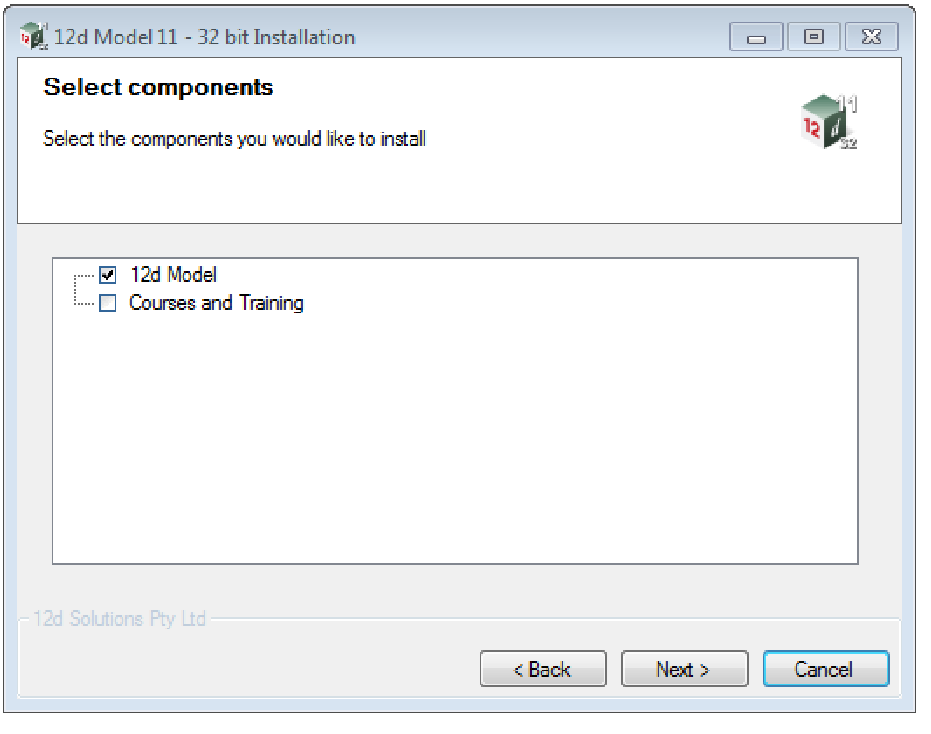
Software License Agreement *12D Solutions license agreement*



If you agree with the License conditions, click on *I have read and accept the terms of the Software License Agreement.*

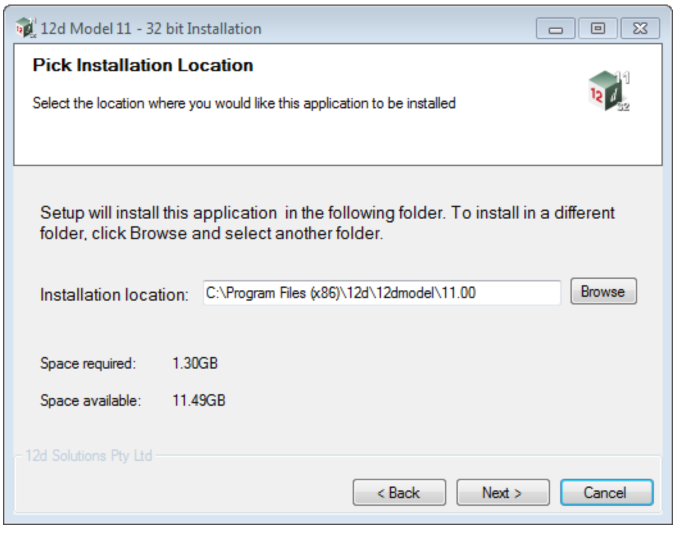
Select ***Next*** to continue with the installation

Select Components



select ***Next*** to continue with the installation

Installation Location



Continue with the default installation folder for the software:

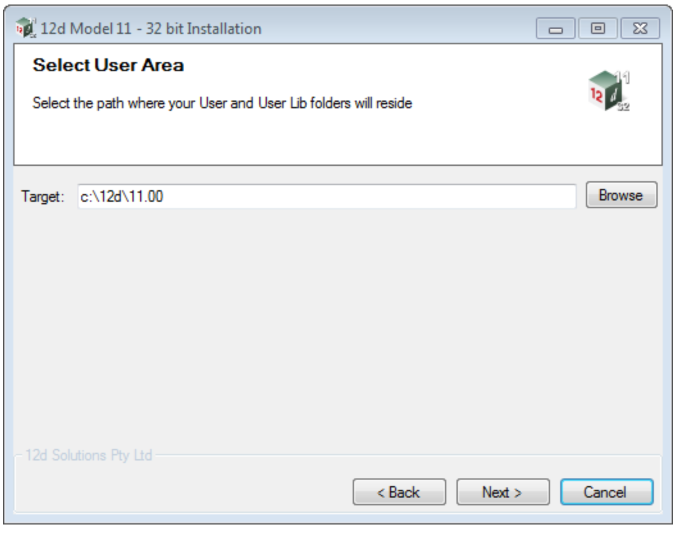
for 64 bit version: c:\Program Files\12d\12dmodel\11.0

for 32 bit version: c:\Program Files (x86)\12d\12dmodel\11.0

or click on ***Browse*** to browse to another folder for the installation

Select ***Next*** to continue with the installation

User Area



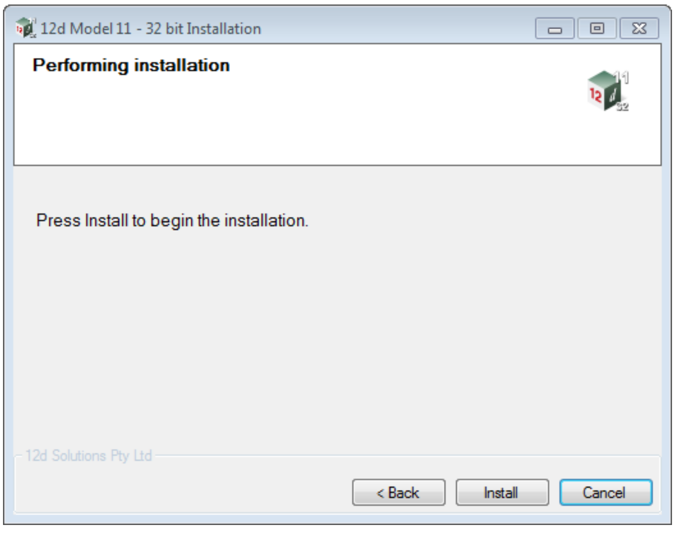
Continue with the default folder for the User Area for the software:

c:\12d\11.0

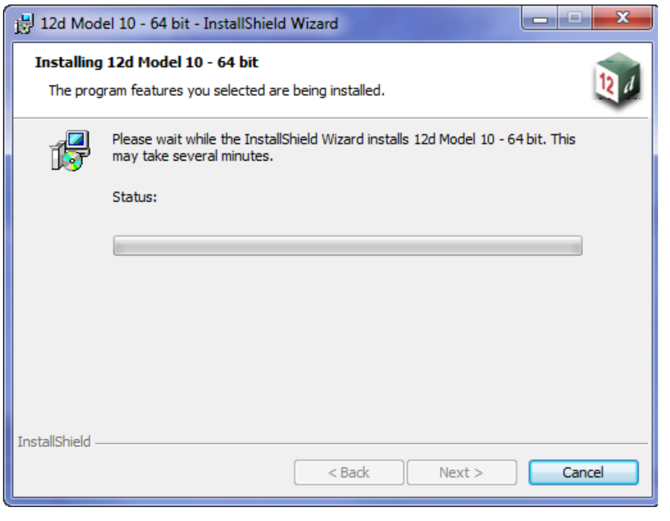
or click on ***Browse*** to browse to another folder for the User Area.

Select ***Next*** to continue with the installation

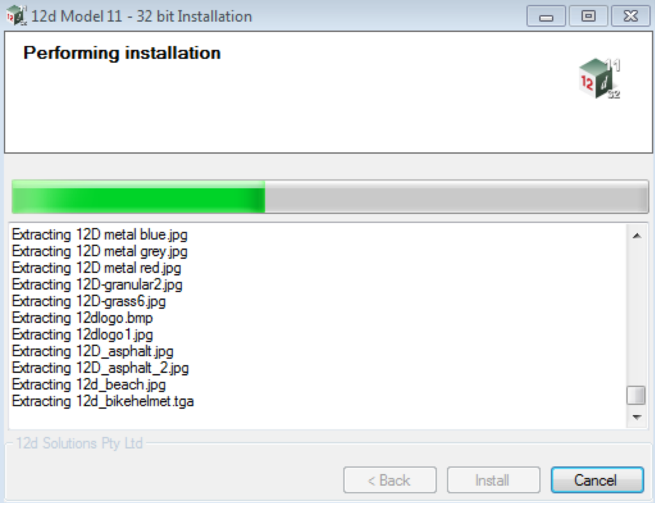
Ready to Install



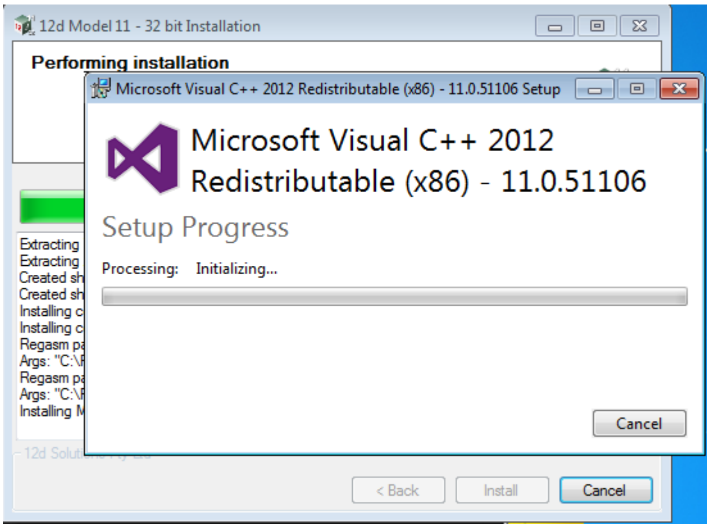
Select ***Install*** to begin the actual installation



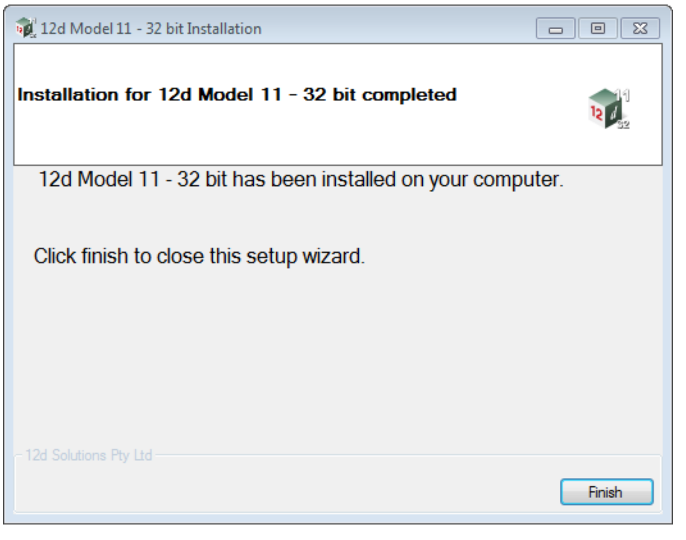
The software will be copied and installed onto the computer.



The Microsoft C++ Redistributables will be installed (32 and 64 for 64-bit install)

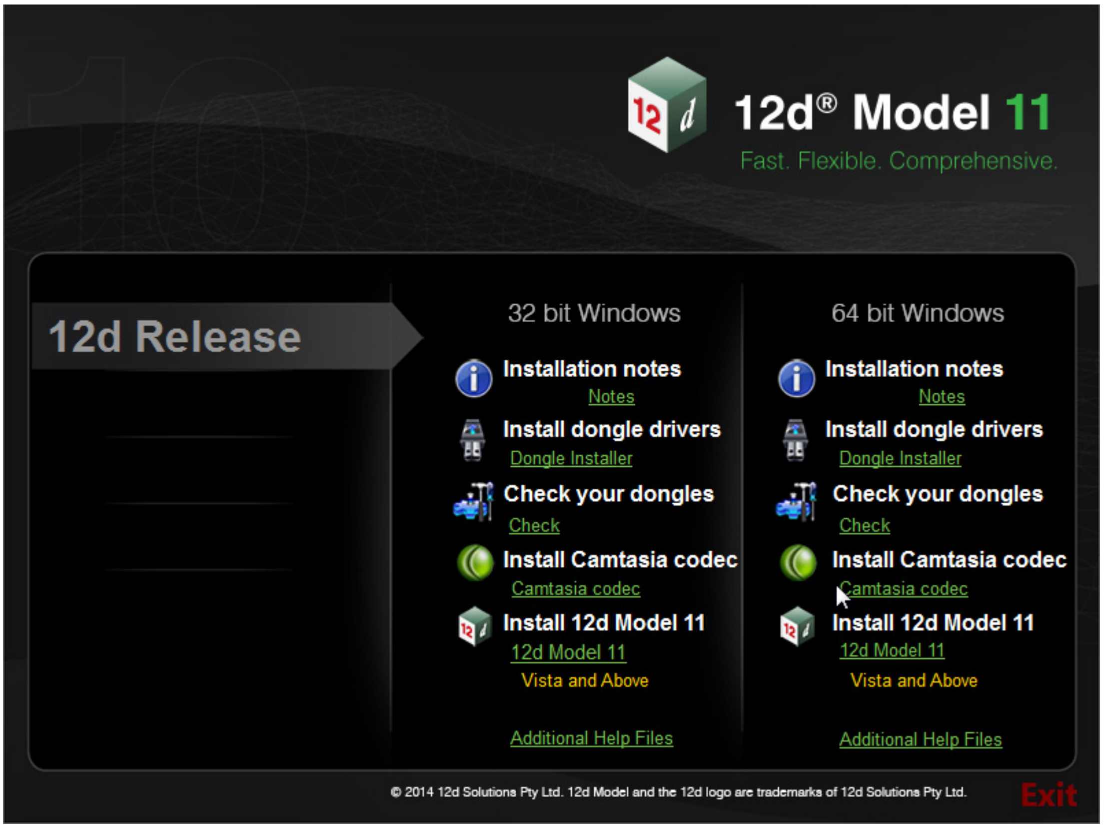


Setup Complete



End of installation. Select ***Finish*** to complete the installation

The *12d Model Release* screen will then appear.



Select **Exit** at the bottom right hand corner of the screen to end the installation.

This completes the installation of the ***12d Model*** software.

12d Model will not function without an authorisation file called ***nodes.4d***.

So the next step is to install and test the ***nodes*** file.

See

Folders Created by the Installation
Icons Created by the Installation,

Or go to Step 5. Installing the Nodes.4d file.

Folders Created by the Installation

(a) For 32 bit *12d Model* on Windows 32 bit operating systems

The *12d Model* installation loads the ***12d Model software*** into the folder

C:\Program Files\12d\12dmodel\11.00

OR

(b) For *64 bit 12d Model* on Windows 64 bit operating systems:

The *12d Model* installation loads the ***12d Model software*** into the folder

C:\Program Files\12d\12dmodel\11.00

OR

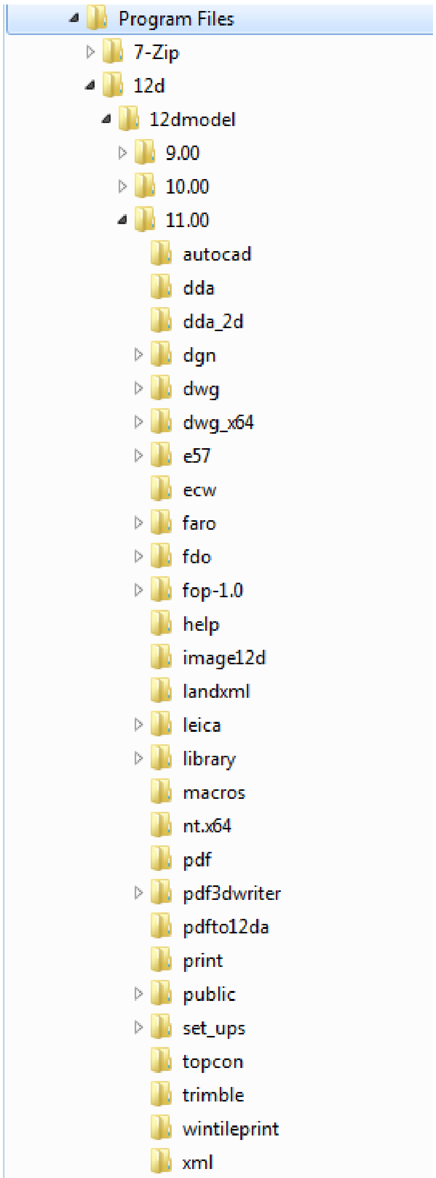
(c) For 32 bit *12d Model* 32 bit (for versions up to 5M) on Windows 64 bit operating systems:

The *12d Model* installation loads the ***12d Model software*** into the folder

C:\Program Files (x86)\12d\12dmodel\11.00

12d Model users normally only have ***read*** access to the *Program Files* and/or *Program Files (x86) areas*.

12d Model software area



under Program Files

The *12d Model* installation on either 32 bit or 64 bit WIndows, also creates an area

C:\12d\11.00

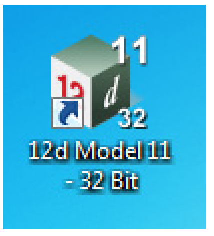
which during the installation is given read/write access for the user.

The folder 12d\11.00 contains the training data used with the *Getting Started for Design and Getting Started for Surveying* manuals *and the subfolders* ***User*** and ***User_Lib*** are created for future user customisations of *12d Model*

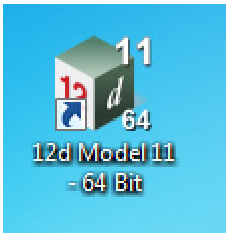
12d Model user areas

Icons Created by the Installation

The installation loads the appropriate components and creates the ***12d Model 11*** icon



icon for 12d Model 32 bit exe



icon for 12d Model 64 bit exe

The ***12d Model 11 - 32*** *and* ***12d Model 11 - 64*** icons fire up ***12d Model*** and attach to the folder *12d\11.00*.

Continue to Step 5. Installing the Nodes.4d file.

Step 5. Installing the ***Nodes.4d*** file

12d Model will not function without an authorisation file called ***nodes.4d***.

The information inside ***nodes.4d*** controls

(a) ***which dongles*** are authorised to run ***12d Model***

(b) what ***version*** of ***12d Model*** will run for a dongle

(c) what ***modules*** are authorised to run for a dongle

To authorise your ***12d Model***, two files ***nodes.12d11n*** and ***nodes.4d*** will have been emailed to you by your local ***12d Model*** Reseller.

Subject: 12D Auth file for 12D Solutions - Lee; Product 12d Model - 5c2d47013c -

Attachments: nodes.12d11n (11 KB)

Nodes file for : 12D Solutions - Lee
- 5c2d47013c -

The authorization file for 12d Model - is attached to this message.

The self-install procedure which follows is for this one workstation and requires 12dmodel installed.
After 12d Model version 11 is installed, please double click on the file attachment [nodes.12d11n] & to open it and 12d will guide you through.

If this succeeds you do not need to read further.

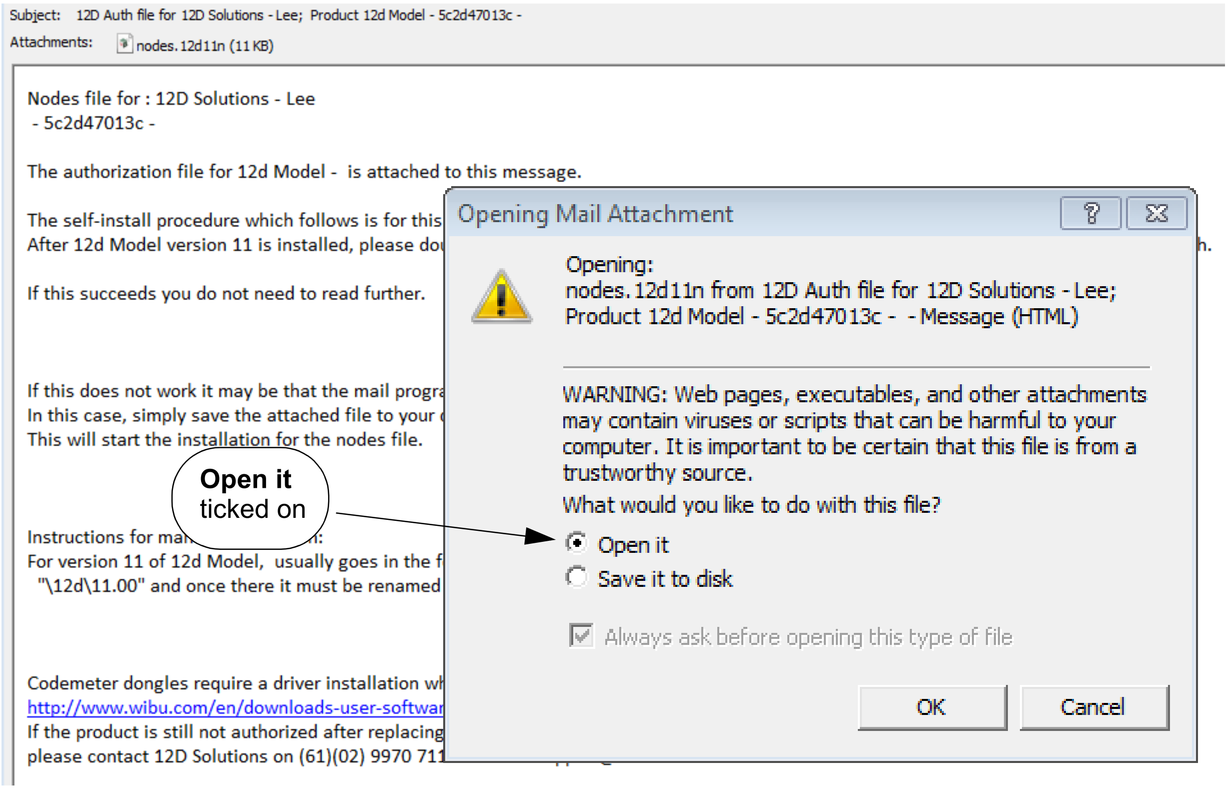
If this does not work it may be that the mail programme does not allow you to run attachments.
In this case, simply save the attached file to your desktop and open (from the right-mouse menu or by double-click).
This will start the installation for the nodes file.

Instructions for manual Installation:
For version 11 of 12d Model, usually goes in the folder
"\12d\11.00" and once there it must be renamed to "nodes.4d"

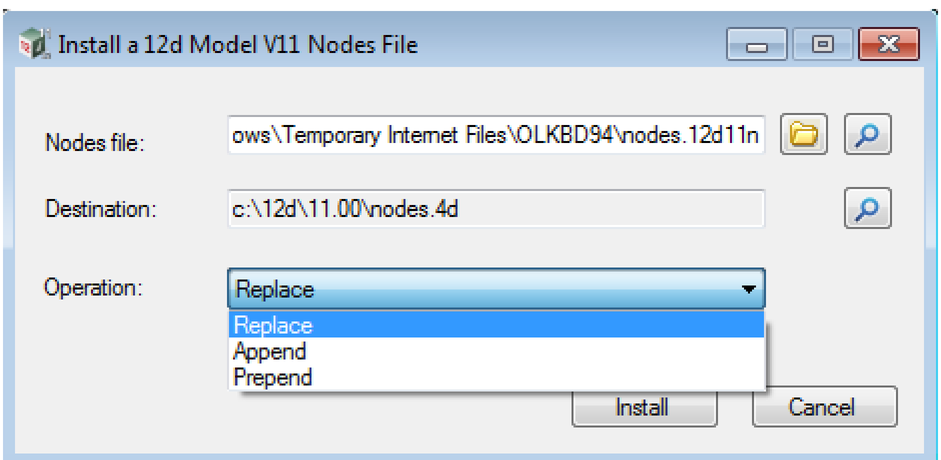
Codemeter dongles require a driver installation which can be obtained here
http://www.wibu.com/en/downloads-user-software.html
If the product is still not authorized after replacing or updating "nodes.4d"
please contact 12D Solutions on (61)(02) 9970 7117 or email support@12d.com

Installing ***12d Model*** sets up a *Windows* file association so that a ***nodes.12d11n*** file is recognised by ***12d Model*** and automatically installs a ***nodes.4d*** file in the correct location.

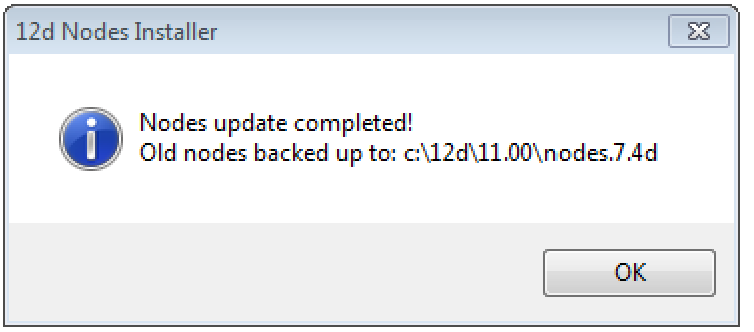
In the email, double click on the files ***nodes.12d11n***, click on ***Open it*** and then click on ***OK***



The **Accept Nodes** panel then appears



Select ***Replace***, ***Append*** *or* ***Prepend*** and then click **Install**.
12d Model saves the ***nodes.4d*** file to the folder ***C:\12d\11.00***.



Note - if you don't have one or both of the files ***nodes.4d*** or ***nodes.12d11n*** attached to an email but instead have either of the files in a folder accessible from your computer, then you can do the following:

If there is a ***nodes.12d11n*** file, double click on that file and the **Accept Nodes** panel should appear and you continue with the instructions above.

If that doesn't work or you only have a ***nodes.4d*** file, start up ***12d Model*** and click on the **Nodes** button at the bottom of the **Project Selection** panel. This will also bring up the **Accept Nodes** panel and you can browse for the ***nodes.4d*** or ***nodes.12d11n*** file in the New nodes file panel field. You can then continue with the instructions above.

Continue to Step 6. Installing 12d Model Context Sensitive Help for Vista and Win 7.

Step 6. Installing 12d Model Context Sensitive Help for Vista and Win 7

12d Model has a context sensitive reference help system which can be accessed directly from most menus and panels:

(a) For most menus in ***12d Model***, when the menu is on the screen and has the Windows focus, simply press F1 and the ***12d Help*** will open automatically at that menu

(b) For most panels in ***12d Model***, when the panel is on the screen and has the Windows focus, simply press F1 and the ***12d Help*** will open automatically at that panel

(c) Most panels in ***12d Model*** have a **Help** button on them and clicking on the **Help** button opens the ***12d Help*** at that panel

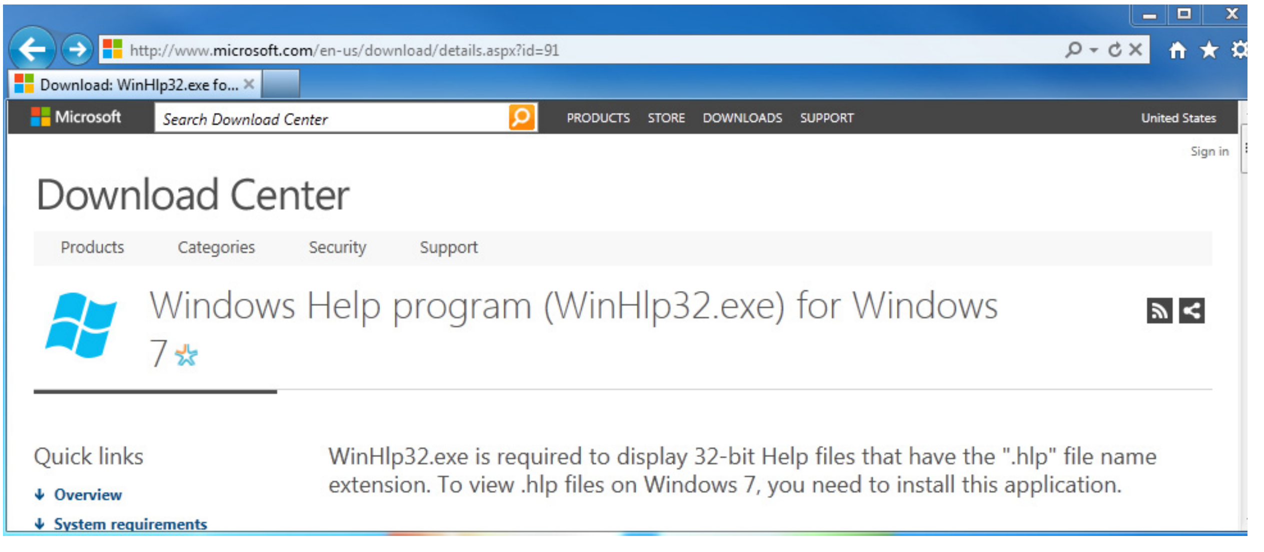
(d) By clicking on the option ***Help =>12d Model***

The ***12d Model*** context sensitive help uses Microsoft's ***WinHlp***.

For *Vista* and *Win 7*, Microsoft no longer ships the WinHlp.exe executable and Microsoft will no longer allow it to be installed by the 12d Model installation DVD.

So if you are running Vista or Win 7, you need to download and install WinHlp.exe from Microsoft's website to access the ***12d Model*** *Help* files. The link to the area for the download is

www.microsoft.com/en-us/download/details.aspx?id=91



Or if you have 12d Model up and running, the link is available on the menu

Help =>Microsoft 7

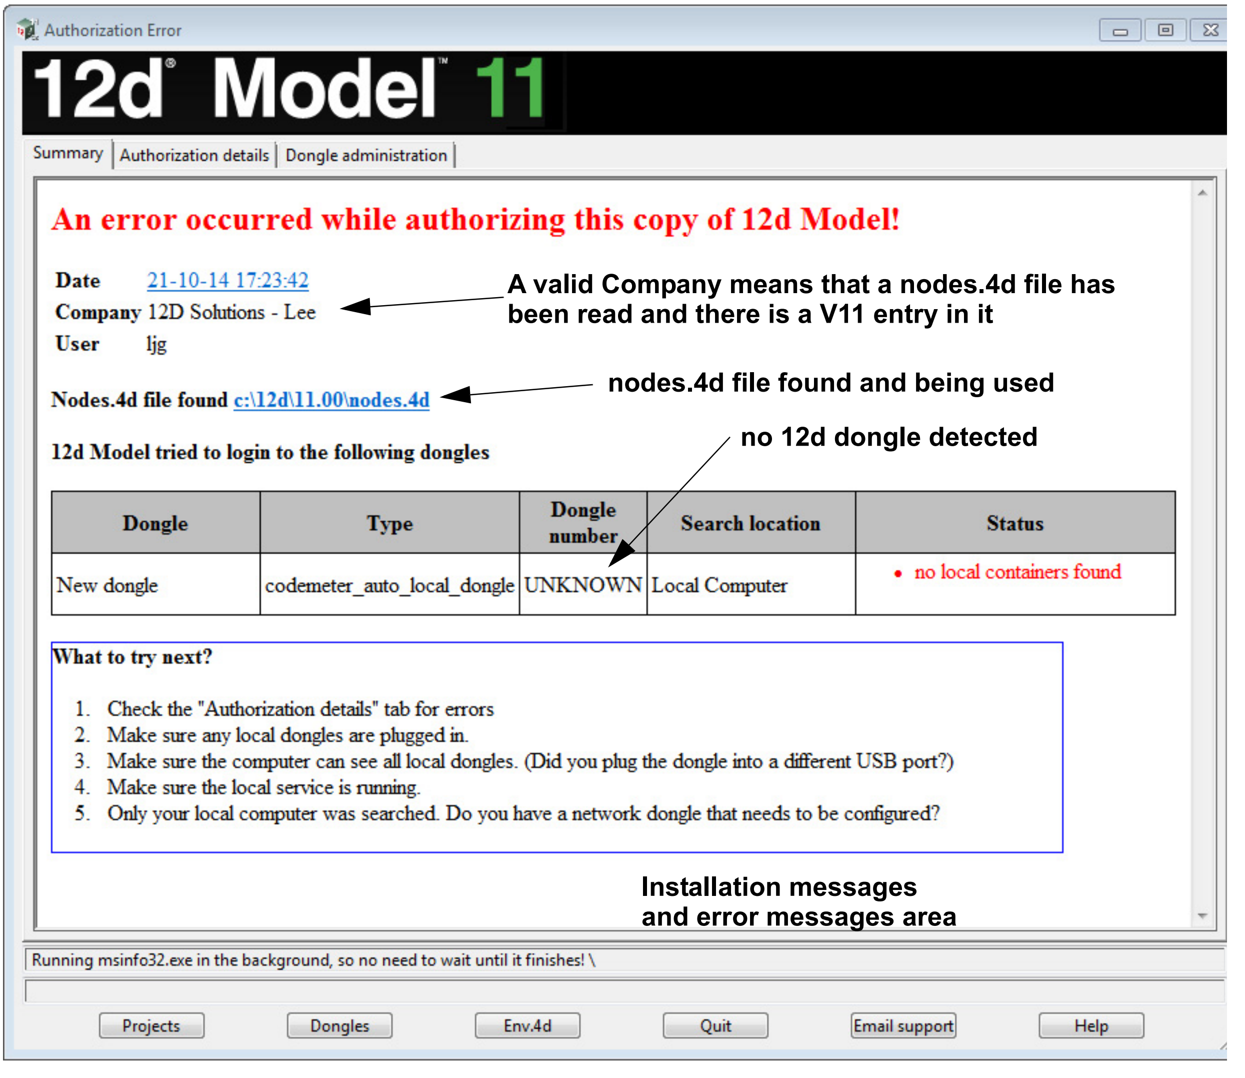
Note: the entire ***12d Model Reference*** manual is available in pdf format on the ***Documentation*** tab of the ***12d Model 11 Installation*** DVD.

CONGRATULATIONS - 12d Model has now been successfully installed and you have finished with these notes.

If ***12d Model*** did ***not*** install correctly, please continue to the next section, 2.3 12d Model 11 Not Authorising, of these notes.

2.3 12d Model 11 Not Authorising

If there is an ***error*** with the installation, then the **Error Authorizing Release Version** panel appears with possibly error message in the panel message area.



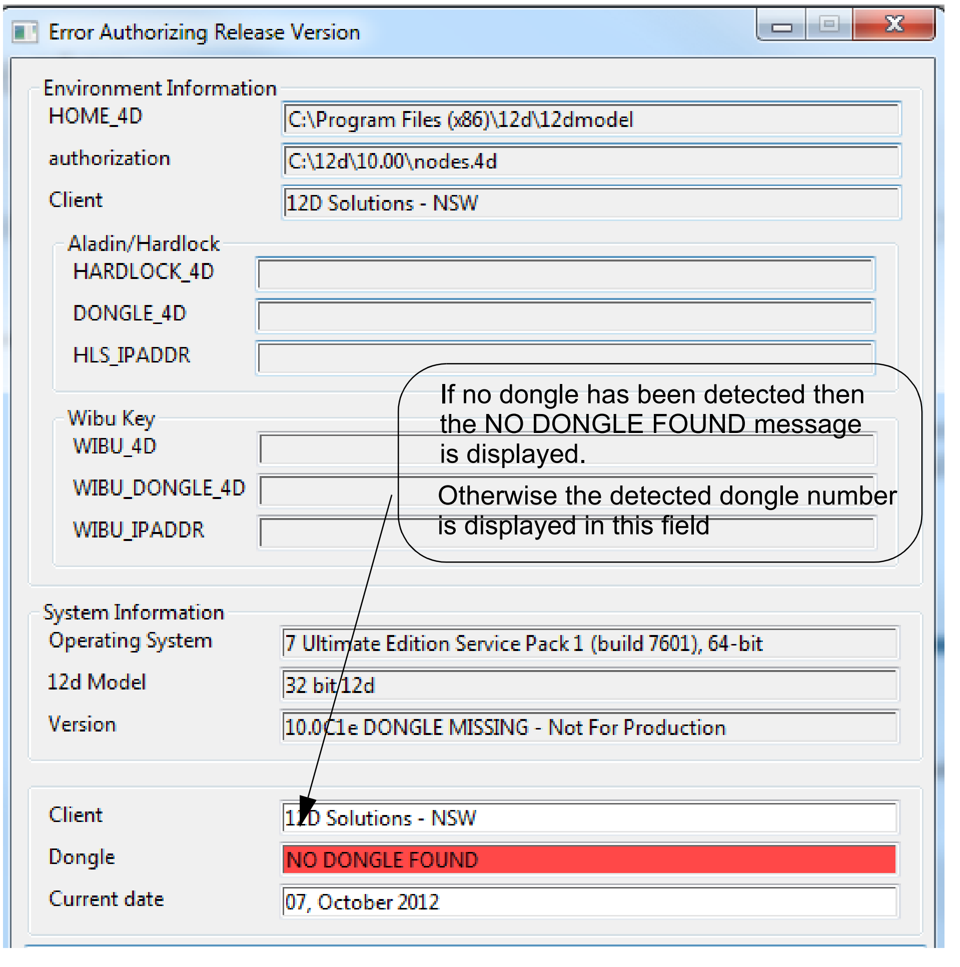
If there is no error message on the panel or it is still not obvious what the problem is, please check the list of possible errors in the next section 2.4 Possible Problems When Authorizing the Release Version.

For example, in the above panel, the DONGLE UNKNOWN shows that no ***12d*** dongle has been detected.

2.4 Possible Problems When Authorizing the Release Version

NOT YET UPDATED FOR V11

1. The ***12d dongle number*** does not come up in the ***Dongle*** field of the **Error Authorizing Release Version** panel.



Please check that

(a) the ***12d*** dongle is firmly attached to the computer.

If not, please attach the dongle and retry starting up ***12d Model*** and accessing a project.

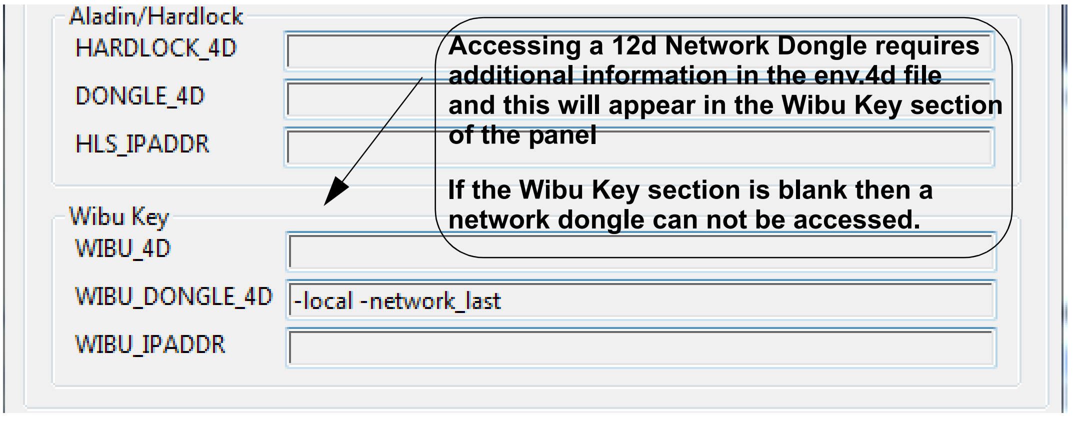
(b) if it is a parallel dongle, the dongle is before any Rainbow dongles. For example, before any AutoCAD dongle.

(c) your computer has the latest dongle drivers installed. These can be obtained from *Updates* section of the web site www.12d.com.

If the dongle number still does not come up in the **Error Authorizing Release Version** panel, please click on the **Email info** button to bring up the **Email Information on 12d Model to 12D Solutions** panel. Fill in the panel and click on **Email** to send the information to 12D Solutions and then contact 12d Solutions or your local distributor.

Special Note If Using a Network Dongle

If you are using a network dongle, then your ***env.4d*** needs to be modified so that ***12d Model*** will correctly ***search*** for the Network dongle. In that case there will be information in the ***Wibu Key*** section of the **Error Authorizing Release Version** panel.



If the Wibu Key section is blank then a network dongle will not be searched for and so cannot be accessed.

Please see the notes on *Installing a Network Dongle* under the ***Documentation*** tab of the ***12d Model 11 Installation*** DVD on how to set up the env.4d file correctly for accessing a network dongle.

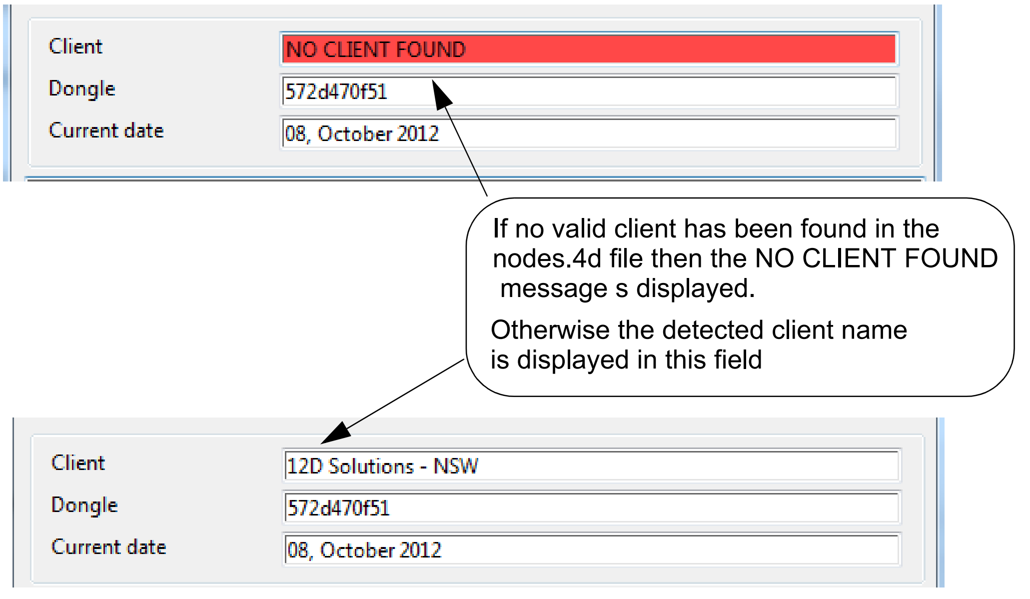
2. Check if there is a recent ***nodes.4d*** or ***nodes.12d11n*** file in the correct area on your computer, which by default is in the folder *C:\12d\11.00.*

   The nodes.4d file found is displayed in the **Authorization** field.

   If it is blank then no nodes.4d has been found.

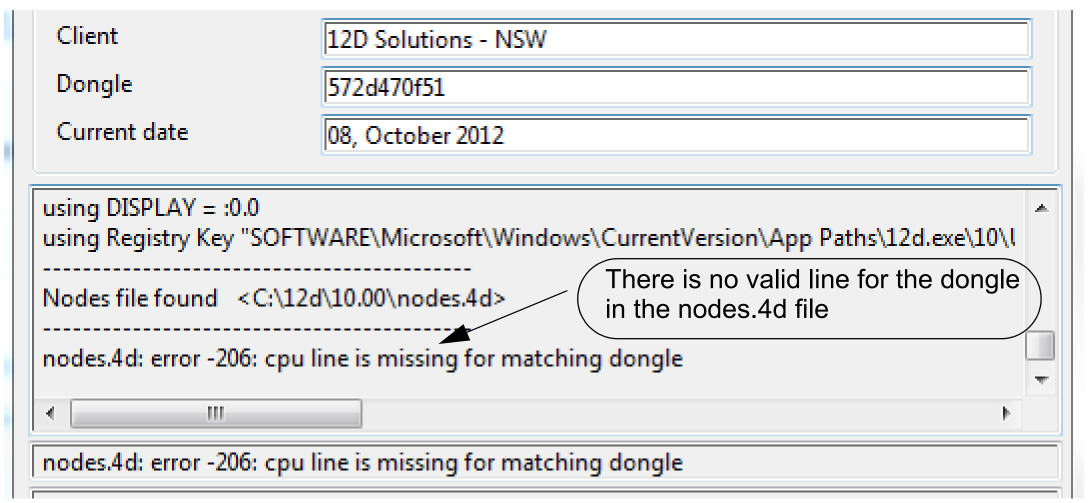
   If you do not have a ***nodes.4d*** or ***nodes.12d11n*** file, contact your local distributor.

3. The ***Client*** field in the **Error Authorizing Release Version** panel has NO CLIENT FOUND.



If the ***Client*** field has a valid *Client Name* in it then that indicates that a 1***2d Model 11 nodes.4d*** file is being read and has a valid Client line in it.

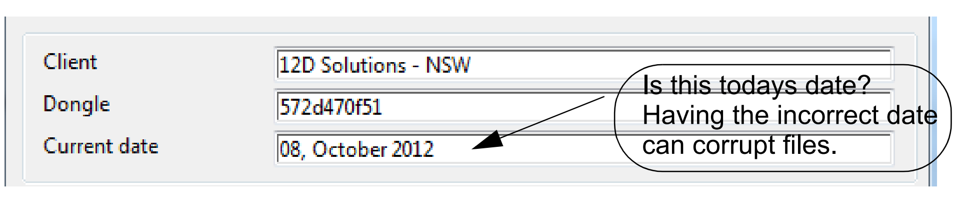
4. Client and Dongle fields look correct but you now get an **error -206**



This error now indicates that there is **no** line, or no valid line, in the ***nodes.4d*** file for the dongle number given in the **Dongle** field.

If you do not have the correct *nodes.4d* file, contact your local distributor.

5. Check that the date on your computer is correct.



If the date is not correct then be very careful. Having an incorrect date in your computer can corrupt computer files and ***12d Model*** projects.

6. If the date on your computer is correct then you need to check that it is between the *start* and *end dates* given in the line in the *nodes.4d* file for your dongle.

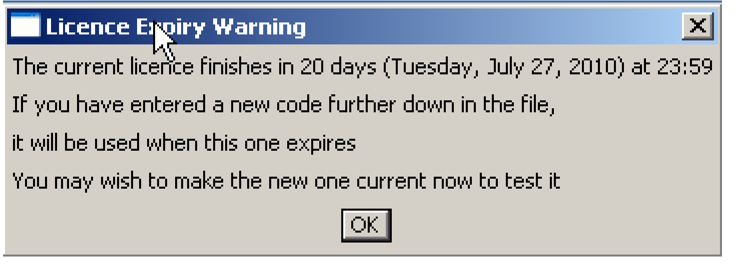
   If there is no valid date line in your nodes.4d file for your dongle, then contact your local distributor for a new nodes.4d file.

7. ***12d Model*** still can't access a project.

   Please contact your local Reseller.

2.5 Licence Expiry Warning

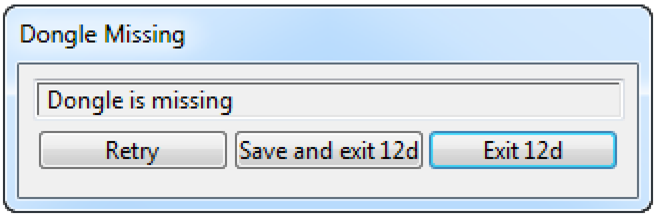
The ***nodes.4d*** file that controls *12d Model*, only validates *12d Model* to run for a certain period of time.
If when running ***12d Model***, the **Licence Expiry Warning** panel appears:



it simply means that the ***nodes.4d*** file needs to be updated.
Please contract your ***12d Model*** *Distributor* to obtain a new *nodes.4d*.

2.6 Dongle Missing

If when running ***12d Model***, the **Dongle Missing** panel appears:



it simply means that the ***12d*** dongle can no longer be seen by ***12d Model***.

Please check that your ***12d*** dongle is still attached to your computer, or if you are using a network dongle, that your network is still active.

Even if you can not see the dongle, ***12d Model*** will allow to save your current work do nothing is lost.

3 Installation of 12d Model 10 Practice Version

The *Practise* version is limited to a maximum of 5,000 points and creates projects that cannot be accessed by the *Release* versions of ***12d Model*** and vice-versa. However the *Practise* version can be used free of charge by 12d Solutions customers and registered *Practise* Users.

These notes are for installing the ***Practise version*** of ***12d Model 10.*** There are separate notes for installing the *Release* version.

The *Practise* version must be Registered with 12d Solutions once it is installed on a computer. A new Registration is required for each computer that the Practise version is run on.

The *12d Model 10 Installation CD* can be used to install the *Practise* versions of ***12d Model 10***.

Or

The file *12dModel 10 Practise.exe* can be down loaded from the web site www.12d.com. The file *12dModel 10 Practise.exe* is a self-extracting file for installing the *Practise* version of ***12d Model***.

Extra Notes for All Installations

1. A three-button mouse is essential.
2. The *12d Model Installation CD* contains extra information other than just the installation version of *12d Model*. For example, extra documentation, course notes and source code to macros.

   The extra data can be copied from the *12d Model Installation CD* but the copied files may only have a “read only” attribute set. This means that the files can not be edited or modified in any way.

   To change the attribute so that a file can be modified, select the file in Explorer, bring up the Properties sheet and under the General tab sheet change the “read only” box so that it is not ticked on.

   Selecting ***OK*** or ***Apply*** will then modify the attribute of the file.

3.1 Installing the Practise Version of 12d Model 10

These notes are for installing the **Practise** version of 12d Model 10. There are separate notes for installing the **Release** version.

A. Disk Space required for installing 12d Model 10

Approximately 200 megabytes of disc space will be required for the installation to succeed. After installation this can be reduced to a minimum of 60 megabytes.

B. Before installing from the DVD or the Web

For Windows 2000, XP, Vista, Windows 7:

Reboot the PC **before** installing 12d Model from the DVD or the Web.

Your login must have Administrator privileges.

C. Installing 12d Model from the Web

The self-extracting file *12dModel 10 Practise.exe* can be down loaded from the web site www.12d.com. *and* used to install the *Practise* version of *12d Model.*

After down loading *12dModel 10 Practise.exe*, double-click on *12dModel 10 Practise.exe* and the installation software will be automatically extracted from the file and fires up the ***Install 12d Model Practise*** screen.

Please go to section Step 3. Dialogues from the 12d Model 10 Practise InstallShield Wizard:

D. Installing Using the 12d Model 10 Installation DVD

Insert the ***12d Model 10 Installation DVD*** into the CD drive.

On inserting the CD, the ***12d Model*** Setup program automatically begins.

If it doesn’t, simply double click on the program ***Launch.exe*** from the DVD.

The ***12d Model Release*** front screen will appear.

Click on the ***12d Practise*** tab

The ***12d Model Practise*** screen will appear.

E. 12d Model Practise Screen

The ***12d Model Practise*** screen:

Note - when installing from the web, the *tabs* with *12d Release*,*12d Practise*, *Other Software* and *Documentation* will not appear. The extra tabs only appear if you are installing from the *12d Model Installation DVD*.

The Steps on the ***12d Practise*** *tab* of the*12d Model Installation DVD* will lead you through the installation of the *Practise* version of *12d Model.*

A ***video*** to guide you through the installation process can be viewed by clicking on ***Videos*** under the ***Installation notes*** heading. Or the ***Installation Notes*** in pdf format can be viewed by clicking on ***Notes*** under the ***Installation notes*** heading.

NOTE - If the *Camtasia* codec is already installed on your computer then you can proceed to ***Install 12d Model 10 Practise.***

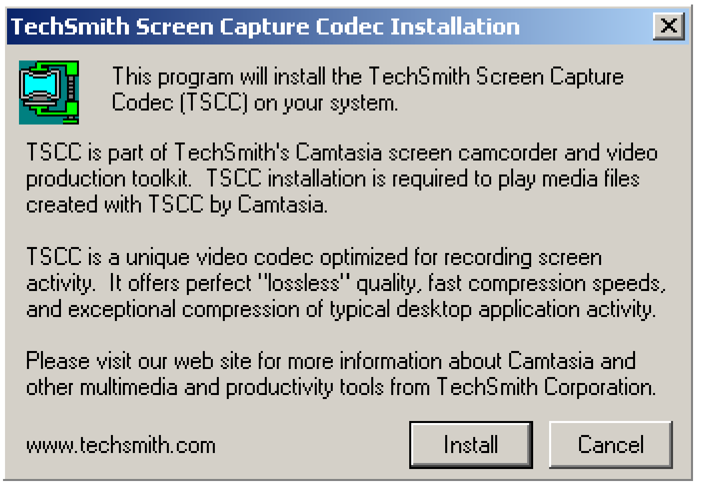
Step 1. Install Camtasia Codec

Install the Camtasia Codec that is used for displaying some of the videos on the ***12d Model Training CD***s and DVDs.

Note - you need Administrator rights to install the Camtasia Codec.

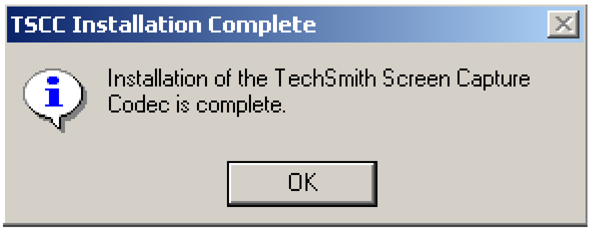
Click on *Camtasia codec*:

Installation *Installation message*



Select **Install** to continue with the installation

Installation Complete



Select **OK**.

This completes the installation of the *Camtasia Codec*.

The ***12d Model Practise*** screen will then appear.

Step 2. Install 12d Model 10 Practise From DVD

Installing the 12d Model Practise software and Training area:

Note - you need Administrator rights to install ***12d Model 10 Practise***.

Click on *12d Model 10 Practise*:

The installation will then start.

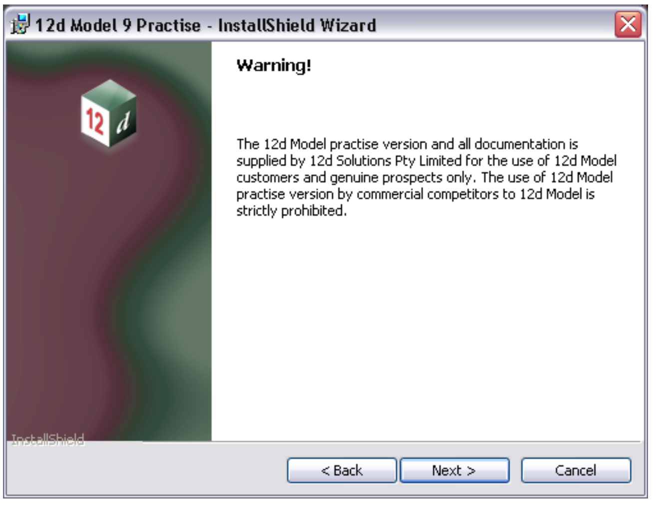
Step 3. Dialogues from the 12d Model 10 Practise InstallShield Wizard:

Welcome *Welcome message*

Select **Next** to continue with the installation

Warning for commercial competitors

12d Solutions warning



The ***12d Model Practise*** version and all documentation are supplied by *12d Solutions Pty Limited* for the use of ***12d Mode***l Customers and genuine prospects only. The use of the ***12d Model*** practise versions by commercial competitors to ***12d Model*** is strictly prohibited.

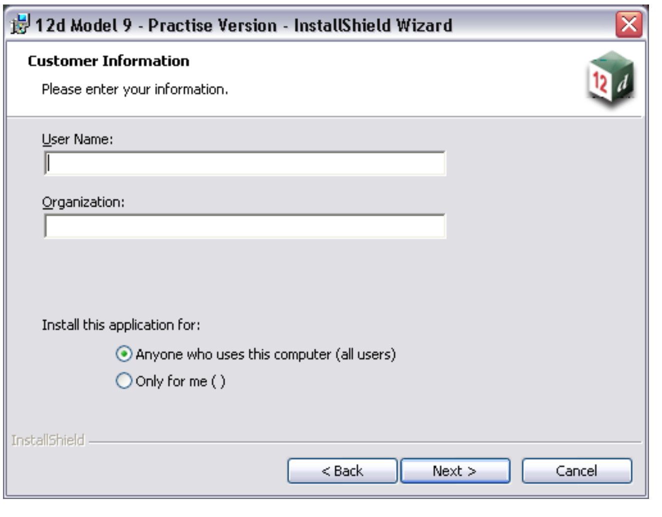
Select **Next** to continue if you are a ***12d Model*** Customers or a genuine prospect

Software License Agreement *12d Solutions license agreement*

If you agree with the License conditions, click on *I accept the terms in the license agreement*

Select **Next** to continue with the installation

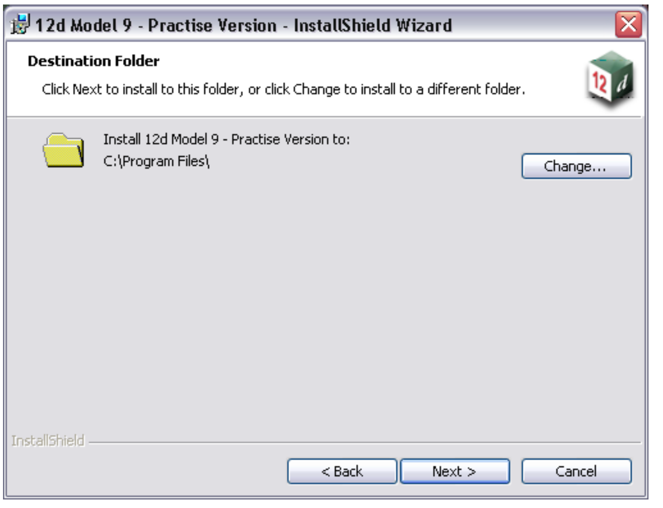
Customer Information



fill in *User Name* and *Organisation*, tick who can use the computer

select ***Next*** to continue with the installation

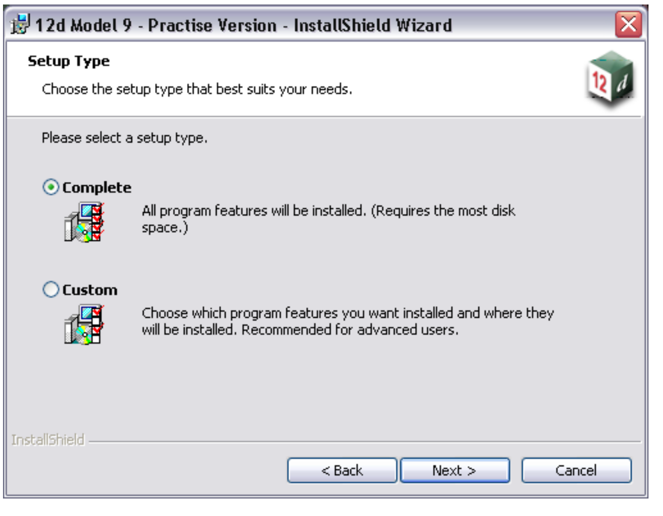
Destination Folder



continue with the default installation area for the software *c:\Program Files* or click on *Change* to browse to another area for installation

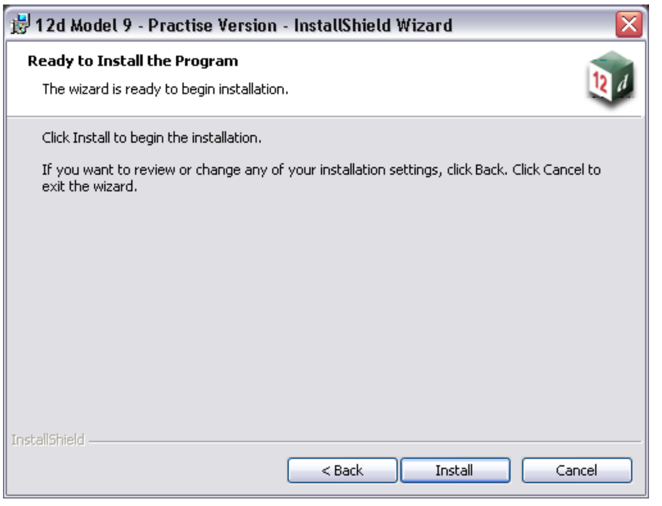
select ***Next*** to continue with the installation

Setup Type



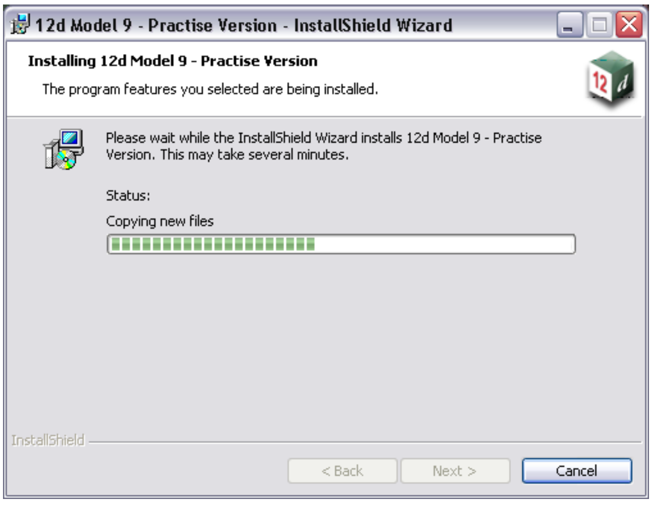
select **Complete** select **Next** to continue with the installation

Ready to Install *Begin the installation*

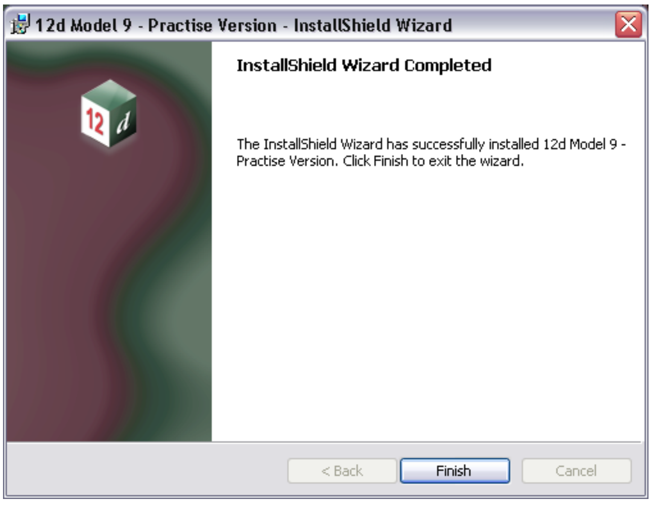


select **Install** to continue the installation

The software will be copied onto the computer and installed.



Setup Complete *End of installation*



Select **Finish** to complete the installation

The ***12d Model Practise*** screen will then appear.

Select **Exit** at the bottom right hand corner of the screen to end the installation.

For ***Practise*** versions, the software needs to be authorised by emailing information about your computer to 12d Solutions.

The form for the required information is automatically created when an unauthorised *12d Model Practise version* is ***started up***. The form can be emailed to *12d Solutions* from the *12d Model Practise* software.

3.2 Folders and Icons Created by Installing 12d Model Practise

Folders Created by the Installation

(a) For *12d Model Practise* on Windows 32-bit operating systems:

the *12d Model Practise* installation loads the ***12d Model Practise software*** into the folder

C:\Program Files\12d Practise\12dmodel\10.00

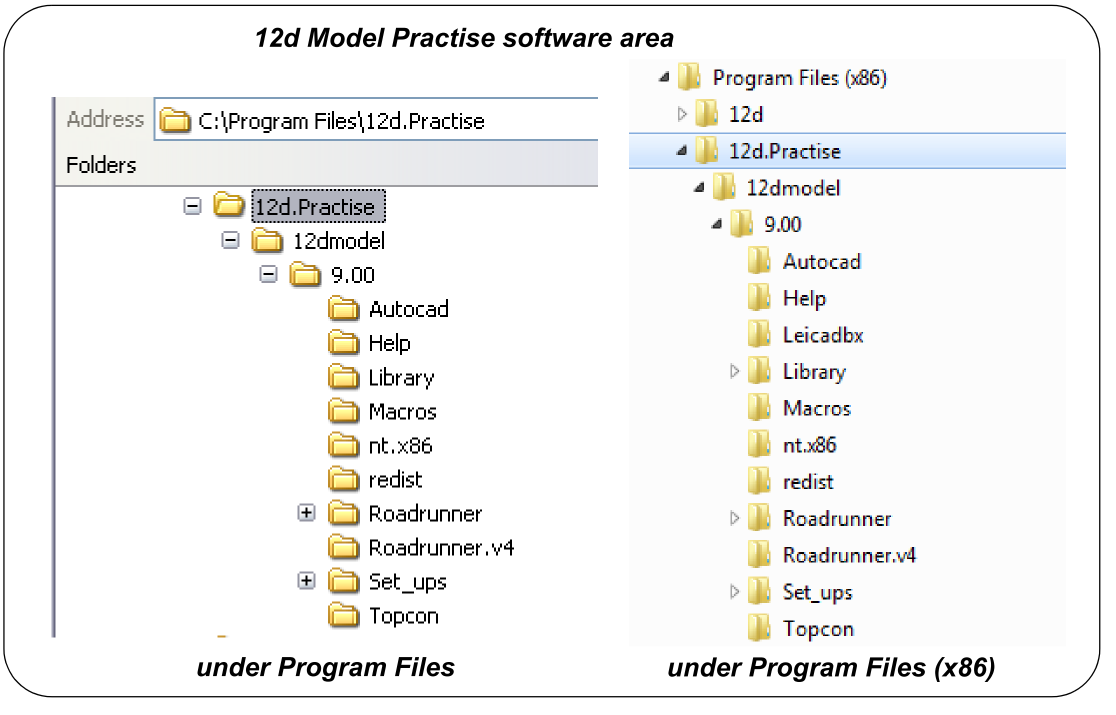
OR

(b) For *12d Model Practise* on Windows 64-bit operating systems:

the *12d Model Practise* installation loads the ***12d Model Practise software*** into the folder

C:\Program Files (x86)\12d Practise\12dmodel\10.00

12d Model Practise users normally only have ***read*** access to the *Program Files* and/or *Program Files (x86) areas.*

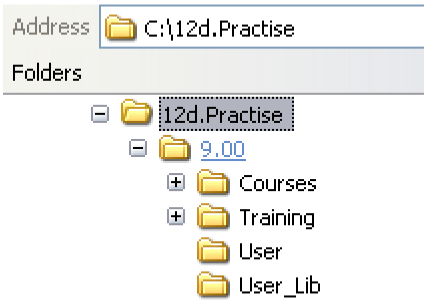


The *12d Model* installation also creates an area

C;\12d Practise \10.00

which during the installation is given read/write access for the user.

The folder 12d Practise\10.00 contains the training data used with the *Getting Started for Design and Getting Started for Surveying* manuals *and the subfolders* ***User*** and ***User_Lib*** are created for future user customisations of *12d Model*



12d Model Practise user areas

Icon ~~s~~Created by the Installation

The installation loads the appropriate components and creates the ***12d Model 10 Practise*** icon

The *12d Model 10 Practise* icon fires up ***12d Model Practise*** and attaches to the folder *12d Practise\10.00*.

3.3 Authorizing the Practise Version of 12d Model 10

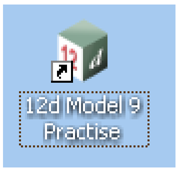
Warning

The *12d Model Practise* version and all documentation is supplied by *12d Solutions Pty Ltd* for the use of 12d Model Customers and genuine prospects only. The use of the *12d Model Practise* version by commercial competitors to 1***2d Model*** is strictly prohibited.

The Practise version is limited to a maximum of 5,000 points and creates projects that cannot be accessed by the Release versions of 12d Model and vice-versa. However the Practise version can be used free of charge by *12d Solutions* customers and registered Practise Users.

The Practise version needs to be Registered with *12d Solutions* once it is installed on a computer and a new Registration is required for each computer the Practise version is run on.

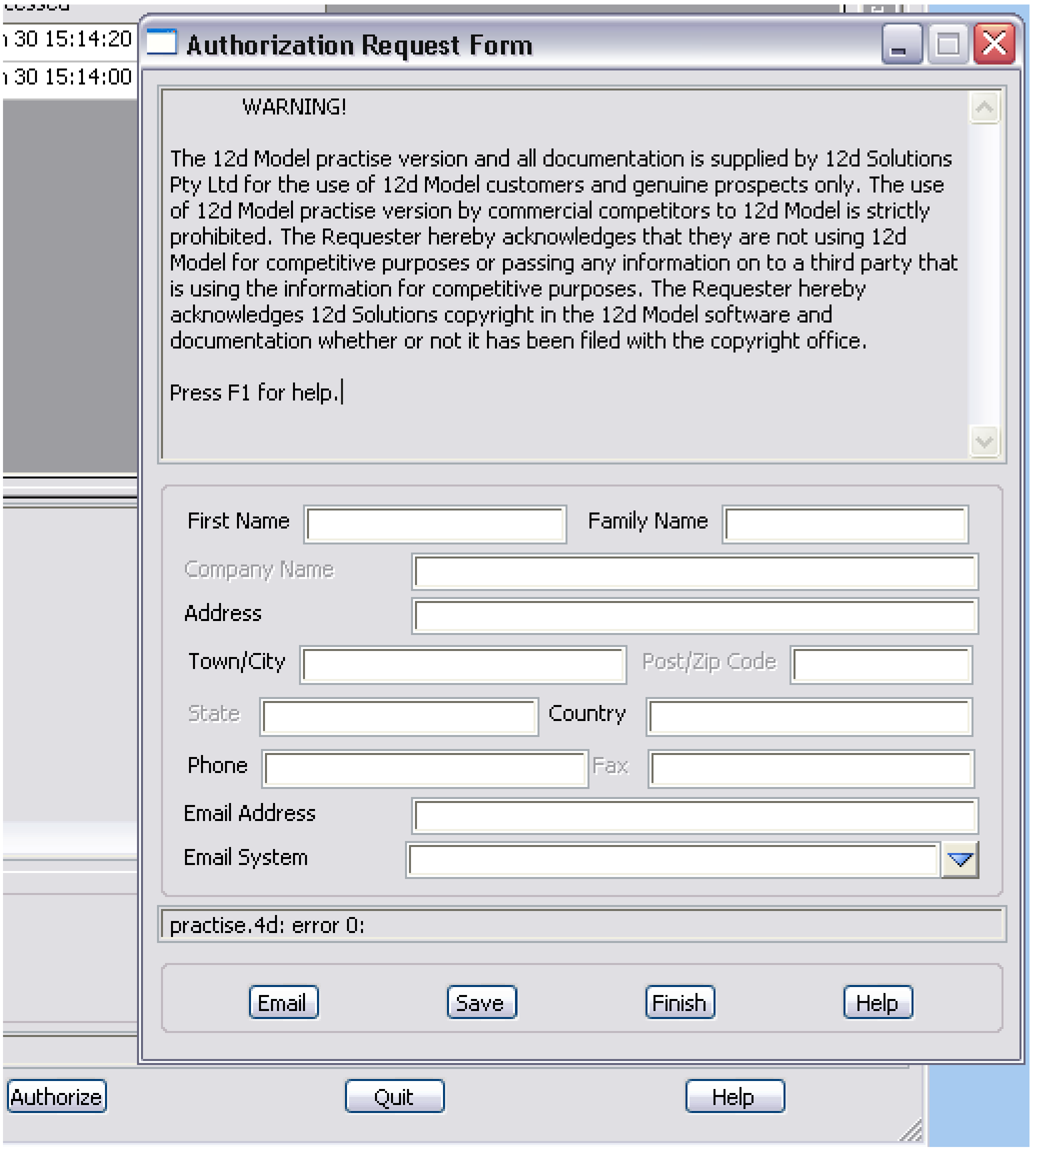
The installation creates the ***12d Model 10 Practise*** icon:



Next fire up ***12d Model Practise*** by double clicking on the *12d Model 10 Practise* icon.

This will bring up the Project Selection panel with an **Authorize** button it.

Click on **Authorize** to display the **Authorize Request Form** panel.



Fill in the details (all those in black type must be filled in) and then either

(a) click on the **Email** button to send the information to 12d Solutions Pty Ltd

or if this fails

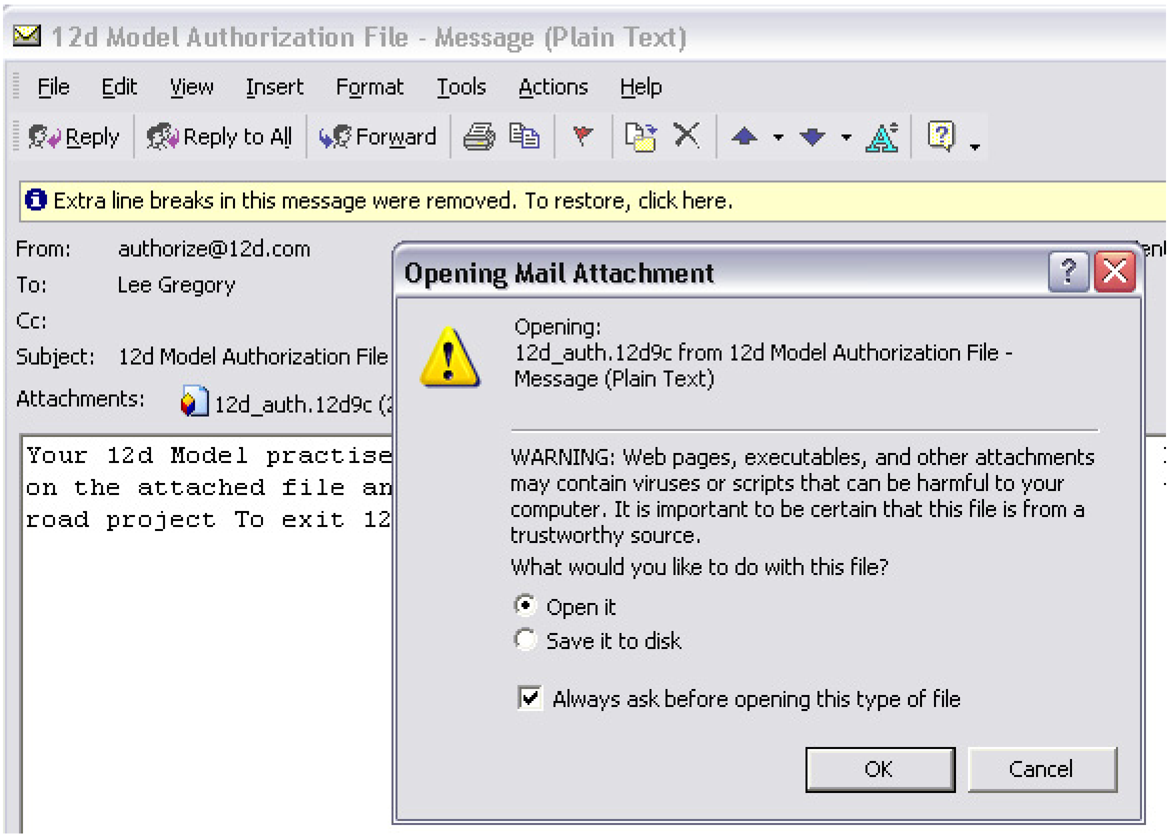
(b) click on the **Save** button. A file called *12d_auth.12d10r* is then written out to the folder ***My Documents***. Please email this file (as an attachment) to *authorize@12d.com*

Then click on the **Finish** to exit *12d Mode*l.

On receiving your request, 12d Solutions will generate an authorization code and send an email back to you with an attachment called ***12d_auth.12d10c***

When you receive the email with the file *12d_auth.12d10c* attached to it, double click on the attached file *12d_auth.12d10c,* click on ***Open it*** and finally click on ***OK***.

.



12d Model Practise will then start up and

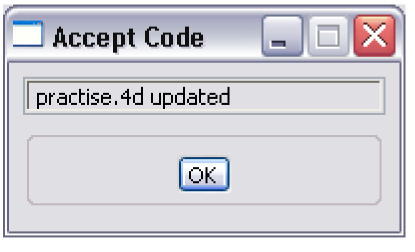
validate the ***12d_auth.12d10c*** file, and if it is valid

save the authorization code away as the file ***practise.4d*** in the folder

c:\12d Practise\10.00

and then bring up the ***Accept Code*** panel with the *practise.4d updated* message.

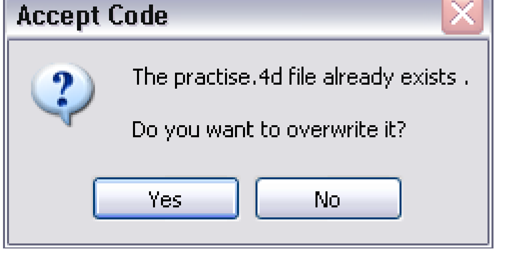
.



Click on ***OK*** and *12d Model Practise* will open and display the project *Road*.

Note: if you already have a pratise.4d file in the folder then the ***Accept Code*** panel will be brought up, stating that the *practise.4d* file already exists, and asking to overwrite it.

.

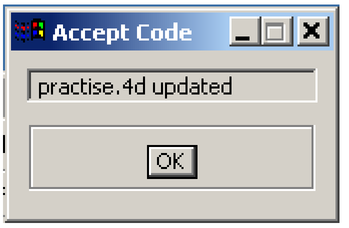


Click on ***Yes*** and the new authorization code will be saved away as the file ***practise.4d*** in the folder

c:\12d Practise\10.00

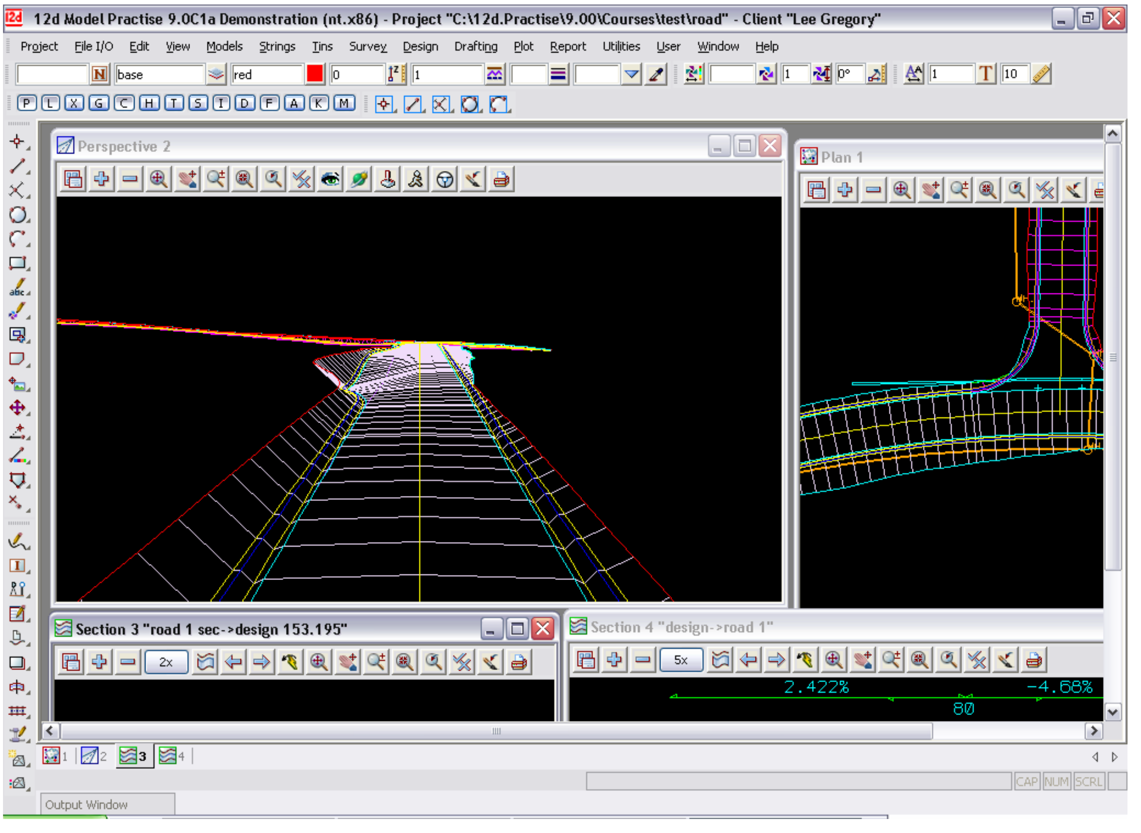
The ***Accept Code*** panel then comes up with the *practise.4d updated* message.

.



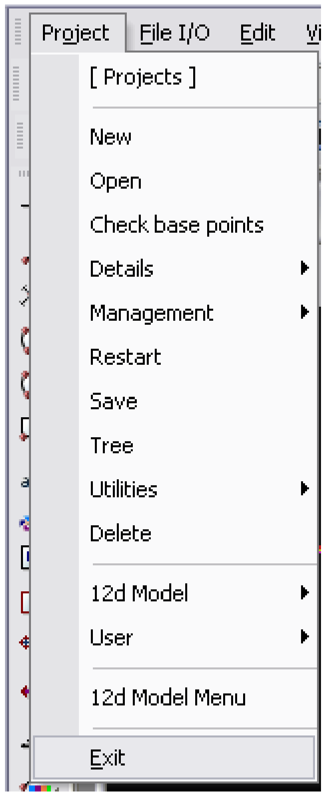
Click on ***OK*** and *12d Model Practise* will open and display the project *Road*.

.



To exit *12d Model Practise*, click on **Project =>Exit**

.



If *12d Model Practise* does not start up correctly, please go to the next section 3.4 Possible Problems When Authorizing the Practise Version

3.4 Possible Problems When Authorizing the Practise Version

1. The date on your computer is not the correct date.
2. The computer your are authorizing is not the same one that the *Authorisation Request Form* was generated for.

   The ***12d_auth.12d10c*** and the generated ***practise.4d*** file are only valid for the computer that the *Authorisation Request Form* was generated on. If you want the Practise version to run on another computer, you need to generate a new *Authorisation Request Form* on that computer and send it to 12d Solutions.
3. If you change your network card after generating the *Authorisation Request Form* then the authorization will stop working. A new *Authorisation Request Form* needs to sent to 12d Solutions.
4. If the file ***12d_auth.12d10c*** does not appear as an attachment then your email system can't handle MIME attachment. Please contact 12d Solutions at *authorize@12d.com*

4 Tools and Concepts

The chapter contains information about the definitions and behaviour of general items used in ***12d Model*** such use of the mouse, keyboard, how information is displayed on the screen, picking items, *etc.*

See

For documentation on the first item, continue to the next section 4.1 The Mouse.

4.1 The Mouse

The mouse is used extensively in ***12d Model***.

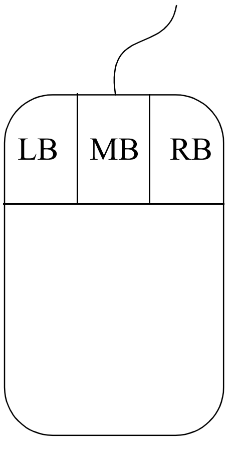
12d Model can be operated with either a two or a three button mouse but a three button mouse is preferred.

In this manual the buttons will be denoted by

LB = the left button

MB = the middle button

RB = the right-button



12d Model monitors the mouse being pushed down and when it is subsequently released as separate events. Unless otherwise specified in the manual, **clicking** a button will mean **pressing the button down and releasing it again**. The **position of the mouse** is normally taken as being when the **button is released**.

In screen messages, the effect of pressing each button on the mouse is shown by enclosing the effect for each button in square brackets ([]) in left-to-right button order. That is

[left button effect] [middle button effect] [right button effect]

Empty brackets, [], indicate that pressing the button has no effect at that time.

NOTE: If the Middle button is also a wheel, then the wheel can be used in some ***12d Model*** operations such as zoom.

Please continue to the next section 4.2 The Keyboard or return to 4 Tools and Concepts.

4.2 The Keyboard

For clarity, the characters and special keys on the keyboard will be enclosed in the angle brackets **< >**. For example, the delete key is <del>.

When two or more keys are to pressed down together, they will be shown in angle brackets separated by a plus sign (**+**).For example, **<ctrl> + <d>** means that the control key and d are pressed down together.

In ***12d Model***, the *escape* key (normally labelled **Esc** on the keyboard and denoted by <esc> in this manual) is used to **stop drawing** in a view or to **break out** of computer intensive options (*escape* or *abort* the option) but still remain in ***12d Model***. Options which can be terminated by <esc> are noted in the manual.

Please continue to the next section 4.3 Screen Layout or return to 4 Tools and Concepts.

4.3 Screen Layout

Inside the ***12d Model*** screen are six distinct areas (main menu, top Toolbar area, side toolbar area, view area, output window and status bar) which create and control nine associated objects (panels, toolbars, control bars, floating menus, Plan views, Section views, Perspective views and Perspective OpenGL views displayed on the screen.

The main areas and their purposes are:

(a) Main Menu

The **Main Menu** is at the top of the ***12d Model*** screen and is a standard Microsoft type menu. Options are selected in the standard Microsoft way and bring up ***12d Model*** **panels** and **floating menus**. See 4.3.1 Main Menu.

(b) Views Area

The **Views Area** displays the ***12d Model*** drawing views for seeing and examining the data. There is no limit to the number of **Plan**, **Section** or **perspective, Perspective OpenGL** and views that can be created, overlapped or iconised (the **Perspective Hide** view has been superseded by the Perspective OpenGL view). See 4.3.7 Views.

(c) Output Window

The **Output Window** displays ***12d Model*** system and error messages, and intelligent log lines. The Output Window can be turned on/off from the Main menu. See 4.3.9 Output Window.

(d) Background Tasks Window

The **Background Tasks** window displays messages from tasks started by ***12d Model*** as background tasks. The Background Tasks window can be turned on/off from the Main menu. See 4.3.10 Background Tasks Window.

(e) Status Bar

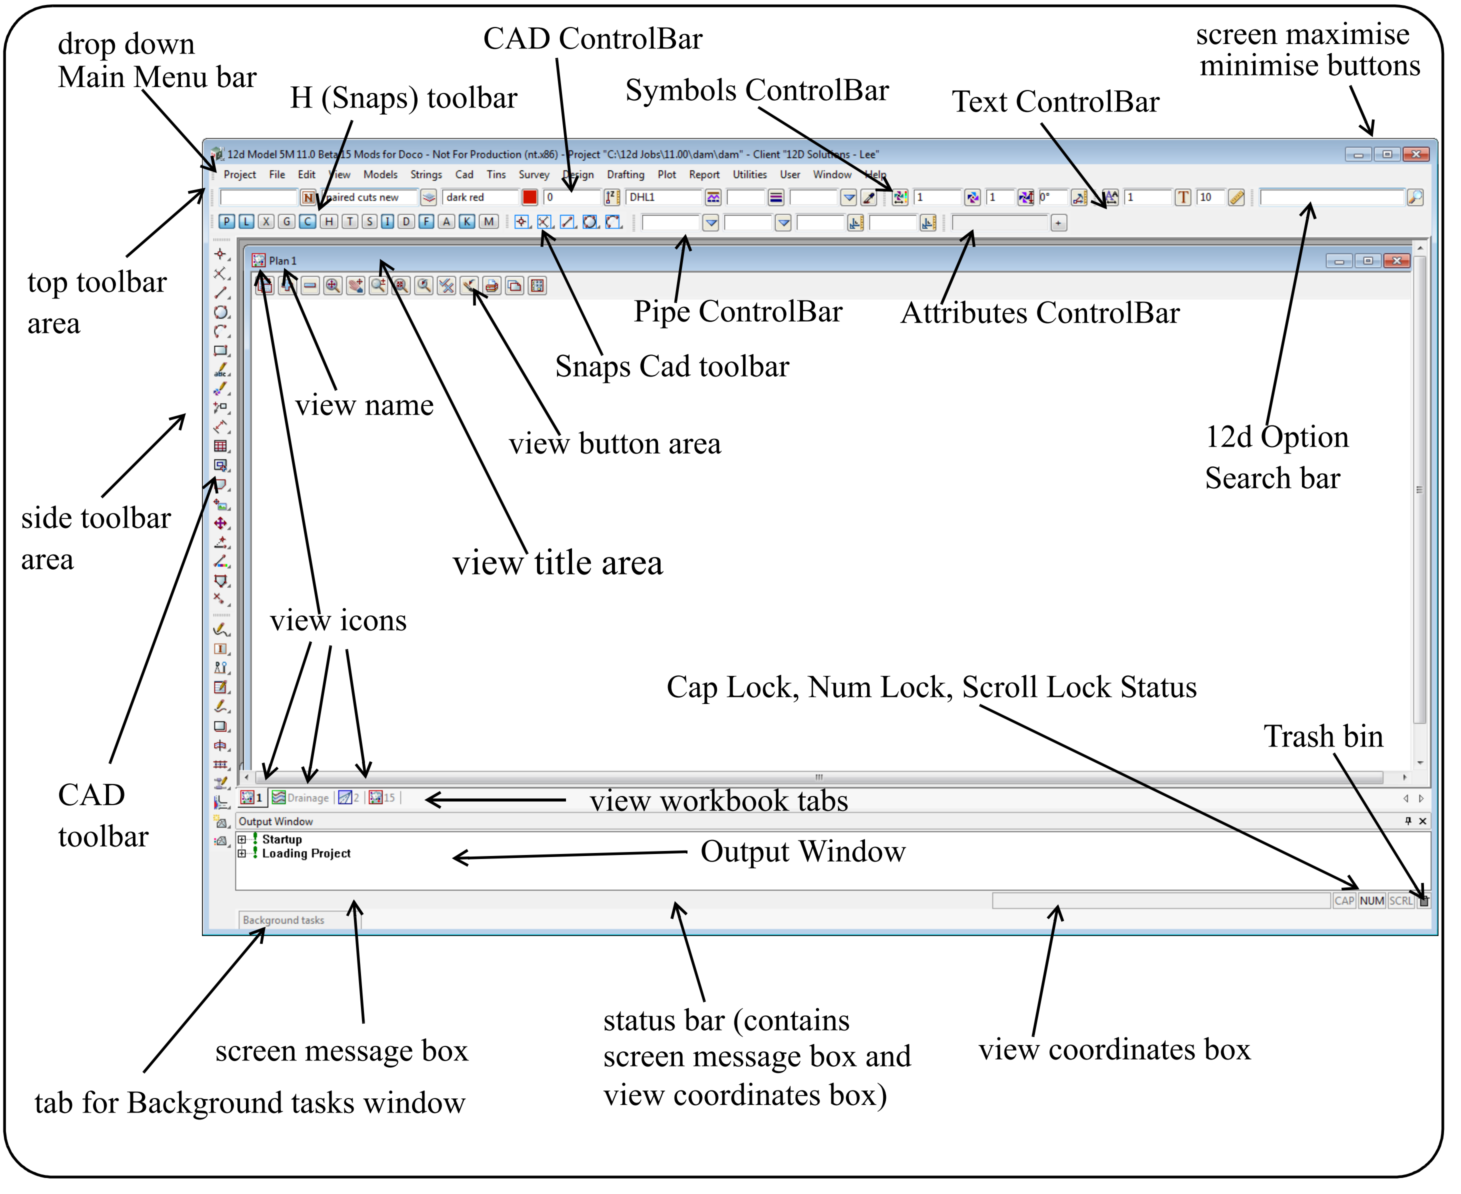
The **Status Bar** displays message prompts and the x, y and z coordinates of the cursor when it is in a drawing view. The Status Bar can be turned on/off from the Main menu. See 4.3.8 Status Bar.

(f) Top Toolbar area

The **Top Toolbar area** is below the Main Menu and contains the CAD control bar, Text control bar and the snaps toolbar.

(g) Side Toolbar area

The **Side Toolbar area** is on the far left side and the CAD Toolbar and other Toolbars defined in *Toolbars.4d*

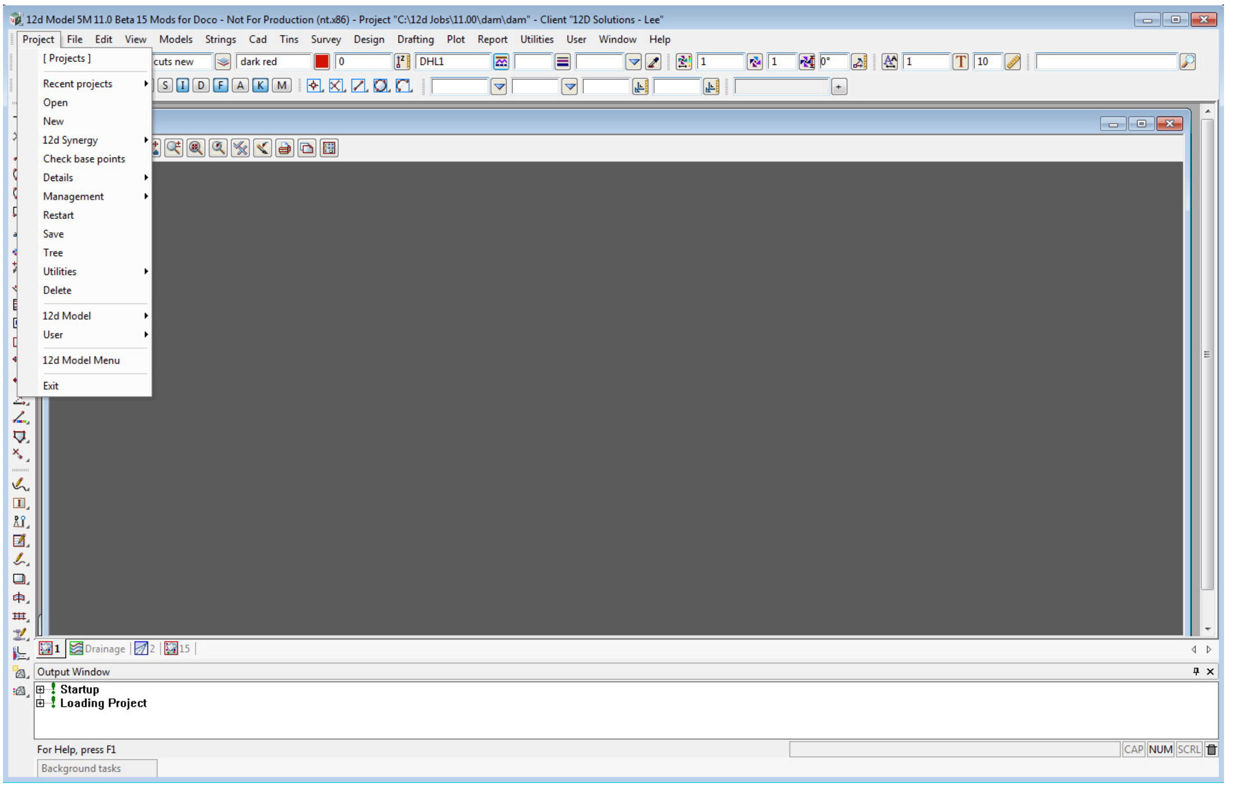


Please continue to the next section 4.3.1 Main Menu.

4.3.1 Main Menu

At the top of the ***12d Model*** window is the **Main** menu, a standard Microsoft type menu.

.



Options can be selected in the standard Microsoft way and bring up ***12d Model*** panels (dialogues) or create floating menus.

The **Main** menu can be moved around, or docked on any of the four sides of the window.

If the Window is not wide enough, the **Main Menu** will automatically wrap around onto two or more lines.

Options can be selected from the **Main Menu** or from the walk rights on option on the **Main Menu**.

Or most menus on the **Main Menu** can be torn off to create floating menus that can be placed anywhere on the screen,

Continue to the next section 4.3.2 Creating Floating Menus from the Main Menu.

4.3.2 Creating Floating Menus from the Main Menu

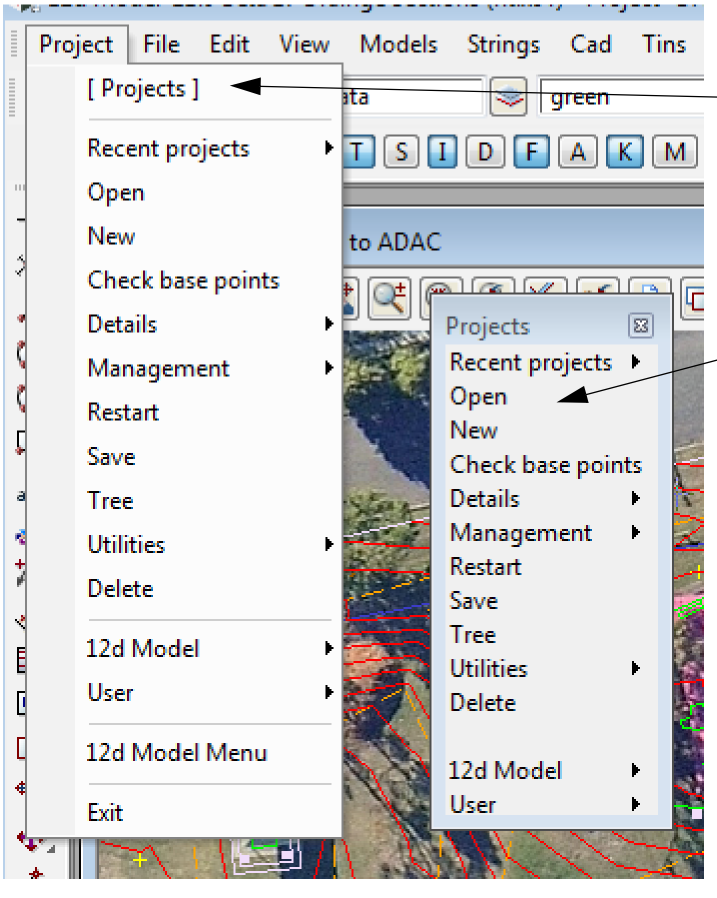
As well as the standard Microsoft type menu, ***12d Model*** has the concept of **floating (tear away) menus**.

The presence of a **floating menu** on the **Main Menu** is indicated by a menu item enclosed in square brackets **[ ]**. Selecting a menu item in square brackets will create a **floating menu** of that name.

For example, selecting **[Project]** from the top menu **Project** creates the floating menu called **Projects.**

A floating menu can be moved around the screen, even outside the ***12d Model*** window, and will stay up until the **[X]** button is selected on the top right hand side of the floating menu.

A floating menu created from the **Main Menu** usually contains the same items and walk-right menus as the **Main Menu** but has the distinct advantage that it **doesn't disappear** when the cursor is moved to select other menus from the **Main Menu.** It stays on the screen as a menu in its own right.



[Projects] to indicate that a floating menu (tear away menu) can be created by clicking on the **[Projects]**

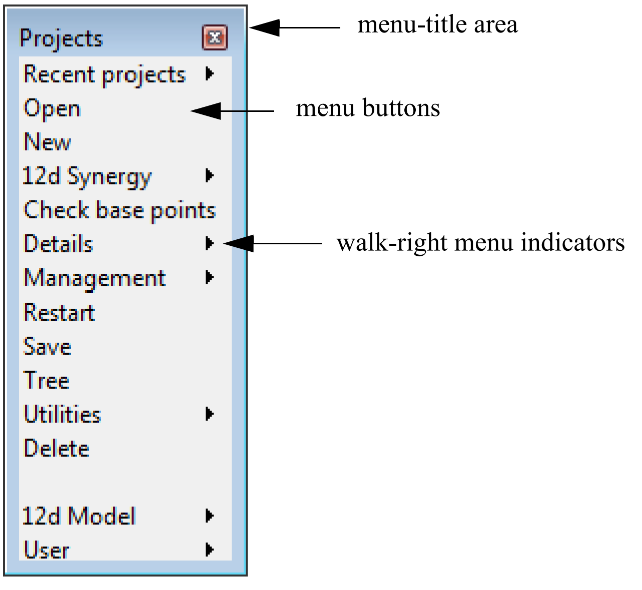
the **Projects** floating or tear away menu

Continue to the next section 4.3.2 Creating Floating Menus from the Main Menu.

4.3.3 Floating Menus

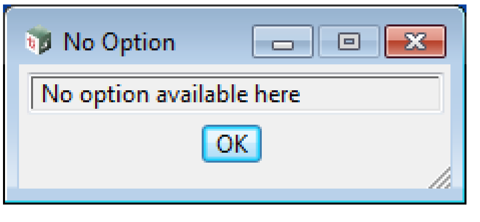
Floating menus or **tear away** menus consist of a **menu title area** and a series of options, called menu buttons, lined up under the menu title.

For example, the **Projects** menu looks like



An option on the menu is invoked (or selected) by clicking LB whilst over the option.

If no option exists, a **No Option** panel is placed on the screen. The panel will remain until the **OK** or **[X]** button is selected.



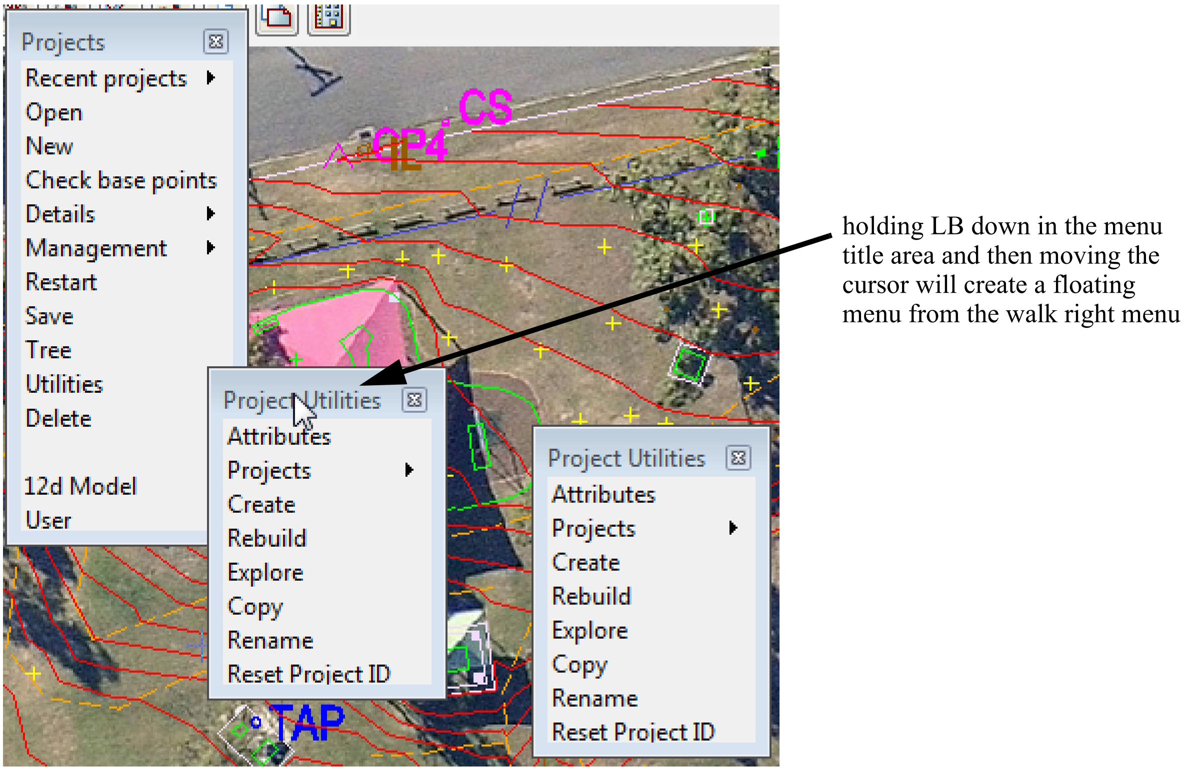
The icon ▸ on a menu-option indicates that there is a **walk-right** menu attached to that button.

The walk-right menu only appears as the cursor **moves over** the ▸ .

The walk-right menu can consist of further menu options and walk-rights.

If a walk-right menu is showing and the user wanders back into the menu where the walk-right originated, the walk-right menu will collapse back to the ▸ .

When a walk right menu is showing on a **floating menu**, holding LB down in the menu title area and then moving the cursor will tear the sub menu from the main menu and create a **new floating menu** of the **walk right menu**.



For the description on:

Moving a menu go to	4.3.3.1 Moving a Menu
Dumping a menu	4.3.3.2 Dumping a Menu or Panel
Deleting a menu	4.3.3.3 Deleting a Menu

4.3.3.1 Moving a Menu

A menu can be moved (dragged) by **holding down LB** anywhere in the menu title area (except on the **[X]** button) and then moving the cursor with **LB** still depressed. The menu moves with the cursor to indicate where the new menu position will be. The menu is finally positioned when **LB** is released.

When an expanded walk-right menu is moved, a **copy** of the walk-right menu will be moved and placed on the screen as a new floating menu. The original menu still contains the walk-right menu.

Continue to the next section 4.3.3.2 Dumping a Menu or Panel or go back to 4.3.2 Creating Floating Menus from the Main Menu.

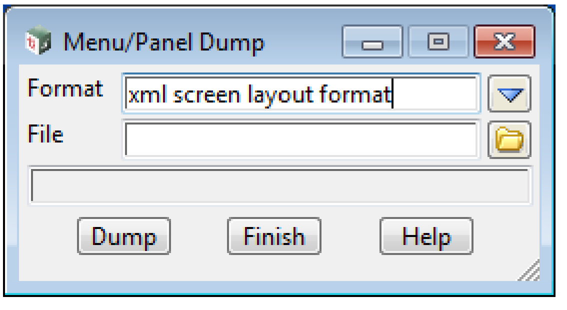
4.3.3.2 Dumping a Menu or Panel

The menu or panel can be written out to disk in a variety of images formats, as a screen layout file (SLX), and for a panel, as a defaults file (DDX). This is called dumping the menu or panel.

The **Dump** option is invoked by clicking the middle mouse button (MB) anywhere in the menu/panel title area. The **Menu/Panel Dump** panel is then displayed.

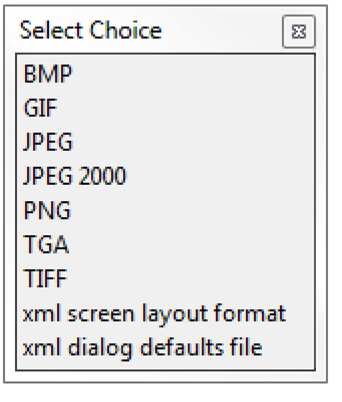
Note: If a screen layout file is created and added to the *layout.4d* file (by selecting *layout.4d* as the file name and selecting **Append**), then the menu/panel will appear whenever a project is opened. See layout.4d

.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format	choice box	screen layout file	



format for writing the menu/panel to disk.

File file box

name of the disk file to write the image or screen layout information to.

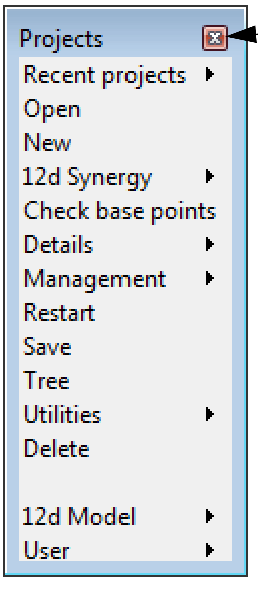
Dump button

dump the menu information to disk.

Continue to the next section 4.3.3.3 Deleting a Menu or go back to 4.3.2 Creating Floating Menus from the Main Menu.

4.3.3.3 Deleting a Menu

A floating menu is deleted by selecting the **[X]** button in the menu-title area.



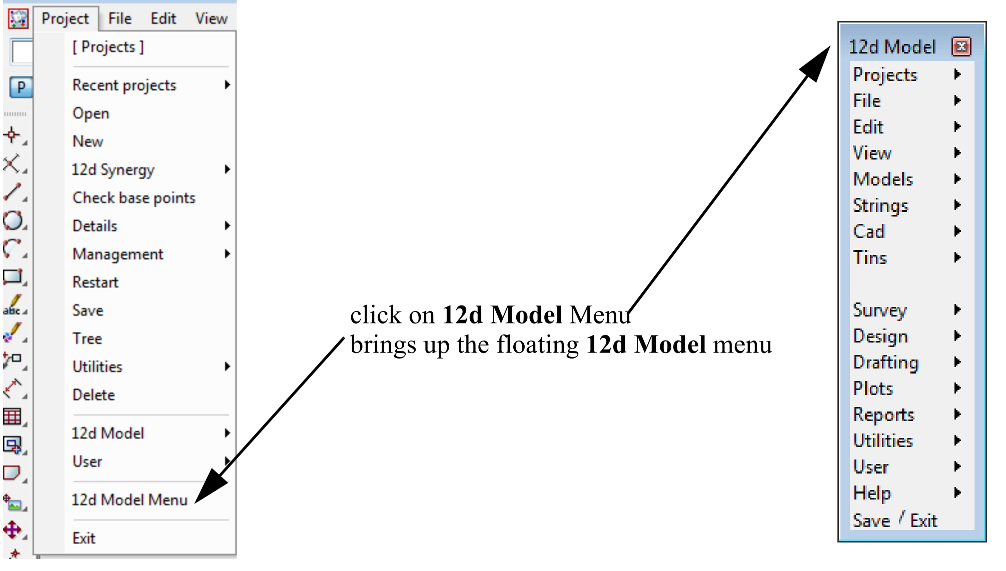
click on [X] to delete the menu and remove it from the screen

Please continue to the next section 4.3.4 12d Model Menu.

4.3.4 12d Model Menu

A floating ***12d Model*** menu is available by selected ***12d Model* Menu** on the **Projects** menu.

Selecting **12d Model Menu** again will *remove* the **12d Model** menu.



All of the options going across the **Main Menu** are available by going down the **12d Model** menu.

Please continue to the next section 4.3.5 Toolbars and Controlbars.

4.3.5 Toolbars and Controlbars

See

4.3.5.1 Toolbars
4.3.5.2 ControlBars
4.3.5.3 Snaps (H) Toolbar

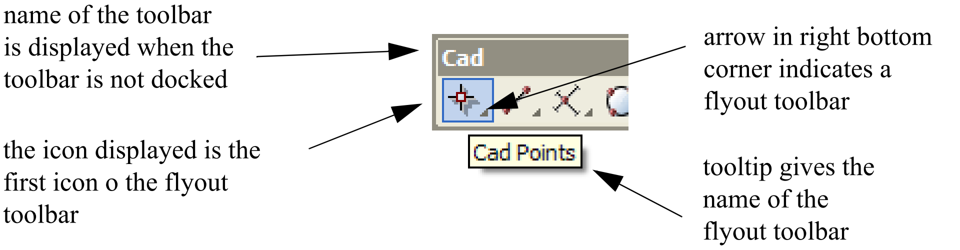
4.3.5.1 Toolbars

Options can be grouped together on *toolbars*. T*oolbars* are made up entirely of *icons* and each icon can have a ***12d Model*** option attached to it.

Toolbars have unique names which are displayed on the top of the toolbar when it is not docked.

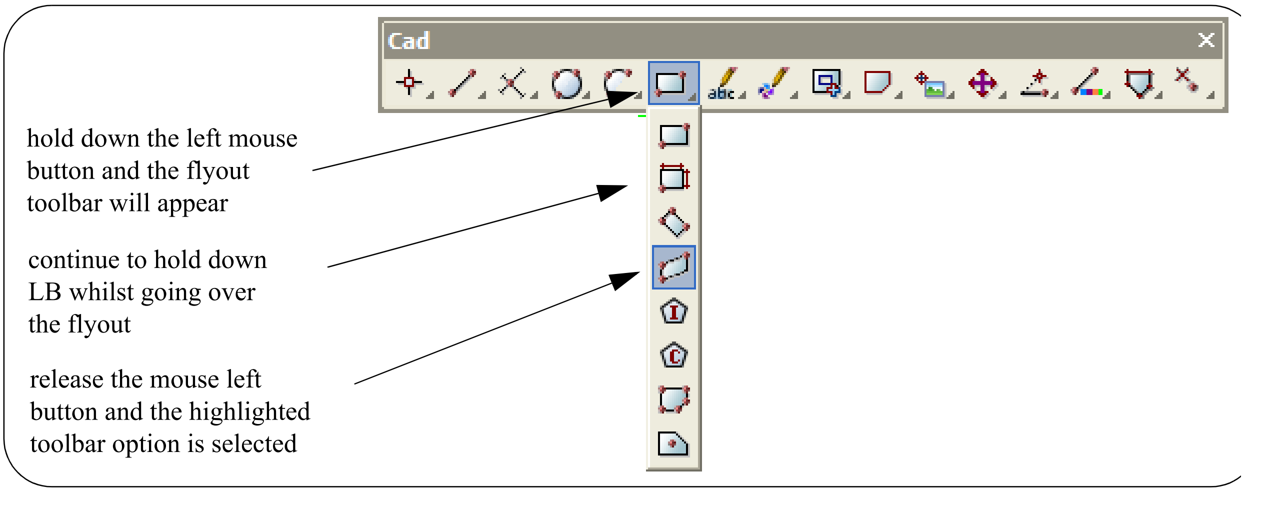
Toolbars can also have one level of **Flyouts** of other toolbars and when a flyout exists, there is a small arrow on the bottom right of the icon to indicate a flyout exist. The *tool tip* for the icon gives the *name* of the flyout toolbar. The actual icon itself is the icon of the f*irst item* on the *flyout* toolbar.

For example, the *CAD toolbar* is entirely made up of flyout toolbars.



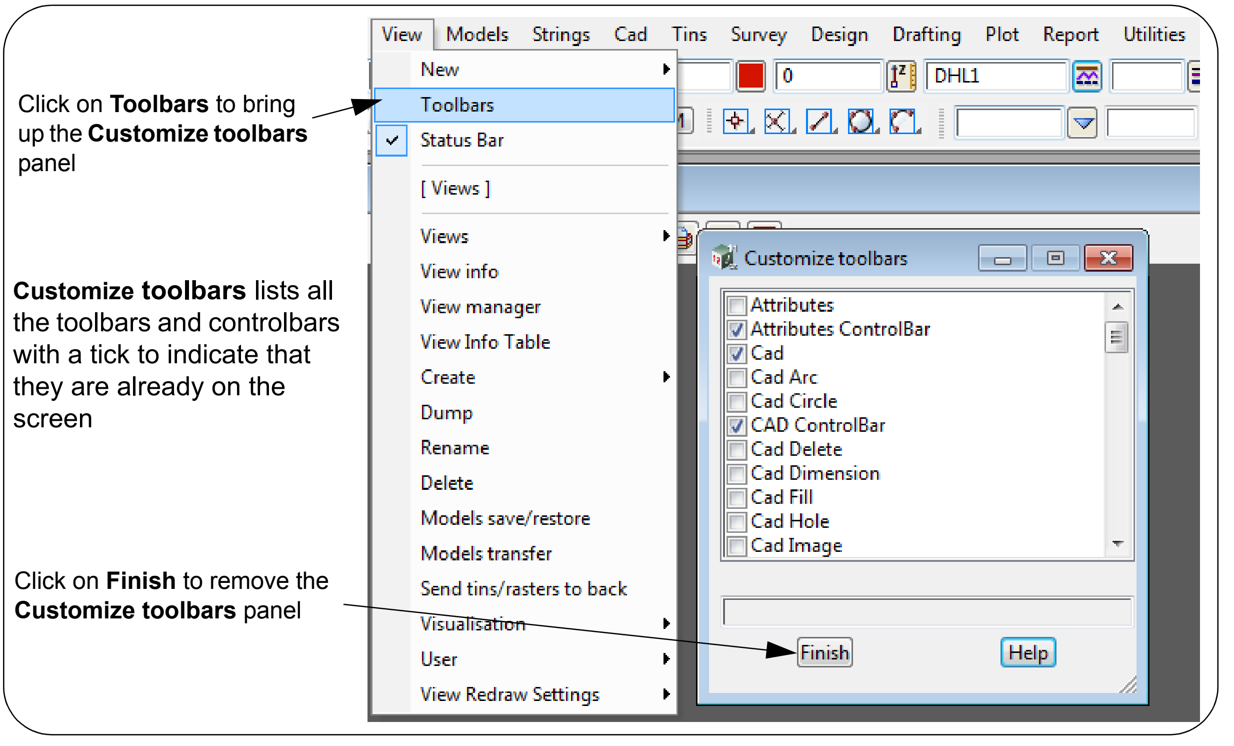
To display and select from a flyout toolbar, hold down LB whilst over the icon on a toolbar with a flyout menu and the flyout menu will appear. Whilst still holding down LB, move along the flyout toolbar to the appropriate option and then release LB. The option attached to the highlighted icon will then be selected.

Note - if LB is released whilst a icon with a flyout toolbar is highlighted, the first option on the flyout Toolbar is selected.



All the toolbars in ***12d Model*** are defined in a file with the default name *toolbars.4d or user_toolbars.4d.* For the definition of toolbars, see the section 41.3 User Defined Toolbarsin the Appendix 41 Functions Keys, Menus, Toolbars.

The list of all defined toolbars is given by selecting **View =>Toolbars** from the main menu which brings up the **Customize toolbars** panel. A toolbar is shown with a tick if it is already on the screen.



Ticking **on** a toolbar in the list brings up the toolbar in the top left hand corner of the screen. The toolbar can then be moved or docked.

Ticking **off** a toolbar in the list, or clicking on **X** in the top right hand corner when the toolbar is not docked, removes the toolbar from the screen.

Important Note - the toolbars are not active whilst the **Customize toolbars** panel is on the screen. Close the **Customize toolbars** panel as soon as you finished with it.

What toolbars are on the screen and their position is recorded with the project so that when a project is exited and later started again, the final position of the toolbars is restored.

Also at any time, a workspace file can be read in and define a new setup and position of toolbars. For more information on using workspace files, please go to the section 7.6.9 Project Workspace.

For links to the options on each *Toolbar, go to* 4.28 Options on Toolbars.

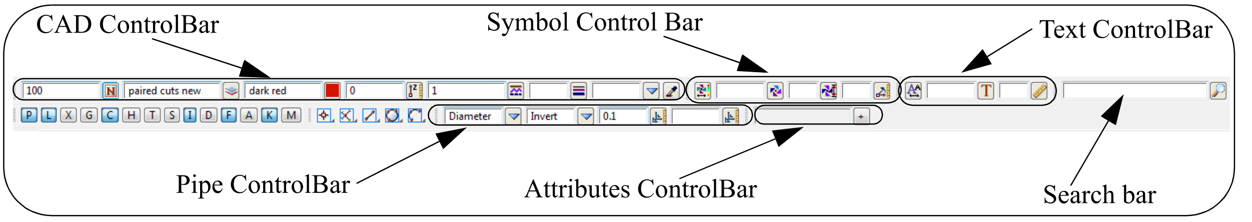
Continue to the next section 4.3.5.2 ControlBars or return to 4.3.5 Toolbars and Controlbars.

4.3.5.2 ControlBars

ControlBars can have icons on them but they also have controls such as a model box on them.

ControlBars are not user defined and there are six of them in ***12d Model*** - the **CAD ControlBar**, **Symbol ControlBar**, **Text ControlBar**, **Pipe ControlBar**, **Attributes ControlBar** and **Search bar.**

This default position of the *controlbars* is on the top left hand side of the screen under the main menu.



Although not toolbars, the *Controlbars* do appear in the *Toolbars* list in the **Customize toolbars** panel and can be turned on/off and docked just like toolbars.

Important Note - the toolbars are not active whilst the **Customize** panel is on the screen. Close the **Customize toolbars** panel as soon as you finished with it.

The *ControlBars* CAD, Symbol, Text, Pipe and Attributes are used by *CAD toolbars* and the *Strings Create* options. *Strings* created by the *CAD toolbars* and *Strings Create* options use values in the *ControlBars* to define string properties such as name, model, colour, pipe justification and size.

Like toolbars, the type and position on the screen of ControlBars is recorded with the Project so that when a Project is exited and then started later, the final position of the *ControlBars* is restored.

Also at any time, a workspace file can be read in and define a new setup and position of the *ControlBars*. For more information on using workspace files, please go to the section 7.6.9 Project Workspace.

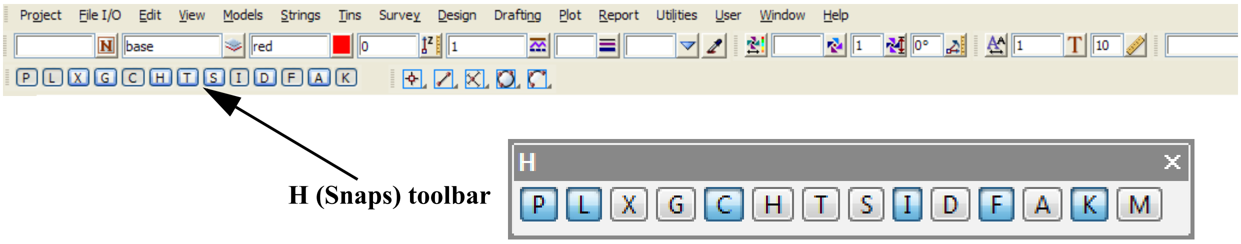
The Search bar is also a ControlBar and allows quick access to any option in ***12d Model***.

The *ControlBars* **CAD**, **Symbol**, **Text**, **Pipe**, **Attributes** and **Search bar** will be described in detail in the section 15.1 Controlbars.

Continue to the next section 4.3.5.3 Snaps (H) Toolbar or return to 4.3.5 Toolbars and Controlbars.

4.3.5.3 Snaps (H) Toolbar

The ***H Toolbar*** (the ***Snaps*** toolbar) which has the default position at the top left hand side of the ***12d Model*** screen, under the CAD ControlBar.



Snaps are documented in the section 4.13 Snaps or return to 4.3.5 Toolbars and Controlbars.

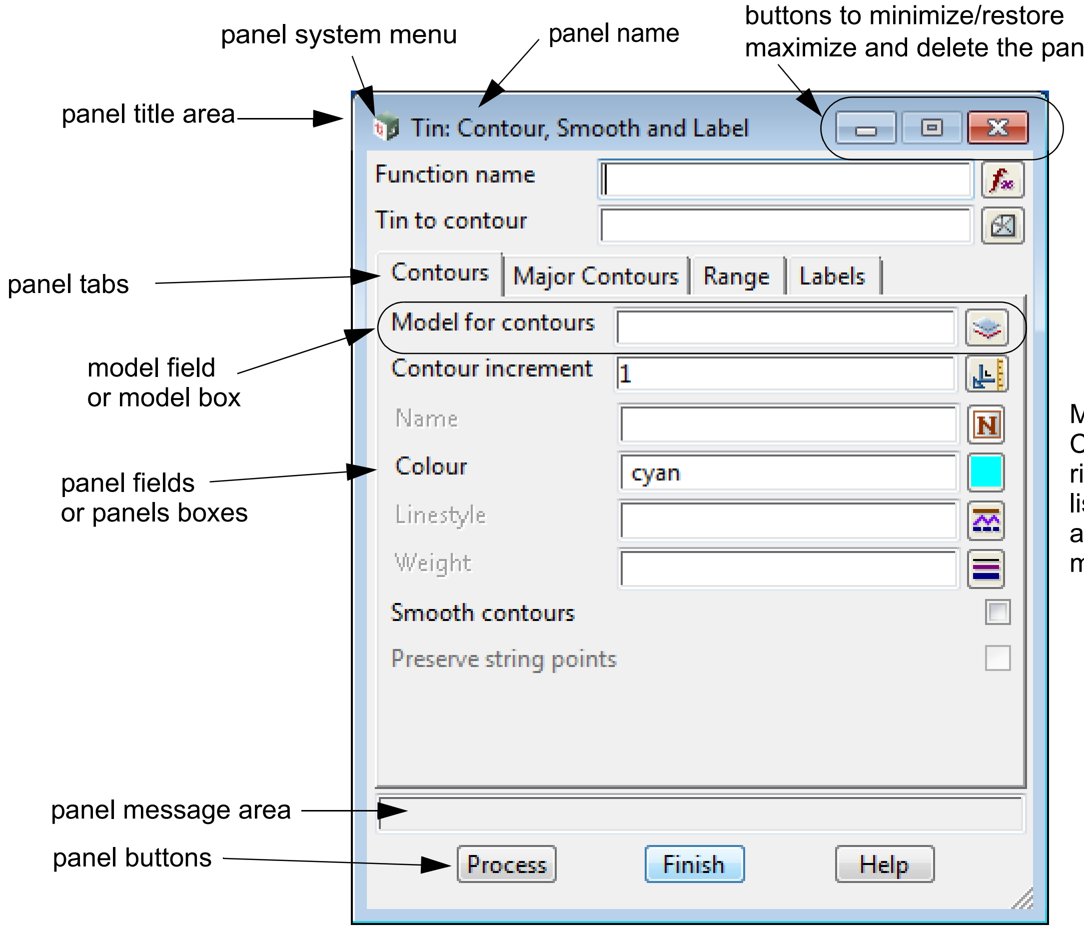
4.3.6 Panels

After a menu option has a been selected, extra information is often required before the operation represented by the menu option can begin.

For example, before the contour option can proceed, the required contour interval must be supplied.

In ***12d Model***, an object called a **panel** is used to collect and validate any extra information required to run the option.

For example, the **Model Information** panel is



A Panel consists of various types of areas.

Panel title area

Contains the title (name) of the panel, the buttons to minimize and restore the panel, and the **[X]** button. In the example above, the panel title is **Tin: Contour, Smooth and Label**.

Panel fields (also know as Panel Boxes)

Depending on the panel, these area for entering and/or displaying information for the panel.

The user can type answers into some fields or the program may display special information in the fields (output only fields).

Often the areas are for collecting/displaying special ***12d Model*** information. There is often an icon at the far right of the panel field/panel box which may contain a pop-up list of values to choose from.

In the example, **Model for contours** is an input field and is a Model box.

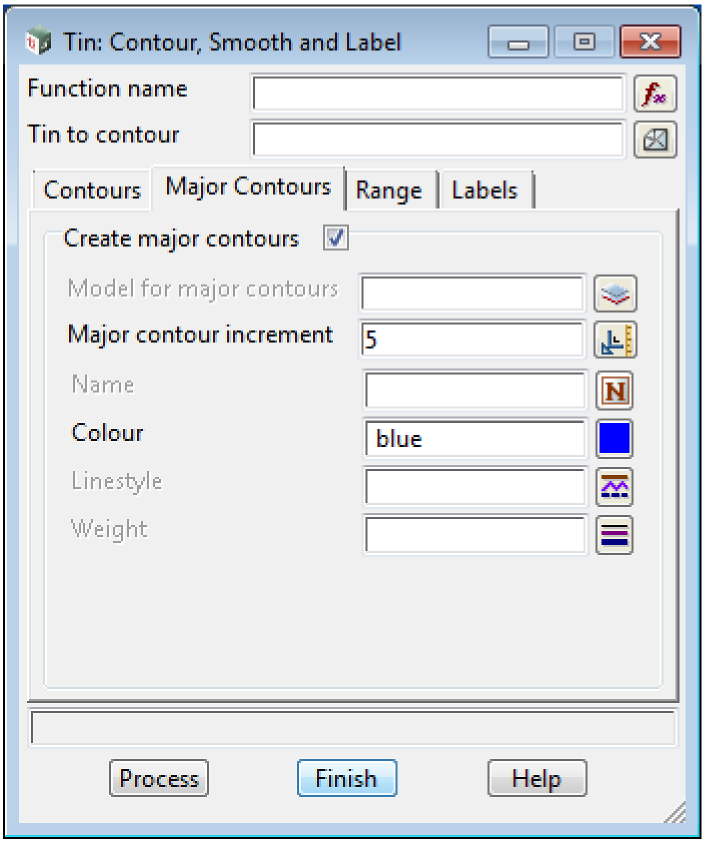
If the panel field is *optional*, then the description text is greyed out - entering data into the field will cause the text to be redrawn in black.

Panel Tabs

Clicking on a **Panel Tab** displays a whole new page of panel fields.

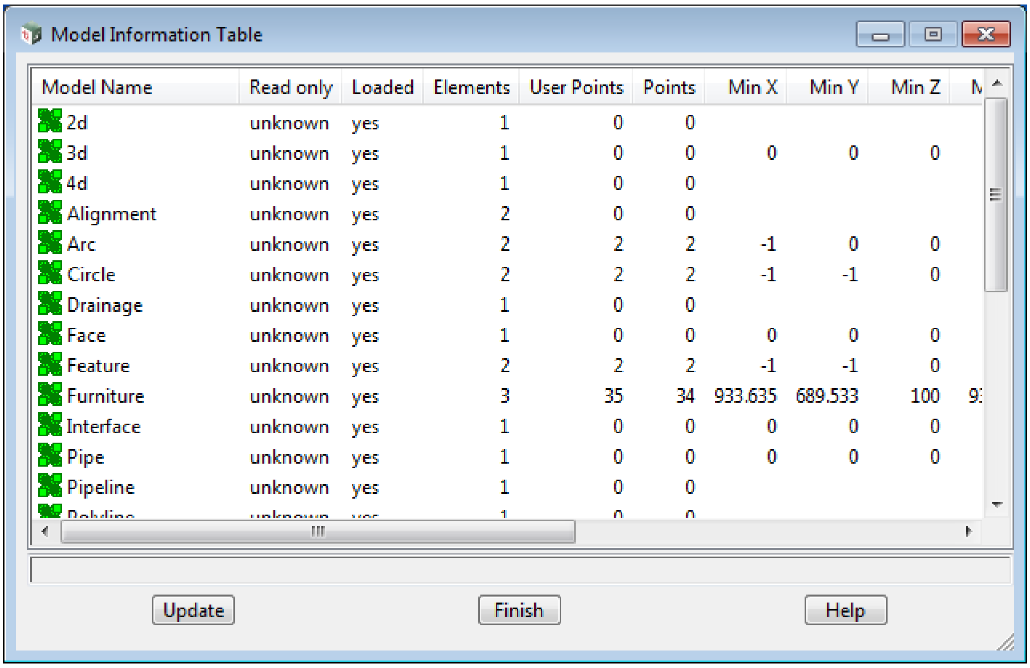
Panels tabs are often needed because there are too many panel fields to fit on the panel at the same time, or to group some fields together.

For example, clicking on Major Contours in the **Tin: Contour, Smooth and Label** panel will display panel fields to collect information to define the **Major Contours**.



Panel Grids

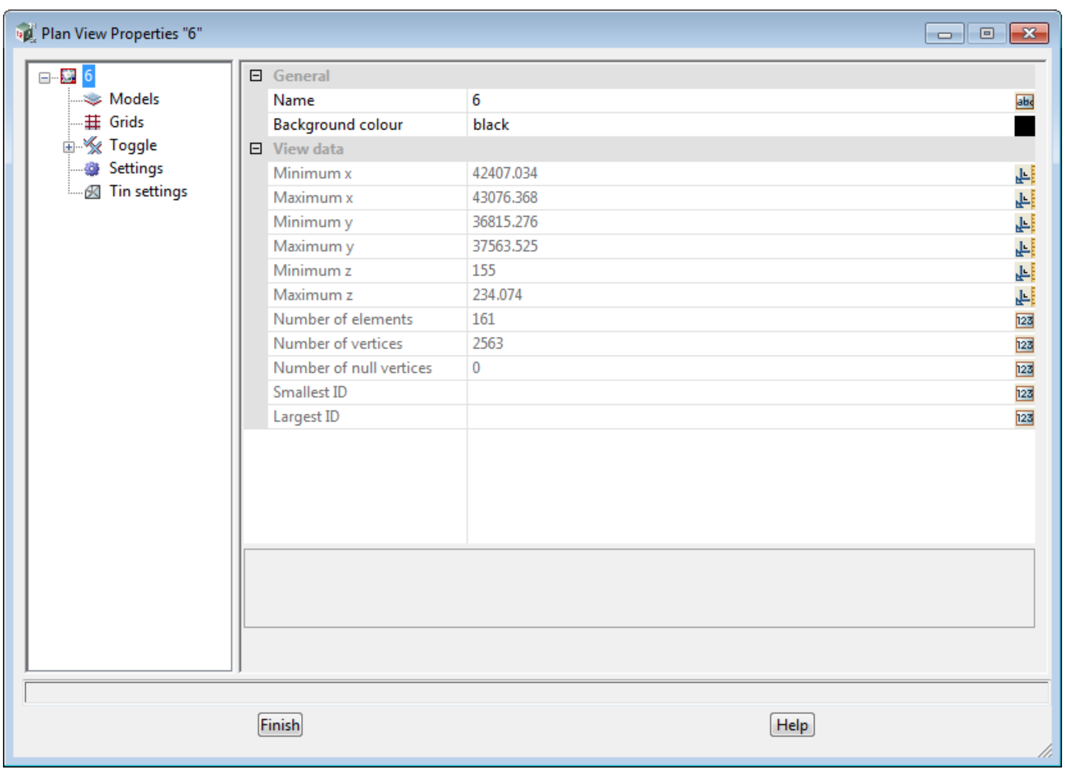
Many panels have grids to collect information that is best displayed and entered in columns.



For information on grids in panels, see 4.19.6 Grids in Panels.

Panel Trees

Panels have trees to better order the information that is to be displayed and collected.



Message area

Each panel has its own area where ***12d Model*** displays messages for the option.

Messages are used for a variety of purposes including

- indicating the **next step** in a complex option
- reporting **errors**
- giving **progress** in time consuming operations
- informing that an option has **completed** successfully.

Most messages are sent to the panel message area but a few are displayed in the Status Bar.

Panel buttons

Buttons are used on the panel to select things or control the processing of the panel. Almost every panel has minimize and restore button, and a **Finish** and **[X]** buttons which when selected will end the option and remove the panel from the screen. All panels also has a **Help** button which brings up on-line help about the panel.

The minimize, restore, **Finish**, **[X]** and **Help** buttons will not be documented for each panel.

Continue to the next section 4.3.6.1 Data Entry in a Panel or return to 4.3.6 Panels.

4.3.6.1 Data Entry in a Panel

To help save the user time, many panel fields have default answers.

However, any panel field value can be replaced by typing in new information (**typed input**) or when available, by selecting an answer from the **panel field pop-up** or using special name completion characters.

All panel fields are validated before the option runs and any error messages displayed in the ***panel message area.***

Typed input

To type information into a panel field, move the cursor to the position for the information, left click to get focus in the panel field and then start typing. The information will go into the field starting at the input-position indicator (a upright bar in the panel field).

The input-position indicator can be moved by

- clicking LB when the cursor is at the new position for input
- using the keys ->, <-, home and end

The **backspace** key, **<backspace>**, will delete one character before the input-position indicator and the **delete** key, **<del>**, will delete one character after the input-position indicator.

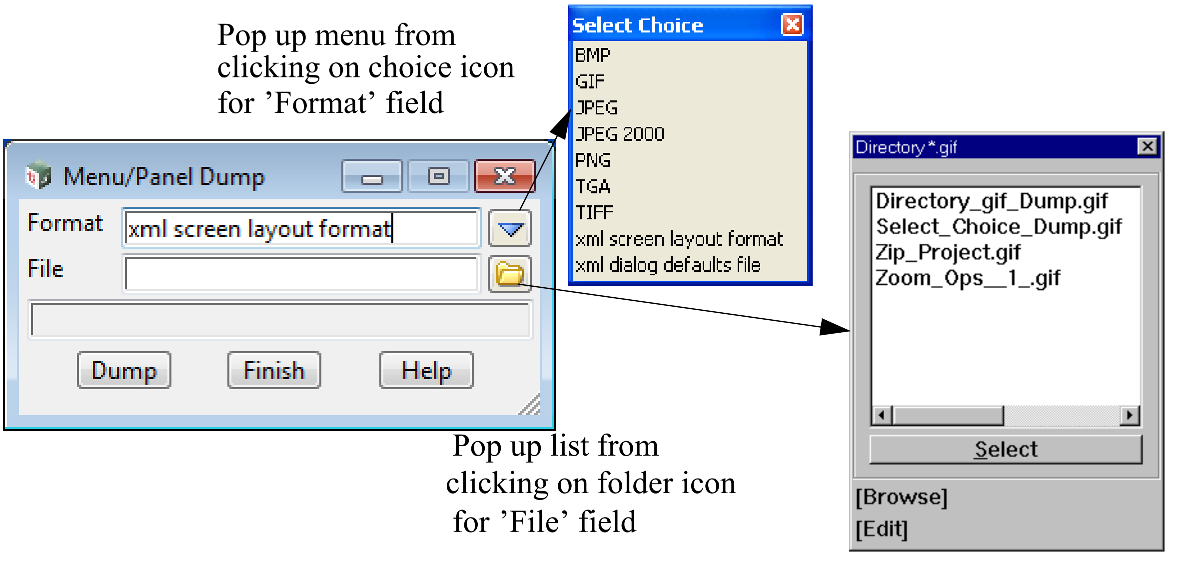
The user can move to any field in the panel by using the mouse. The **<tab>** key will move the cursor to the next panel field or button and **<shift>+< tab>** will move the cursor to the previous panel field or button.

Note - the entire field is used as the answer, not just up to the input-position indicator. The input-position indicator indicates where the characters will go when typing, not the end of the data.

Pop-Up Lists and Menus

The **panel field pop- up list** or **menu**, or panel field pop-up, is raised by clicking LB on the **[+]** or other choice icons at the right of the panel field.

A panel field pop-up consists of a list of choices which may be displayed as either a *menu* or a *list*.



For a pop-up list, an answer is chosen from the list by **double** clicking LB over the required answer.This answer is then displayed in the panel field and the pop-up list disappears.

For a pop-up menu, an answer is chosen from the pop-up menu by clicking LB over the required answer.This answer is then displayed in the panel field and the pop-up menu disappears.

The pop-up list or menu can also be removed without a selection by clicking LB on the **[X]** on the pop-up list or menu, by clicking LB again on the icon or **[+]** for the panel field, or by simply typing into any visible part of the panel field that the pop-up is for (some of the field may be obscured by the pop-up itself).

The pop-up lists and menus and the choice icons are described in more detail in the section on *Special Panel Fields*.

Name completion

To help speed data entry a process called **name completion** is available in most panel fields. **<ctrl> + <d>** is the special key combination used for name completion and how it works will now be described.

If one or more characters have been typed into a panel field and the **<ctrl> + <d>** combination is pressed, then ***12d Model*** checks to see how many answers in the available pop-up start with the same typed characters. If a unique match exists, then it will be placed into the panel field. If more that one match exists, a pop-up menu with all the matches will be presented for the user to select from.

Name mapping

When typing a string name into a **Name Box** panel field, a **name mapping file** can be used to fill out information such as colour, model *etc.* for given string names.

The name mapping works in two ways. After typing part or all of a string name,

(a) if <enter> is entered, the name map file is searched for a match in the first column of the Basic node (the **Key** column).

If a match is found, the name, colour, model, style *etc.* from the other columns in the **Basic** node are used to fill out the panel fields.

The key can contain wild cards and/or characters.

Other nodes of the name mapping file may also fill out other information such as pipe type and pipe diameter (**Pipe** node).

(b) if **<ctrl> + <d>** is entered, the **second** column of the Basic node of name mapping file (the **Name** column) is searched for a list of completions which is written to the field if it is unique or displayed in a pop-up if there is more than one match. If a * is found in the **Name** column, the first column is used for matching. When an entry is selected from the completion list, the name, colour, model, style *etc.* from the columns in the **Basic** node of the name mapping file are used to fill out the panel fields.

If a name mapping file exists, then the N for the *name* panel field will include the entries from the first column of the **Basic** tab of the name mapping file. If an item is selected from the list, then the name, colour, model, style *etc.* from the columns in the name mapping file are used to fill out the panel fields

The name mapping file is pointed to by the environment variable

NAME_MAPPINGS_4D

or is if the environment variable is not set, the default name is **names.4d**.

During a ***12d Model*** session, the name mapping file can be changed by the *Name Settings* tab on the option **Utilities=>Defaults**. Note that this new name mapping file is not saved with the project.

Validation

After the panel field information is entered, an <enter> key requests that the panel field information be validated. Any error message will be displayed in the panel's message area. If there is no error, the cursor will move onto the next panel field. If an error occurs, the cursor will remain in the invalid panel field.

New panels or menus can be fired up before completing panels or menus already on the screen. This gives the user full control over the work flow, rather than being locked in by fixed sequences in a program.

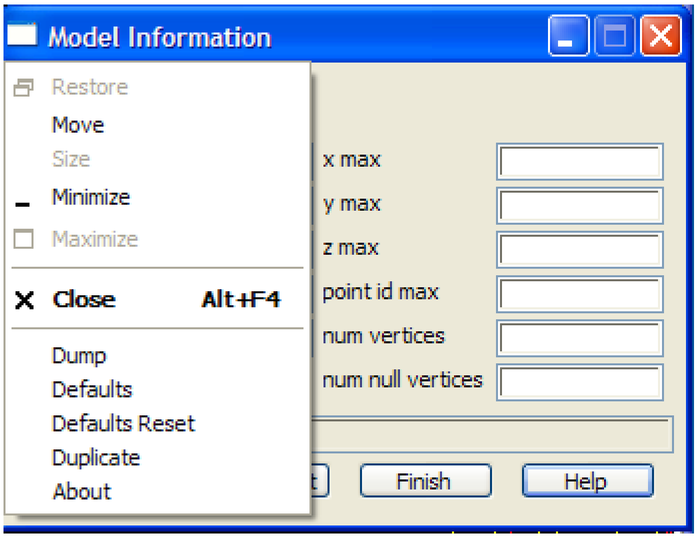
Continue to the next section 4.3.6.2 Panel System Menu or return to 4.3.6 Panels.

4.3.6.2 Panel System Menu

The **Panel System** menu is brought up by clicking LB on the windows icon on the left hand corner of the panel title area.

The **Panel System** menu has options to move, minimize, close, dump (write out an image of the panel), create defaults (ddx) file (ddx), reset a defaults (ddx) file and duplicate the panel.

.



For the option
Move, go to 4.3.6.3 Moving a Panel
Minimize/Maximize 4.3.6.4 Minimizing and Maximizing a Panel
Dump 4.3.6.5 Dumping a Panel, Creating a Screen Layout File or Default File
Close 4.3.6.10 Deleting a Panel
Defaults 4.3.6.6 Panel Defaults - ddx Files
Defaults Reset 4.3.6.7 Defaults Reset - Deleting a ddx File
Duplicate 4.3.6.8 Duplicating a Panel

TODO: Replace-Cancel
TODO: Append-Replace-Cancel

Continue to the next section 4.3.6.3 Moving a Panel or return to 4.3.6 Panels.

4.3.6.3 Moving a Panel

A panel can be moved (dragged) by **holding down LB** anywhere in the menu title area (except over the windows icon on the left and the minimize, restore and **[X]** buttons on the right) and then moving the cursor with the LB still depressed.

The panel (or panel outline) moves with the cursor to indicate where the new panel position will be, and the panel is finally positioned when LB is released.

Move can also be started by selecting **Move** from the **Panel System** menu and then holding down LB in the menu title area and continuing as described above.

Continue to the next section 4.3.6.4 Minimizing and Maximizing a Panel or return to 4.3.6 Panels.

4.3.6.4 Minimizing and Maximizing a Panel

The **panel** can be minimized (iconized)/restored and maximized using the standard Windows minimize/restore and maximize buttons on the top right hand corner of the panel.

A panel can also be minimized by selecting **Minimize** from the **Panel System** menu.

Continue to the next section 4.3.6.5 Dumping a Panel, Creating a Screen Layout File or Default File or return to 4.3.6 Panels.

4.3.6.5 Dumping a Panel, Creating a Screen Layout File or Default File

The panel can be written out to disk in a variety of images formats, or as a screen layout (slx) file or a default (ddx) file. This is called dumping the panel.

The **Dump** option is selected by clicking MB in the panel title area, or by selecting **Dump** from the **Panel System** menu which is invoked by clicking the left mouse button (LB) on the Windows icon on the left of the panel title area.

The **Menu/Panel Dump** panel is then displayed and for its description, go to 4.3.3.2 Dumping a Menu or Panel.

Continue to the next section 4.3.6.6 Panel Defaults - ddx Files or return to 4.3.6 Panels.

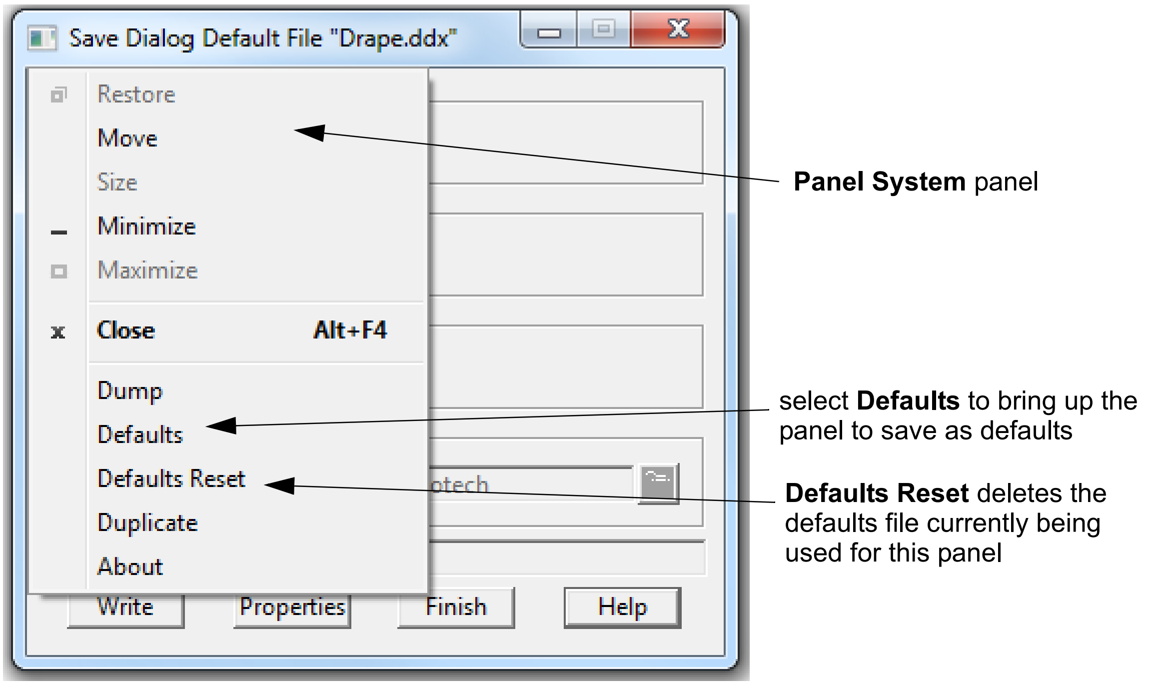
4.3.6.6 Panel Defaults - ddx Files

When a panel is opened, ***12d Model*** may set some default values.

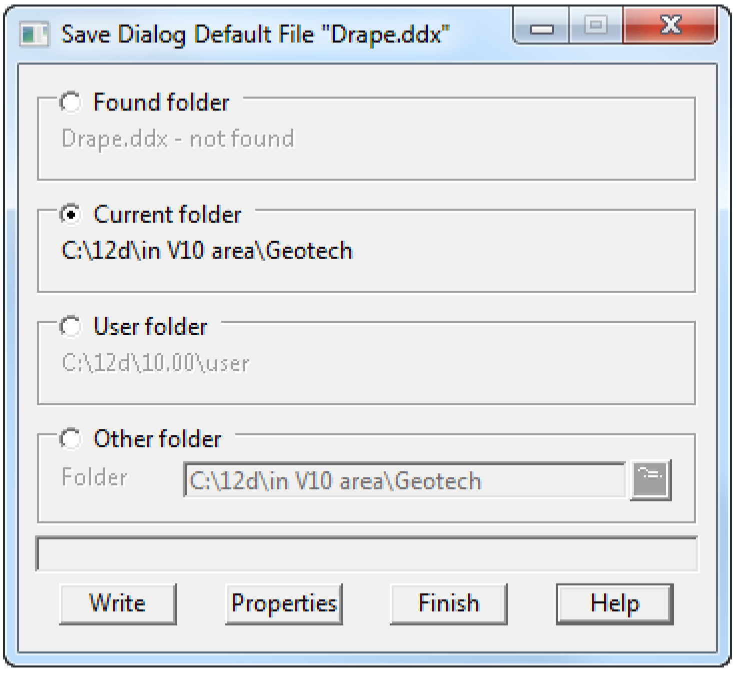
However for most panels ***the user can supply the values*** to be used ***for*** all the ***panel fields*** each time a panel is opened. This information is stored in a defaults file for a panel. The defaults file has the file ending .ddx (or a pre- ***12d Model 11*** format, .ddf).

If no defaults file exists for a panel, then the ***12d Model*** defaults are used for the panel.

To set user defined defaults for a panel, simply open the panel, fill in the default values that are required, and then bring up the **Panel System** menu (by clicking LB in the top left had corner of the panel) and select **Defaults**.



A panel comes up asking what folder to write the ***ddx*** file for the panel to.



Clicking on **Write** writes out the ddx file for the panel.

When a ***12d Model*** panel starts up, the standard paths are searched for a defaults file to use to set the default values for the panel fields.

If no defaults file is found for the panel, the ***12d Model*** system defaults are used.

Note - for ***12d Model 10*** and above, the defaults file has an xml structure and is written to a file ending in **.ddx**. An earlier format ended in **.ddf**. If both a .ddx and a .ddf file exists for the panel, then the .ddx file is used.

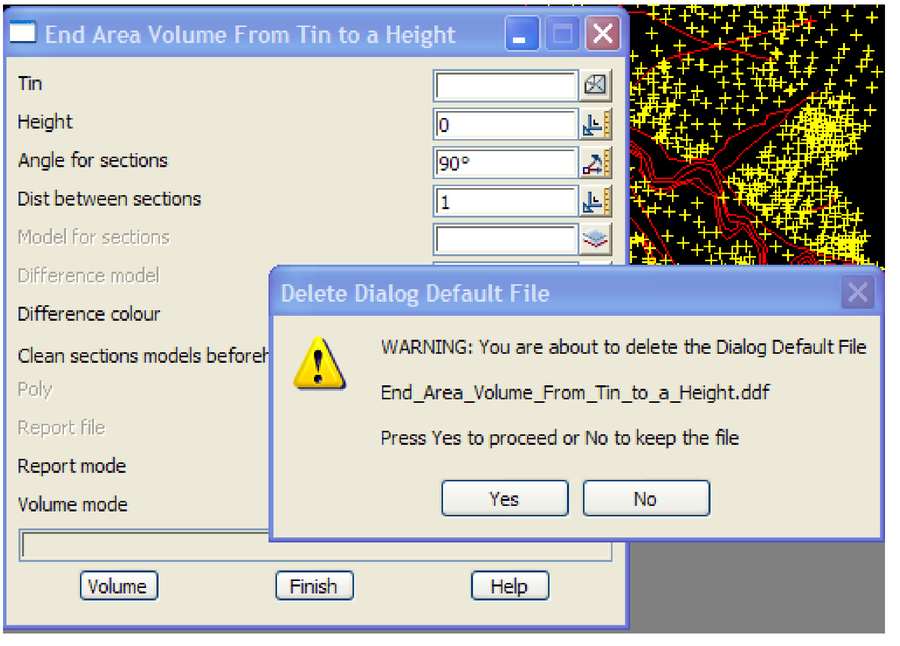
Continue to the next section 4.3.6.7 Defaults Reset - Deleting a ddx File or return to 4.3.6 Panels.

4.3.6.7 Defaults Reset - Deleting a ddx File

If user defined defaults are no longer required for a panel, simply bring up the panel and then the **Panel System** menu by clicking LB in the top left had corner of the panel.

Select **Defaults Reset** and the default ***ddx*** file for the panel is deleted.

.



Continue to the next section 4.3.6.8 Duplicating a Panel or return to 4.3.6 Panels.

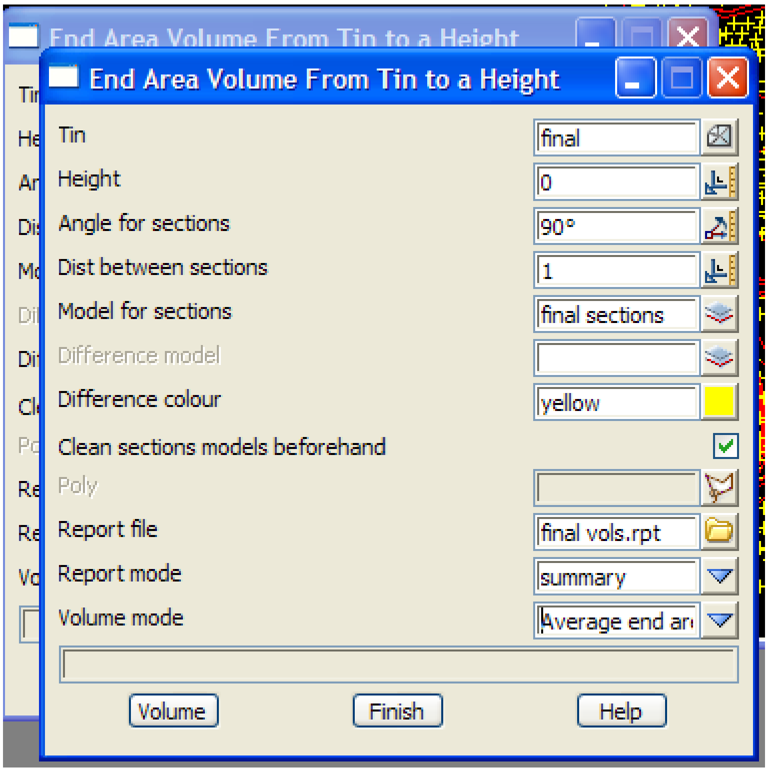
4.3.6.8 Duplicating a Panel

After filling in all the fields of a panel, it is often useful to have a copy of the panel with almost all the same panel field values.

For example, when calculating the volume from a tin to a height using end area, it is normal to run the option with a number of different angles for the sections, and maybe different distances between the sections.

To create a new panel with all the same values in the panel fields, bring up the **Panel System** menu for the panel and select **Duplicate.**

.

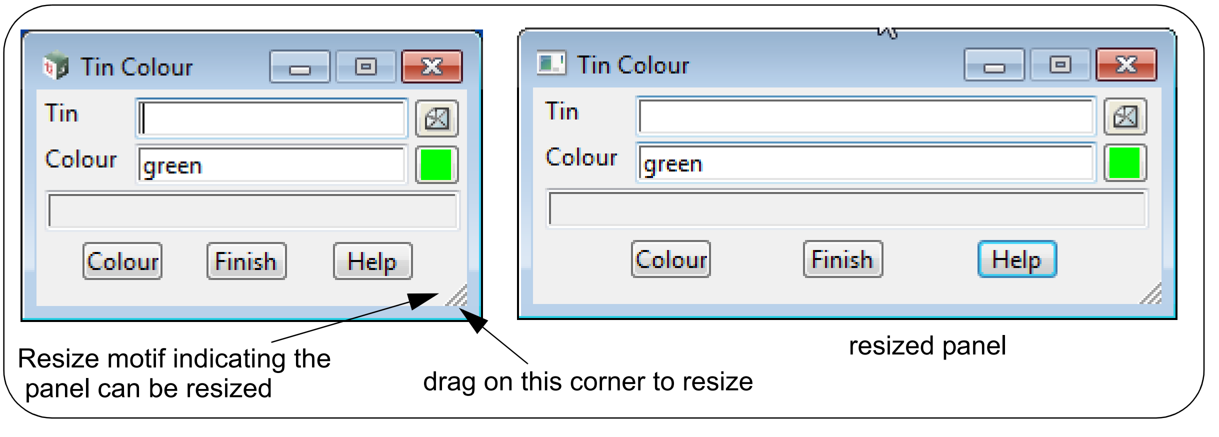


Continue to the next section 4.3.6.9 Resizing of Panels or return to 4.3.6 Panels.

4.3.6.9 Resizing of Panels

Most panels can be resized.

If a panel can be resized then there is an *Resize motif* (three lines) in the bottom right corner and dragging from that corner will resize the panel.



How the panel can be resized will depend on what items are in the panel. For example, the **Tin Colour** panel can only be made wider but cannot be made smaller or taller.

When a screen layout file (SLX) or a panel defaults file (DDX) is written out for a resized panel, or a resized panel recorded in a Chain, the resized panel size is recorded.

Continue to the next section 4.3.6.10 Deleting a Panel or return to 4.3.6 Panels.

4.3.6.10 Deleting a Panel

There are three methods are available for deleting a panel. Picking the **[X]** button in the panel title area, using the **finish** button or by selecting **Close** from the **Panel System** menu.

Continue to the next section 4.3.6.11 OK Panel or return to 4.3.6 Panels.

4.3.6.11 OK Panel

The **OK** panel requires the selecting of the button **OK**.

Continue to the next section 4.3.6.12 Yes-No Panel or return to 4.3.6 Panels.

4.3.6.12 Yes-No Panel

The **yes no** panel requires the selecting of the button **yes** or **no**.

Continue to the next section 4.3.6.13 Yes-No-Cancel Panel or return to 4.3.6 Panels.

4.3.6.13 Yes-No-Cancel Panel

The **yes no cancel** panel requires the selecting of the button **yes, no** or **cancel**.

Continue to the next section 4.3.6.14 Yes-No-All-Cancel Panel or return to 4.3.6 Panels.

4.3.6.14 Yes-No-All-Cancel Panel

The **yes no all cancel** panel requires the selecting of the button **yes, no, all** or **cancel**.

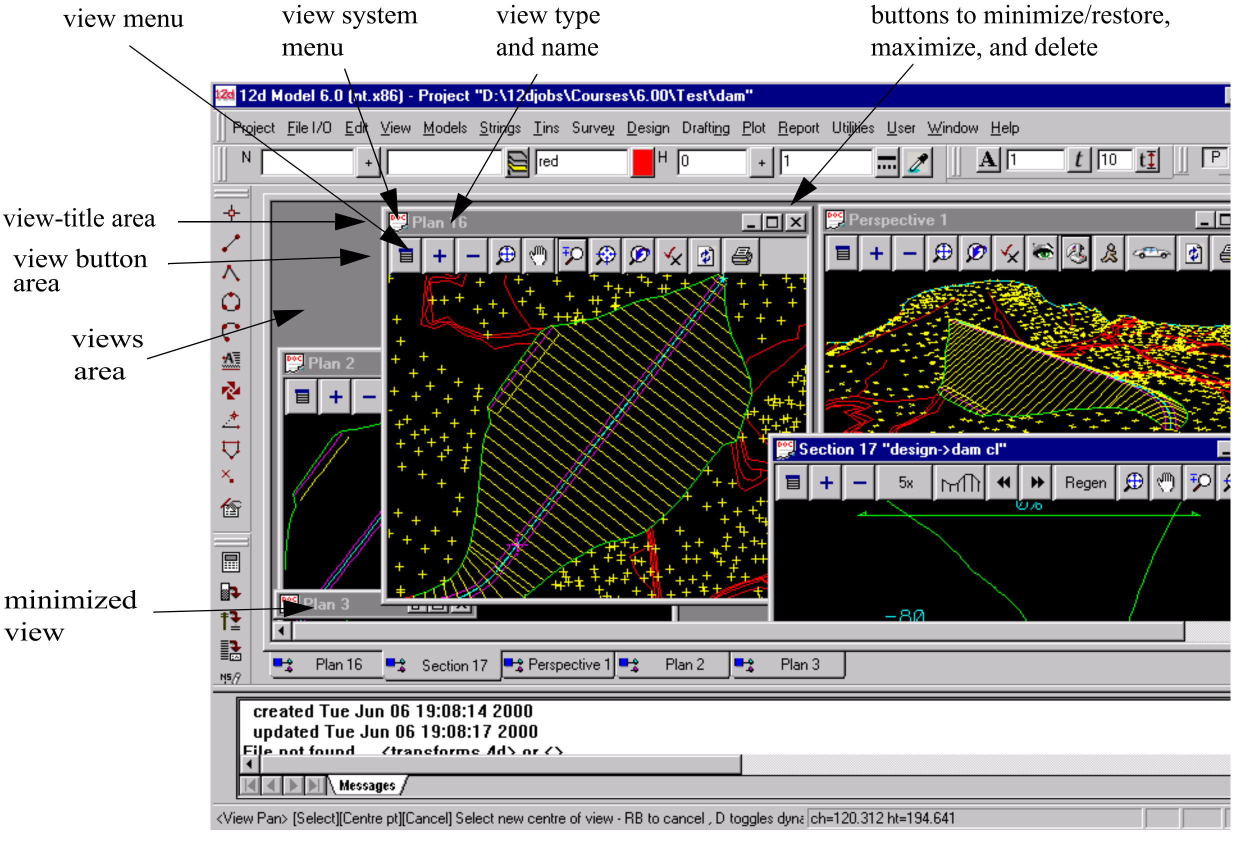
The next major section 4.3.7 Views or return to 4.3.6 Panels.

4.3.7 Views

Views are the screen drawing areas for ***12d Model*** and come in four flavours - plan, section, perspective and opengl perspective.

Views can be created and deleted as required by the user and there is no limit to the number of views on the screen. Views can be overlapped and minimized.

Each view has a unique name of up to two hundred characters. The ***view type*** and ***name*** are displayed on the top left corner of the view in what is called the **view-title area**.



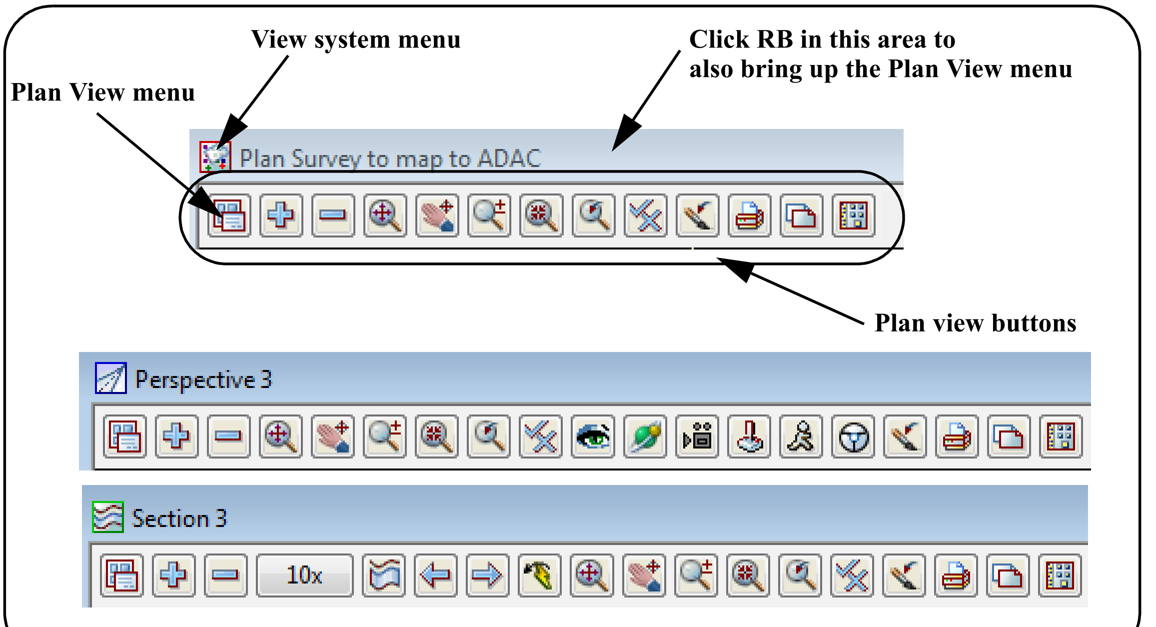
For information on:

View buttons, go to [4.3.7.1 View Buttons]
View menu [4.3.7.2 Plan/Section/Perspective View Menu]
View system menu [4.3.7.3 View System Menu]
View dump [4.3.7.4 Dumping a View]
Moving a view [4.3.7.5 Moving a View]
Resizing a view [4.3.7.6 Resizing a View]
Minimising/maximizing a view [4.3.7.7 Minimizing and Maximizing a View]
Deleting a view [4.3.7.8 Deleting a View]

4.3.7.1 View Buttons

On the row under the view type and name, are a number of options called **view buttons**.

The view buttons act like menu items and are activated by clicking LB when the cursor is above the button.



View Buttons

For the function of each View Button see

- 9.5.1 Plan View Buttons
- 9.5.2 Perspective View Buttons
- 9.5.3 Section View Buttons

Continue to the next section 4.3.7.2 Plan/Section/Perspective View Menu or return to 4.3.7 Views.

4.3.7.2 Plan/Section/Perspective View Menu

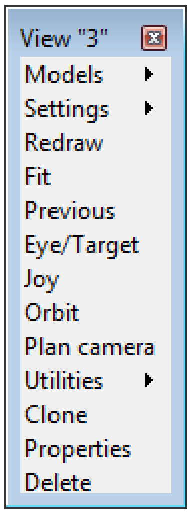
If LB is clicked on the **Menu** icon in the view buttons area, or RB is clicked in the *View Title area* or the *View Buttons area*, a new menu called the **Plan/Section/Perspective View** menu appears (or just **View** menu for short).

To remove the **Plan/Section/Perspective View** menu, select **[X]** on the **View** menu or click RB again in the *View Title area* or the *View Button area*.

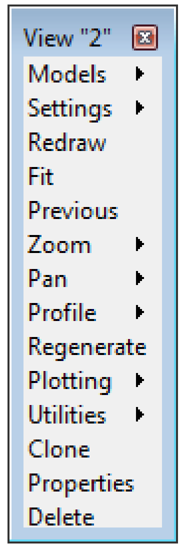
Because of the differences between plan, perspective and section views, the options on the **View** menu vary for each view type.

Plan View Menu

Perspective View Menu



Section View Menu



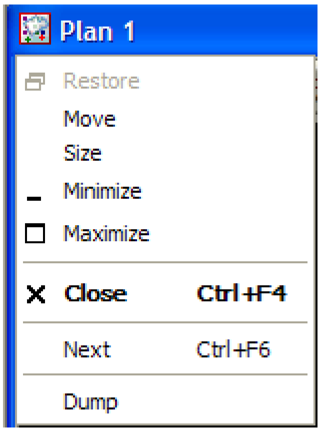
The **View** menus are discussed in the section 9 Menus on Views.

Continue to the next section 4.3.7.3 View System Menu or return to 4.3.7 Views.

4.3.7.3 View System Menu

The **view system** menu is brought up by clicking LB on the windows icon on the left hand corner of the *view title area*.

.



The **View system** menu has options to move, resize, minimize, maximize, close (delete) and dump the view.

For information on *Moving a view*, go to	4.3.7.5 Moving a View
Resizing a view	4.3.7.6 Resizing a View
Minimizing/maximizing a view	4.3.7.7 Minimizing and Maximizing a View
Closing a view	4.3.7.8 Deleting a View
Dumping a view image	4.3.7.4 Dumping a View

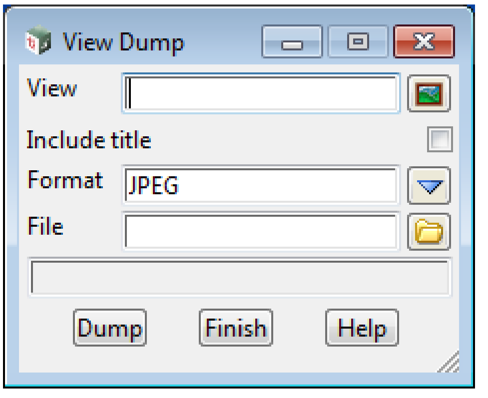
Continue to the next section 4.3.7.4 Dumping a View or return to 4.3.7 Views.

4.3.7.4 Dumping a View

An image of the view can be written out to disk in either bmp, tif, postscript format or as a screen layout (slx) file. This is called dumping the view.

The **Dump** option is selected from the **View System** menu which is invoked by clicking the left mouse button (LB) on the Windows icon on the left of the view-title area. The **View Dump** panel is then displayed

.



The fields and buttons have the following functions.

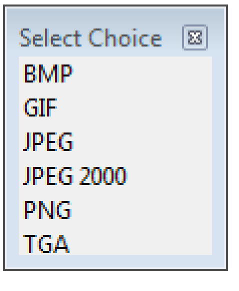
Field Description	Type	Defaults	Pop-Up
View	view box	current view picked from	available views

the view to dump out in the specified format.

Include title	tick box		

*if **ticked**, the view title area is included in the dump.*

Format	choice box	JPEG	BMP, GIF, JPEG, JPEG 2000, PNG, TGA



the format to dump the view out in.

File	file box	*.jp*g	

the file to dump the view images out to

Dump	button		

dump in the given format the image of the view given in the **View** *field to the file given in the* **File** *field.*

Continue to the next section 4.3.7.5 Moving a View or return to 4.3.7 Views.

4.3.7.5 Moving a View

A View can be moved (dragged) by **holding down LB** anywhere in the view-title area (except over the windows icon on the left and the minimize, restore and **[X]** buttons on the right) and then moving the cursor with the LB still depressed. Or **Move** can be selected from the **View System** menu.

The View moves with the cursor to indicate where the new view position will be. The view is finally positioned when LB is released.

Continue to the next section 4.3.7.2 Plan/Section/Perspective View Menu or return to 4.3.7 Views.

4.3.7.6 Resizing a View

A **View** can be resized using the standard Windows resize methods of holding down LB on the view border and moving the mouse to the new position for the view border. and then releasing LB.

Continue to the next section 4.3.7.7 Minimizing and Maximizing a View or return to 4.3.7 Views.

4.3.7.7 Minimizing and Maximizing a View

A **View** can be minimized (iconised), restored and maximized using the standard Windows minimize/restore and maximize buttons on the top right hand corner of the view, or by selecting **Minimize** or **Maximize** from the **View System** menu.

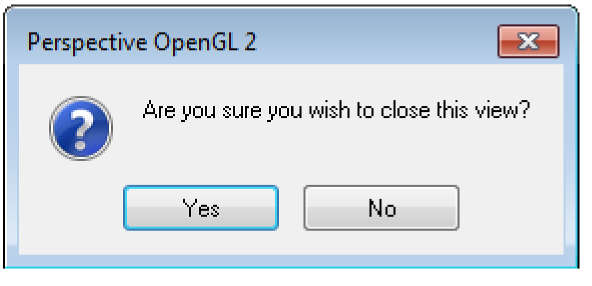
Continue to the next section 4.3.7.8 Deleting a View or return to 4.3.7 Views.

4.3.7.8 Deleting a View

Picking the **[X]** button in the *view-title area* or selecting **Close** from the **View System** menu will delete the view.

If the environment variable ***Prompt on close*** is set on, then a prompt will be displayed to confirm that the view is to be closed./deleted

.



Please continue to the next major section 4.3.8 Status Bar or return to 4.3.7 Views.

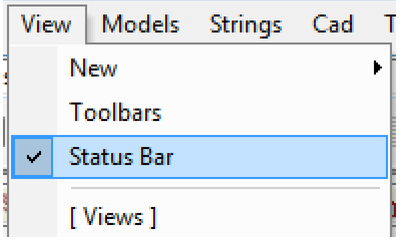
4.3.8 Status Bar

The Status Bar is used to display many of the messages generated by ***12d Model*** options (each panel also has its own special message area) and the dynamic coordinate position of the cursor as it moves around in any view on the screen.

The messages are displayed on the left hand side of the Status Bar and the view coordinates on the right hand side of the Status Bar.

The coordinate values displayed depends on the view type. For example, the world coordinate (x,y) position of the cursor is displayed when inside plan views, and the (chainage,height,x,y) position when in a section view.

The Status Bar can be toggled on/off by the option **View** => **Status Bar** on the Main menu.

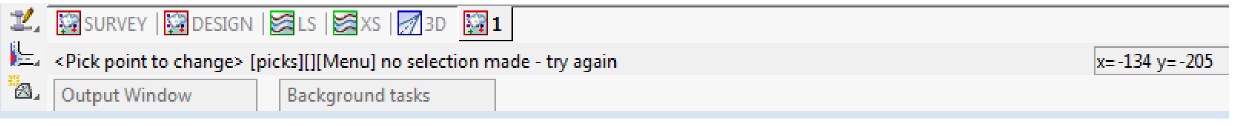


Please continue to the next section 4.3.9 Output Window.

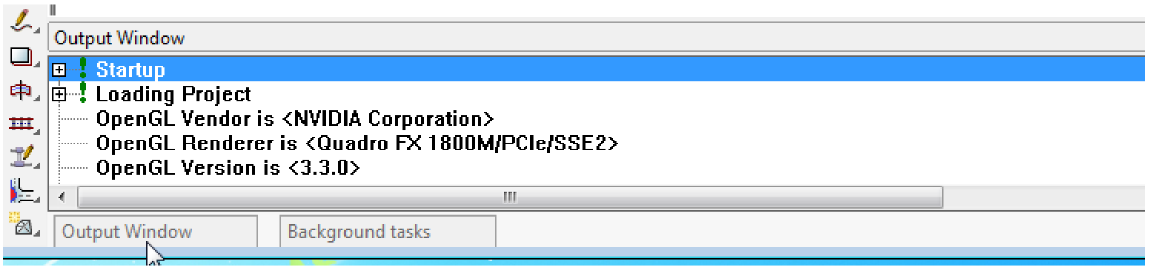
4.3.9 Output Window

The **Output Window** displays ***12d Model*** system and error messages.

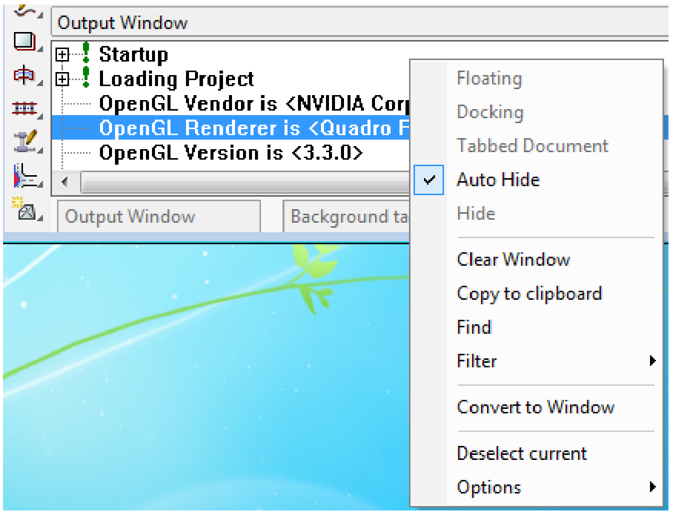
By default the **Output Window** is in **Auto-Hide** mode and appears as a tab at the bottom left of the screen and flashes if there are any messages that need to be reviewed.



When in *Auto-Hide* mode, as you move your cursor over the Output Window tab the Output Window appears.



Auto-Hide mode can be turned off by moving over the Output Window area and pressing RB to bring up the **Output Window** menu. Click on **Auto-Hide** to remove the tick and *Auto-Hide* is no longer on.



When **Auto-Hide** is turned **off**, the Output Window stays open.

The **Output Window** menu includes the options:

Clear - clears the Output Window,

Copy to clipboard - copy any selected text in the Output Window to the Clipboard.

Hide - removes the Output Window.

Float - makes the Output Window a floating window that can be docked on any of the sides of the 12d Model screen.

Convert to window - turns the Output Window into a normal Window which then appears on your desktop. It may be moved by clicking LB in the Output Window heading area, then dragging the cursor to another part of your desktop and releasing the LB to pin it down.

When the Output Window is a normal Window or a floating window, clicking on **x** at the top right of the window will remove the Output Window.

The Output Window can be made taller or shorter by moving the bar at the top of the Output Window.

The Output Window can be removed by **Hide** but also unticking the Output Window on the Window Main Menu will remove the Output Window.

If an **error message** is sent to the Output Window and the Output Window it is removed (**turned off**) then the Output Window is **automatically toggled on** to indicate an error has occurred.

Once the Output Window is removed and no error messages have been sent to it, the only way to turn it back on is to click on **Output Window** on the **Window** Main Menu.

Message lines which are intelligent log lines are begun with a green exclamation mark!

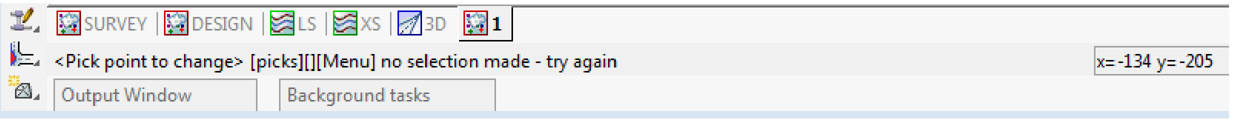
Please continue to the next section 4.3.10 Background Tasks Window.

4.3.10 Background Tasks Window

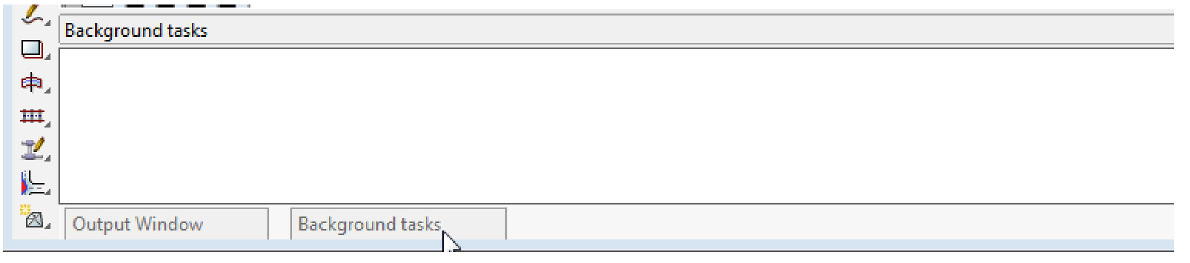
12d Model uses multi-cores and background processes to make things faster for the user.

The **Background Task** window displays messages from tasks running in the background.

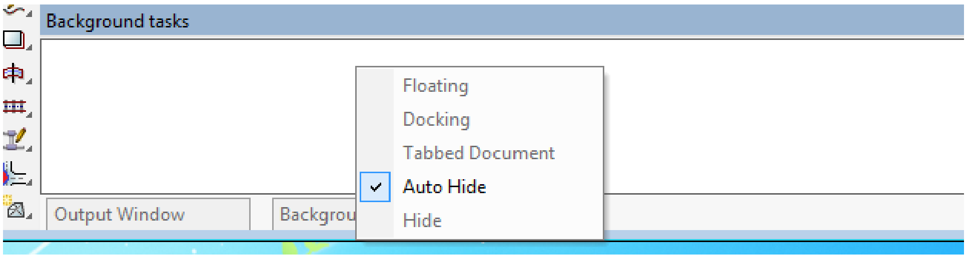
By default the **Background tasks** window is in **Auto-Hide** mode and appears as a tab at the bottom left of the screen and flashes if there are any messages from a background task that need to be reviewed.



When in *Auto-Hide* mode, as you move your cursor over the **Background Task** tab the **Background tasks** window appears.



Auto-Hide mode can be turned off by moving over the Background Tasks window area and pressing RB to bring up the **Background Tasks** menu. Click on **Auto-Hide** to remove the tick and *Auto-Hide* is no longer on.



When **Auto-Hide** is turned **off**, the Background Tasks window stays open.

The **Background Tasks** menu includes the options:

Hide - removes the Background Tasks window.

Float - makes the Background Tasks window a floating window that can be docked on any of the sides of the 12d Model screen.

When the **Background Tasks** window is a normal window or a floating window, clicking on **x** at the top right of the window will remove the Background Tasks window.

The Background Tasks window can be made taller or shorter by moving the bar at the top of the Background Tasks window

The Background Tasks window can be removed by **Hide** but also unticking the Background Tasks on the **Window** Main Menu will remove the **Background Tasks** window.

If a message is sent to the Background Tasks window and the Background Tasks window is removed (**turned off**) then the Background Tasks window is **automatically toggled on** to indicate that there is a background task message.

Once the Background Tasks window is removed and no messages have been sent to it, the only way to turn it back on is to click on **Background Tasks** window on the **Window** Main Menu.

Message lines which are intelligent log lines are begun with a green exclamation mark!

Please continue to the next section 4.4 Ascii, Ansi and Unicode.

4.4 Ascii, Ansi and Unicode

From ***12d Model 10*** onwards, text is stored in the ***12d Model*** database as Unicode (UTF-16 Unicode) and the default format for all output files produced by ***12d Model*** is for them to be Unicode files.

But what does that mean?

Computers can only understand numbers (only zeros and ones actually), so a common code is needed for the numerical representation of characters such as 'a' or '1' or some action such as TAB and a number of common codes have evolved over time.

The common code is not only needed for text in a file or text on a Web page, but also for the names of the files and folders on a computer disc or an internet site.

See 4.4.1 ASCII Character Set
4.4.2 ANSI Character Set
4.4.3 Unicode Character Set
4.4.4 Unicode Encoding: UTF-8
4.4.5 Unicode Encoding: UTF-16
4.4.6 Endian and BOM
4.4.7 Writing out Files from 12d Model

4.4.1 ASCII Character Set

The ASCII (American Standard Code for Information Exchange) was first published in 1963 and was adopted by the American National Standards Institute (ANSI) during the 1960s and has been in common use since then.

The ASCII definition used 7 bits to define characters and some non character codes such as tab, back space and line feed (new line). The seven bits means that only a maximum of 127 codes are allowed.

An examples of the ASCII codes are:

2 is the ASCII code for start of text (STX)

8 is the ASCII code for back space (BS)

9 is the ASCII code for horizontal tab (TAB)

10 is the ASCII code for line feed, new line (NL)

27 is the ASCII code for escape (ESC)

32 is the ASCII code for a space (" ")

36 is the ASCII code for a dollar sign **$**

40 is the ASCII code for a left parenthesis **(**

41 is the ASCII code for a right parenthesis **)**

48 is the ASCII code for the digit zero **0**

49 is the ASCII code for the digit zero **1**

65 is the ASCII code for the Latin capital letter A **A**

97 is the ASCII code for the Latin small letter a **a**

126 is the ASCII code for a tilde **~**

127 is not used

Even with the newer standards, the 7-bit ASCII table continues to be the backbone of modern computing and data storage. Is is so ubiquitous that the terms "text file" and "ascii file" have come to mean the same thing for most computer users.

The ASCII standard was good, as long as you were only working in US English.

Go to the next section 4.4.2 ANSI Character Set or back to 4.4 Ascii, Ansi and Unicode.

4.4.2 ANSI Character Set

The ANSI standard extended the ASCII character set. In the ANSI standard, the first 128 characters where the same as for ASCII but from character 128 onwards, there were different ways depending on where you lived. These different ways were called ***code pages***.

For example, in Israel DOS used a codepage called 862 while Greek users used code page 737.

The ANSI set of 218 characters (also know as Windows-1252) was the standard for core fonts supplied with US versions of Microsoft Windows up to and including Windows 95 and Windows NT 4 (character 218 was the euro currency symbol was added during this time).

ANSI characters 32 to 127 correspond to those in the 7-bit ASCII character set.

Some of the extra ANSI codes are:

163 is the ANSI code for a currency Pound sign

165 is the ANSI code for a currency Yen sign

If you use a version of Windows that is designed for a non-Latin alphabet such Arabic, Cyrillic, Greek or Thai to view a document that has been typed using the ANSI character set, then in the codepage for the characters from these languages may replace some of those in the 128-255 range and so the document will look different.

There are similar problems when transferring ANSI documents to DOS or Macintosh computers, because DOS and MacRoman arrange characters differently in the 128-255 range.

Go to the next section 4.4.3 Unicode Character Set or back to 4.4 Ascii, Ansi and Unicode.

4.4.3 Unicode Character Set

Today people want to transfer information around the world in emails and on Web sites but the ASCII and ANSII character sets can not work with a variety of Latin and non-Latin alphabets in the one document.

The solution is to move to a system that assigns a unique number to each character in each of the major languages of the world. Such as system has been developed and is known as **Unicode** and it is intended to be used on all computer systems, not just Windows.

The Unicode Standard covers more than 110,000 characters covering 100 scripts, a set of code charts for visual reference, an encoding methodology and set of standard character encodings, an enumeration of character properties such as upper and lower case, a set of reference data computer files, and a number of related items such as character properties, rules for normalisation, decomposition, collation rendering and bidirectional display order (for the correct display of text containing both right-to-left scripts such as Arabic and Hebrew and left-to-right scripts such as English). As of 2012, the most recent version is ***Unicode 6.1***

Unicode's success at unifying character sets has led to its widespread use in computer software and the standard has been implemented in XML, Java, Microsoft .NET Framework and modern operating systems.

To make it Unicode compatible with ASCII, the first 128 characters where the same as for ASCII but from character 128 onwards they are totally different.

All the Unicode characters can be covered with 32 bits but to use a 32-bit representation in a file means that a standard ASCII file would be four times as large when written out in Unicode.

So to save on disk space, and the size of files for emailing etc, there are a number of different mapping methods, or character encodings, for writing Unicode characters to a file.

The Unicode standard defines two mapping methods: the Unicode Transformation Format (UTF) encodings, and the Universal Characters Set (UCS) encodings. An encoding maps the range of Unicode characters (or possibly a subset) to sequences of values in some fixed-size range.

Note: Even though software stores Unicode characters, the computer system still needs the graphics for the character sets to be able to correctly display the Unicode characters.

Go to the next section 4.4.4 Unicode Encoding: UTF-8 or back to 4.4 Ascii, Ansi and Unicode.

4.4.4 Unicode Encoding: UTF-8

One of the most common character encodings is UTF-8.

In UTF-8 encoding, only 8-bits are used for any ASCII characters from 0 to 127. For characters 128 and above, it uses between 16, 24 and up to 48 bits.

And because the representation of the first 128 characters are the same in Unicode and ASCII, US English text looks exactly the same in UTF-8 as it did in ASCII.

So why can't a standard ASCII text editor, or a program requiring plain ASCII text have problems with a Unicode file just containing ASCII characters?

The main reason is that in many Unicode files, a special character called a BOM (see 4.4.6 Endian and BOM) is often placed at the beginning of the file, and the BOM would not be recognised by a program only expecting ASCII and would generate an error, or show up as blank spaces or strange-looking characters.

Go to the next section 4.4.5 Unicode Encoding: UTF-16 or back to 4.4 Ascii, Ansi and Unicode.

4.4.5 Unicode Encoding: UTF-16

In UTF-16 encoding, 16-bits are the basic unit and depending on the Unicode character, UTF-16 encoding may require one or two 16-bit code units. Using the two 16-bit code units, UTF-16 is capable of encoding up to 1,112,064 numbers.

The basic unit of computers is a byte which consists of 8-bits. Because the UFT-16 encoding uses 16-bit and so is made up of two bytes and the order of the bytes may depend on the endianness (byte order) of the computer architecture.

To assist in recognizing the byte order of code units, UTF-16 allows a Byte Order Mark (BOM - see 4.4.6 Endian and BOM), a code with a special value to precede the first actual coded value.

Because the fundamental unit in UFT-16 is 16 bits, storing a text file only containing ASCII text will take twice as much disk space as the ASCII version.

Microsoft has used UTF-16 for internal storage for Windows NT and its descendents including Windows 2000, WIndows XP, Windows Vista and Windows 7.

Go to the next section 4.4.6 Endian and BOM or back to 4.4 Ascii, Ansi and Unicode.

4.4.6 Endian and BOM

From early computing, the fundamental unit of storage was a byte consisting of 8-bits (a bit is a one or a zero). When computers started using 16-bits, this could be stored as two bytes but there was a choice of the order of storing the two bytes. Two different approaches arose and are referred to the endian or endianness.

Big endian stores the most significant byte first and the least significant byte second. Similar to a number written on paper. ***Little endian*** stores the least significant byte first and the most significant byte second.

The ***byte order mark*** (BOM) is a Unicode character used to signal endianness (byte order) of a text file or character stream.

A BOM is essential when the basic unit of an encoding consists of two bytes such as in UTF-16.

Beyond its specific use as a byte-order indicator, the BOM character may also indicate which of the Unicode encoding has been used because the values of the bits in the BOM will be different for the different Unicode encodings.

So although a BOM is not strictly necessary for UTF-8 when it only contains ASCII data, it still alerts the software that it is UTF-8.

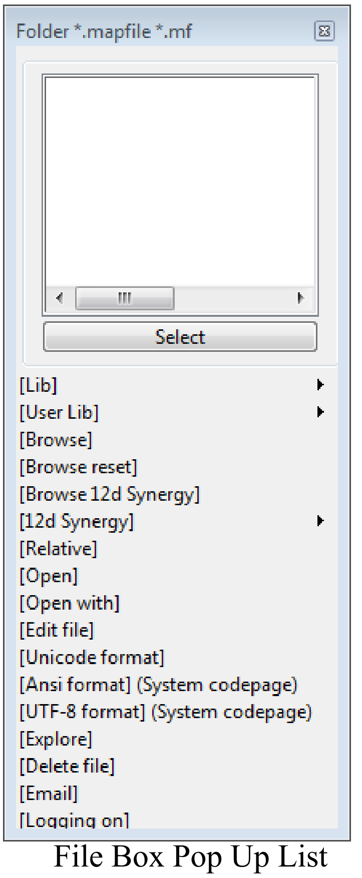
Some common programs from Microsoft, such as Notepad and Visual C++, add BOMs to UTF-8 files by Default. Google Docs adds a BOM when a Microsoft Word document is downloaded as a .txt file.

When a BOM is used, it should appear at the **start** of the text.

Go to the next section 4.4.7 Writing out Files from 12d Model or back to 4.4 Ascii, Ansi and Unicode.

4.4.7 Writing out Files from 12d Model

When a file box is used in a ***12d Model*** panel, clicking **LB** of the ***Folder*** icon will bring up the folder pop-up and on the pop-up is the choice for writing out the file in ANSI, or UTF-8 rather that the default of Unicode (UTF-16).



File Box Pop Up List

For more information on the **File Box**, see 4.19.8 File Box.

Continue to the next section 4.5 Data Types (or return to 4.4 Ascii, Ansi and Unicode).

4.5 Data Types

12d Model was designed from the ground up as an object based system and programmed in C++, the most widely used Object Oriented programming language.

As objects, strings know what type of string they are and behave accordingly without user intervention. As a simple example, when selecting a string for editing, the string knows what type of string it is and brings up the appropriate editor.

A more complicated example is a super alignment with computations. Such a string can be constructed from references to other string, automatic fillets, automatic draping on tins *etc.* and if any of this auxiliary information changes, the super alignment will change as well.

See

4.5.1 Strings
4.5.2 General String Properties
4.5.3 Models
4.5.4 Tins
4.5.5 Trimeshes
4.5.6 Templates
4.5.7 Projects
4.5.8 Attributes or Meta Data

4.5.1 Strings

12d Model uses the string object as one of its basic modelling elements.

In its simplest form, a ***12d Model*** string is an *ordered* series of vertices or points, joined by a segment.

However a ***12d Model*** string can also be much more complex including referencing to other objects and complicated construction methods. The string object can also have an almost unlimited number of user defined attributes for the whole string, for each vertex and for each segment joining vertices.

However, as an object, the ***12d Model*** string shields the user from its full complexity and only displays the relevant information and properties as required for a particular context.

So starting with the basics, a ***12d Model*** string is an *ordered* series of vertices or points.

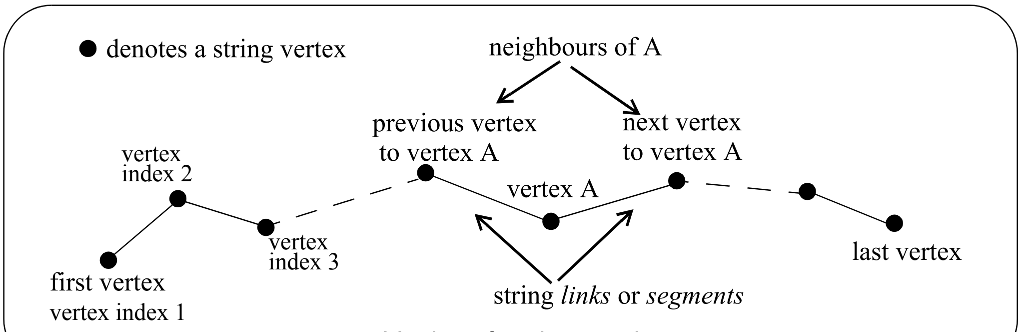
Apart from the first and last vertex in a string, each vertex in a string has a unique ***previous vertex*** (predecessor) and a unique ***next vertex*** (successor). The previous and next vertices for a vertex are called its ***string neighbours***.

The objects joining a vertex with its neighbours are called string links or ***segments***. Segments may be straight lines or plan arcs, or transition elements such as spirals. The segments can be *visible* or *invisible*.

The string has an implied **direction** starting from the first vertex of the string and then proceeding to the successor vertices in the string.

The ordering along a strings allows each vertex to be given a ***vertex index*** where the first vertex has vertex index **1**. Note that if additional vertices are inserted or vertices deleted then the vertex indices will change. Also note that for super strings, a vertex may have a ***point id*** (also called a ***vertex id*** *and sometimes a* ***point number***) which is ***not*** the same thing as the *vertex index*.

A string which has the same first and last vertex is called a ***closed*** string otherwise a string is said to be ***open***.



Vertices forming a string

Strings are very useful in the modelling of terrain and design surfaces and when using strings, for some applications they need to a particular properties.

For example, a ***contour*** displayed on maps is actually a string with the special property that all the vertices have exactly the same height (z value). And if the height of one vertex of the contour is modified, then all the vertices of the contour string must also be modified to have exactly the same height or the string is no longer a contour. So a ***contour*** string is a special type of string that ***knows*** how to behave when the z-value of the string is modified. This is why strings are ***objects*** - they intrinsically know how to behave.

To make it easier to refer to particular sets of properties that some strings must have, ***12d Model*** defines a number of different **types** of strings. Using the string ***type*** is a a convenient short hand for saying the string has certain well defined properties.

4.5.2 General String Properties

Super string

A super string is a general purpose string.

Each vertex can have tinability, a symbol with its own size and rotation, z-value, text and an unlimited number of user definable attributes.

Segments can be lines, arcs or transitions (for example spirals). Each segment (link) has visibility, colour and breakline flags (segment tinability) and values for diameter or width and height (box culvert), radius, text and an unlimited number of user definable attributes.

2d, 3d, 4d, polyline and pipe strings are special cases of the super string.

2d or contour super string

The z-value of a 2d super string is the same at every vertex in the string.

Consequently the entire string has a height (the ***string height***) rather than having to refer to the height at each vertex. By changing the string height, the heights of all the vertices are modified. The height of a single vertex of a *2d* string ***can not*** be changed to a height that is different to the string height.

So if a ***2d*** string is selected by the string editor, as an object the ***2d*** string can signal the object editor that it has a ***string height*** and that the editors height command can only work on the string height and won't allow the individual vertex heights to be modified.

3d super string

The z-value can vary for each vertex in the string.

So if a ***3d*** super string is selected by the string editor, as an object the ***3d*** string can signal the object editor that each vertex has an individual height, and that the editors height command must select an individual vertex and modify that vertex's height.

4d super string

A ***4d*** super string has (x,y,z) values at each vertex ***plus*** vertex text defined at each string vertex. Useful when a description is needed at each vertex. For example, design sections are created as 4d strings and the vertex text records the name of the string that goes through that vertex.

alignment string

An ***alignment*** string is a more complicated string object which defines the string by specifying the horizontal and the vertical geometry for the string.

The horizontal geometry of the string is a a series of horizontal intersection points (HIP's) with plan arcs and leading (left) and trailing (right) transitions defined for each HIP. This defines the plan geometry of the alignment string.

The vertical geometry of the alignment string is defined as a series of vertical intersection points (VIP's) defined by horizontal chainage along the string and height. Each VIP can have a parabolic or circular curve on it.

Alignment strings are used for defining entities such as the centre line or a simple road or railway.

The alignment string has been superseded by the super alignment string which not only has IP methods but also fixed and floating definitions of elements.

super alignment string

A ***super alignment*** string is also specified by defining the horizontal and the vertical geometry for the string but neither of the geometries is restricted to just intersection (IP) points. The horizontal geometry can be made up of almost any combination of straights, arcs, transitions, partial transitions, horizontal IP's. Similarly the vertical geometry is made up of combinations of straights, arcs and parabolas.

In the super alignment object, the elements of the horizontal and vertical geometries can be defined by referencing to other strings, offsets, intersections *etc.* and if these items change, the super alignment object knows how to re-calculate itself.

arc string

An arc string is an arc in a plan projection but with a linearly varying z-value on the circumference. So the arc string is actually a 3d helix. The centre point of the arc is for display purposes only.

circle string

A circle string is a plan circle a constant z-value around the circumference. Hence the circle string is always parallel to the (x,y) plane. The centre point of the circle is for display purposes only.

control station

control stations are used in the survey reduction option where a name of a station can be given in the 12d survey field file and the coordinates of the station can given by the control station of that name in the specified model of control points. In ***12d Model***, a Control station is represented by a one vertex 4d or super string and the name of the control station is the name of the one vertex string. Usually the point id for the vertex of the super string, or the text for the 4d string, is also the Control station name.

drainage and sewer string

Special string made up of straights, arcs and manholes.

feature string

A feature string is a plan circle with a z-value at the centre point but only null values on the circumference.

If a feature string is given a ***world*** line style, then the style is centred on the centre point of the feature string and scaled up to the radius of the feature string.

If a feature string is given a ***screen*** or ***paper*** line style, then the style is wrapped around the circumference of the feature string.

interface string

An interface string is a special string constructed from a string and a surface. Each vertex of the interface string records whether the corresponding vertex on the original string was above or below the surface.

pipe super string

A pipe string is a 3d string with a diameter.

pipeline string

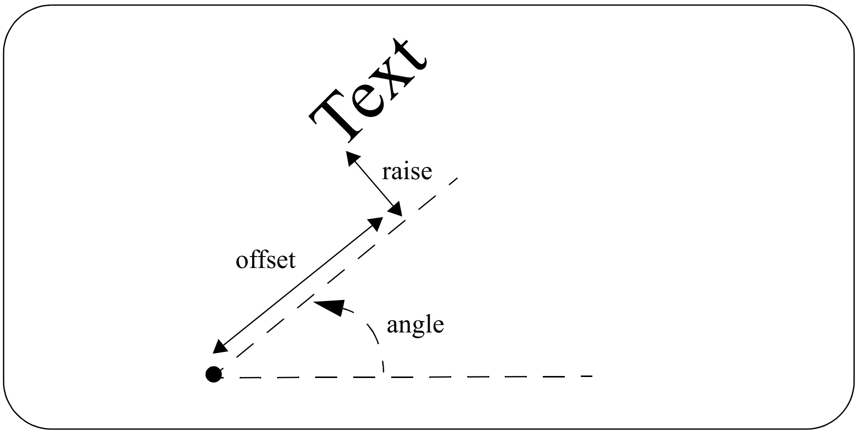
A pipeline string is an alignment string with a diameter.

polyline super string

A polyline string is similar to a 3d string except that there can be straights or arcs joining the string vertices.

text string

a text string has an (x,y) position and contains characters and information about how the characters are displayed (textstyle, units, height, offset, raise, justification, angle, slant and x factor). For more information on angle, offset and raise, go to the section 4.6 Text Definitions.



Super strings can also have text defined on its vertices and segments, and 4d strings can have text defined on each vertex,

Go to the next section 4.5.2 General String Properties or back to 4.5 Data Types.

4.5.2 General String Properties

See Name and Model
Breakline Type
Tinable
Linestyle and Colour
String Chainage

Name and Model

Strings have a text name of up to two hundred alphanumeric characters, spaces and dots (**.**). The string name does not have to be unique and can be blank. When strings are created, they are stored in **models**. A string is in one and only one model. Models are discussed in the next section.

Breakline Type

When triangulating data, if all the vertices and all the segments of a string are to be preserved as the sides of triangles and hence are part of the triangulation the string is called a **breakline** or **line** string. **Note** - all the segments of all the breaklines can only be preserved with there are no crossing segments amongst any of the breakline strings

If all the vertices are included in the triangulation but none of the segments are, then the string is called a point string.

For triangulation purposes, each of the super string types 2d, 3d, 4d and polyline can be used as **either** breaklines (line strings) or point strings.

Line strings are useful in describing terrain features such as ridge lines and creek beds or design features such as the edge of a building platform. Point strings can represent information such as spot heights.

Alignments, arcs, circles, pipelines, interfaces, drainage and sewer strings can only be breakline strings. Feature strings can only be point strings with a z-value at the centre of the circle.

Tinable

For a ***super string***, the concept of breakline has been **extended** to a property called **tinable** which can be set *independently* for each vertex and each segment of the super string.

If a **vertex** is tinable, then the vertex is included in triangulations. If the vertex is not tinable, then the vertex is ignored when triangulating.

If a **segment** is tinable, then the segment is used as a side of a triangle during triangulation. That is, the segment is used as a breakline. This may not be possible if there are *crossing* tinable segments.

Note that for a segment to be used as a side of a triangle, then its end vertices must also be tinable.

So a ***breakline string*** is one where all the vertices and all the segments are tinable.

A **point** string is one where all the vertices are tinable and all the segments are not tinable.

Linestyle and Colour

All strings (except text) can be given a user defined **linestyle** or simply **style**.The style describes how the string is drawn on the screen and on plots. The default style is **1**.

A style can also be continuous or just at the vertices of a string, regardless of the breakline type of the string. A breakline string (line string) with default style **1** will be drawn with solid lines between the nodes, and a non breakline string (point string) with default style will be drawn with crosses at the string nodes with no visible lines between the nodes.

Strings have a default colour but how that colour is used depends on the breakline type and style of the string. For example, a line string with default style **1** is drawn with the string's links in the string colour and for a point string with default style **1**, crosses are drawn at each string point in the string colour. However, styles can have their own colours which override the default colour of the string. Interface strings have two colours (red and green) which are used to represent cut and fill information.

Hence super strings with **default styles** appear on the screen as

point string (non breakline string)

each string link is considered to be an **invisible** line. String values are not defined along the invisible string links.

line string (breakline string)

each string link is considered to be a **solid** line. String values are defined along the string links by linear interpolation between the end points of the string link.

String Chainage

Every vertex along a string has a **chainage** value. This chainage is calculated by taking the start chainage defined for the first vertex of the string, and adding to it the **plan** distance along the string from the start vertex to the selected vertex on the string.

Go to the next section 4.5.3 Models or back to 4.5 Data Types.

4.5.3 Models

Within a ***12d Model*** project, information is collected in units called **MODELS**. Models contain strings, tins, super tins, grid tins, trimeshes and plot frames. (see the next section).

Each model has a unique user-defined text name of up to two hundred alphanumeric characters and spaces.

For convenience, model names should reflect the nature of the information in the model. For example, a model containing terrain data could be called **terrain**. **design** could be another model containing design data.

Each model has minimum and maximum x, y and z values which define a bounding box which encloses all the data in the model (the model bounding box). The size of the model bounding box is automatically updated as new data is added to the model, but not adjusted as data is deleted. A re-calculation of the model bounding box is performed by the **calc extents** buttons on the model and view information panels.

There is an option to list all the models available in a ***12d Model*** session (the model list). The model list is also used in various pop-ups and walk-right menus.

Displaying Models

The screen display areas in ***12d Model*** are the views. Models are displayed in views by “adding” the model to the view. Similarly, when a model is “removed” from a view, it is no longer displayed in that view.

There are options in the ***12d Model*** menu and on each view to add and remove models from views.

Go to the next section 4.5.4 Tins or back to 4.5 Data Types.

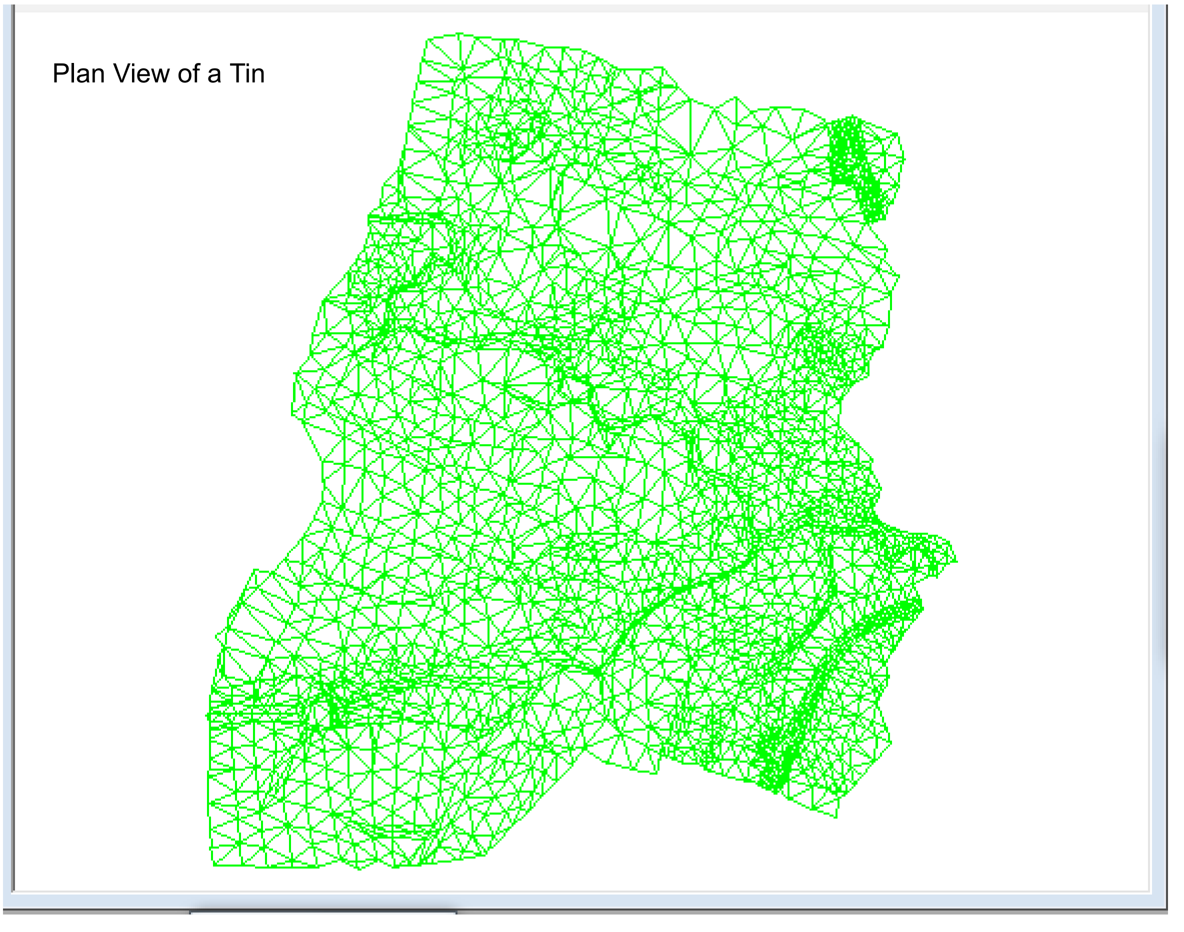
4.5.4 Tins

To form a continuous 2.5D surface representing the data in a model, a process called triangulation is used.

Note: a 2.5D surface has only one z-value for any (x,y) value in the surface.)

Triangulation creates in 2D, a web of connected, non-overlapping triangles, whose nodes are the (x,y) vertices from ***12d Model*** strings. Because the data points are normally irregularly spaced in plan, the triangulation is referred to as a **TIN** - a **T**riangulated **I**rregular **N**etwork.

If more than two vertices have the same (x,y) location, then only one of the z-values can be used for that triangle node.



For the interface strings and the old 2d, 3d, 4d strings, all non null points are included in the triangulation. For super strings, only vertices that are **tinable** are included in a triangulation.

To allow the triangulation to accurately represent features such as ridge lines and creek beds, the segments of breakline strings (line strings) are preserved as edges of triangles in the tin.

For a **super string,** only **segments** that are **tinable** and whose end vertices are also tinable, are included as break lines.

Each tin is given a unique user-defined name of up to two hundred alphanumeric characters and spaces.

There is a default colour for the triangles (faces) in a tin but individual faces can be also be given a different colour to the default colour.

Individual triangles in a tin can also be **nulled**. That is, turned off so they are effectively not there. However the nulled triangles are not deleted and are still stored in the tin and they can be un-nulled at any time.

A tin has a **surface area** which is the sum of the area of each of the triangles in the tin.

Unlike strings, tins can be in more than one model, or even no model at all. However, to be **displayed** in a view or used for **profiling** on a section view, tins need to be in at least one model. It is suggested that each tin be in its own model called "**tin tin_name"**. This makes it easy to know the model a tin is in, and also to see which models contain tins and obtain lists of all tins when using <ctrl> + <d> for name completion.

There is an option to list all the tins available in a ***12d Model*** session (the tin list) which also displays the models the tin is in as a walk-right. The tin list is also used in various pop-ups and walk-right menus.

Tins can be "added" and "removed" from models with options in the ***12d Model*** **Triangles** menu. If a tin is to displayed in a view, it must be "added" to a model that is being displayed in that view.

For safety, they are **not** deleted when any model containing them is cleaned or deleted.

Tins can only be **deleted** by using the **Triangles=>Delete** options.

WARNING

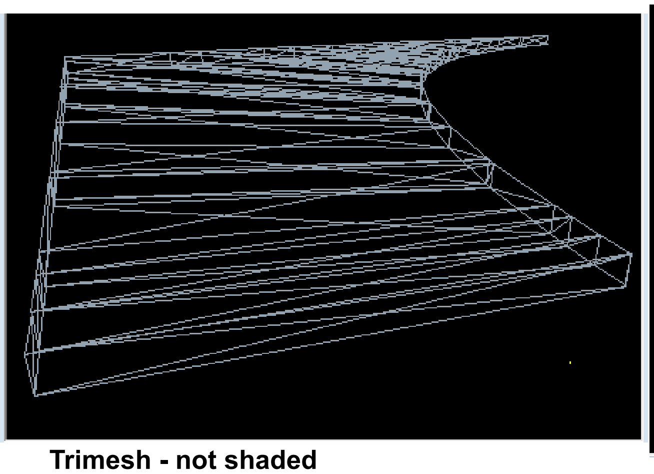
Tins are stored with **copies** of the points that were triangulated so if the original points are modified, the triangulation will not reflect this change until a **Recalc** of the triangulation is done.

Go to the next section 4.5.5 Trimeshes or back to 4.5 Data Types.

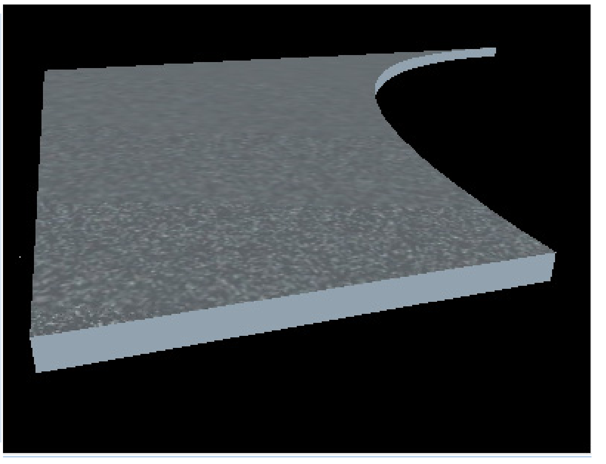
4.5.5 Trimeshes

To model a continuous 3D surface, trimeshes are used.

A trimesh is a web of connected 3D triangles. where none of the triangles intersect each other.



Trimesh - not shaded



Trimesh - shaded

A trimesh can have a name of up to two hundred alphanumeric characters and spaces. The trimesh name can be blank.

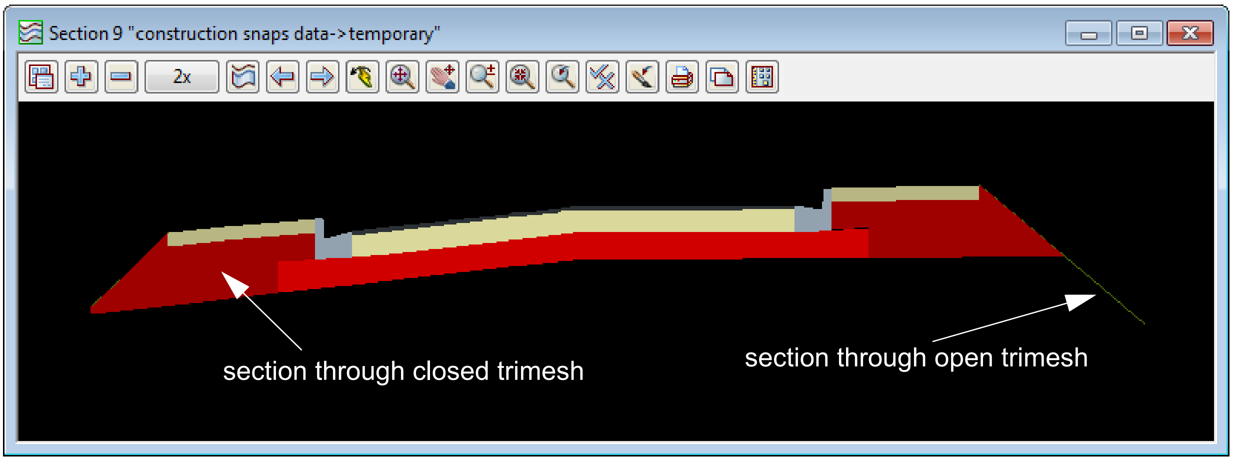
There is a default colour for the triangles (faces) in a trimesh but individual faces can be also be given a different colour to the default colour.

A trimesh has a **surface area** which is the sum of the area of each of the triangles in the trimesh.

A trimesh is **closed** if for each side of a triangle in the trimesh, there is another triangle in the trimesh butting up to it. A **closed** trimesh can have a **volume**.

If a trimesh is not **closed** then it is said to be **open**. An **open** trimesh **does not** have a **volume**.

When taking a section through a trimesh, the **outline** of the trimesh is shown and if the trimesh is **closed**, then the trimesh is **colour filled**.



A trimesh is a generalisation of a tin and unlike a tin, a trimesh can fold under itself.

There are numberous tools in ***12d Model*** for generating ***trimeshes*** for representing pavement layers, gutters, tunnels etc as 3D objects.

Go to the next section 4.5.6 Templates or back to 4.5 Data Types.

4.5.6 Templates

Templates are used as a quick and easy method for defining design details along a string for use in conceptual and detail designs, and visualizations. Templates are stored with each project but can be written out and read in using a readable file format.

Go to the next section 4.5.7 Projects or back to 4.5 Data Types.

4.5.7 Projects

In ***12d Model***, information is organised into **projects**.

When ***12d Model*** begins, the user specifies the name of the project to work on. A project name can be up to two hundred alphanumeric characters and spaces.

All the information created for that project is kept together in a special folder called the **project area**.

The project area contains all the models, templates and tins associated with the project. Copies of models and tins created in other projects can be added to another project from within ***12d Model***.

External data files can be read into the project (imported) using special input options. Similarly, output options are provided to write data out for use in other software packages (exported).

Go to the next section 4.5.8 Attributes or Meta Data or back to 4.5 Data Types.

4.5.8 Attributes or Meta Data

Extra data can be attached to the Project, Models, Strings, Tins and other Elements as **attributes**, including **user defined attributes**. Attributes are also called **meta data**.

Super strings can not only have attributes defined for the entire string (**string attributes**) but can also have attributes defined for each vertex (**vertex attributes**) and for each segment (**segment attributes**).

An attribute has a **name** and can store either an **integer** (32 bit), a **real** (64-bit double precision), a **text**, a **64-bit integer**, an **uid** (which is just a number), or it can be a special attribute called a **group** attribute that can store other attributes.

Hence attributes in ***12d Model*** can be grouped into a ***hierarchy*** or ***tree.***

That is, there are attributes at the ***Top*** level (the first level), and amongst the top level attributes can be group attributes that contain zero or more other attributes. Attributes in a first level group attribute are said to be in the **second** level.

Similarly an attribute in the second level can be a group attribute and hence contain other attributes which are said to be in the **third** level.

So attributes form a tree structure much like a folder structure for files.

Within a group, all the attributes must have unique names.

See Attribute Pathname
Accessing Attribute Values
Attribute Data Panel
Comparing Attribute Data
Accessing Attribute Values

Attribute Pathname

The **pathname** of an attribute is the list of attribute names that you must go through, starting at the top level, until you get to the attribute. That is, the path name is the path through the attribute structure that you must go through until you reach the attribute.

The attribute names that you pass through at each level are unique so the pathname to an attribute is unique is a unique and is written by listing the attribute names you pass through at each level separating each name by a **/**:

first_level_att_name / second_level_att_name/ **...**/attribute_name

For example, if the first level contains the attributes

sun, moon and earth   top or first level

and **earth** is a group attribute containing the attributes

asia, africa, lee, america europe and australia   second level

and **australia** is a group attribute containing the attributes

brisbane, melbourne, perth and sydney   third level

and **sydney** is a group attribute containing

fred, joe, mary, sam and lee   fourth level

then the path name to **lee** in the group **sydney** is

earth/australia/sydney/lee

Note that there is also a **lee** in the second level but there is only one **lee** at each level so there is no problem. The pathname to the first **lee** is:

earth/lee

In***12d Model*** options where attribute names are required in an input field, the full ***pathname*** of the attribute must be given to uniquely identify the attribute.

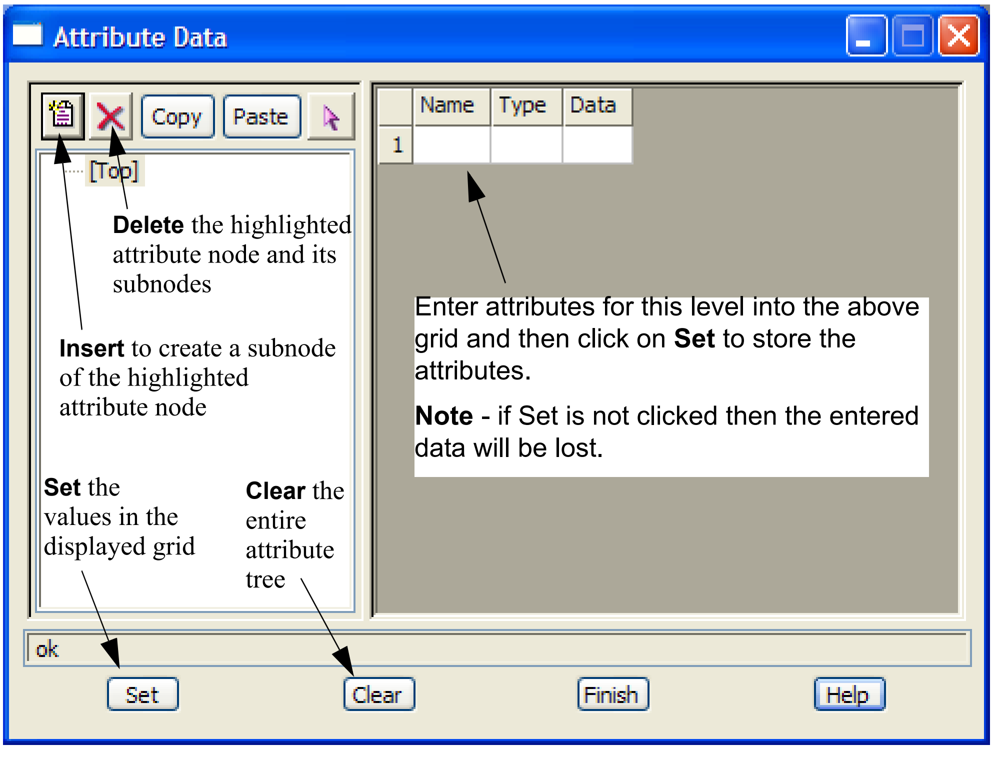
Attribute Data Panel

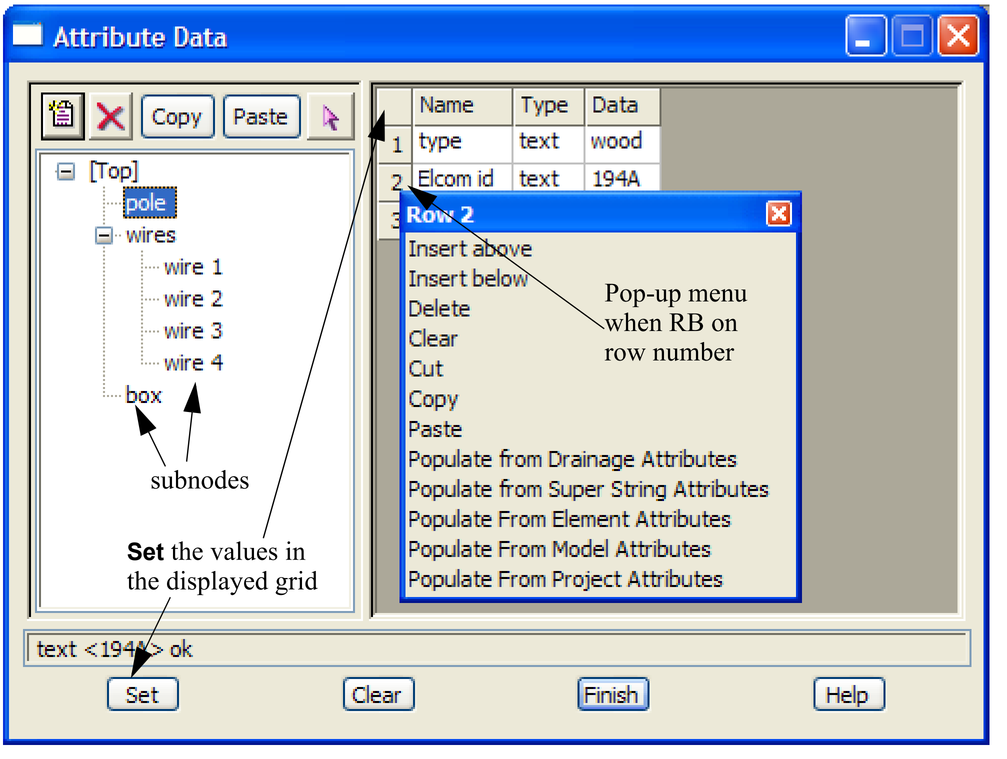
In many options when attributes are to be defined, the **Attribute Data** panel is displayed.

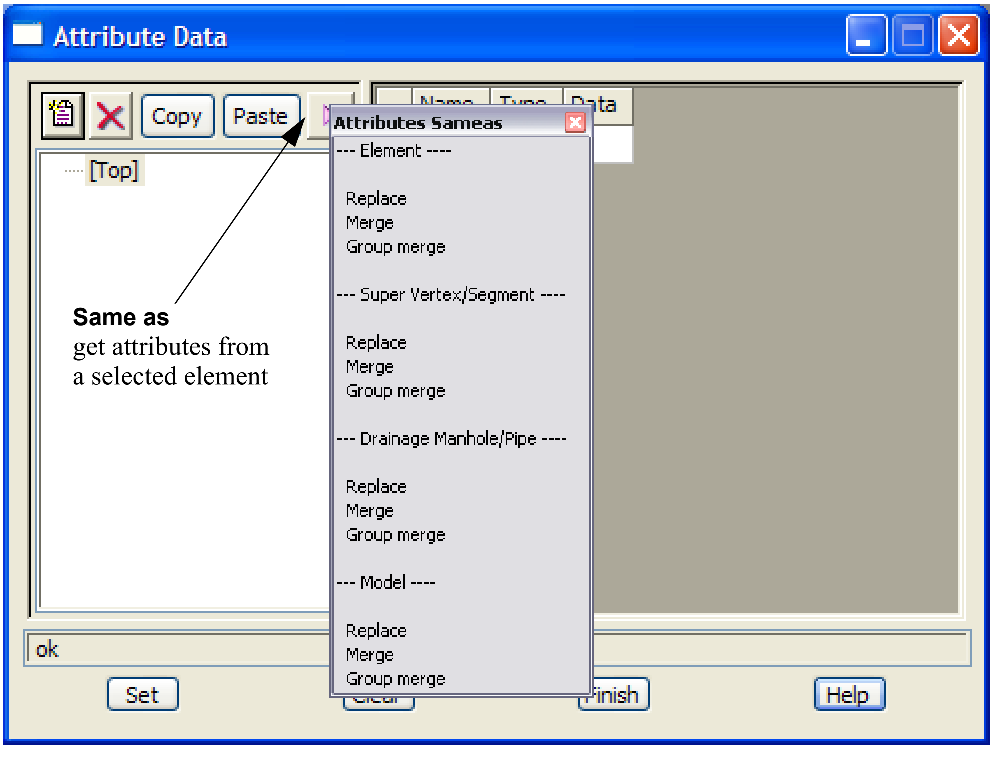
The **Attribute Data** panel can create and edit attributes.

When no attributes exist for an object, the **Attribute Data** panel just shows the **Top** of the attribute tree. New attributes for the top level can be added in the right hand side grid.

Sub nodes (the lower levels of the attribute tree) of an attribute node are created by simply highlighting the attribute node and then clicking on the **Insert** icon. Attributes for the subnode are then entered into the right hand grid and the **Set** button clicked to save the subnode and its attributes.







The buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Insert	button		

create a new attribute node (subnode) beneath the highlighted attribute node

Delete button

delete the highlighted attribute node

Copy button

copy the highlighted attribute node into the attribute buffer

Paste button

paste the attribute buffer to the highlighted attribute node

Same As button

paste the attribute buffer to the highlighted attribute node

Set button

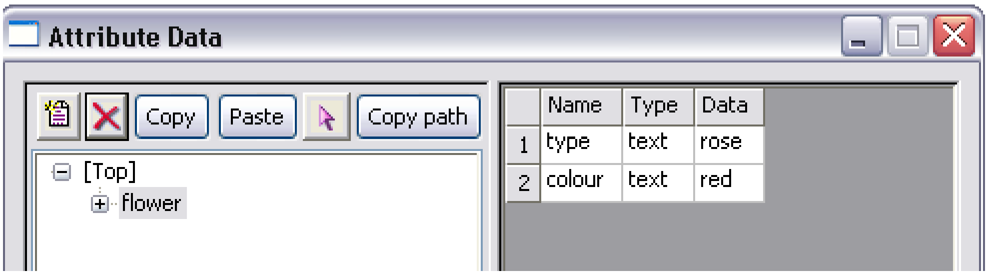
set the values given in the current grid in the attribute tree

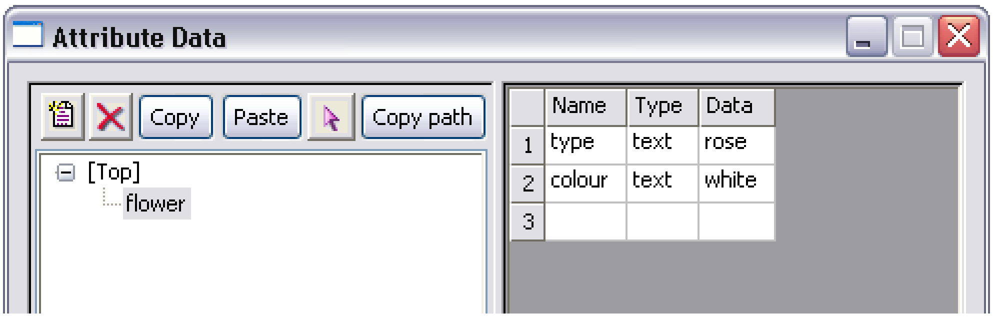
Clear button

clears out the entire attribute tree

Comparing Attribute Data

Two Attribute Datas are the same if each Attribute Data has exactly the same groups, and each group has exactly the same attributes in them, and each identical attribute has ***exactly the same value***.





For example, the two attribute data shown above have exactly the same attribute group "flower" and the group "flower" has exactly the same attributes "type" and "colour", the attribute data are not the same because the value of "colour" is "red" for one attribute data, and "white" for the other attribute data.

Accessing Attribute Values

In some options, in particular in the Map File, the actual ***value*** of a given attribute (the column called Data in the **Attribute Data** panel***)***, is specified by putting a **$** in front of the attribute path name.

That is

$earth/australia/sydney/lee

refers to the actual value of the attribute given by the path name *earth/australia/sydney/lee.*

For example, see 8.8.3 Map File Substitution by Attributes.

Please continue to the next section 4.6 Text Definitions.

4.6 Text Definitions

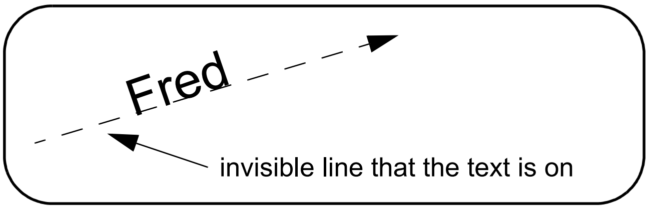
Text can occur as a text string, or on vertices and segments of a super string.

The Text itself consists of one or more lines of text but the display position of the text is not as straight forward as simply placing a vertex.

The ***text display position*** of is defined by

(a) an initial start position - usually a vertex or a segment

(b) the ***direction*** for the text - the invisible line that the text runs along



(c) the ***text justification point*** and the ***offset***, ***raise*** and ***angle*** defined with respect to the justification point. Note that the definition of the justification point and the offset, raise and angle depend on whether the text is vertex text or segment text.

(d) the justification (top left etc) for the text about the justification point

Apart from text display positioning, text also has a

(e) textstyle

(f) text units for text height, offset and raise value

(g) height (size)

(h) width factor (w or x factor)

(i) slant

(j) colour

(k) weight

(l) underline, strikeout and italic

(m) border and border type

(n) whiteout

There are also special ways of defining characters which are not available on the keyboard. For example the degree character and the squared and cube characters.

Instead of having separate variables on each panel for all of these text definition values, a ***Textstyle Data*** has been introduced to hold all the Text variables.

Apart from saving a massive amount of room on panels, another major benefit of the ***Textstyle Data*** is that in the future, extra variables can be added to the ***Textstyle Data*** structure and the variables are then available everywhere a ***Textstyle Data*** is used.

The **Textstyle Data** or **Textstyle Info** panels are usually brought up to enter Text setup data. For information on those panels, see 4.6.12 Textstyle Data and Textstyle Info.

For definitions on textstyle data values, see

4.6.1 Justification Point and Offset, Raise, Angle
4.6.2 Text Justification
4.6.3 Textstyle
4.6.4 Text Units

4.6.1 Justification Point and Offset, Raise, Angle

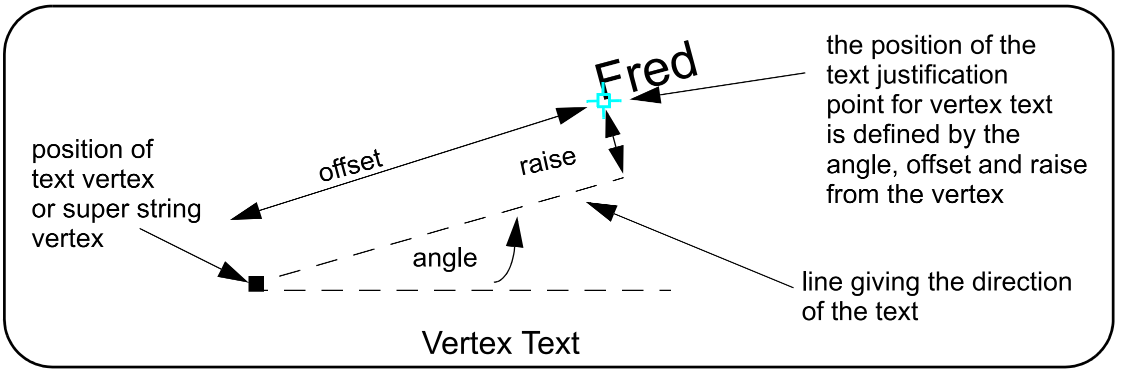
Vertex Text

Vertex text refers to the text of a *text string* or text at a super string vertex (vertices are displayed by toggling on ***Vertices*** for a plan view).

For vertex text, the text ***justification point*** and the ***direction of the text*** are defined by:

(a) the *direction of the text* is given as a *counter clockwise* ***angle*** *of rotation* (measured from the x-axis) about the vert*ex*

(b) the *justification point* is given as an ***offset*** from the vertex *along the line through the vertex with the direction of the text*, and a perpendicular distance (called the ***raise***) from that offset point to the justification point.



The vertex and justification point only coincide if the offset and raise values are both zero.

All text on a 4d string must have the same height, colour, angle, offset and raise.

What parts of the text on a super string vertex can be independently modified depends on the settings for the super string.

Note that these definitions are relative to the vertex and if the vertex moves, then the text moves with it.

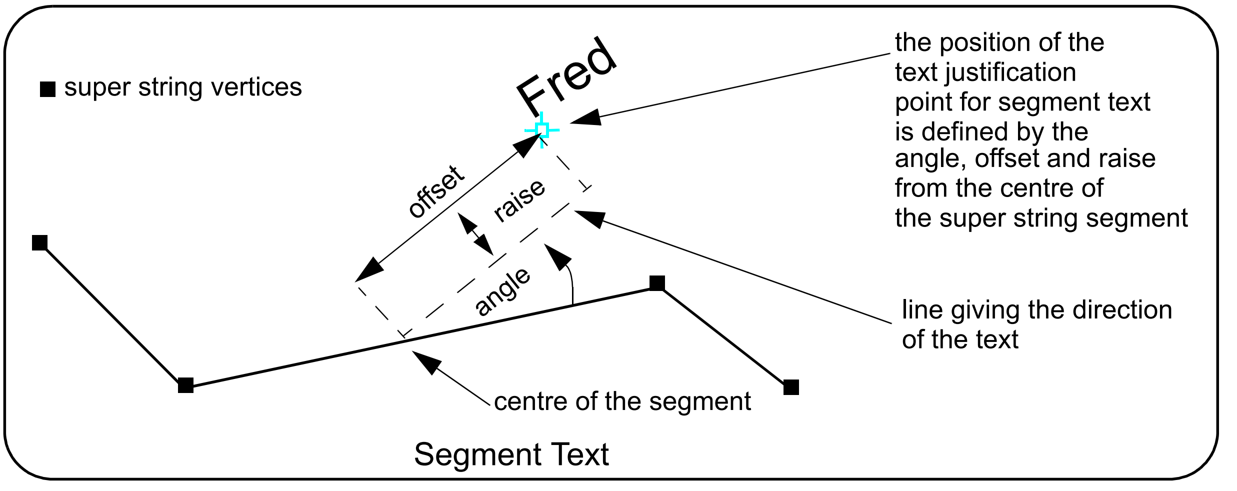
Segment Text

Segment text is a special type of text that can only be placed on the *segment* of a super string. Unlike text at a vertex, the segment for segment text has a direction and mostly the text is required to be parallel, or related to the segment direction.

For segment text, the text ***justification point*** and the ***direction of the text*** are defined by:

(a) the *direction of the text* is given as a *counter clockwise* ***angle*** *of rotation,* measured from the segment, about the centre of the segment

(b) the *justification point* is given as an ***offset*** from the centre of the segment *along the line through the centre of the segment with the direction of the text*, and a perpendicular distance (called the ***raise***) from that offset point to the justification point.



The direction of the text is parallel to the segment if the angle is zero.

Note that these definitions are relative to the segment and if the vertex segment in any way, then the text also moves with it.

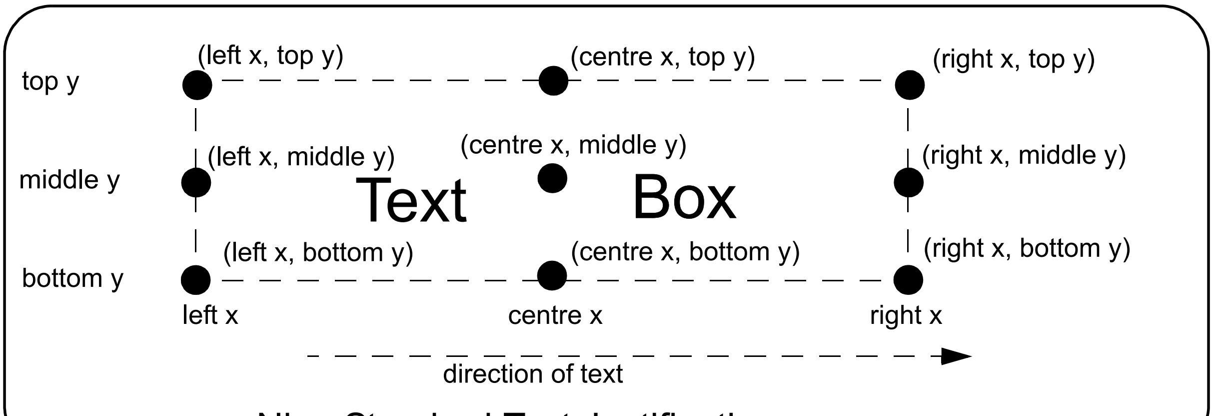
Please continue to the next section 4.6.2 Text Justification or return to 4.6 Text Definitions.

4.6.2 Text Justification

There are nine ways that any text can be positioned relative to the ***justification point***, and sixteen ways for numbers with a decimal point.

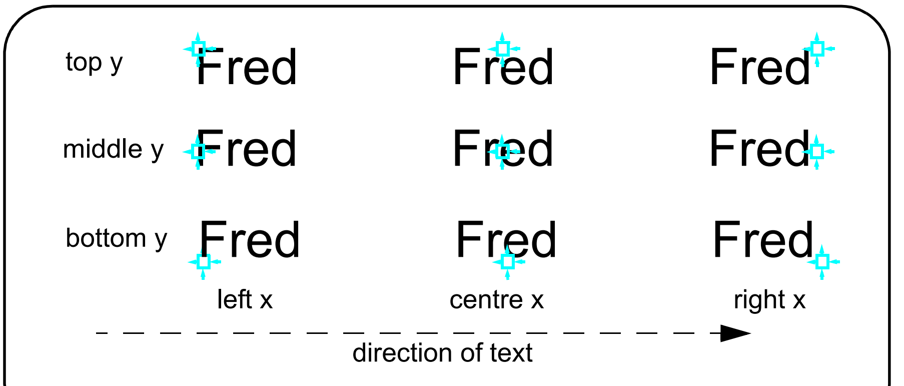
For standard text, the justification is defined in terms of the rectangular box surrounding the text, and this box depends on the height of the text, the text font, and the actual characters in the text (especially for proportional fonts).

In term of the text box, the nine justifications are formed by dividing the bottom and sides of the box in half and calling bottom points left x, centre x and right x, and the side points bottom y, middle y and top y. The nine justifications are



Nine Standard Text Justifications

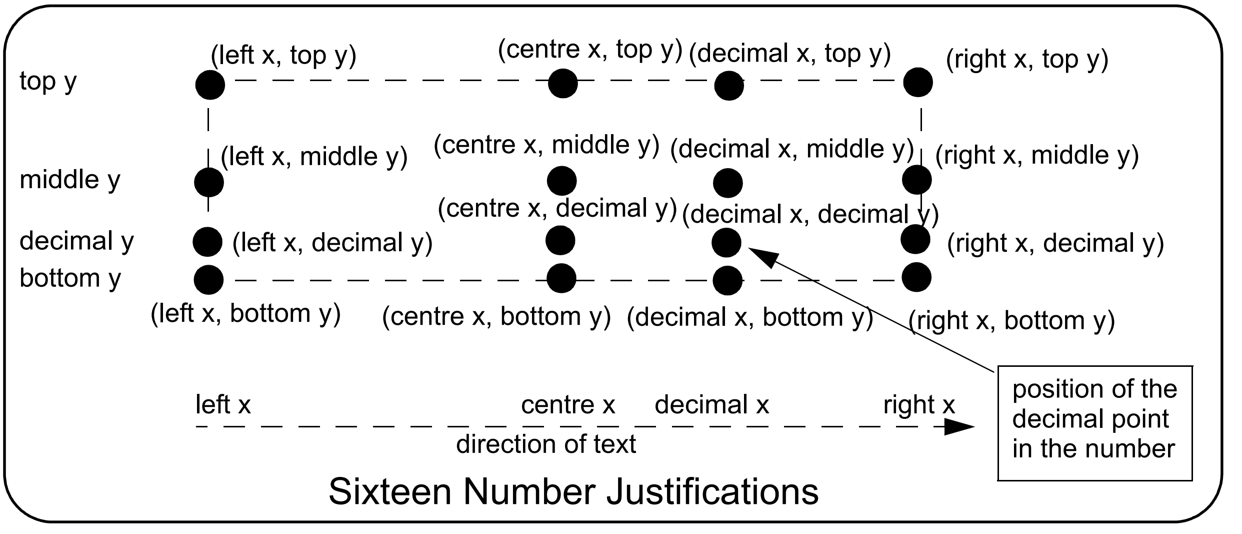
As an example, for the text **Fred**



Text Justifications

For numbers with a decimal point, the position of the decimal point gives an addition point on the bottom called decimal x and on the side called decimal y.

So there are sixteen possible justification for numbers.

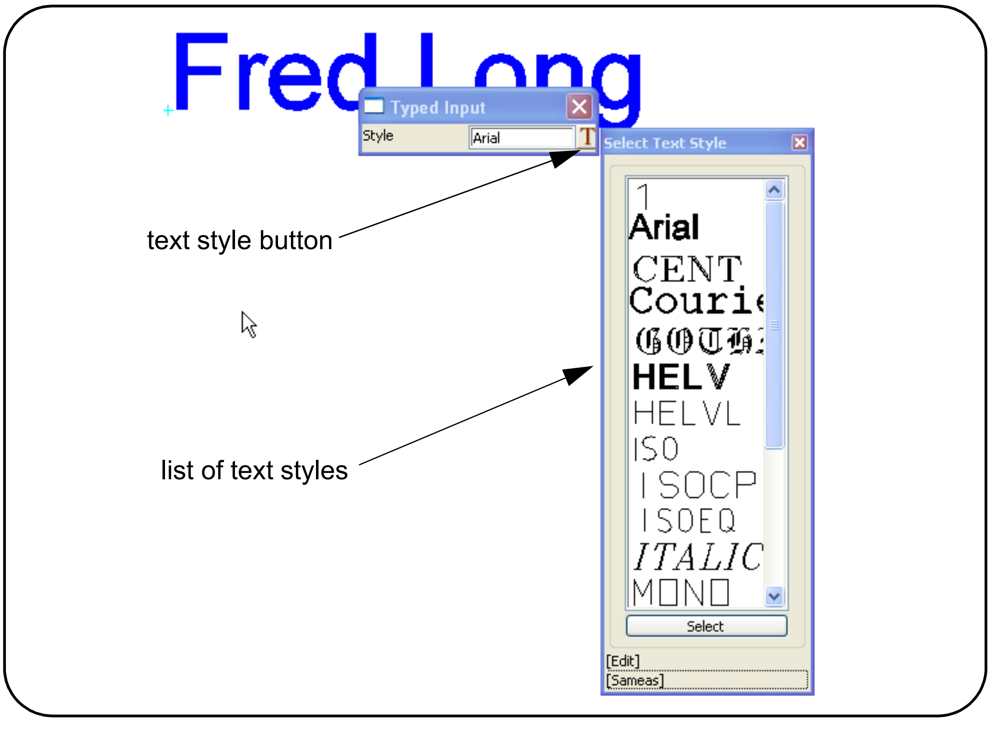


Please continue to the next section 4.6.3 Textstyle or return to 4.6 Text Definitions.

4.6.3 Textstyle

The available text styles for a ***12d Model*** project are defined by textstyles definition file (see the section 40.3 Textstyles and Fonts in the Appendix 40 Linestyles, Symbols, Textstyles &Patterns).

The text style is selected from the pop-up list displayed when clicking on the **Text style** button.



Please continue to the next section 4.6.4 Text Units or return to 4.6 Text Definitions.

4.6.4 Text Units

Text occurs in 12d Model in three ways -

- user defined **text strings**
- automatic text such as grid values, x-section and long-section plot annotation.
- text within linestyles.

The most difficult thing about text is that because of the different uses of text, there needs to be more than one systems of **units** to define text heights.

The height of text for a given textstyle is defined to be the height of a capital A. However, in 12d Model, there are three methods of defining the units for measuring this height.

- world units - the units used for data
- screen units - pixels (the screen is 1000 pixels wide)
- plot paper units - millimetres.

World Units

World units are the units of user data. For most users, the base unit for user data is metres. However 12d Model is a dimensionless system and the base unit is totally dependent on the user.

The height of world text when displayed in a view depends upon on the text height and the scale of the view.

When plotted, the height that world text appears on a plot sheet is the same as for any data defined in world units - the height depends on the **scale** used for the plot.

Text heights that are only given in world units have **(w)** after them.

For some text, the choice of units is either world or pixels. The text parameters then have a **(u)** after them.

Screen Units - pixels

When screen units (pixels) are used, the text is a fixed height on the screen. If the user zooms in on text given in pixels, the text remains the same height.

To have a height on a plot, screen unit text needs a height defined in millimetres.

For some screen text, both a pixel and a millimetre height is supplied when the text is defined.

For text with only a pixel height, there is a plotting multiplication parameter called **pixels-to-millimetres** which is used to convert pixel heights to plot paper heights. The value of pixels-to-millimetres is set using the **plots=>pixels to mm** option and is stored for the project.

Text heights that are only given in pixels have a **(pix)** or **(p)** after them.

For some text, the choice of units is either world or pixels. These text parameters then have a **(u)** after them.

Plot Paper Units - millimetres

Text defined in plot paper units (millimetres) has a well defined height on a plot sheet. When a view scale is set for a plan view, then paper text will draw at the correct size for that scale.

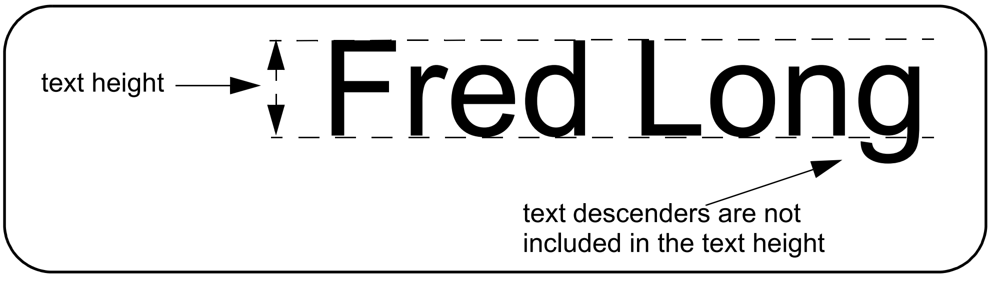
Text heights that are only given in millimetres have **(mm)** after them.

Please continue to the next section 4.6.5 Text Height or return to 4.6 Text Definitions.

4.6.5 Text Height

The height of text is defined to be the height measured from the line that the text sits on to the top of the upper case characters such as F.

Text descenders are not included in the definition of height.



Please continue to the next section 4.6.6 Text Width Factor or X Factor or return to 4.6 Text Definitions.

4.6.6 Text Width Factor or X Factor

In a text font, each character has a defined width which may depend on the character.

For a ***non-proportional font*** such as `Courier New`, all the characters in the font have the same width.

For a ***proportional font*** such as Arial, the width varies for each character.

The character width is actually defined as part of the font and is not available to 12d text but the character widths are multiplied by a *width factor (x factor)* which is set for each text string.

Proportion Font - Arial

x factor = 1 Fred Long

x factor = 2 Fred Long

Non-Proportion Font - `Courier New`

x factor = 1 `Fred Long`

x factor = 2 `Fred Long`

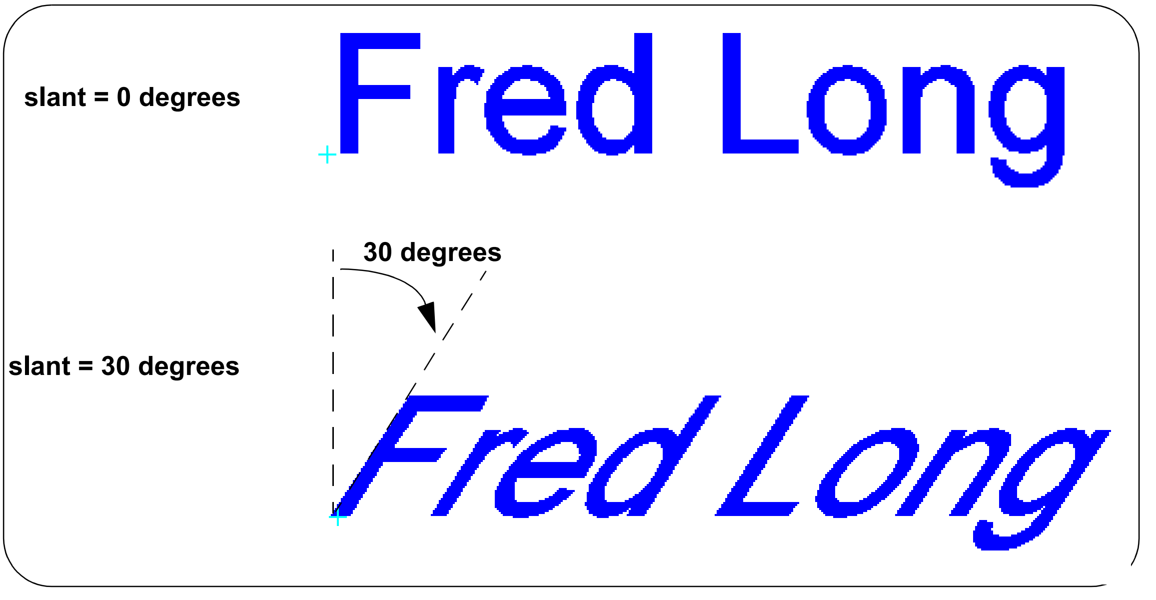
Please continue to the next section 4.6.7 Text Slant or return to 4.6 Text Definitions.

4.6.7 Text Slant

A ***slant*** angle of between 0 and 45 degrees can be defined for a text string.

For non-zero slant angles, the text characters are slanted by the given angle measured in a clockwise direction from the vertical (a bearing).

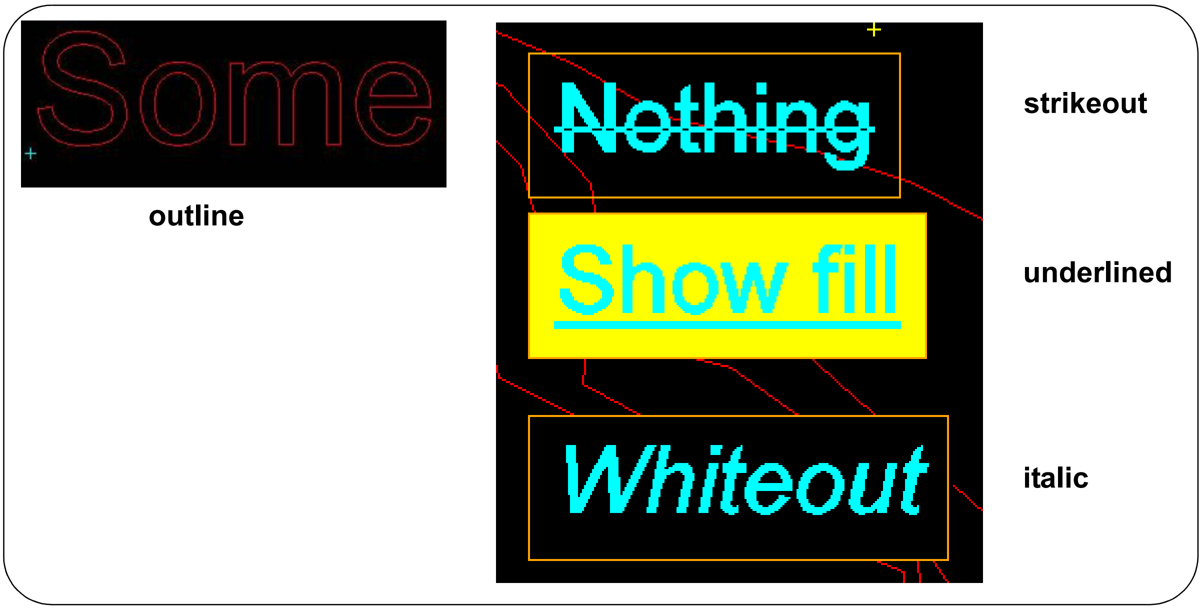
Currently the text *slant* angle can only be set by the ***Slant*** field in the **Textstyle Data** panel field. The value is in degrees in the format ddd.mmssfff.



Please continue to the next section 4.6.8 Weight, Underline, Strikeout, Italic, Outline or return to 4.6 Text Definitions.

4.6.8 Weight, Underline, Strikeout, Italic, Outline

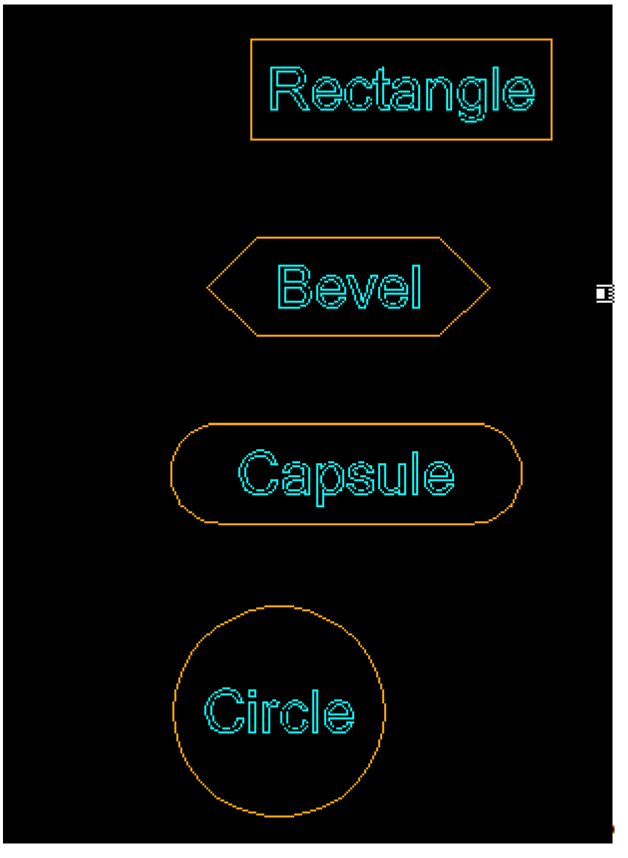
For ***True Type Fonts*** only:



Please continue to the next section 4.6.9 Border and Border Style or return to 4.6 Text Definitions.

4.6.9 Border and Border Style

Text can have a border around the text with one of the border styles Rectangle, Bevel, Capsule and Circle.



Please continue to the next section 4.6.10 Whiteout or return to 4.6 Text Definitions.

4.6.10 Whiteout

The border around the text an be colour filled before the text is drawn. This is called Whiteout.

In the **Select Colour** pop up there is one special colour on the bottom of the menu called **[View colour]**.

If **[View colour]** is selected, then the fill colour automatically changes to whatever the background colour of the view that the text is on.

Although the whiteout colour fills the border around the text, the border does not have to be drawn.

Please continue to the next section 4.6.11 Special Text Characters or return to 4.6 Text Definitions.

4.6.11 Special Text Characters

There are special text characters that do not appear on the standard keyboard but can still be entered into text strings, vertex text and segment text with textstyles using ***true type fonts***.

The special characters are entered by holding down the Alt key and typing in certain numbers on the *number pad* whilst the Alt key is still being held down). The character will appear when the Alt key is released.

Some commonly used special characters and their Alt codes are

Squared character	²	Alt 0178
Cubed character	³	Alt 0179
Middle dot character	·	Alt 0183
Large diameter character	Ø	Alt 0216
Small diameter character	ø	Alt 0248
Degree character	°	Alt 0176
Copyright character	©	Alt 0169
Registered character	®	Alt 0174
British Pound character	£	Alt 0163
Japanese Yen character	¥	Alt 0165

The Alt values come from the character map for Windows. This can be quickly viewed by

run charmap.

NOTE - these values may depend on the true typed font used in the textstyle.

Please continue to the next section 4.6.12 Textstyle Data and Textstyle Info or return to 4.6 Text Definitions.

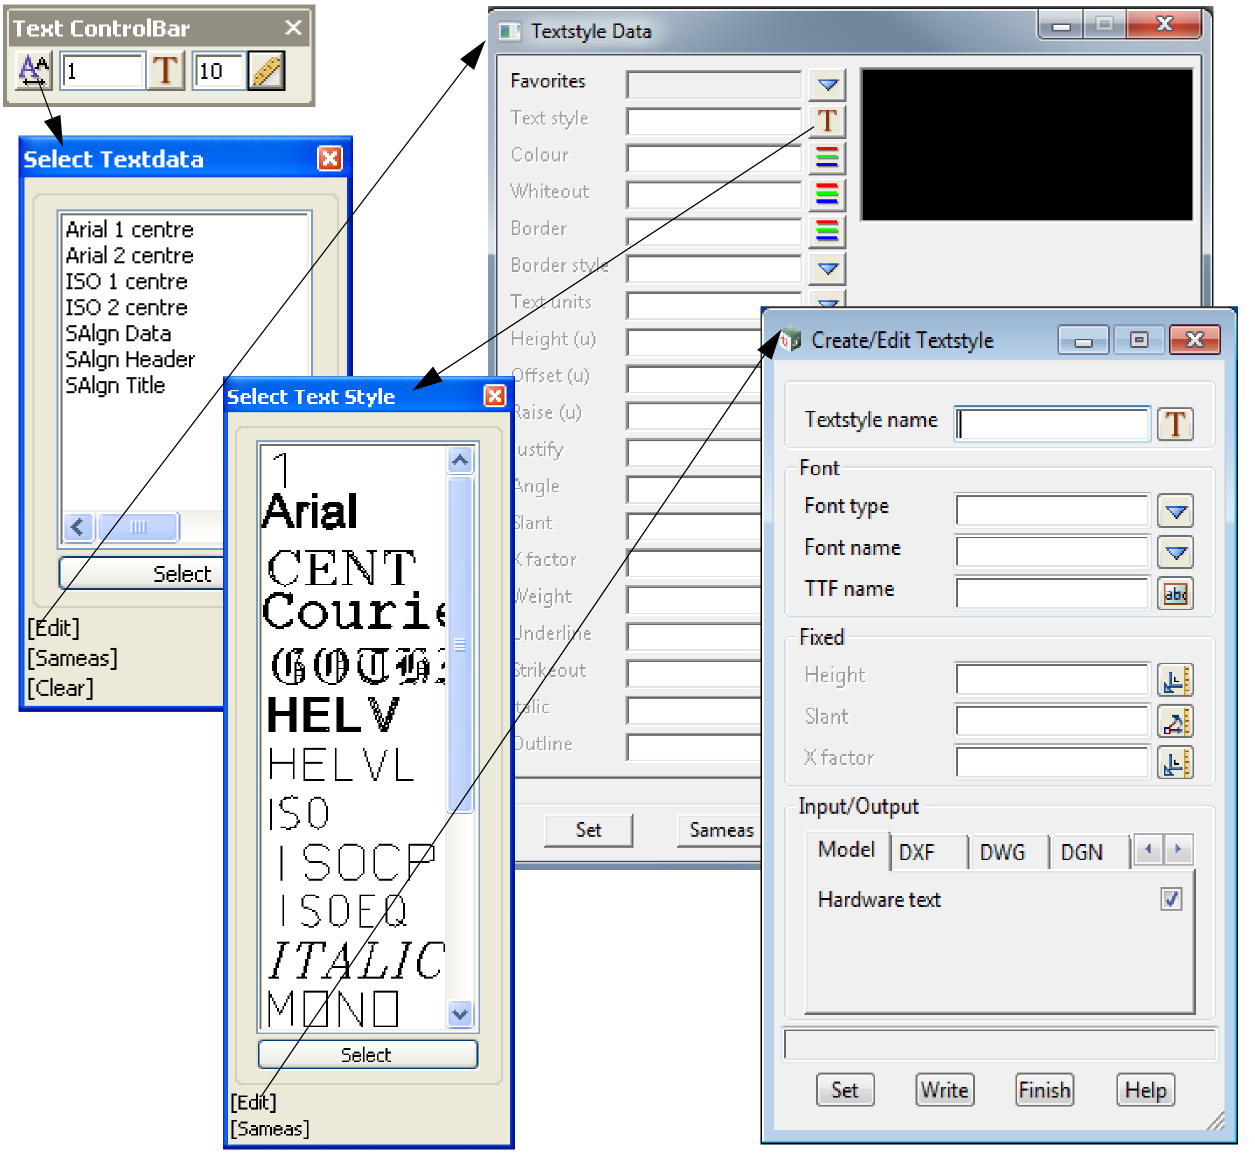
4.6.12 Textstyle Data and Textstyle Info

Text_info

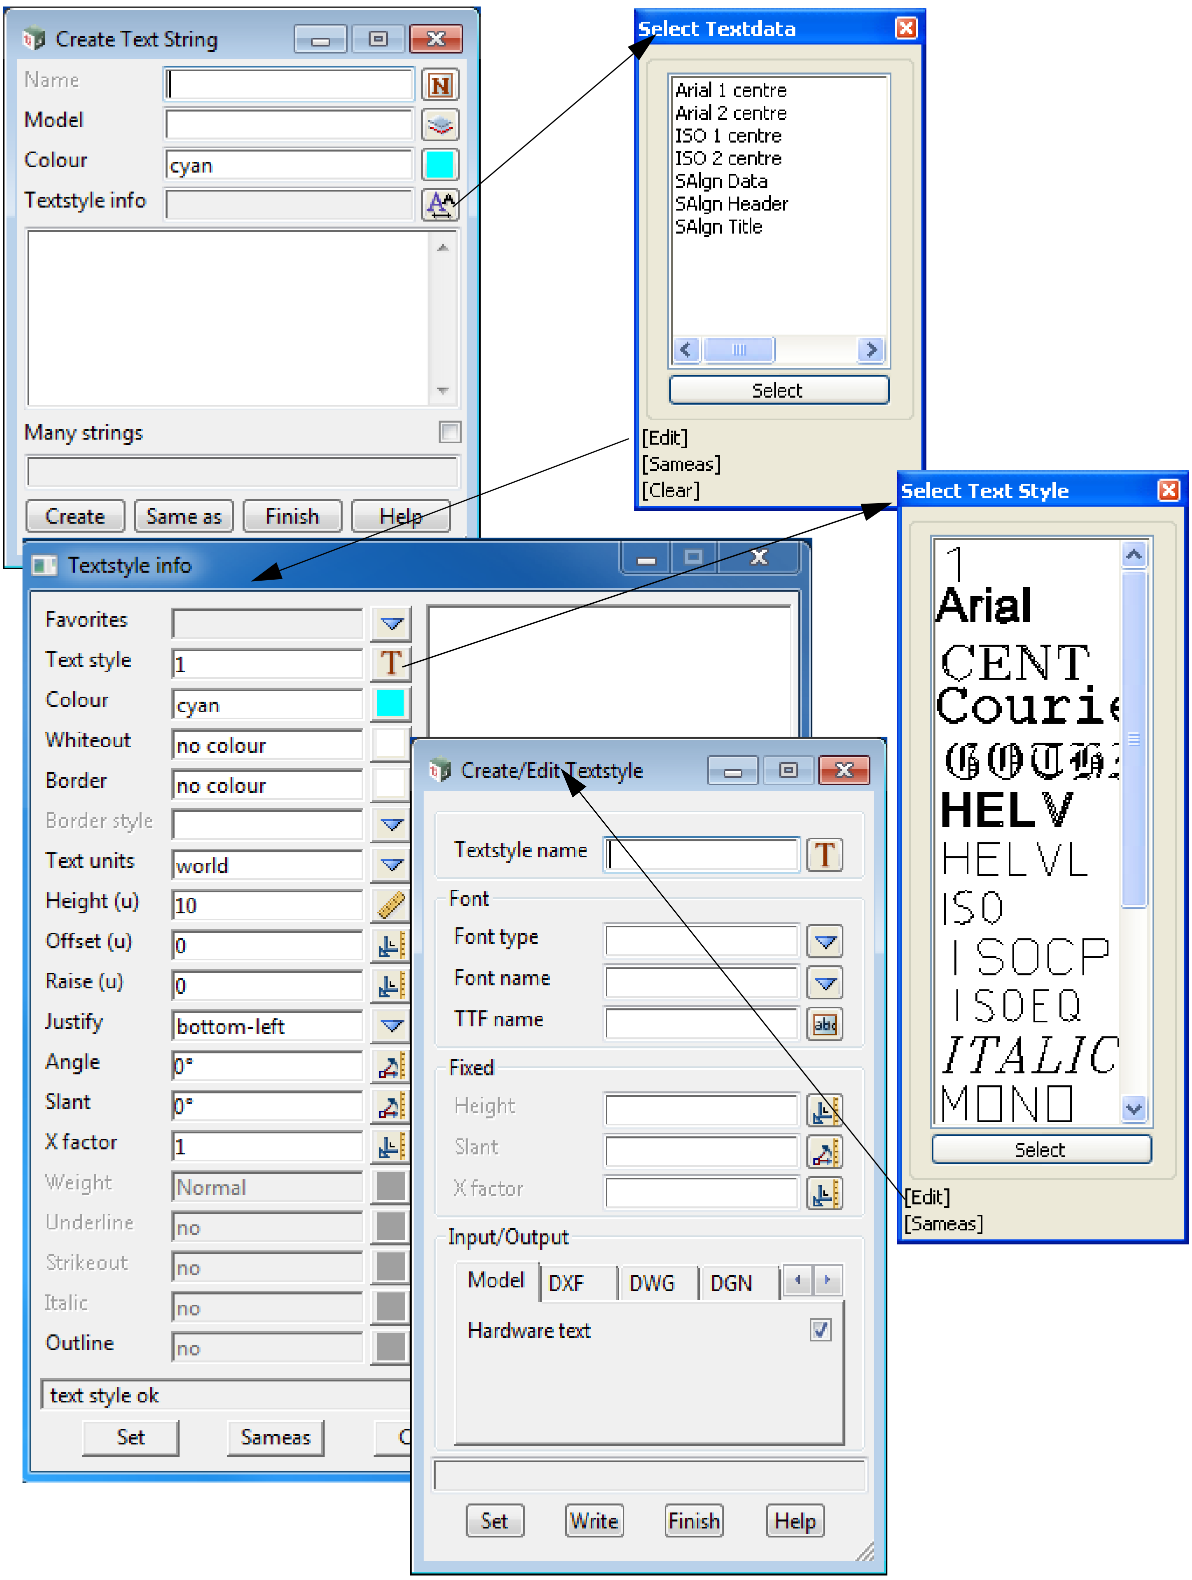
There is a **textstyle info** panel field for defining the text parameters.
Clicking on the textstyle info icon on the Text Controlbar or on a panel, brings up the **Select Textdata** pop-up menu which lists the textstyle favourites. By clicking on **[Edit]**, the **Textstyle Info** panel is brought up and all the definitions for the text style can be modified and written to the **textstyle info** panel field by clicking on **Set**.

Textstyle favourites are defined in the Browse option **Projects=>Browse=>Textstyle data favourites** and documented in the section 7.9.7 Textstyle Data Favourites.

Note that there is a **Textstyle Data** panel that is identical to the **Textstyle Info** panel except that it doesn't have the **Colour** field. The Textstyle Data panel is brought up by clicking on the A on the Text Controlbar.



For information about the **Create/Edit Textstyle** panel, see 7.9.6 Textstyles.



For information about the **Create/Edit Textstyle** panel, see 7.9.6 Textstyles.

For information on the definitions of the fields in the **Textstyle Data** and **Textstyle Info** panels, go to the section 4.6 Text Definitions

Please continue to the next section 4.7 Symbol Definitions.

4.7 Symbol Definitions

Symbols are often on a one vertex super string but they can be placed on any vertex of a super string.

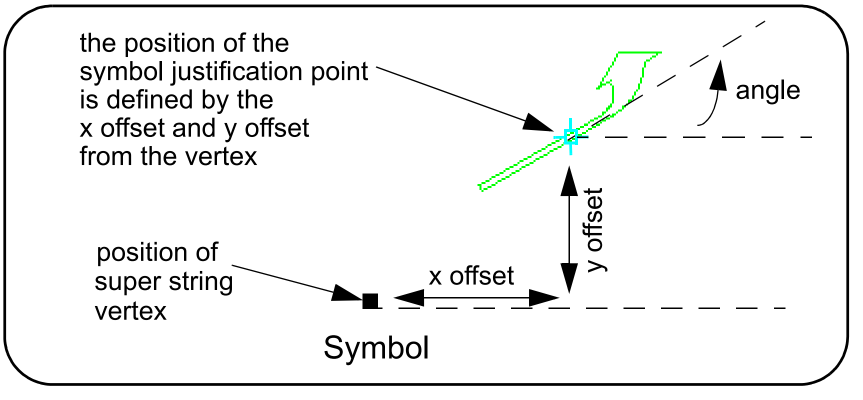
The displayed symbol is defined by

(a) an initial start position

(b) the actual symbol

(c) the **x offset** and **y offset** of the ***symbol justification point*** from coordinates of the vertex. The vertex and justification point only coincide if the x offset and y offset values are both zero.

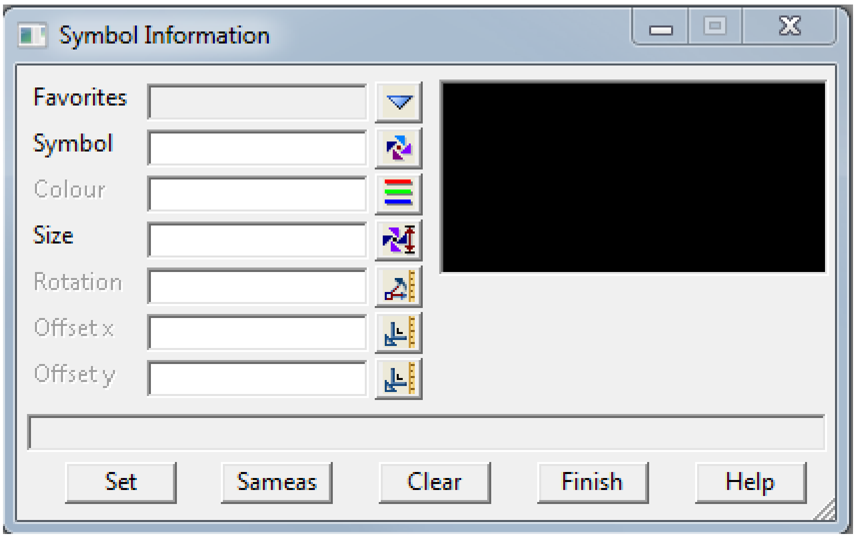
(d) the rotation *angle of the symbol* is given as a *counter clockwise **angle** of rotation* (measured from the positive x-axis) about the symbol justification point.



Note that these definitions are relative to the vertex and if the vertex moves, then the symbol moves with it.

What parts of the symbols on the vertices of the same super string can be independently modified depends on the settings for the super string. For example, all symbol angles may have to be the same.

The **Symbol Information** panel is usually brought up to enter symbol information (see 4.7.1 Symbol Data).



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Favourites

not yet implemented.

Symbol	**Symbol** box		available symbols

*the name of the **symbol**. This field can not be blank.*

Colour — **select colour** menu

the colour of the symbol

Size — **measures** menu

the size of the symbol. This field can not be blank.

Rotation — **measures** menu

the angle of rotation of the symbol. The angle is measured in a counterclockwise direction from the positive x-axis. The units for angle are degrees minutes and seconds and it is entered in 4.17.1 HP Notation.
*If **blank** then the rotation is 0.*

Offset x/y — **measures** menu

the x/y-distance to offset the symbol from each vertex of the string.
*If **blank** the value is 0.*

Set — button

set the values to be those in the panel.

Sameas — button

anther string can be selected and the information about it automatically put in the panel fields.

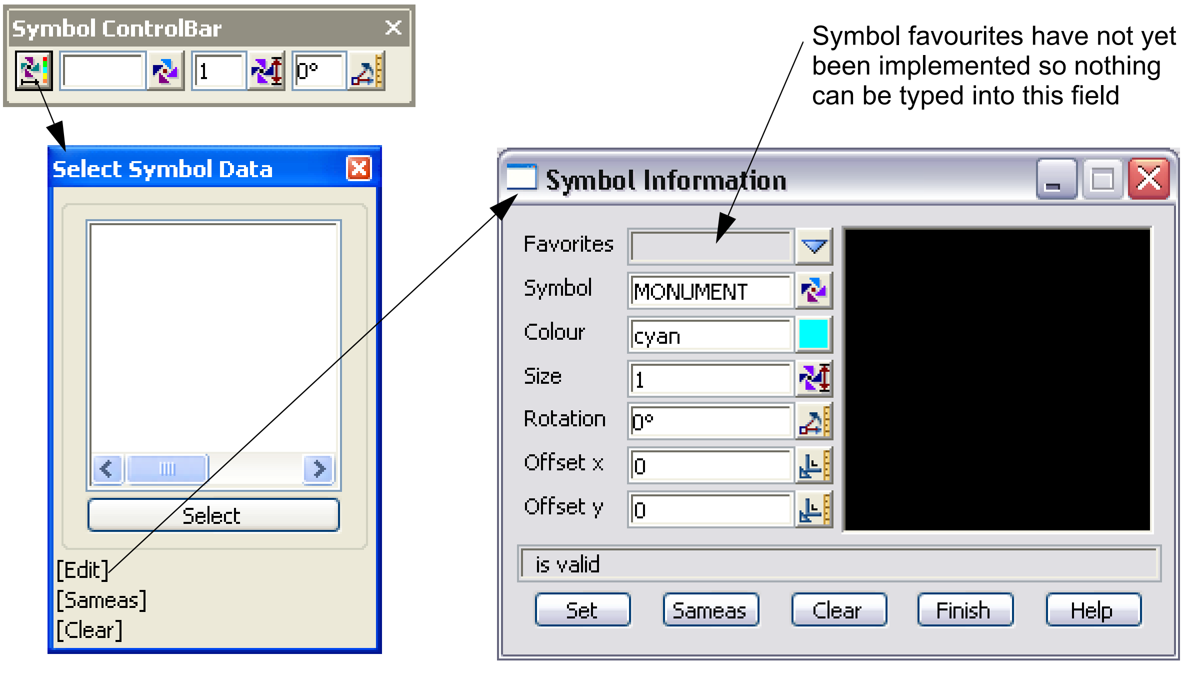
Clear — button

clear all the values in the panel fields.

4.7.1 Symbol Data

There is a **Symbol Information** panel for defining symbol parameters.

Clicking on the **Symbol info** icon on the **Symbol Controlbar** or on a panel, brings up the **Select Symbol Data** pop-up menu. By clicking on **[Edit]**, the **Symbol Information** panel is brought up and all the definitions for the symbol can be modified and written to the **Symbol Info** panel field by clicking on **Set**.



For information on the **Symbol Information** panel and the definitions for *symbols.* go to 4.7 Symbol Definitions

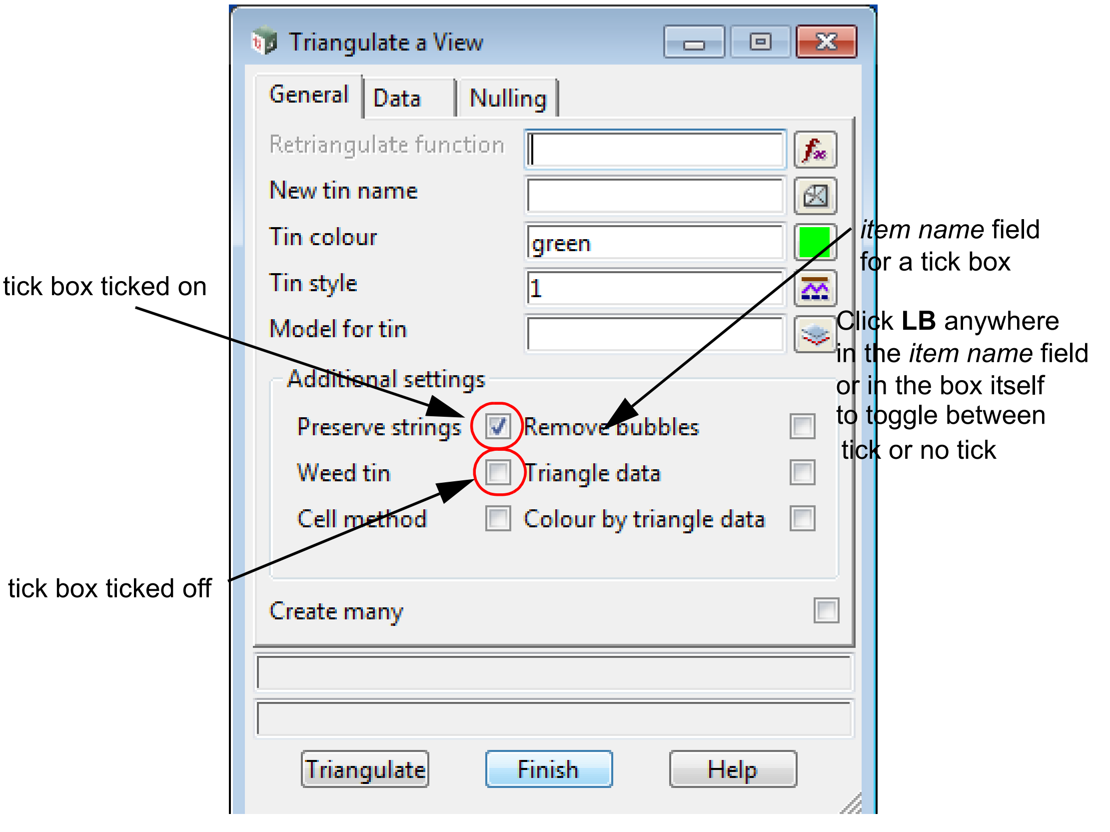
Please continue to the next section 4.8 Tick Box.

4.8 Tick Box

Many items require a mode to be either on or off.

In ***12d Model***, there is a special box with a **tick** to indicate that the setting is **on** and **nothing** to indicate that the setting is **off**.

In a **tick** box, the tick is changed to the nothing state by clicking LB in the box surrounding the tick or clicking LB on the **item name** field for the tick box.



Please continue to the next section 4.9 Picking Strings.

4.9 Picking Strings

In many ***12d Model*** options, the user is required to “pick” the string to be used in the option, or to get information about a string.

After any option requiring a pick is selected, a message regarding the function of the mouse buttons is written to the screen message area.

<option> [picks][fast][menu]

There are three picking method available in ***12d Model***:

(a) fast pick where the pick and the accept occur as one operation

(b) fast accept where the if there is only one item satisfying the snap conditions then it is automatically accepted but if there is more than one, the tentative pick mechanism is used

and

(c) tentative picks with a separate pick and accept mechanism

Fast pick will be documented first, followed by ***fast accept*** and ***tentative pick*** (pick and accept).

See 4.9.1 Fast Pick
4.9.2 Fast Accept
4.9.3 Tentative Pick

Go to the next section 4.9.1 Fast Pick or back to 4.9 Picking Strings.

4.9.1 Fast Pick

To **fast pick** a string, simply move the cursor near the string and **click MB** or type <Enter>. The nearest string to the cursor satisfying the snap conditions is selected.

Fast pick is used when the **F** snap is on.

Various snap modes can be set for the fast pick. The available snaps are point (vertex), line, grid, tin and cursor. One or more snaps can be set simultaneously. The snaps are described in more detail in the section 4.13 Snaps.

Go to the next section 4.9.2 Fast Accept or back to 4.9 Picking Strings.

4.9.2 Fast Accept

To **fast accept** a string, simply move the cursor near the string and **click LB** or type <Enter>. If there is only one string satisfying the snap conditions, then it is automatically accepted.

If there is more than one string satisfying the snap conditions, the nearest string to the cursor satisfying the snap conditions highlighted and an information menu containing information about the selected string is displayed.

If the correct string has been tentatively picked, **click MB** or **type <enter>** accepts the string. If the incorrect string is tentatively picked, click LB and the next closest string satisfying the snap conditions will be highlighted. See the section 4.9.3 Tentative Pick for more information on tentative picking.

Fast accept is used when the **A** snap is on.

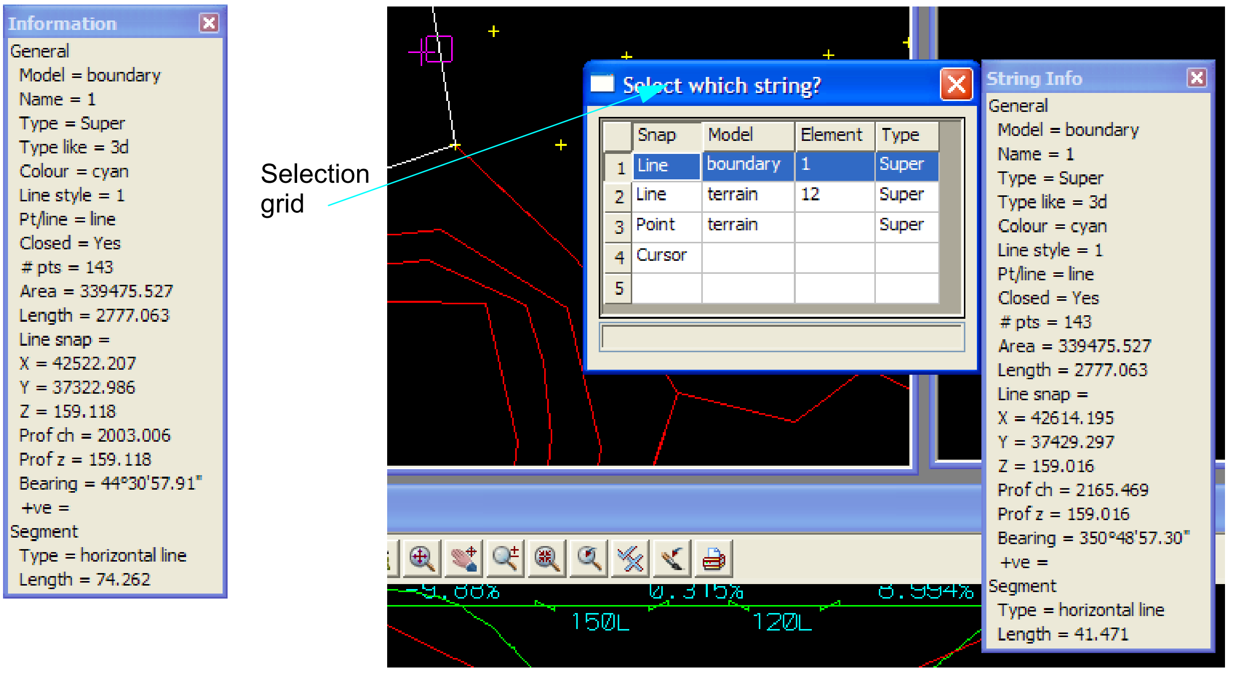
Various snap modes can be set for the fast pick. The available snaps are point (vertex), line, grid, tin and cursor. One or more snaps can be set simultaneously. The snaps are described in more detail in the next major section 4.13 Snaps.

Go to the next section 4.9.3 Tentative Pick or back to 4.9 Picking Strings.

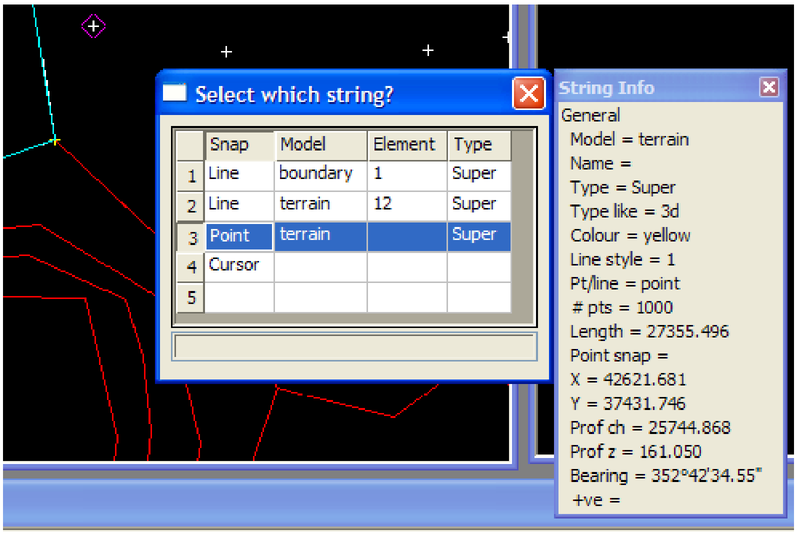
4.9.3 Tentative Pick

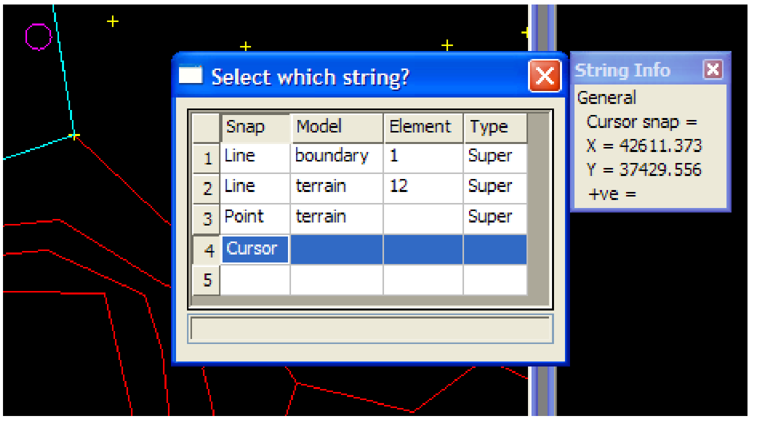
To **tentatively pick** (or tentatively select) a string, move the cursor near the string and **click LB**. The nearest string to the cursor satisfying the snap conditions (see the next section on Snaps) is highlighted and an information menu containing information about the selected string is displayed (the information varies for each string type- see the section 14.11.1 String Information).

If ***M*** snap is on, all the strings satisfying the search criteria are listed in a grid (the selection grid) as well as the Information panel.



When the selection grid is displayed, any other string in the grid can be made the considered string by simply clicking on the row containing the string in the grid. The new string will highlight and the snap position displayed.





The information menu disappears if the cursor is moved slightly.

The string name, the string model and the mouse button functions are also displayed in the Status Bar when the picked string is highlighted:

<option> [selects][accepts][menu] “model->string name”

If the correct string has been tentatively picked, **click MB** or **type <enter>** to accept the string. If the information menu was still up, it disappears when the string is accepted.

Note - if the information menu does not appear when a string is highlighted, then the *information snap* may be set to off. See the section 4.13 Snaps.

Tentative Picking and Repicking

If ***M*** snap is ***off***, and one string is tentatively picked (and highlighted) but another string was intended to be picked, click ***LB*** again without moving the cursor and the next nearest string to the current cursor position will be selected, highlighted and an information menu put up for it. Any strings already rejected during the pick will be ignored. Continuing to click ***LB*** again without moving the cursor will sequentially pick the next nearest string and ignore the earlier rejected strings.

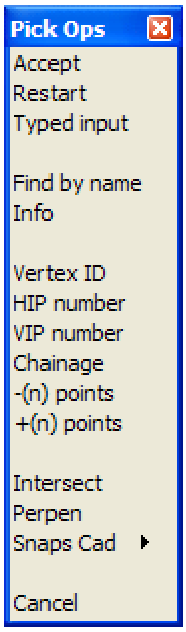
To allow **all** strings to be eligible for picking again, simply move the cursor a small distance (the reset distance - default five pixels) and start picking again. This will automatically **reset** the rejection list.

When ***M*** snap is ***on***, all strings are shown in the selection grid and any one can be picked without the need to keep clicking ***LB***.

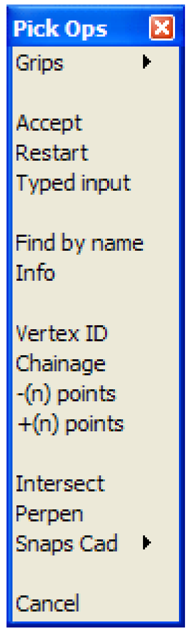
Pick Ops Menu

Options to allow all strings to be eligible for picking again, to cancel the pick operation and to accept a picked string are all available from the **Pick Ops** menu.

The **Pick Ops** menu appears whenever RB is clicked whilst in the pick option. The **Pick Ops** menu is



Alignment and Pipeline strings



For most other string types

To allow all strings to be eligible for picking again, select **Restart** from the **Pick Ops** menu. This has the same effect as moving the cursor the reset distance.

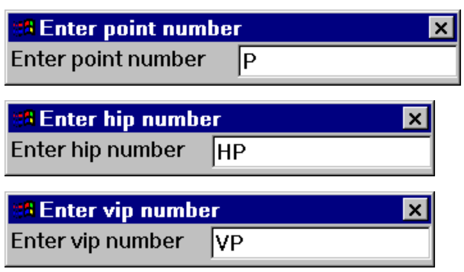
To cancel the pick without selecting any string, select **Cancel** from the **Pick Ops** menu.

Selecting **Accept** from the **Pick Ops** menu, accepts the current picked string. This is the same as clicking MB without calling up the **Pick Ops** menu.

The **Find by name** option allows the user to specify a string name to restrict the pick by. This options is also available in the snap option and will be described there.

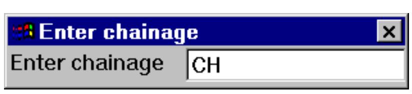
Selecting **Info** will redisplay the information menu for the string.

If **Vertex/HIP/VIP number,** is selected, the **enter vertex/hip/vip number** box is displayed.



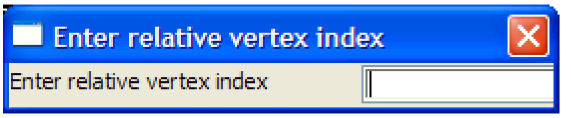
Typing the number into the box terminated by <enter> will move the pick position to that vertex or IP point.

If **Chainage** is selected, the **Enter Chainage** box is displayed.



Typing a chainage into the box terminated by <enter> will move the pick position to that chainage on the tentatively selected string.

If **-(n) vertices** or **+(n) vertices** is selected, the **Enter relative vertex index** box is displayed.



Typing a positive/negative number into the box terminated by <enter> will move the pick vertex to that many vertices after/before the selected position on the tentatively selected string.

The left and right arrow keys (**<-**, **->**) can also be used to move the pick position to the previous or following vertex respectively.

When selecting **Snaps Cad**, the **Snaps Cad Menu** appears on the screen. The **Snaps Cad Menu** can also be accessed by walking right on **Snaps Cad**. For more information please go to 4.28.4 Snaps Cad

To remove the **Pick Ops** menu without selecting an option, either select the **[X]** button from the **Pick Ops** menu title area or simply click RB again whilst the cursor is in a view.

Various snap modes can be set for the pick. The available snaps are point, line, grid, tin and cursor. One or more snaps can be set simultaneously. The snaps are described in more detail in the next section.

Go to the next section 4.9.4 Picking with Direction or back to 4.9 Picking Strings.

4.9.4 Picking with Direction

Picking a string is one operation where **12d** ***Model*** is monitoring the cursor position when button LB (or MB for fast pick) is pushed down and also the cursor position when button LB (MB) is subsequently **released**.

The **pick position** is taken as the cursor position when button LB (MB) is released, but the difference between the down and up positions for button LB (MB) defines a **direction** vector or **sense** to the pick. This direction is called the **picking direction** or **picking sense**.

The **picking direction** is used in a number of **12d** ***Model*** options.

For example, in the information panel displayed for any picking operation, if the picking direction is the same as the string direction, a **+ve** is displayed at the bottom of the panel. If the directions are opposite, then a **-ve** is displayed in the panel.

Important Note
If a string was picked with direction, then to automatically reset the rejection list, the cursor must be move fifty (50) pixels rather than the five required for a non-directional pick.

Go to the next section 4.9.5 Summarising the 12d Model Picking Mechanisms or back to 4.9 Picking Strings.

4.9.5 Summarising the 12d Model Picking Mechanisms

Tentative picking - pick and accept as separate operations

LB - left button — select the next nearest string.
moving the cursor more than five pixels resets the rejection list for a non-directional pick.
moving the cursor more than fifty (50) pixels resets the rejection list for a directional pick.

MB - middle button — accept the current selected (highlighted) string - ends the pick.

RB - right button — brings up the **Pick Ops** menu.

Typing **<Enter>** — same as MB: accepts the current selected (highlighted) string - ends the pick

Fast accepting - pick and accept in one operation if there is only one item satisfies the snap conditions or a tentative pick if more than one item.

LB - left button — select the next nearest string. If there is only one item possible then it is automatically accepted. Otherwise it is the same as for a tentative pick.
moving the cursor more than five pixels resets the rejection list for a non-directional pick.
moving the cursor more than fifty (50) pixels resets the rejection list for a directional pick.

MB - middle button — accept the current selected (highlighted) string - ends the pick.

RB - right button — brings up the **Pick Ops** menu.

Typing **<Enter>** — same as MB: accepts the current selected (highlighted) string - ends the pick

Fast picking - pick and accept in one operation

MB - middle button — pick and accepts the nearest string.
or

Typing **<Enter>** — same as MB: pick and accepts the nearest string - ends the pick.

Please continue to the next section 4.10 X Y Z and Ch Ht Typed Input Box (or back to 4.9 Picking Strings).

4.10 X Y Z and Ch Ht Typed Input Box

Many **12d** ***Model*** options use a *cursor select* (picking) in a view to pick strings, obtain information about a string, get an x, y and z coordinates for a new vertex *etc.*

In most cases, **typed input** can also be used to enter the information instead of using the cursor select. For example, an exact values for the x, y (and possibly z) co-ordinates could be typed in or a chainage and a height typed in rather than picking a position on a view.

Typed input is available in ***12d Model*** whenever a *cursor select* is used.

To use *typed input*, simply begin typing the values. As soon as a character is typed, a special *typed-input* box appears on the screen and the typed characters are automatically placed in it.

Alternatively, instead of clicking **LB** to select a string, click **RB** to bring up the **Pick Ops** menu and then select **Typed Input** from the **Pick Ops.** This will also bring up the *typed input* box.

Depending on the view type that the cursor is over, the *typed input* box will be either an *Enter X Y Z* or an E*nter Ch Ht* box. If the focus is on a Plan or Perspective view, then an **Enter X Y Z** box comes up. If the focus is on a Section view, then an **Enter Ch Ht** box appears. These are also called the *XYZ typed input* box and the *Chainage Height typed input* box respectively.

The x, y (and possibly z) co-ordinate values or chainage height required by the box are simply typed in, each value being separated by **one or more spaces**.

An <enter> terminates the typed input and sends the entered values to the option. The typed-input box then disappears.

If the user wishes to **abort** the typed input and return to mouse input, simply select the **[X]** button on the typed input box, or type <enter> with no values in the typed input box.

The *Enter X Y Z/Ch Ht* box can be **moved** (dragged) to a new position on the screen in the standard way.

The default mode for the **Enter X Y Z** box is to receive absolute *x*, *y* and *z* values.

However, by typing special character codes before the values, the **Enter X Y Z** box can be used to enter data in a variety of formats including relative co-ordinates and bearing-distance combinations.

The full list of typed input codes now follows (the text will be given in lower case, but it can be typed in either upper or lower case).

s *actual x* *actual y* *actual z*

x y z

or

a x y z

s *relative x* *relative y* *relative z*

r x y z

s bearing in degrees-minutes-seconds distance actual z

bd ddd.mmssfff distance

where ddd.mmssfff is the bearing expressed in degrees, minutes and seconds as

ddd whole degrees

. separator between degrees and minutes

mm whole minutes

ss whole seconds

fff fractions of seconds (as many as required)

- bearing in decimal degrees distance actual z

  dbd ddd.dd distance z

- angle in degrees-minutes-seconds distance actual z

  ad ddd.mmss distance z

- angle in decimal degrees distance actual z

  dad ddd.dd distance z

The default mode for the **Enter Ch Ht** box is to receive *chainage* and *height* values.

However, by typing special character codes before the values, the **Enter Ch Ht** box can be used to enter data in a variety of formats including grade distance and slope distance.

The full list of typed input codes now follows (the text will be given in lower case, but it can be typed in either upper or lower case).

- actual *chainage* actual *height*

  chainage *height*

  or

  a *chainage* *height*

- relative *chainage* relative *height*

  r *chainage* *height*

- *slope* and *distance*

  sd *slope* *distance*

  where slope is **1 vertical in slope horizontal** units

- *grade* and *distance*

  gd grade distance

  where grade is 1/slope as a percentage

Please continue to the next section 4.11 Tentative Typed Inputs.

4.11 Tentative Typed Inputs

If the string has been ***tentatively*** selected (by clicking LB and highlighting the string but not yet accepting it), then further typed inputs are available which then work for the ***highlighted*** string only.

The ***Tentative typed inputs*** are:

CH*chainage*	go to the given chainage
V*vertex-index*	go to the vertex number *vertex-index*
P*point-id*	go to vertex with the given point-id (vertex-id)
+	go to the next vertex
-> (right arrow)	go to the next vertex
+*number*	go forward *number* vertices
-	go back to the previous vertex
<- (left arrow	go back to the previous vertex
-*number*	go backward *number* vertices
HP*number*	go to horizontal IP number ***number***
VP*number*	go to vertical IP number ***number***

When a string is *tentatively* selected, the above *typed input* options are also available as *menu items* from the **Pick-Ops** menu. This has been documented in the section Pick Ops Menu.

Warning - If ***M*** snap is on and the selection grid is displayed, the tentative typed inputs will not work. Either turn ***M*** snap off, or move the cursor so the selection grid disappears before typing, or use ***RB*** to bring up the **Pick Ops** menu and select the required command from there.

Please continue to the next section 4.12 Picking Point Ids (Point Numbers, Vertex ids).

4.12 Picking Point Ids (Point Numbers, Vertex ids)

When a **12d** ***Model*** option uses a *cursor select* (picking) in a plan view to pick strings, then *typed input* can be used to select a point id (point number, vertex id) which exists in any model on the view (note that a point id can be numeric or alphanumeric).

When over the plan view, instead of clicking ***LB*** to select a string, simply type:

number to select a *numeric* point id

or

P*text* to select an *alphanumeric* point id of name *text.*

This will bring up the ***Enter X Y Z*** box and the typed information will go into the box. Type <enter> and the view will then be searched for the given point number.

If the ***point id*** exists, then a large cross will be drawn over the vertex on the view and the string containing the point id will be highlighted.

Note that if a string is *tentatively* selected (i.e. highlight but not yet accepted), then

Vn will select the nth vertex of the tentatively selected string (vertex index of n)

Please continue to the next section 4.13 Snaps.

4.13 Snaps

In most ***12d Model*** options, the mouse is used to pick data from a string displayed on the screen.

Unfortunately different options usually require different data so an easy method is needed to help select from all the strings on the screen, a specific string or part of a string.

In ***12d Model***, ***Snaps*** are used as part of the string picking mechanism (discussed in the previous sections) to help filter out what data is interactively selected on a view.

Using the **12d** ***snaps*** it is possible to

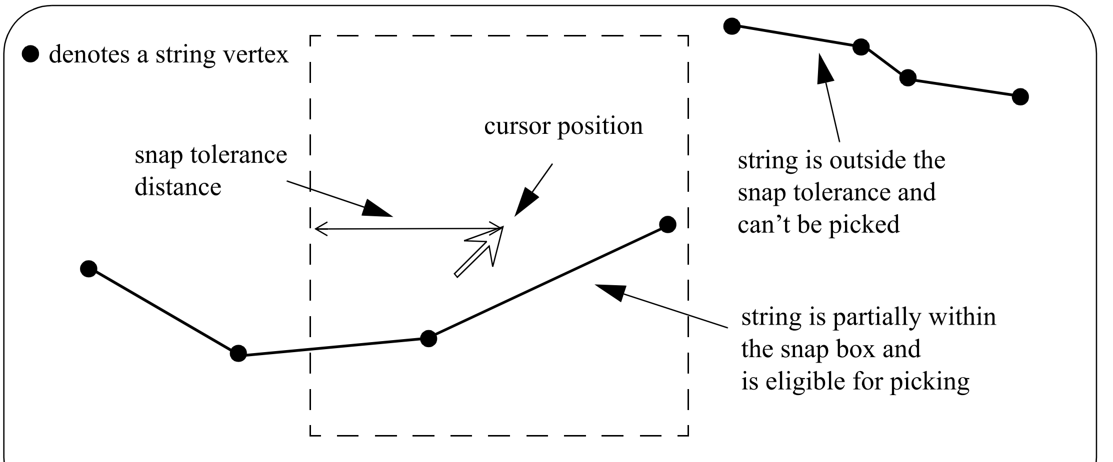
- restrict any string picks to selected string names and/or models
- set modes which are used to determine what parts of strings are used for picking
- set the search distance for picking vertices (point snap tolerance)
- set the search distance for picking (snap tolerance)
- give the name of a tin to be used to set z-values at a (x,y) position
- set whether the user is prompted for a new height (z-value) after every point edit
- turn on/off the information menu when picking
- turn on/off the ***selection*** grid when picking
-

Go to the next section 4.13.1 Point and Line Snaps or back to 4.13 Snaps.

4.13.1 Point and Line Snaps

When trying to interactively pick a string in ***12d Model***, the user moves the cursor near the string in a view and clicks LB (or the MB for a fast pick). ***12d Model*** then makes a search of all the strings on the view to make a selection.

The help restrict the search, only strings that are partially or totally within an x and y distance called the ***snap tolerance*** of the cursor are eligible for picking. That is, only strings that have part, or all, of them within the *snap box* can be selected.

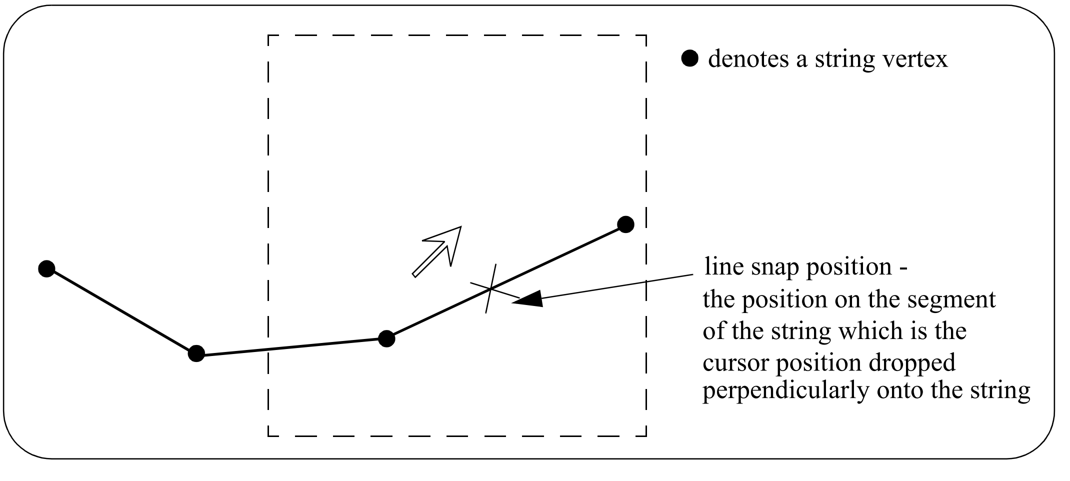


Snap Box

For strings inside the snap box, ***12d Model*** has two snap modes, *point* and *line*, to specify which parts of the strings can be selected.

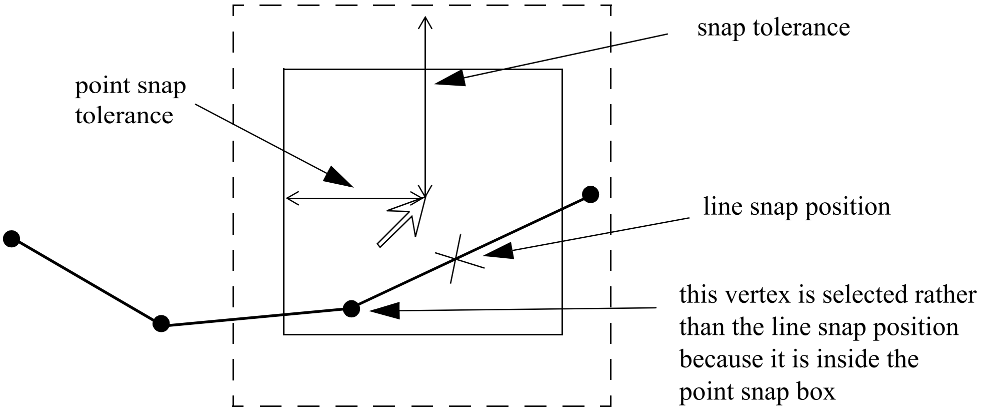
If ***point*** snap is set on, the vertices (points) of a string can be selected. If only *point* snap is on, then the string containing the ***closest vertex*** to the cursor is selected.

If ***line*** snap is set on, then the position on the string that is determined by dropping the cursor perpendicularly onto the string, can be selected. Note that there is usually no string vertex at the perpendicular position (line snap position). If only *line* snap is on, then the string containing the closest perpendicular position to the cursor is selected.



Since in general it is rare for a vertex of a string to be closer to the cursor than the line snap position, then with only the above definitions and *point* and *line* snap both on, the line snap position usually wins. Hence to pick a vertex, line snap would have to be turned off. Since this can lead to line snap being regularly toggled on and off, another distance called the ***point snap tolerance*** has been introduced to give vertices ***priority*** over line snaps when both snaps are on.

When *point snap* is set on, any vertex of a string that is within an x and y distance called the ***point snap tolerance*** of the cursor when LB is clicked, is considered for selection ***before*** any other type of snap is considered. That is, any vertices in the *point snap box* are selected before any line snap positions.



Point Snap Box and Snap Box

In the area between the point snap box and the snap box, vertices and line snap positions are treated equally and the closest one to the cursor is selected.

The other types of snaps are not as complicated and will be discussed in the following sections.

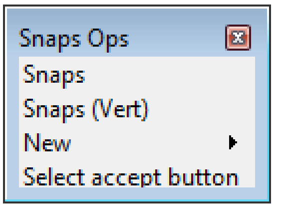
Go to the next section 4.13.2 Setting Snaps or back to 4.13 Snaps.

4.13.2 Setting Snaps

Snaps can be toggled on and off from the **H** toolbar (also know as the **Snaps** toolbar), or the snap settings can be set from the **Snaps** menu or the **V** menu under *Utilities* on the Main menu.

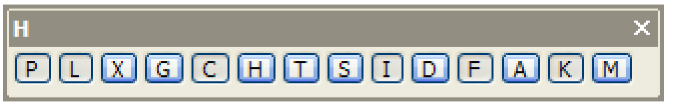
Snaps toolbar

The menu **Utilities =>Snaps** is:



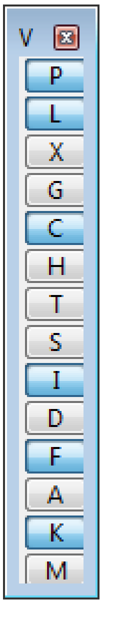
The *Snaps (Vert)* option brings up a Snaps toggle menu similar to the ***H*** (**Snaps**) toolbar except that the *Snaps (Vert)* runs vertically rather than horizontally. Either can be used to toggle the snaps on and off.

H toolbar



The Snaps (Vertical) menu

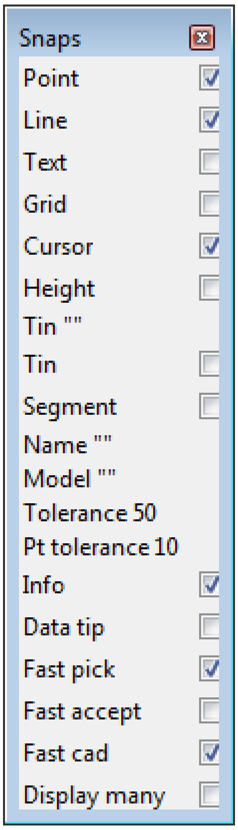
Point
Line
Te**X**t
Grid
Cursor
Height
Tin
Segment
Info
Data tip
Fast pick
fast **A**ccept
Konstruction
Many strings in select



The option **Utilities=> Snaps =>Snaps** option brings up a menu that provides tick boxes to turn the various snap modes on or off plus it is used to set the snap tolerance value, the point snap tolerance value, the tin for tin snaps and string and/or model names for restricting the snaps.

Any combination of snap modes and names can be set.

The **Snaps** menu is



point snap on/off
line snap on/off
text snap on/off
grid snap on/off
allow cursor point on/off
ask for z value at each point in edits
name of tin to snap to
tin snap on/off
turn segment snap on/off
restriction on string names
restriction on model names
set snap tolerance
set point snap tolerance
bring up info panel on/off
turns data tips on/off
turns fast pick snap on/off
turns fast accept snap on/off
turns fast construction snap on/off
display the selection grid (many strings)

The snaps point, line, grid, cursor, tin and info are all set on or off using the tick boxes.

The *snap tolerance* is displayed on the **Tolerance** line of the menu.

The *point snap tolerance* is displayed on the **Pt tolerance** line of the menu.

When a select with snap is made, the type of snap is given in the **Information** panel and also graphically displayed by **changing** the **shape** of the snap cursor. The shape of the snap cursor is

a **diamond** for a **point** snap
square for a **line** snap
circle for a **cursor** snap
circle for a **grid** snap
squiggles under a line for a **tin** snap.

Each of these snaps/settings will now be discussed.

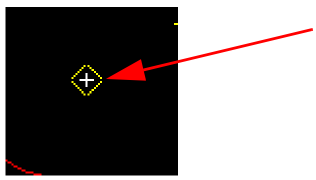
See Point Snap - P and Diamond
Line Snap - L and Square
Text Snap - X and Diamond
Grid Snap - G and Circle
Cursor Snap - C and Circle
Height - H and Enter Height Box
Tin Snap - T and Squiggles under a Line
Name - Snap Name Panel
Model - Snap Model Panel
Snap Tolerance
Point Snap Tolerance
Info Snap - I
Data Tip or Data Tool Tip - D
Fast Pick Snap - F
Fast Accept - A

Display Many Snap - M

Point Snap - P and Diamond

When **Point** (or vertex) snap is set on, any vertex of a string within the point snap box around the cursor when LB is clicked, is considered for selection before any other type of snap is considered. Centres of circles, centres of arcs and arc end points are considered to be vertices.

If the selection is made by a **Point** snap, then the cursor is shown as a **diamond** and **Point snap =** is displayed on the **Information** panel. Note that the entire string is highlighted, not just the selected vertex.



Diamond cursor for **Point** snap

Note that if there are no vertices within the point snap box then any vertices within the snap box of the cursor are considered for selecting.If the tick box is **on** (a tick), snapping to vertices is used.

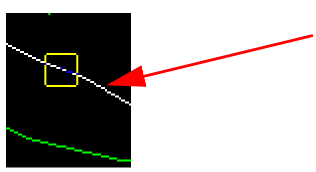
If the **P** is highlighted in the **Snaps** toolbar then **Point** snap is on. Otherwise it is off.

If the **Point** tick box is **on** (a tick) in the **Snaps** menu, snapping to vertices is used.
If the tick box is **off** (a cross or nothing), no **Point** snaps are used.

Line Snap - L and Square

When **Line** snap is set on, the cursor only needs to be within the tolerance distance of any visible segment of a string when LB is clicked, and that string is considered for selection. Also arcs and circles are considered for selection.

If the selection is made by a **Line** snap, then the cursor is shown as a **square** and **Line snap =** is written on the **Information** panel. The entire string is highlighted.



Square cursor for **Line** snap

Note that if a non-zero point snap tolerance is given and point snap is set on, then any vertices that are closer than the point snap tolerance to the cursor will be considered for snapping before any line snap is considered.

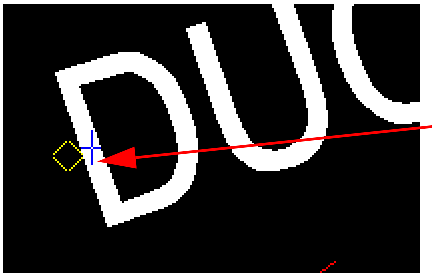
If the **L** is highlighted in the **Snaps** toolbar then **Line** snap is on. Otherwise it is off.

If the **Line** tick box is **on** (a tick) in the **Snaps** menu, dropping perpendicular to strings is used.
If the tick box is **off** (a cross or nothing), dropping perpendicular to strings is not used.

Text Snap - X and Diamond

When **Text** snap is set on, the cursor only needs to be within the tolerance distance of the bounding box of a text string when LB is clicked, and that text string is considered for selection.

If the selection is made by a **Text** snap, then the cursor is shown as a **diamond** and **Text snap =** is written on the **Information** panel. The text string is highlighted.



Diamond cursor for **Text** snap and the text is highlighted

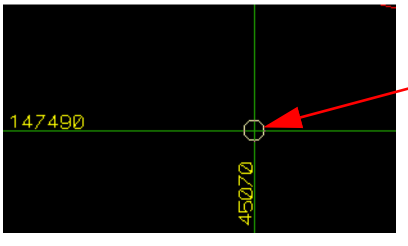
If the **X** is highlighted in the **Snaps** toolbar then **Text** snap is on. Otherwise it is off.

If the **Text** tick box is **on** (a tick) in the **Snaps** menu, **Text** snap is used.
If the tick box is **off** (a cross or nothing), **Text** snap is not used.

Grid Snap - G and Circle

When **Grid** snap is set on, the cursor will snap to the intersection of any grid lines that are displayed in a view.

If the selection is made by a **Grid** snap, then the cursor is shown as a **circle** and **Grid snap =** is displayed on the **Information** panel.



Circle cursor for **Grid** snap

Grid snap is normally used when creating new vertices, or moving vertices so they have only coordinates that are grid intersection points.

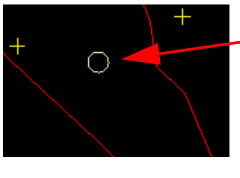
If the **G** is highlighted in the **Snaps** toolbar then **Grid** snap is on. Otherwise it is off.

If the **Grid** tick box is **on** (a tick) in the **Snaps** menu, snapping to grid intersections is used.
If the tick box is **off** (a cross or nothing), no grid intersection snaps are used.

Cursor Snap - C and Circle

If **Cursor** snap is set on and the other snaps are either not set on or have failed, the cursor position is used for the (x,y) and possibly the z value of the pick.

If the selection is made by a **Cursor** snap, then the cursor is shown as a **circle** (like grid snap) and **Cursor snap =** is displayed on the **Information** panel.



Circle cursor for **Cursor** snap.
Nothing else is highlighted because nothing except the cursor position is selected.

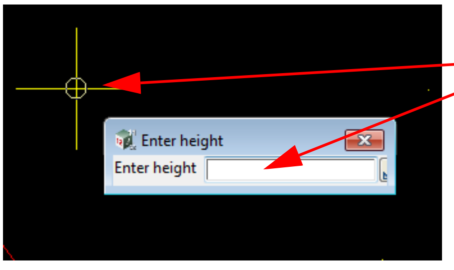
If the **C** is highlighted in the **Snaps** toolbar then **Cursor** snap is on. Otherwise it is off.

If the **Cursor** tick box is **on** (a tick) in the **Snaps** menu, snapping to the cursor position is used.
If the tick box is **off** (a cross or nothing), no **Cursor** snaps are used.

Height - H and Enter Height Box

If **Height** snap is set, then when creating and/or editing strings, the z-value for the snap position is displayed in an **Enter Height** box.

The z-value may be the z-value from a selected vertex when a **Point** snap, or a dropped position on a string when a **Line** snap, or a value from a tin when **Tin** snap is on, or nothing if it is a **Cursor** snap.



Circle cursor for **Cursor** snap and then the **Enter Height** box has no value in it

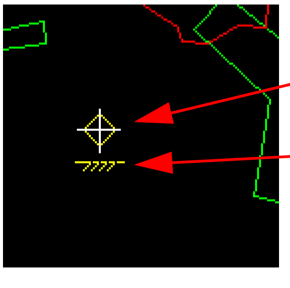
If the **H** is highlighted in the **Snaps** toolbar then **Height** snap is on. Otherwise it is off.

If the **Height** tick box is **on** (a tick) in the **Snaps** menu, the z-value for the snap position is used.
If the tick box is **off** (a cross or nothing), no **Height** snaps are used.

Tin Snap - T and Squiggles under a Line

Tin snap means that when an (x,y) point is selected, the z-value for the point is taken to be the z-value on the tin at the same (x,y) position.

Tin snap is used in conjunction with the other snaps - the other snaps control what the (x,y) location, and the z-value is then taken from the tin for that (x,y) location. So for example, the (x,y) location may be via a Point snap (and hence a Diamond cursor) and then the Tin snap squiggles is show below the Diamond cursor.



Diamond for Point snap

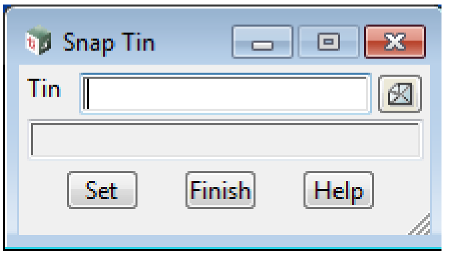
Symbol indicating z-value taken from Tin.snap

To use **Tin** snap, the name of the tin to snap to must first be given. Then, snapping to that tin is controlled by the state of the **Tin** snap.

If the **T** is highlighted in the **Snaps** toolbar then **Tin** snap is on. Otherwise it is off.

If the **Tin** tick box is **on** (a tick) in the **Snaps** menu, snapping to the tin is used.
If the tick box is **off** (a cross or nothing), no Tin snap is used.

The name of the tin to snap to is set by selecting the **Tin " "** item on the **Snaps** menu to bring up the **Snap Tin** panel and selecting the **Set** button.



When a Tin name is set by the panel, **Tin** snap is automatically set to on.

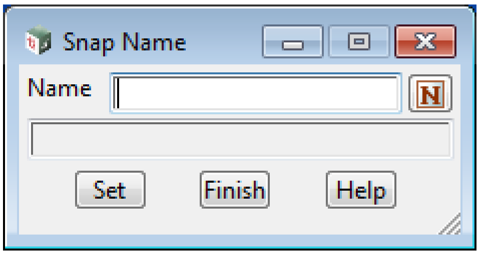
Name - Snap Name Panel

The user can restrict the snap to only strings of a specific name. The name of the strings to restrict the snap to is set by selecting the **Name " "** item on the **Snaps** menu to bring up the **Snap Name** panel.

When ***12d Model*** creates a new project, **line** and **point** snap are set to **on** and all other snaps set off.

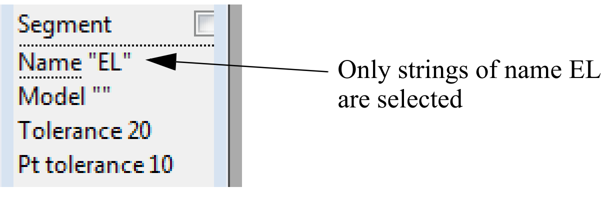
The user can restrict the snap to only strings of a specific name. The name of the string to restrict the snap to is set by selecting the **Name " "** item on the **Snaps** menu to bring up the **Snap Name** panel.

The user can restrict the snap to strings that only have a given name by selecting the **Name** option on the **Snaps** menu. This brings up the **Snap Name** panel.



The string name used to restrict the snap is entered into the **Name** field. The value are then set by selecting the **Set** button.

The string **Name** is then written to the **Snaps** menu.



Note - if there is no string name displayed in the **Snaps** menu then there is no restriction on the string names.

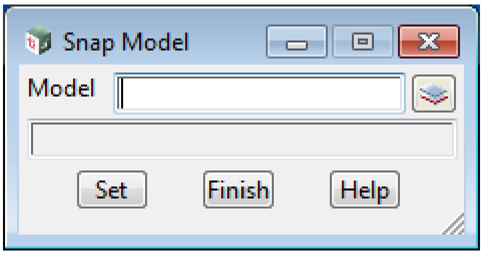
WARNING - if selecting does not appear to be working, check that there is no string name set by mistake.

Model - Snap Model Panel

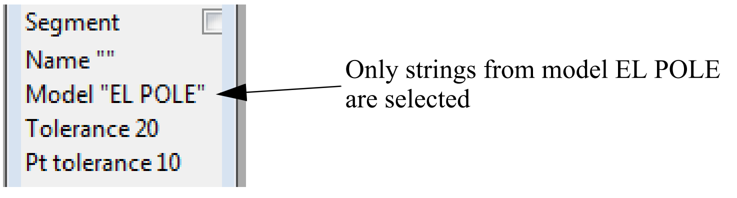
The user can restrict the snap to only strings from a specific model. The name of the model to restrict the snap to is set by selecting the **Model " "** item on the **Snaps** menu to bring up the **Snap**

Model panel.

The user can restrict the snap to strings that are only in a given model by selecting the **Model** option on the **Snaps** menu. This brings up the **Snap Model** panel. The model name used to restrict the snap is entered into the **Model** field. The values are then set by selecting the **Set** button.



The **Model** name is then written to the **Snaps** menu.



Note - if there is no model name displayed in the **Snaps** menu then there is no restriction on the models searched.

WARNING - if selecting does not appear to be working, check that there is no model set by mistake.

Snap Tolerance

Snap Tolerance is not a toggle/tick box but an item on the **Snaps** menu.

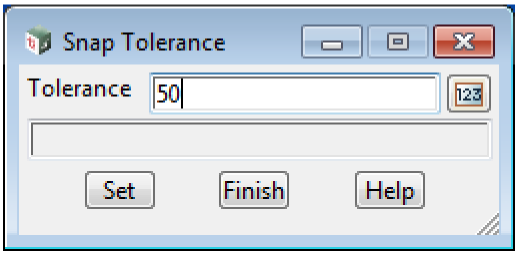
The *Snap Tolerance* value is the distance to be used for considering data when snaps are on.

The snap tolerance distance is given in screen units (pixels). There are about one thousand pixels per screen width, hence a snap tolerance of say 50 means that the snap distance about a point, line *etc.* is one twentieth of the screen width.

Snap tolerance is given in terms of screen units rather than world units because it is a distance on the screen, independent of any coordinate system being used in a view.

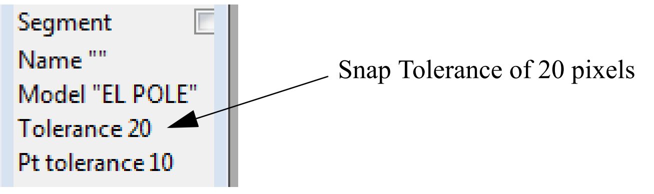
The current snap tolerance value is displayed as ***Tolerance*** on the **Snap** menu.

The *Snap tolerance* is modified by selecting the **Tolerance** item on the **Snaps** menu to bring up the **Snap Tolerance** panel.



To change the **Snap Tolerance**, type a new value into the **Tolerance** panel field and then click LB on the **Set** button.

The new **Snap Tolerance** is then written to the **Snaps** menu.



Point Snap Tolerance

Point Snap Tolerance is not a toggle/tick box but an item on the **Snaps** menu.

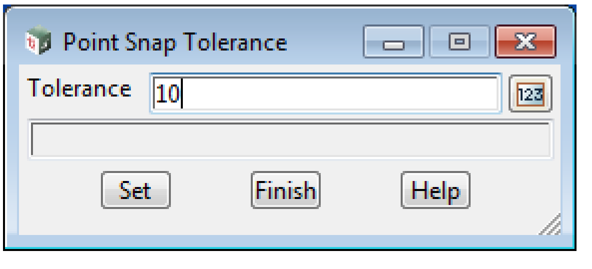
The *Point Snap Tolerance* value is the distance to be used for considering vertices over anything else when **Point** snap is on.

The Point Snap Tolerance distance is given in screen units (pixels). There are about one thousand pixels per screen width, hence a point snap tolerance of say 10 means that the point snap distance about a vertex is one hundredth of the screen width.

The *Point Snap Tolerance* is given in terms of screen units rather than world units because it is a distance on the screen, independent of any coordinate system being used in a view.

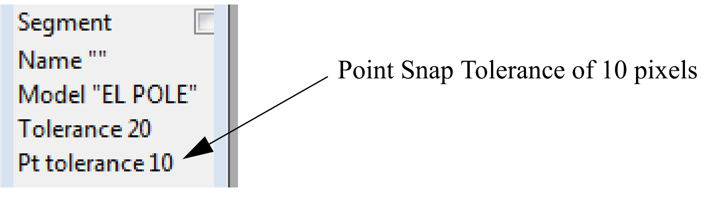
The current point snap tolerance value is displayed as ***Pt tolerance*** on the *Snap* menu.

The *Point snap tolerance* is modified by selecting the **Pt tolerance** item on the **Snaps** menu to bring up the **Point Snap Tolerance** panel.



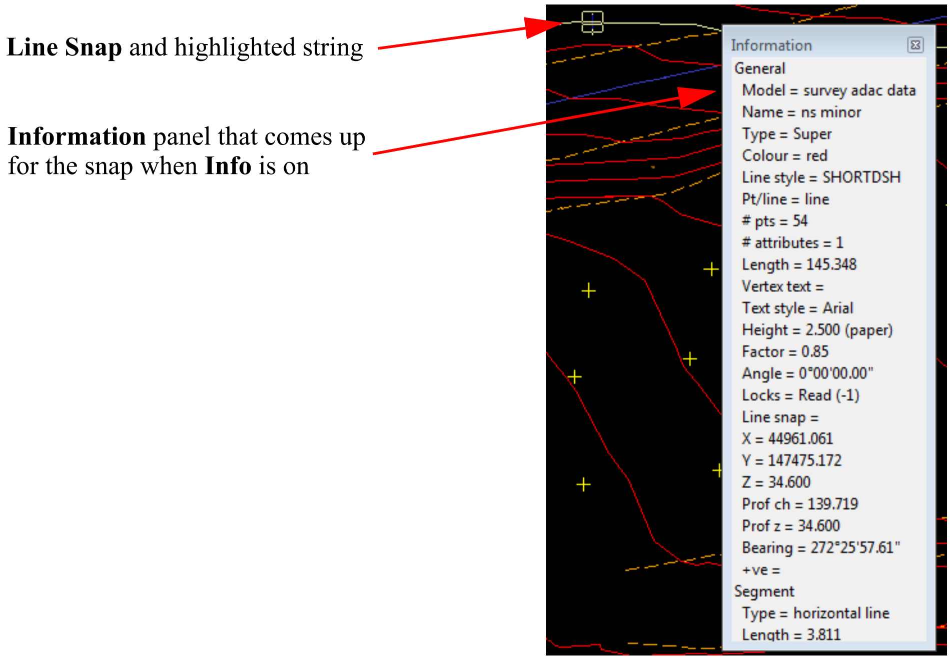
To change the **Point Snap Tolerance**, type a new value into the **Tolerance** panel field and then click LB on the **Set** button.

The new **Point Snap Tolerance** to be used to restrict the point snap is then written to the **Snaps** menu



Info Snap - I

If **Info Snap** is set, then the **Information** panel comes up whenever a string is picked.



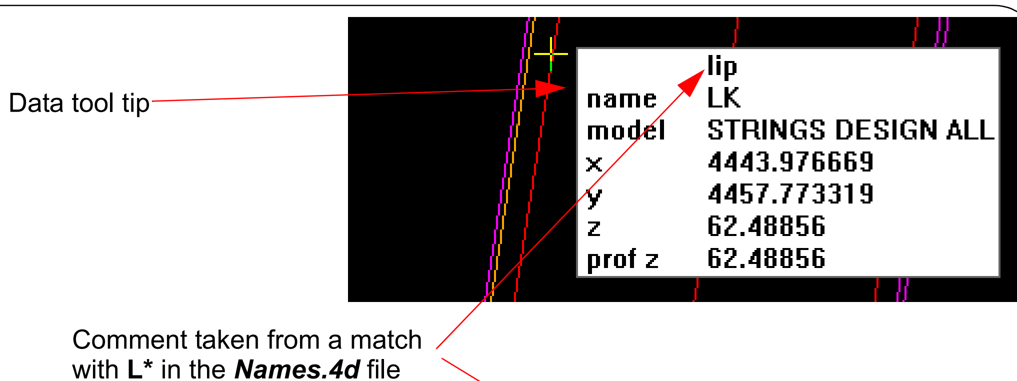
If the **I** is highlighted in the **Snaps** toolbar then **Info** snap is on. Otherwise it is off.

If the **Info** tick box is **on** (a tick) in the **Snaps** menu, then **Info** snap is on.
If the tick box is **off** (a cross or nothing), **Info** snap is off.

Data Tip or Data Tool Tip - D

If **Data Tip Snap** is set, then the Data Tipping for strings occurs. That is when the cursor is near a string, information about the string is displayed beside the cursor.

When ***Data tooltips*** are turned on (**D** snap) and a string matches a row in the ***Names.4d*** file with a comment, then the comment is displayed at the top of the Data Tool tip.



part of ***Names.4d*** file

213	J*	optic	option:	cadast	green		line	1	optional	boundary join line
214	K*	optic	option:	roads	yellow		line	1	optional	top of kerb
215	L*	optic	option:	roads	yellow		line	1	optional	lip
216	N*	optic	option:	surv	red		line	1	optional	ridge breaklines

If the **D** is highlighted in the **Snaps** toolbar then **Data Tips** snap is on. Otherwise it is off.

If the **Data tip** tick box is **on** (a tick) in the **Snaps** menu, then **Data tool tips** are displayed.

If the tick box is **off** (a cross or nothing), **Data tool tips** are not displayed

Fast Pick Snap - F

If **Fast Pick Snap** is set, then **fast picking** is allowed. That is, clicking MB will pick the nearest string to the cursor that satisfies the snap conditions. See 4.9.1 Fast Pick.

If the **F** is highlighted in the **Snaps** toolbar then **Fast Pick Snap** is on and hence Fast Picking is enabled. Otherwise it is off.

If the **Fast pick** tick box is **on** (a tick) in the **Snaps** menu, then **Fast Snap** is on.
If the tick box is **off** (a cross or nothing), **Fast Pick Snap**, and hence Fast Picking, is off

Fast Accept - A

If **Fast Accept Snap** is set, then **fast accepting** is allowed. That is, if when picking and there is only one string that satisfies the snap conditions then that string is automatically accepted. See 4.9.2 Fast Accept.

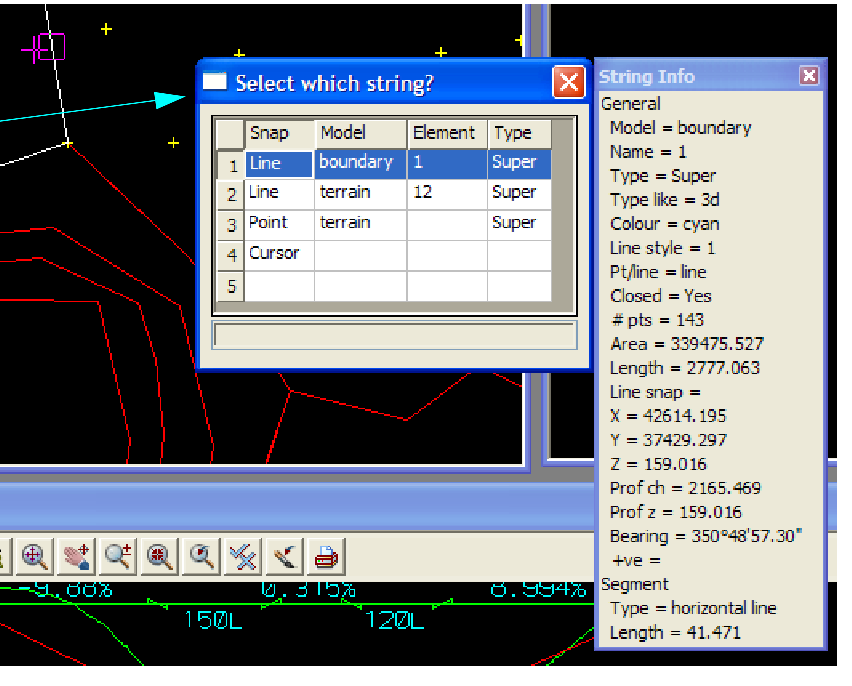
If the **A** is highlighted in the **Snaps** toolbar then **Fast Accept Snap** is on and hence Fast Accepting is enabled. Otherwise it is off.

If the **Fast accept** tick box is **on** (a tick) in the **Snaps** menu, then **Fast Accept Snap** is on.
If the tick box is **off** (a cross or nothing), **Fast Accept Snap**, and hence Fast Accepting, is off

Display Many Snap - M

If **Display Many Snap** is set, then when selecting a string, all the strings satisfying the search criteria are listed in a grid (the selection grid - **Many** strings listed, not just the one). If not set, the selection grid is not displayed. See 4.9.3 Tentative Pick.

Selection grid



If the **M** is highlighted in the **Snaps** toolbar then **Display Many Snap** is on and hence all strings satisfying the selection criteria are displayed. Otherwise it is off.

If the **Display many** tick box is **on** (a tick) in the **Snaps** menu, then **Display Many Snap** is on.
If the tick box is **off** (a cross or nothing), **Display Many Snap** is off.

NOTE: **Segment** snap (**S**) is currently under development.

When 12d **Model** creates a new project, **line** and **point** snap are set to **on** and all other snaps set off. Snap tolerance is set to 50 and Point Snap Tolerance set to 10.

When an existing project is saved, the snap settings, snap tolerance and positions of any **snaps** menus on the screen, are also saved.

Please continue to the next section 4.14 Text Grips (or back to 4.13 Snaps).

4.14 Text Grips

When text is selected for editing, ***grips*** are displayed for quick editing. Vertex text has four grips and segment text three grips.

Note - see the section 4.6 Text Definitions for the definitions of vertex and segment text, text justification point, text height, text angle, text offset and text raise.

Go to the next section 4.14.1 Vertex Text or back to 4.14 Text Grips.

4.14.1 Vertex Text

When vertex text is selected for editing, four ***grips*** are displayed for

(a) modifying the text height (diamond)

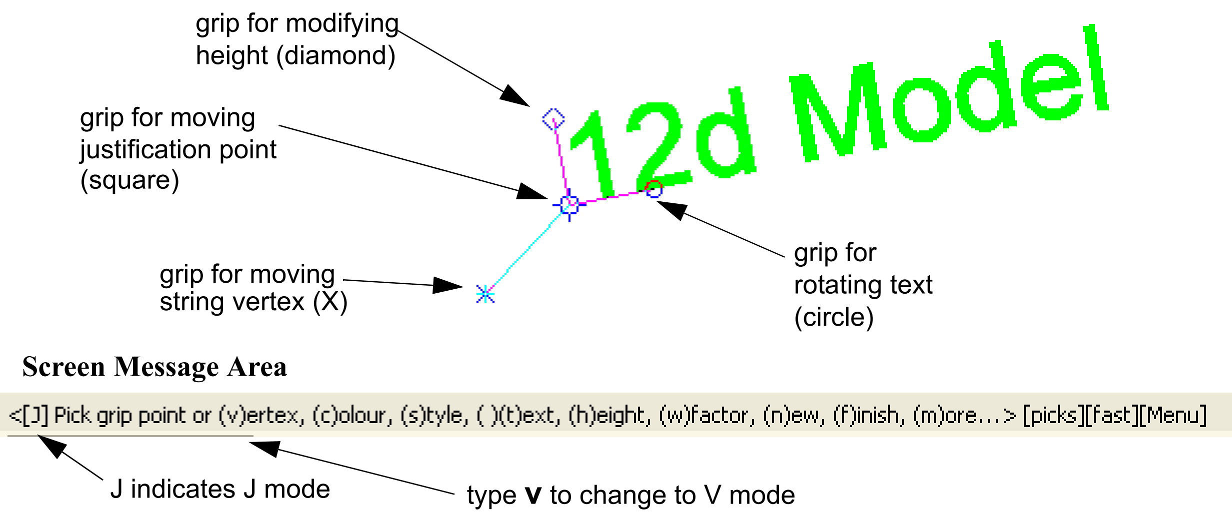
(b) rotating the text around the text justification point (circle)

(c) moving the text justification point (square)

(d) moving the string vertex (**X**)

There are two modes for the grips:

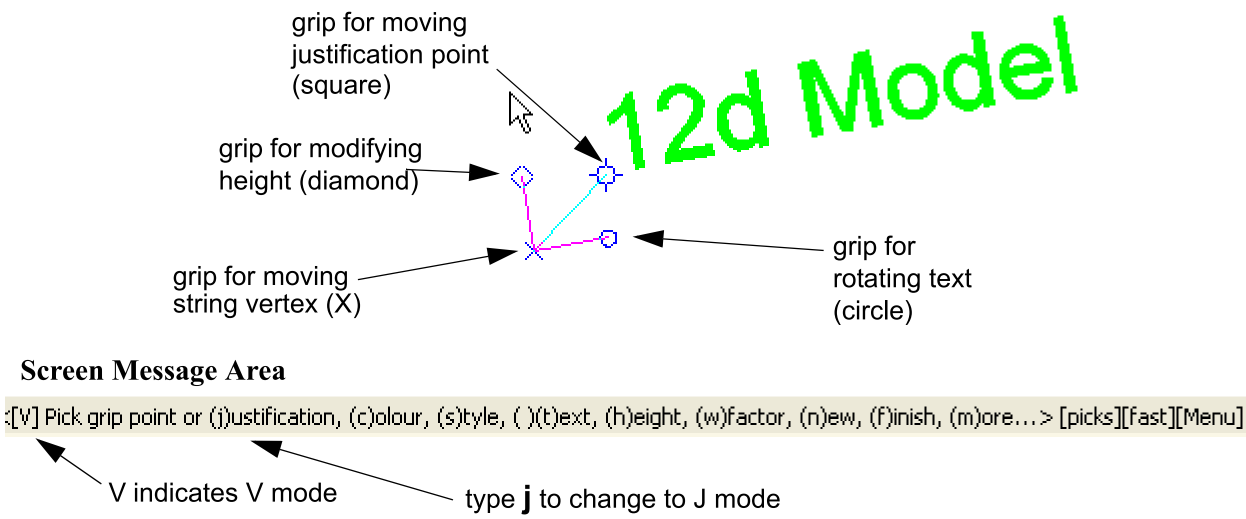
The grips for modifying text height (diamond) and rotating the text (circle) are joined to the justification point to form a right angle (J mode).



Grips on the Justification Point for Vertex Text - J Mode

OR

The grips for modifying text height (diamond) and rotating the text (circle) are joined to the text vertex to form a right angle (V mode).



Grips on the Vertex for Vertex Text - V Mode

The main difference between the J and the M modes is that in J mode, the rotation is about the text justification point, and in V mode the rotation is about the text vertex.

The appropriate grip is then selected for quick editing.

Go to the next section 4.14.2 Segment Text or back to 4.14 Text Grips.

4.14.2 Segment Text

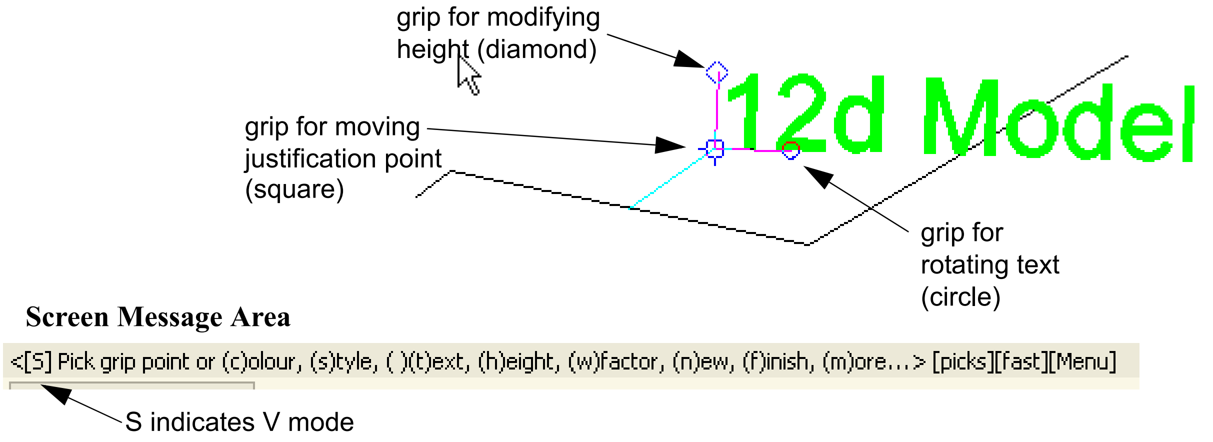
When segment text is selected for editing, three ***grips*** are displayed for

(a) modifying the text height (diamond)

(b) rotating the text around the text justification point (circle)

(c) moving the text justification point (square)

For segment text, the grips for modifying text height (diamond) and rotating the text (circle) are joined to the justification point to form a right angle (S mode).



Grips on the Justification Point for Segment Text - S Mode

The appropriate grip is then selected for quick editing.

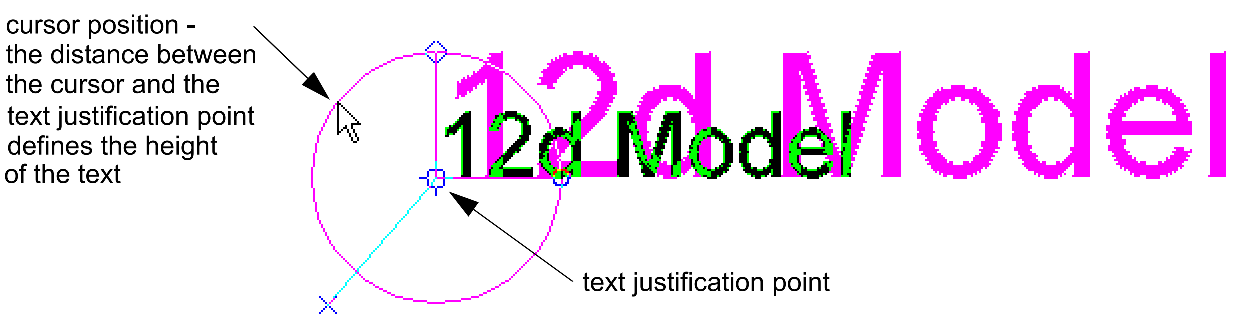
Note - there is no equivalent of the Vertex grip for segment text because the segment text is locked to the centre point of the segment rather than a vertex.

See the section 4.6 Text Definitions for the definitions of vertex and segment text, text justification point, text height, text angle, text offset and text raise.

4.14.3 **Height or Size Grip (diamond):**

J Mode

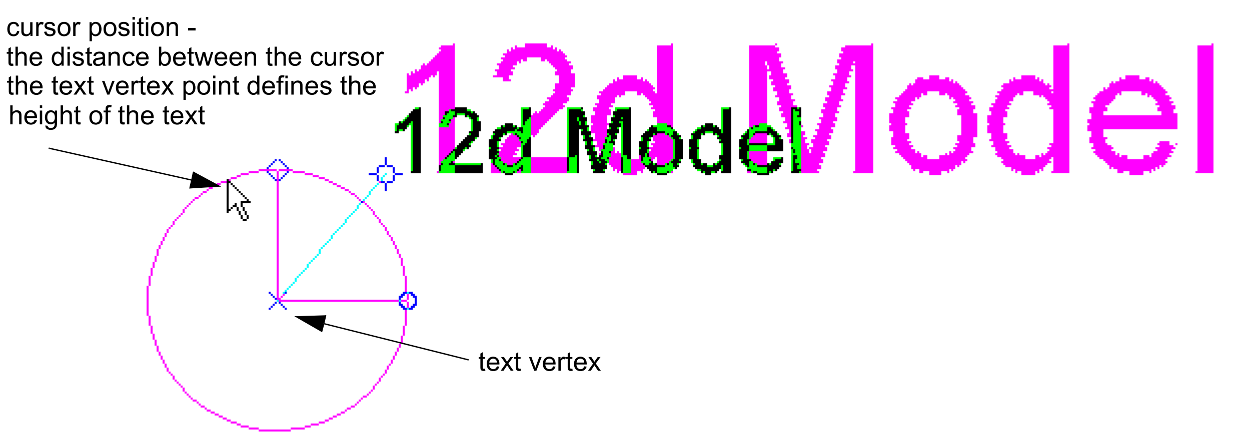
In J mode: if the ***Height* grip** is selected, a circle is drawn from the text justification point to the Height grip and this represents the height of the text. As the cursor is moved, the distance from the cursor to the text justification point is taken as the circle radius and the text height.



Modifying Height - J Mode

V Mode

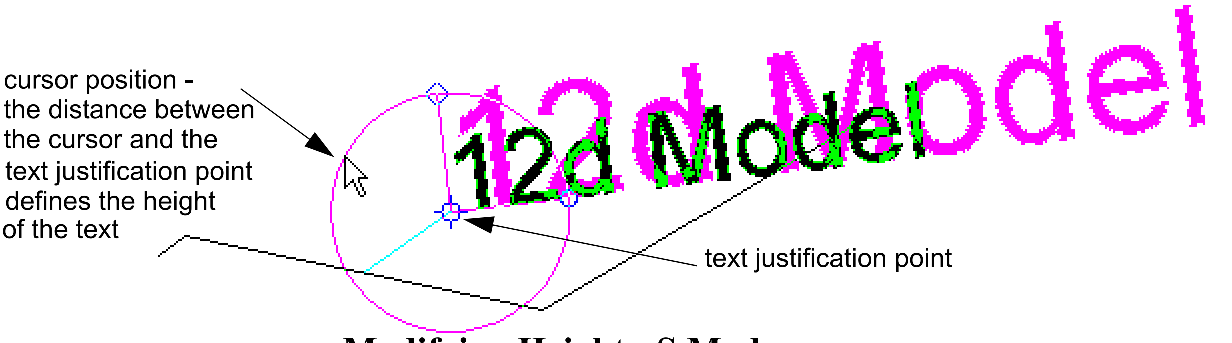
In V mode: if the ***Height* grip** is selected, a circle is drawn from the text vertex to the Height grip and this represents the height of the text. As the cursor is moved, the distance from the cursor to the text vertex is taken as the circle radius and the text height.



Modifying Height - V Mode

S Mode

In S mode: if the ***Height* grip** is selected, a circle is drawn from the text justification point to the Height grip and this represents the height of the text. As the cursor is moved, the distance from the cursor to the text justification point is taken as the circle radius and the text height.



Modifying Height - S Mode

In J, V and S mode, the text height is dynamically displayed as part of the *Enter height* prompt in the screen message area

Screen Message Area

dynamic height value

The text height is set when the cursor position is accepted.

When the text is being dynamically sized, pressing the **d** key brings up the **Enter distance** typed input box with the current **dynamic** text height in it.

An ***exact*** text height can be typed into the ***Enter distance*** **Typed Input** box and accepted by pressing <Enter>.

If instead of typing **d,** the <space bar> is pressed, the ***Enter distance*** **Typed Input** box is displayed with a space in it. The required height can be typed into the box and accepted by pressing <Enter>.

If instead of typing **d,** any character other than **t**, **p**, **c** or **n** is typed (for example the beginning of the exact height required), the ***Enter distance*** **Typed Input** box is displayed with the typed characters in it. The height is accepted by pressing <Enter>.

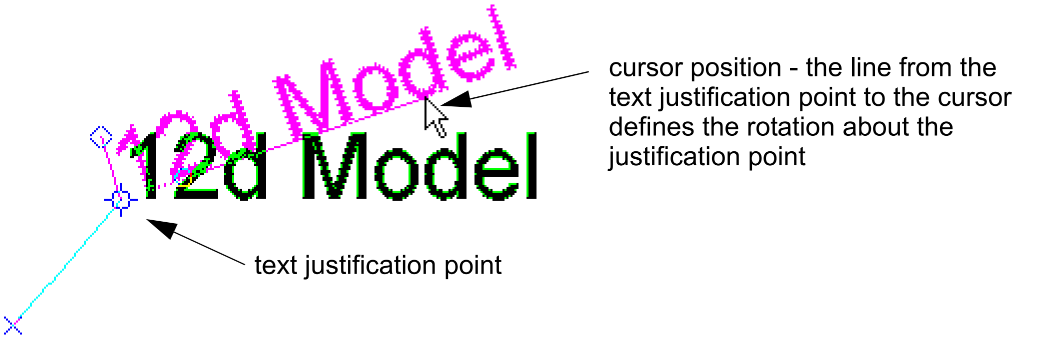
For more information on typing **t**, **p**, **c** or **n**, go to the section 4.14.7 Typing t, p, c or n

To return to dynamic sizing without entering a distance into the ***Enter distance*** input box, simply select the **X** on the top of the input box. The box will disappear and dynamic sizing will resume.

4.14.4 **Rotate Grip (circle)**:

J Mode

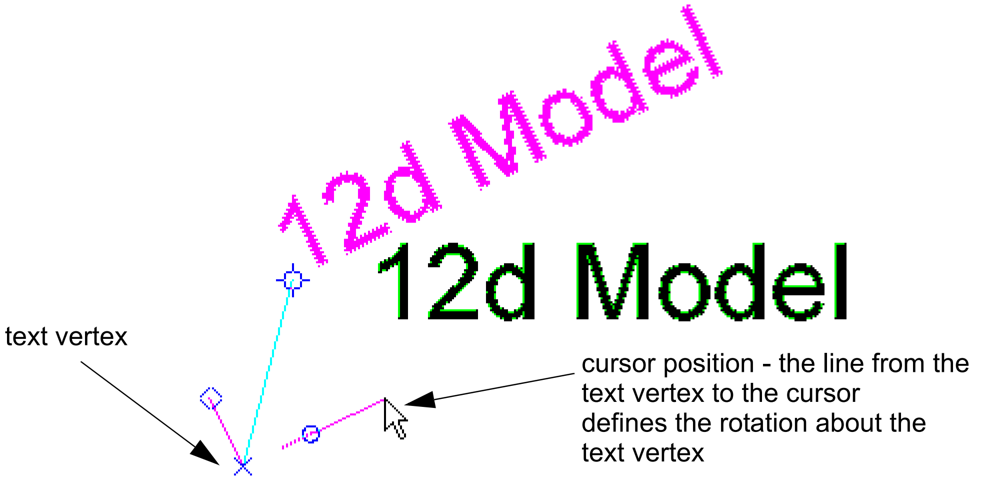
In J mode: if the **Rotate grip** is selected, a line from the text justification point to the cursor position is taken as the text angle. As the cursor is moved, the angle from the cursor to the text justification point defines the text angle.



Modifying Angle - J Mode

V Mode

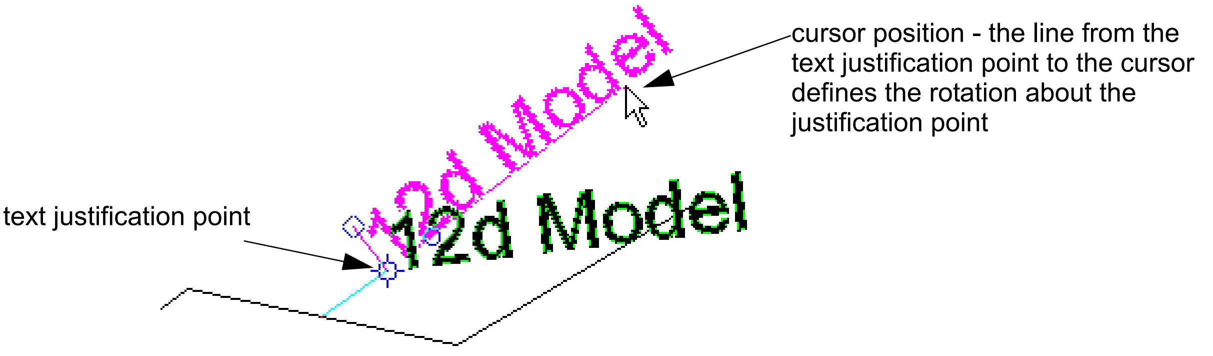
In V mode: if the **Rotate grip** is selected, a line from the text vertex to the cursor position is taken as the text angle. As the cursor is moved, the angle from the cursor to the text vertex defines the text angle.



Modifying Angle - V Mode

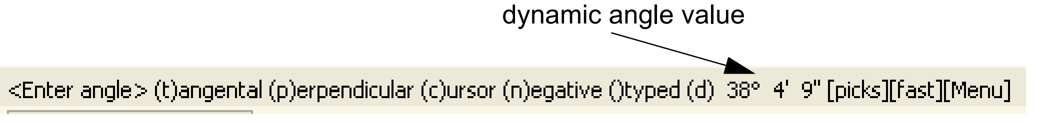
S Mode

In S mode: if the **Rotate grip** is selected, a line from the text justification point to the cursor position is taken as the text angle. As the cursor is moved, the angle from the cursor to the text justification point defines the text angle.



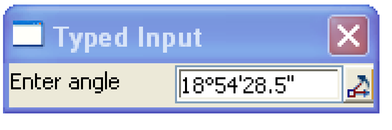
Modifying Angle - S Mode

In J, V and S mode, the angle of the text is displayed as part of the *Enter angle* prompt in the screen message area.



The text angle is set when the cursor position is accepted.

When the angle is being dynamically changed, pressing the **d** key brings up the **Enter angle** typed input box with the current **dynamic** text angle in it.



An ***exact*** text angle can be typed into the ***Enter angle*** **Typed Input** box and accepted by pressing the <enter key>.

If instead of typing **d,** the <space bar> is pressed (shown as **()**), the ***Enter angle*** **Typed Input** box is displayed with a space in it. The required angle can be typed into the box and accepted by pressing the <enter key>.

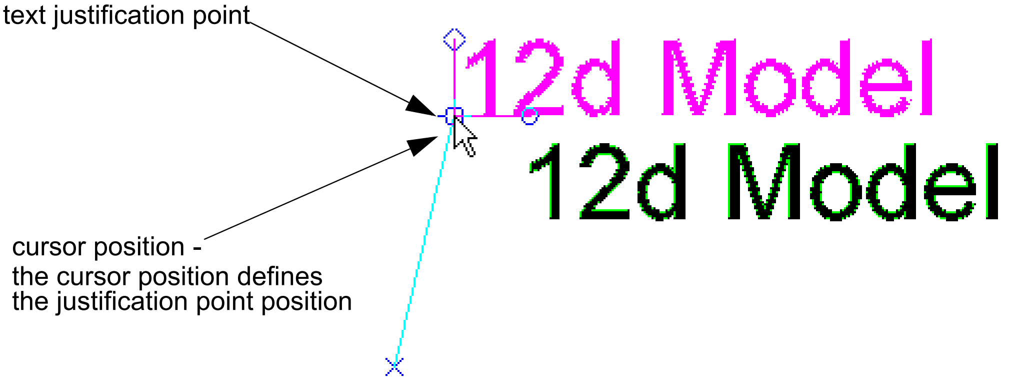
If instead of typing **d,** any character other than **t**, **p**, **c** or **n** is typed (for example the beginning of the exact angle required), the ***Enter angle*** **Typed Input** box is displayed with the typed characters in it. The angle is accepted by pressing the <enter key>.

For more information on typing **t**, **p**, **c** or **n**, go to the section 4.14.7 Typing t, p, c or n

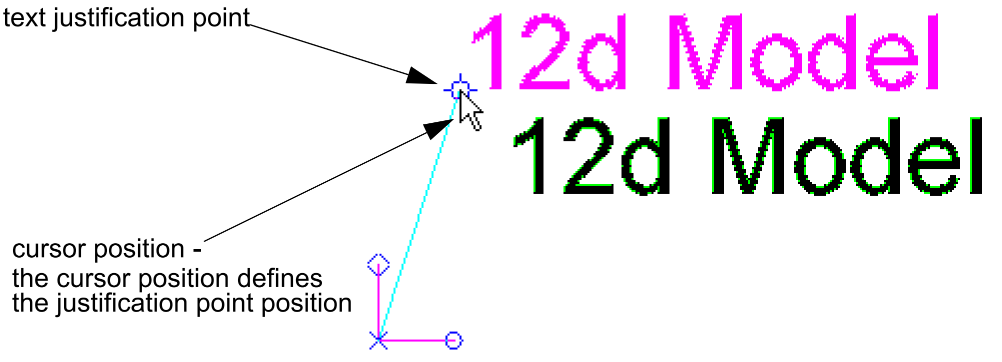
To return to dynamic angling without entering an angle into the ***Enter angle*** input box, simply select the **X** on the top of the input box. The box will disappear and dynamic angling will resume.

4.14.5 **Justification Grip (square)**:

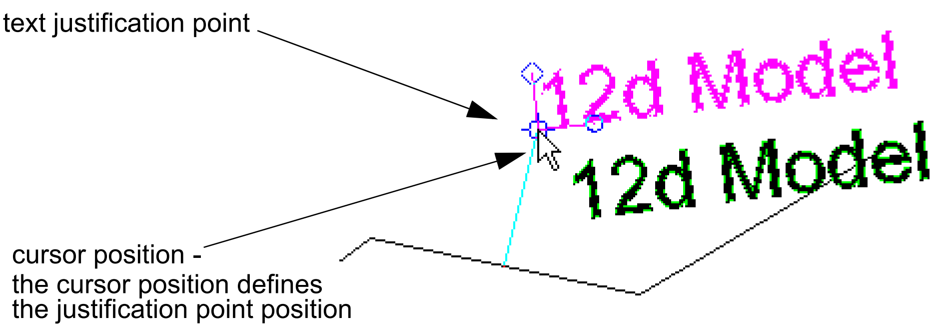
In J, V and S Mode: if the **Justification grip** is selected, the cursor position is taken as the text justification point. As the cursor is moved, the text justification point moves with it.



Moving Text Justification Point - J Mode

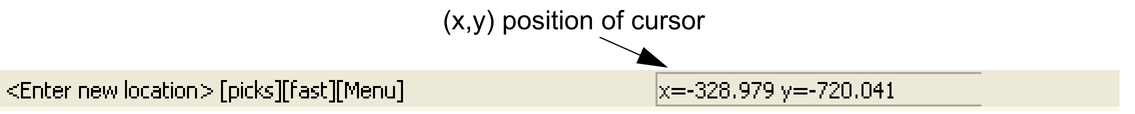


Moving Text Justification Point - V Mode



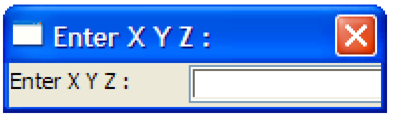
Moving Text Justification Point - S Mode

In J, V and S mode, the (x,y) position of the text is displayed in the screen message area.



The text justification point is set when the cursor position is accepted.

An ***exact*** coordinate can be entered by hitting the <space bar> or by starting to type a coordinate. This brings up the **Enter X Y Z** typed input box. The *x and y coordinates* are typed in, separated by a space, and the <enter> key pressed.



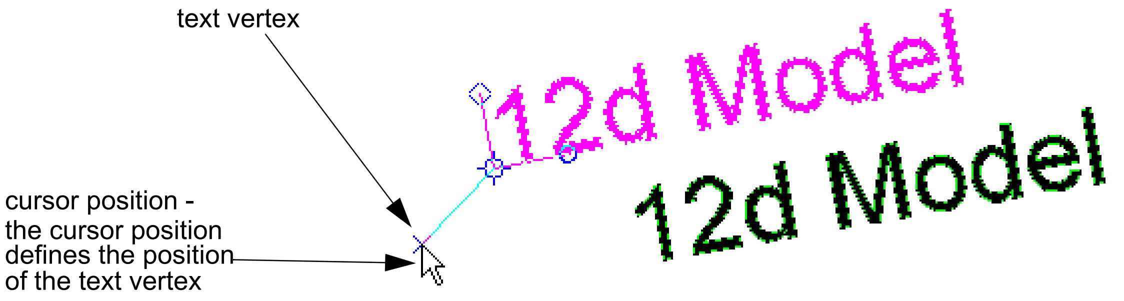
To return to dynamic moving without entering a coordinate, simply select the **X** on the top of the input box. The box will disappear and dynamic moving will resume.

Go to the next section 4.14.6 Vertex Grip (X): - for Vertex Text Only or back to 4.14 Text Grips.

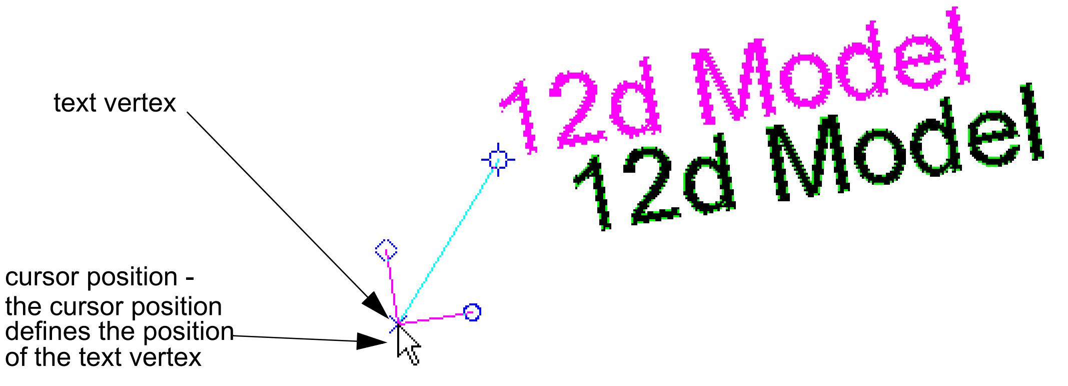
4.14.6 Vertex Grip (X): - for Vertex Text Only

In J and V mode: if the **Vertex grip** is selected, the cursor position is taken as the text vertex, As the cursor is moved, the text vertex moves with it.

Note - the Vertex can not be selected when it is in ***locked*** mode.

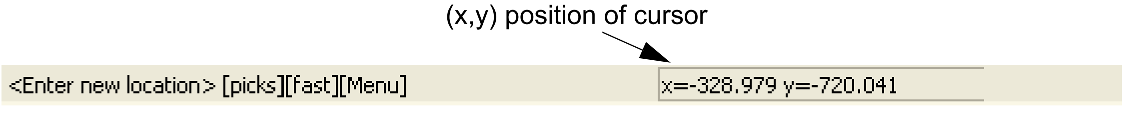


Moving Text Vertex - J Mode



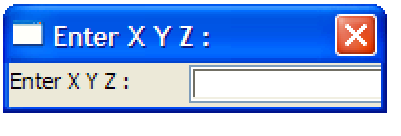
Moving Text Vertex - V Mode

In both J and V mode, the (x,y) position of the text is displayed in the screen message area.



The text vertex is set when the cursor position is accepted.

An ***exact*** coordinate can be entered by hitting the <space bar> or by starting to type a coordinate. This brings up the **Enter X Y Z** typed input box. The *x and y coordinates* are typed in, separated by a space, and the <enter> key pressed.



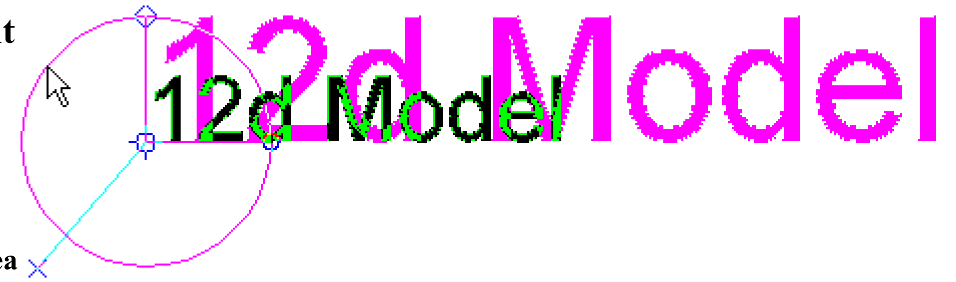
To return to dynamic moving without entering a coordinate, simply select the **X** on the top of the input box. The box will disappear and dynamic moving will resume.

Go to the next section 4.14.7 Typing t, p, c or n or back to 4.14 Text Grips.

4.14.7 Typing t, p, c or n

After selecting the ***Height*** grip (diamond) or the ***Rotate*** grip (circle), the screen message area shows that there are the typed option **t**, **p**, **c**, **n**, **()** and **d** available.

Modifying Height



Screen Message Area

Modifying Angle

Screen Message Area

<Enter angle> (t)angental (p)erpendicular (c)ursor (n)egative ()typed (d) 38° 4' 9" [picks][fast][Menu]

Type **t**: snap cursor tangential to a selected string - go to Snap Tangential - Typing t

Type **p**: snap cursor perpendicular to a selected string - go to Snap Perpendicular - Typing p

Type **c**: return to cursor movement - go to Cursor Mode - Typing c

Type **n**: return to cursor movement - go to Negative Angle - Typing n

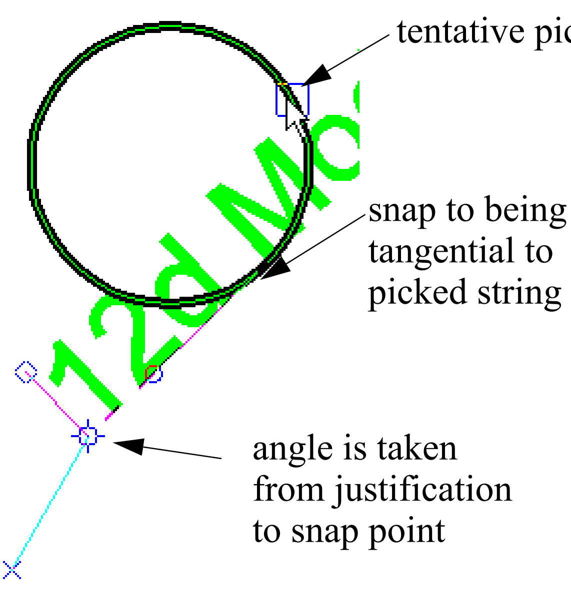
Type **<space bar>**: bring up typed input box for value - go to Hitting Space Bar

Type **d**: bring up dynamic value - go to Display Dynamic Value - Typing d

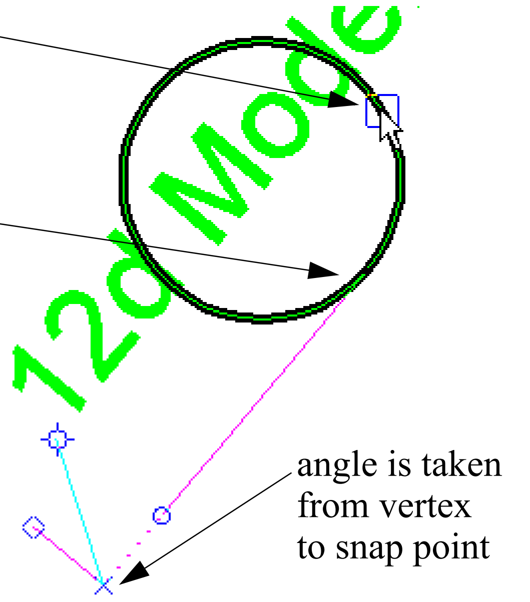
Snap Tangential - Typing t

Snap Tangential - Rotation Grip (Circle)

After selecting the ***Rotation*** grip (circle), typing **t** puts the string select into tangential mode and when a string is tentatively picked, the snap point moves to make the line from the snap point to the text justification point in J mode (or vertex in V-mode) tangential to the selected string.



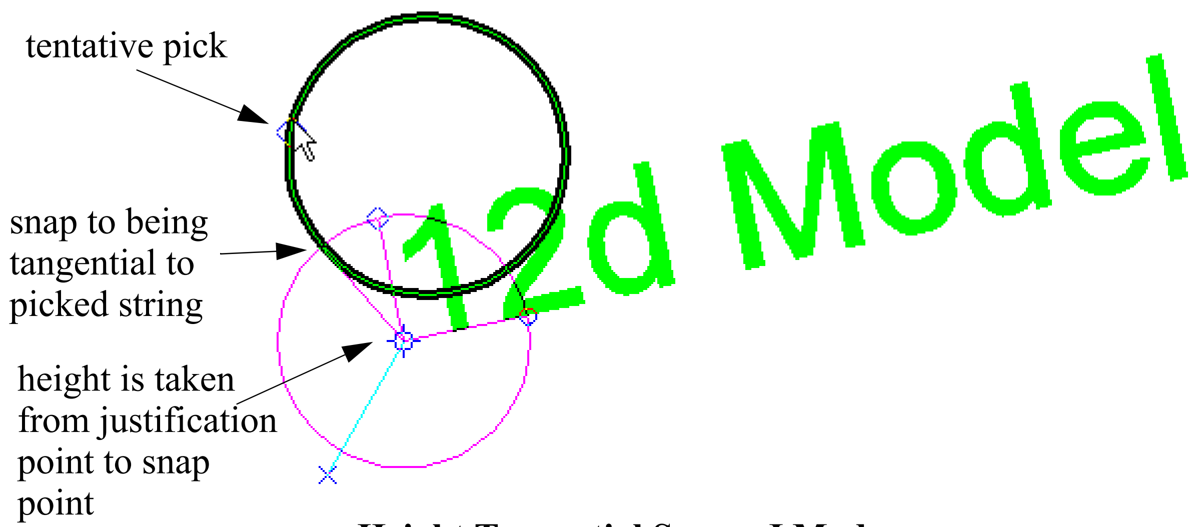
Rotation Tangential Snap - J Mode



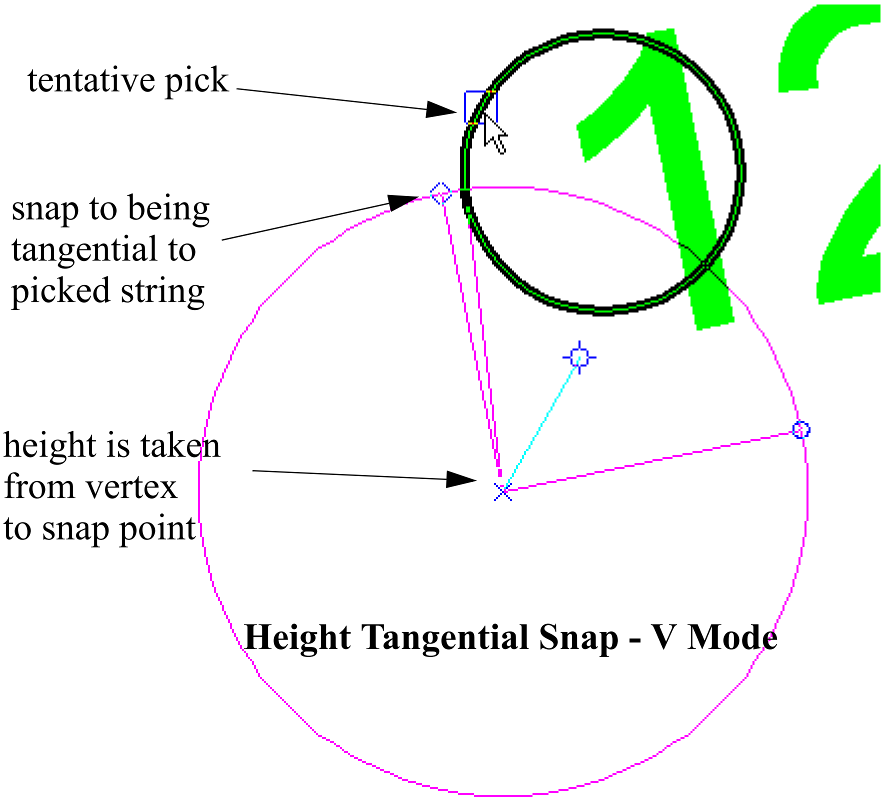
Rotation Tangential Snap - V Mode

Snap Tangential - Height Grip (Square)

After selecting the ***Height*** grip (diamond), typing **t** puts the string select into tangential mode and when a string is tentatively picked, the snap point moves to make the line from the snap point to the text justification point in J mode (or vertex in V-mode) tangential to the selected string.



Height Tangential Snap - J Mode



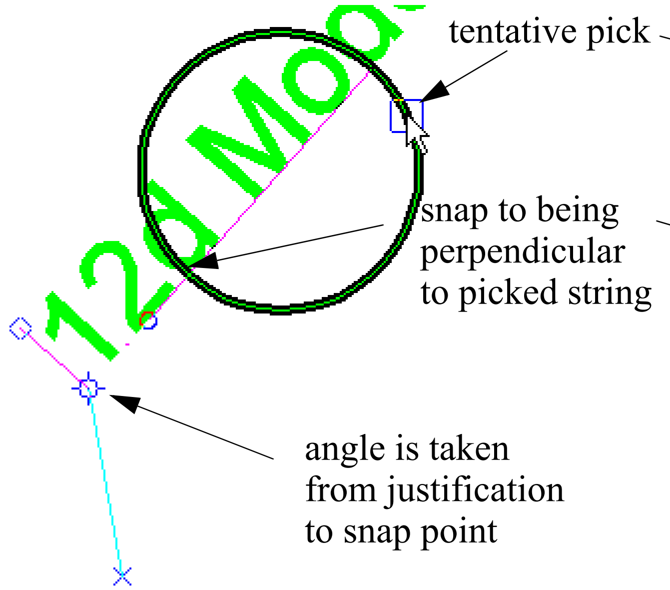
Height Tangential Snap - V Mode

Before the accept button is selected, **p** can be typed to toggle to perpendicular snap mode, **c** to return to using the cursor position or **d** to bring up the dynamic value.

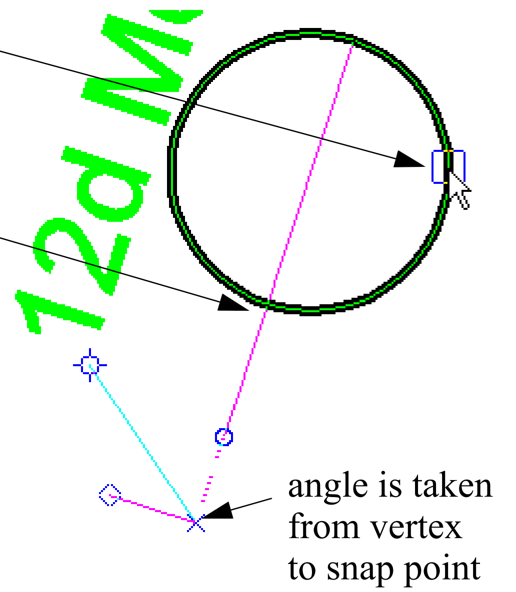
Snap Perpendicular - Typing p

Snap Perpendicular - Rotation grip (Circle)

After selecting the ***Rotation*** grip (circle), typing **p** puts the string select into perpendicular mode and when a string is tentatively picked, the snap point moves to make the line from the snap point to the text justification point in J mode (or vertex in V-mode) perpendicular to the selected string.



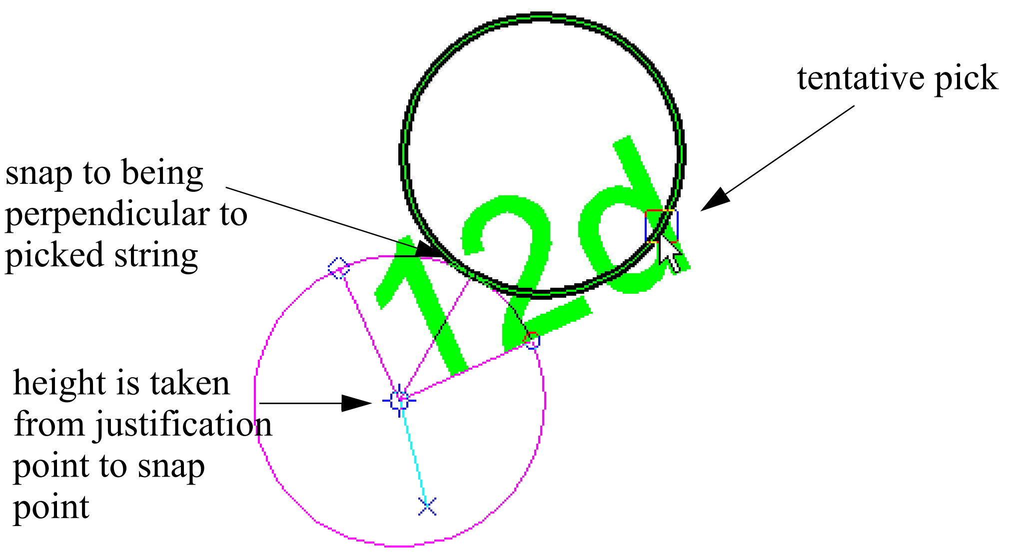
Rotation Perpendicular Snap - J Mode



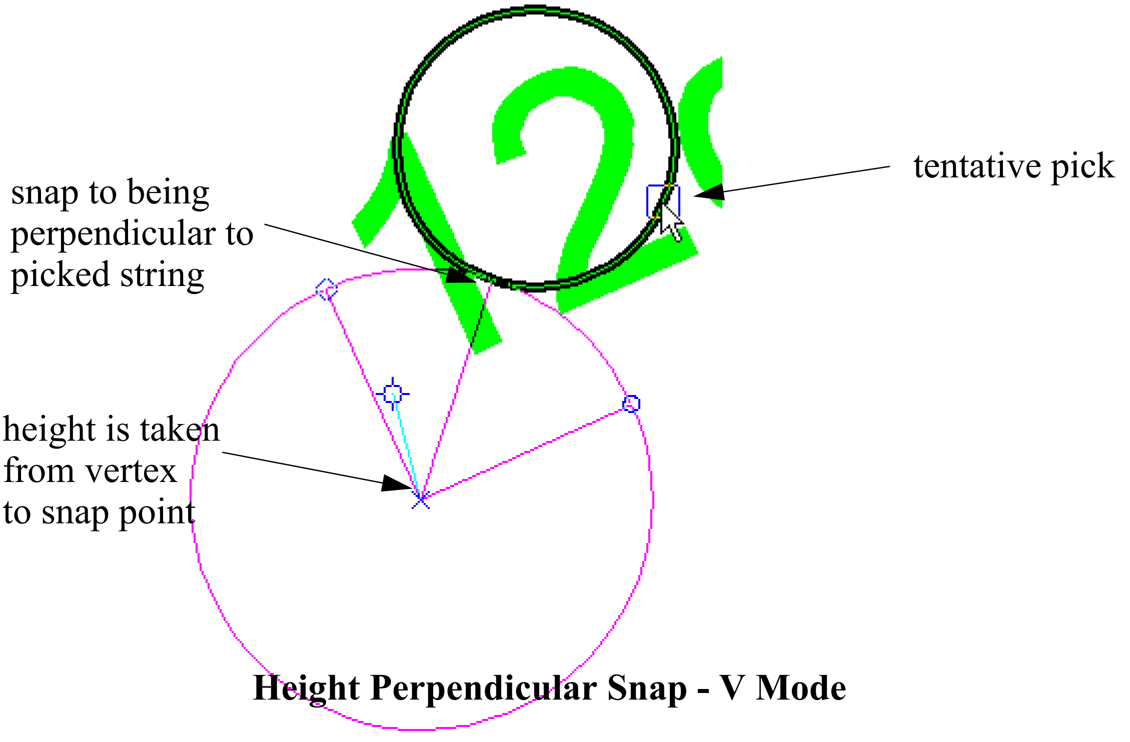
Rotation Perpendicular Snap - V Mode

Snap Perpendicular - Height grip (Square)

After selecting the ***Height*** grip (diamond), typing **p** puts the string select into perpendicular mode and when a string is tentatively picked, the snap point moves to make the line from the snap point to the text justification point in J mode (or vertex in V-mode) perpendicular to the selected string.



Height Perpendicular Snap - J Mode



Height Perpendicular Snap - V Mode

Before the accept button is selected, **t** can be typed to toggle to tangential snap mode, **c** to return to using the cursor position or **d** to bring up the dynamic value.

Cursor Mode - Typing c

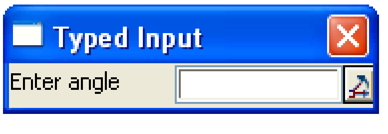
If in either Tangential or Perpendicular mode, typing **c** return to cursor mode.n

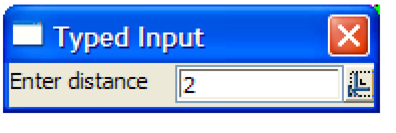
Negative Angle - Typing n

Adds 180 degrees to the current angle.

Hitting Space Bar

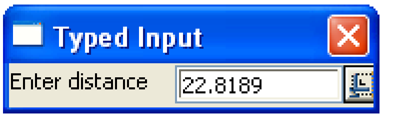
Brings up the **Enter angle** (modifying angle) or **Enter distance** (modifying height) Typed input box with no value in it.





Display Dynamic Value - Typing d

Brings up the **Enter angle** (modifying angle) or **Enter distance** (modifying height) Typed input box with the *dynamic* value in it.



Please continue to the next section 4.15 Symbol Grips.

4.15 Symbol Grips

When a symbol is selected for editing, four ***grips*** are displayed for quick editing.

Note - see the section 4.7 Symbol Definitions for the definitions of symbol justification point, symbol angle, x offset and y offset.

When a symbol is selected for editing, four ***grips*** are displayed for

(a) modifying the symbol height (diamond)

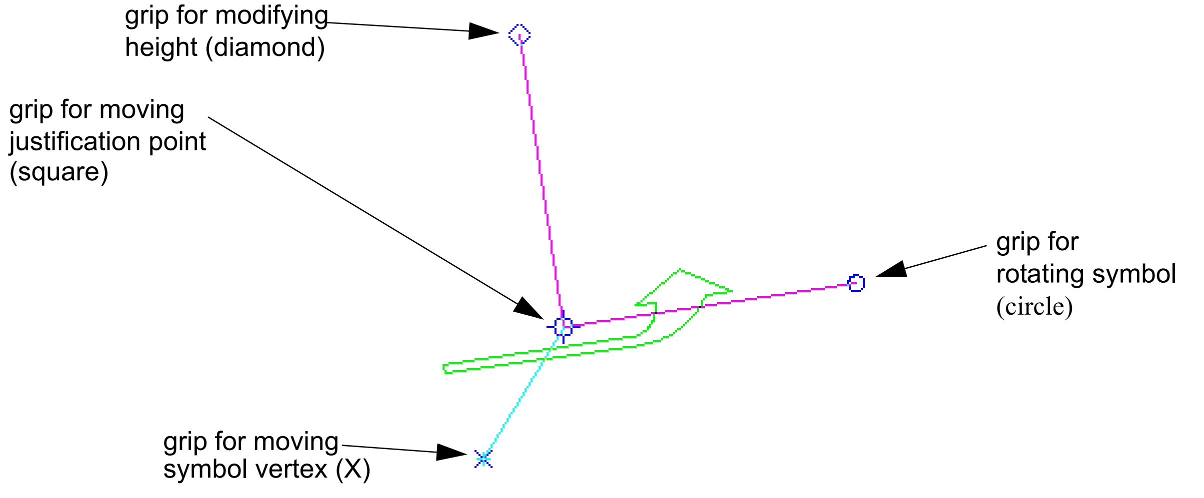
(b) rotating the symbol around the symbol justification point (circle)

(c) moving the symbol justification point (square)

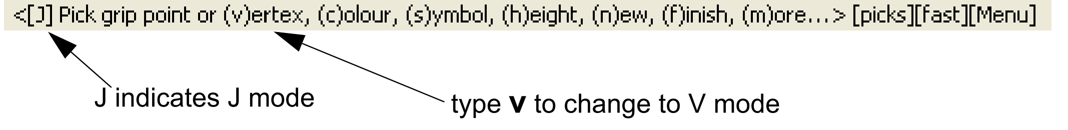
(d) moving the string vertex (**X**)

There are two modes for the grips:

The grips for modifying symbol height (diamond) and rotating the symbol (circle) are joined to the justification point to form a right angle (J mode).



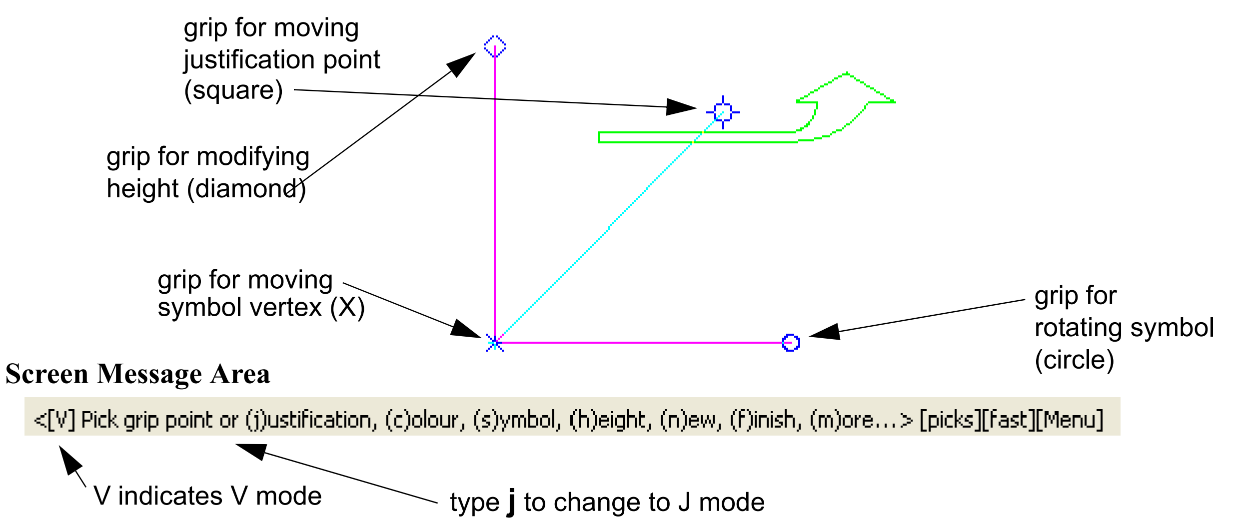
Screen Message Area



Grips on the Justification Point for a Symbol- J Mode

OR

The grips for modifying symbol height (diamond) and rotating the symbol (circle) are joined to the symbol vertex to form a right angle (V mode).



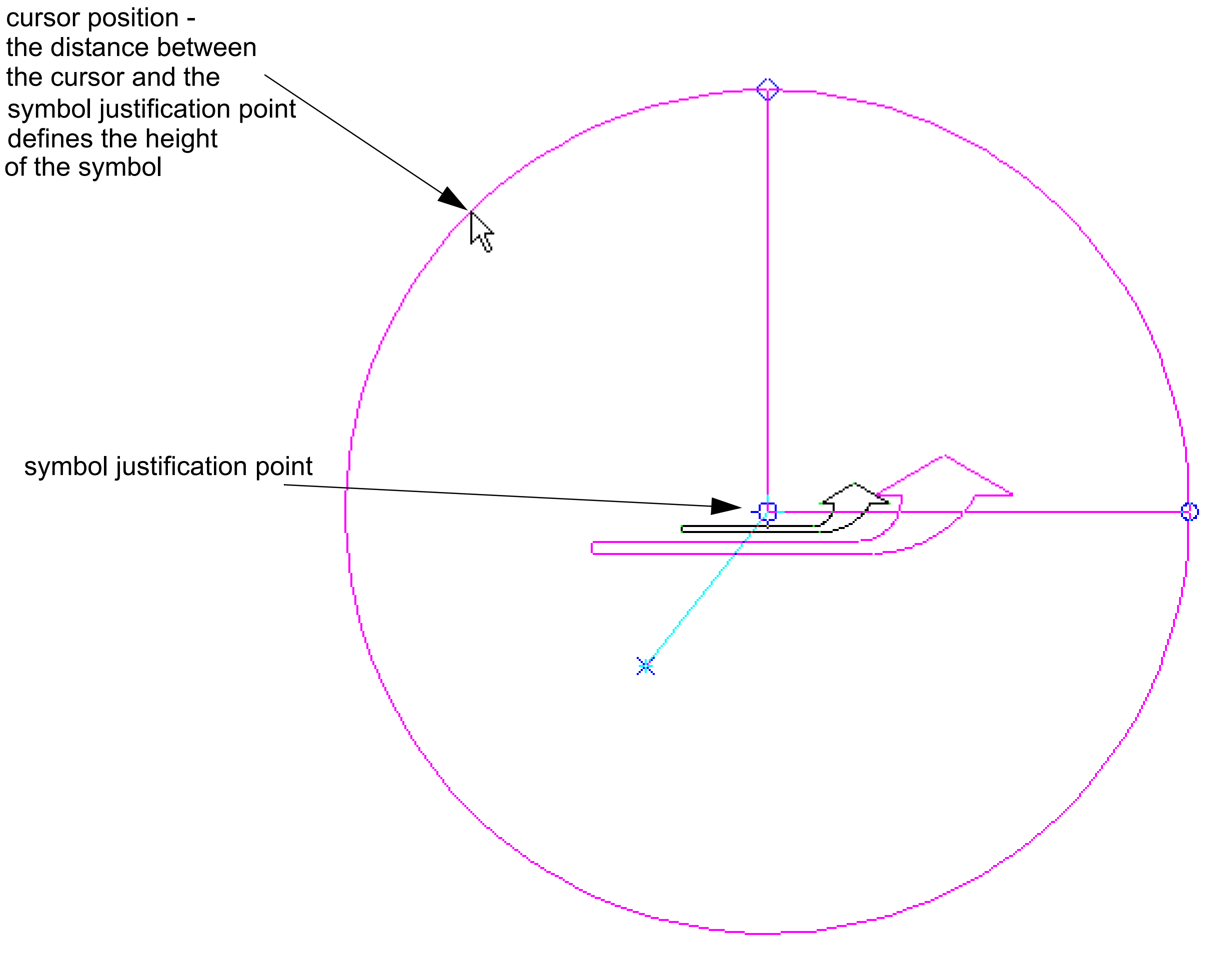
Grips on the Vertex for a Symbol - V Mode

The appropriate grip is then selected for quick editing.

4.15.1 **Height or Size Grip (diamond)**:

J Mode

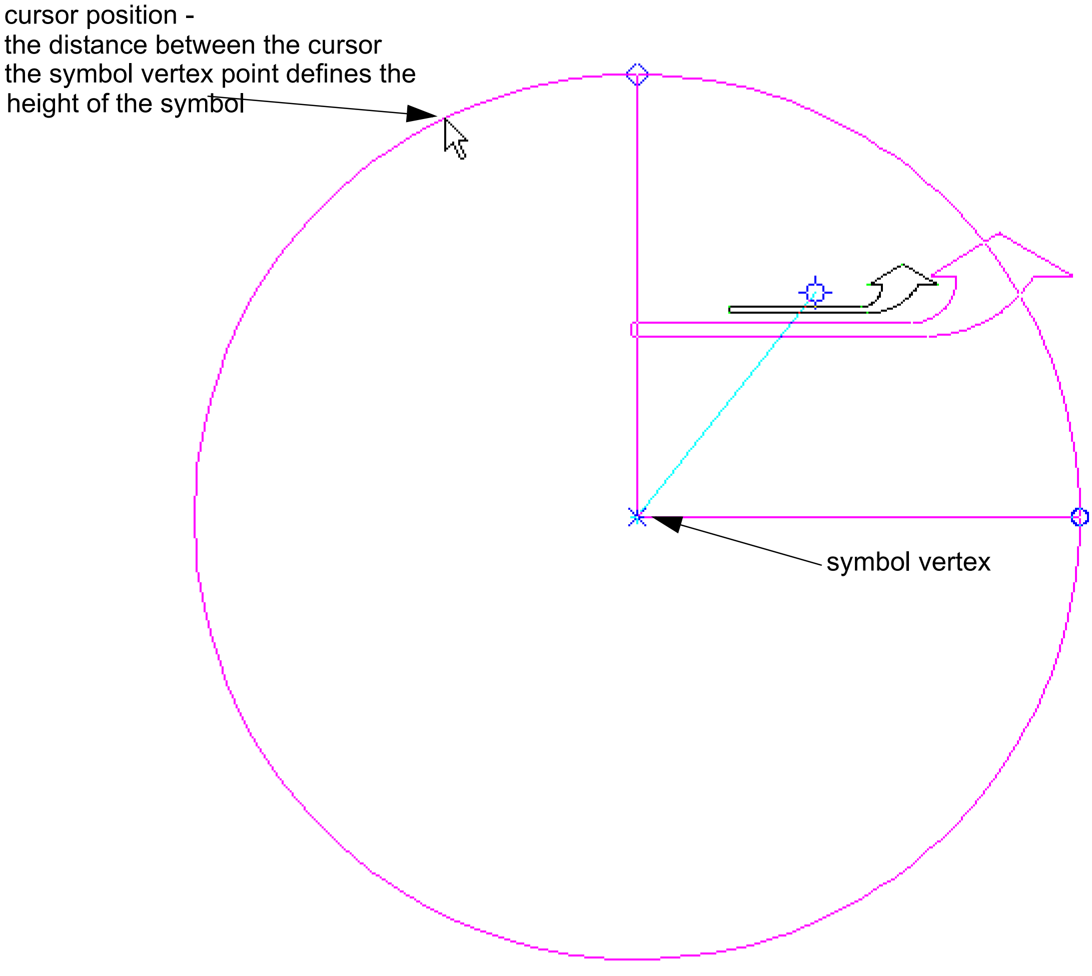
In J mode: if the ***Height* grip** is selected, a circle is drawn from the symbol justification point to the Height grip and this represents the height of the symbol. As the cursor is moved, the distance from the cursor to the symbol justification point is taken as the circle radius and the symbol height.



Modifying Height - J Mode

V Mode

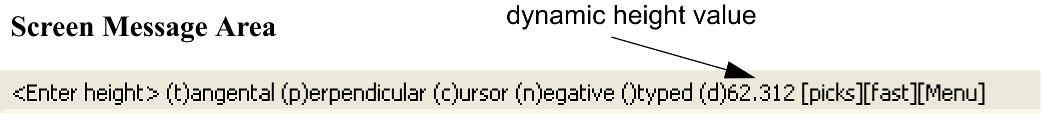
In V mode: if the ***Height* grip** is selected, a circle is drawn from the symbol vertex to the Height grip and this represents the height of the symbol. As the cursor is moved, the distance from the cursor to the symbol vertex is taken as the circle radius and the symbol height.



Modifying Height - V Mode

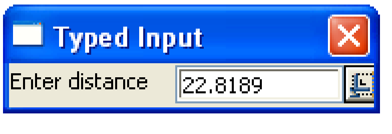
In J and V mode, the symbol height is dynamically displayed as part of the *Enter height* prompt in the screen message area

Screen Message Area



The symbol height is set when the cursor position is accepted.

When the symbol is being dynamically sized, pressing the **d** key brings up the **Enter distance** typed input box with the current **dynamic** symbol height in it.



An ***exact*** symbol height can be typed into the ***Enter distance*** **Typed Input** box and accepted by pressing the <enter key>.

If instead of typing **d,** the <space bar> is pressed, the ***Enter distance*** **Typed Input** box is displayed with a space in it. The required height can be typed into the box and accepted by pressing the <enter key>.

If instead of typing **d,** any character other than **t**, **p**, **c** or **n** is typed (for example the beginning of the exact height required), the ***Enter distance*** **Typed Input** box is displayed with the typed characters in it. The height is accepted by pressing the <enter key>.

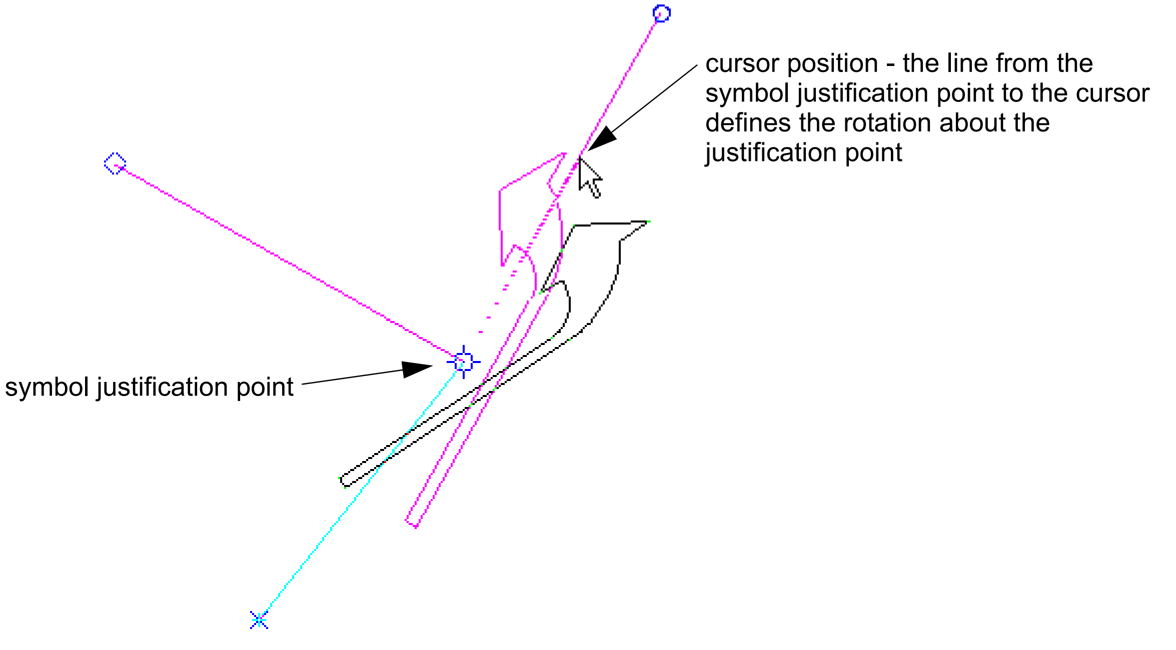
For more information on typing **t**, **p**, **c** or **n**, go to the section 4.14.7 Typing t, p, c or n

To return to dynamic sizing without entering a distance into the ***Enter distance*** input box, simply select the **X** on the top of the input box. The box will disappear and dynamic sizing will resume.

4.15.2 **Rotate Grip (circle)**:

J Mode

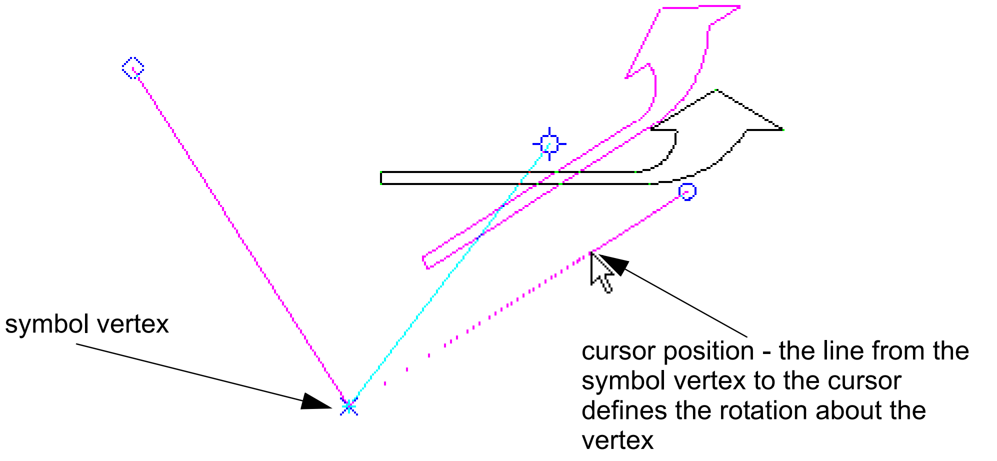
In J mode: if the **Rotate grip** is selected, a line from the symbol justification point to the cursor position is taken as the symbol angle. As the cursor is moved, the angle from the cursor to the symbol justification point defines the symbol angle.



Modifying Angle - J Mode

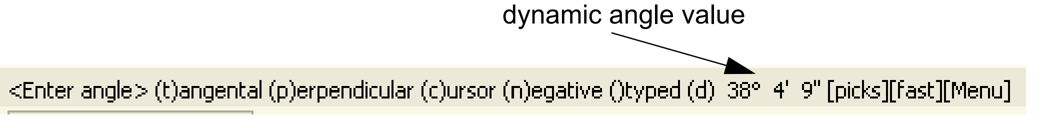
V Mode

In V mode: if the **Rotate grip** is selected, a line from the symbol vertex to the cursor position is taken as the symbol angle. As the cursor is moved, the angle from the cursor to the symbol vertex defines the symbol angle.



Modifying Angle - V Mode

In J and V mode, the angle of the symbol is displayed as part of the *Enter angle* prompt in the screen message area.



The symbol angle is set when the cursor position is accepted.

When the angle is being dynamically changed, pressing the **d** key brings up the **Enter angle** typed input box with the current **dynamic** symbol angle in it.

An ***exact*** symbol angle can be typed into the ***Enter angle*** **Typed Input** box and accepted by pressing the <enter key>.

If instead of typing **d,** the <space bar> is pressed (shown as **()**), the ***Enter angle*** **Typed Input** box is displayed with a space in it. The required angle can be typed into the box and accepted by pressing the <enter key>.

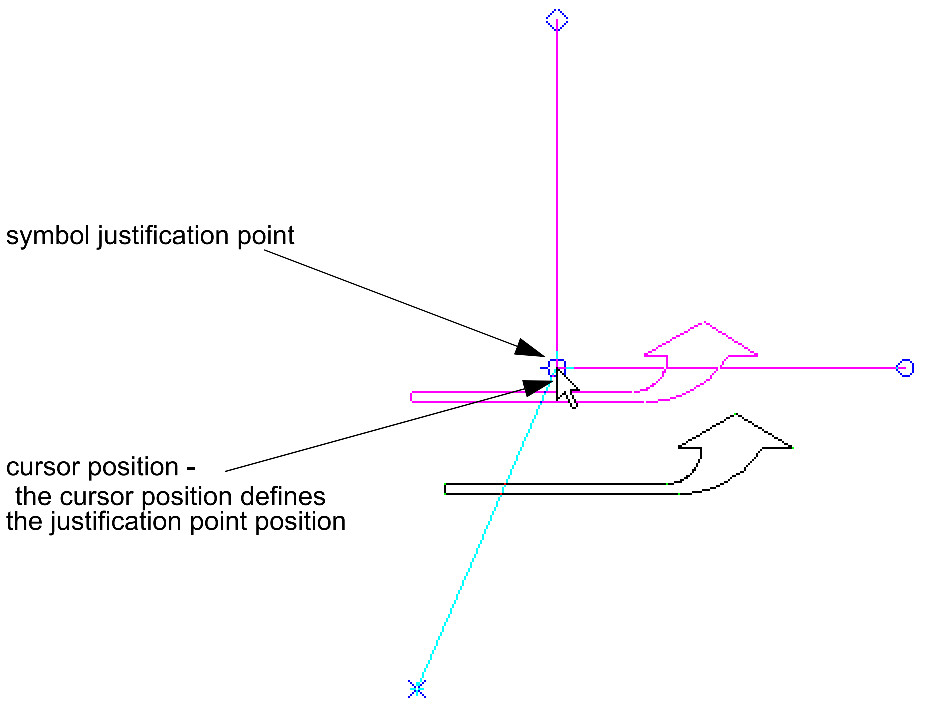
If instead of typing **d,** any character other than **t**, **p**, **c** or **n** is typed (for example the beginning of the exact angle required), the ***Enter angle*** **Typed Input** box is displayed with the typed characters in it. The angle is accepted by pressing the <enter key>.

For more information on typing **t**, **p**, **c** or **n**, go to the section 4.14.7 Typing t, p, c or n

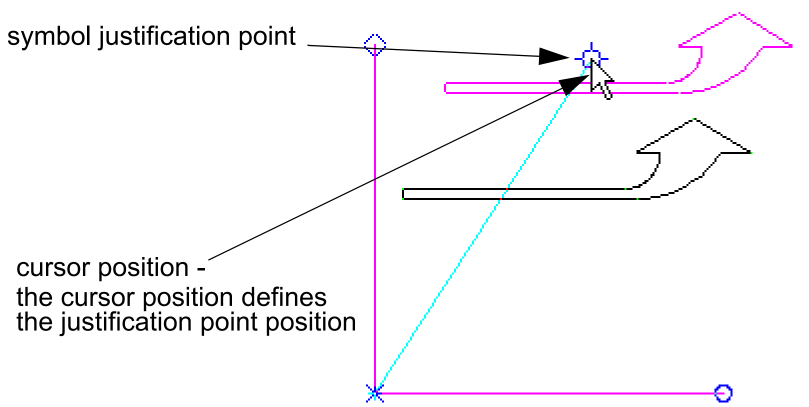
To return to dynamic angling without entering an angle into the ***Enter angle*** input box, simply select the **X** on the top of the input box. The box will disappear and dynamic angling will resume.

4.15.3 **Justification Grip (square)**:

In J and V Mode: if the **Justification grip** is selected, the cursor position is taken as the symbol justification point. As the cursor is moved, the symbol justification point moves with it.

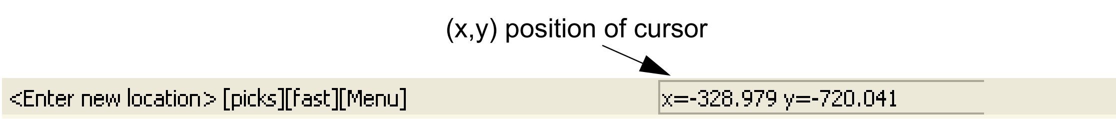


Moving Symbol Justification Point - J Mode



Moving Symbol Justification Point - V Mode

In J and V mode, the (x,y) position of the symbol is displayed in the screen message area.



The symbol justification point is set when the cursor position is accepted.

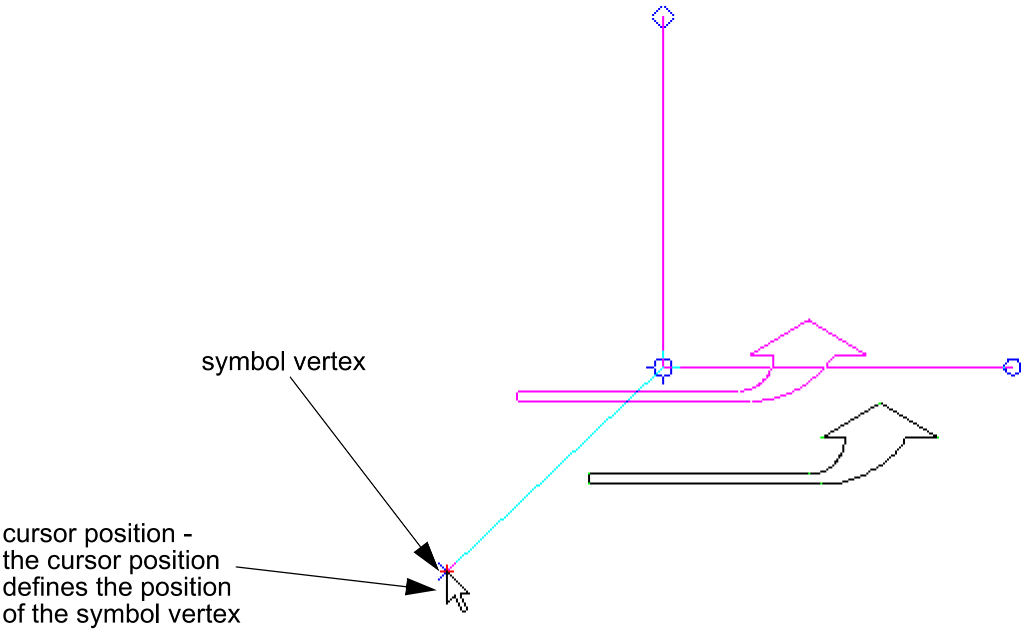
An ***exact*** coordinate can be entered by hitting the <space bar> or by starting to type a coordinate. This brings up the **Enter X Y Z** typed input box. The *x and y coordinates* are typed in, separated by a space, and the <enter> key pressed.

To return to dynamic moving without entering a coordinate, simply select the **X** on the top of the input box. The box will disappear and dynamic moving will resume.

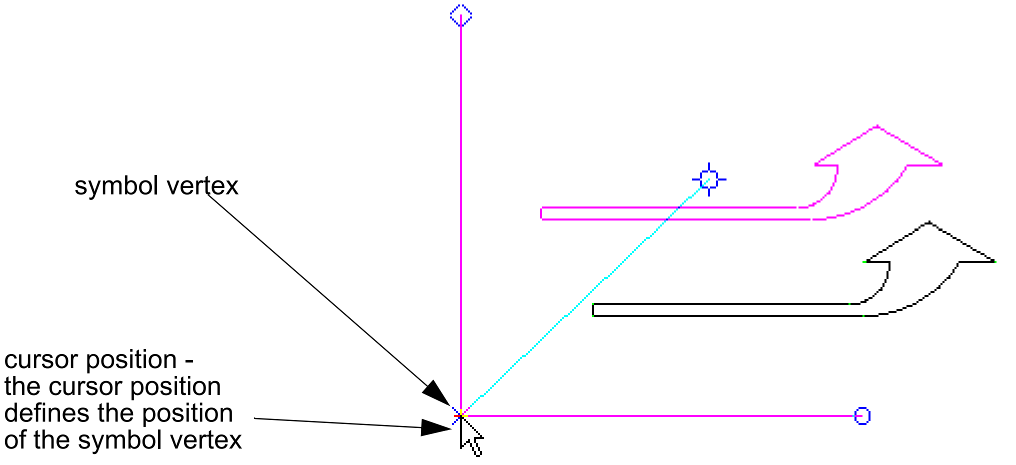
4.15.4 Vertex Grip (X):

In J and V mode: if the **Vertex grip** is selected, the cursor position is taken as the symbol vertex, As the cursor is moved, the symbol vertex moves with it.

Note - the Vertex can **not** be selected when it is in ***locked*** mode.

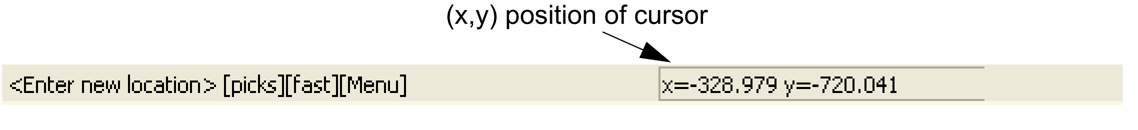


Moving Symbol Vertex - J Mode



Moving Symbol Vertex - V Mode

In both J and V mode, the (x,y) position of the symbol is displayed in the screen message area.



The symbol vertex is set when the cursor position is accepted.

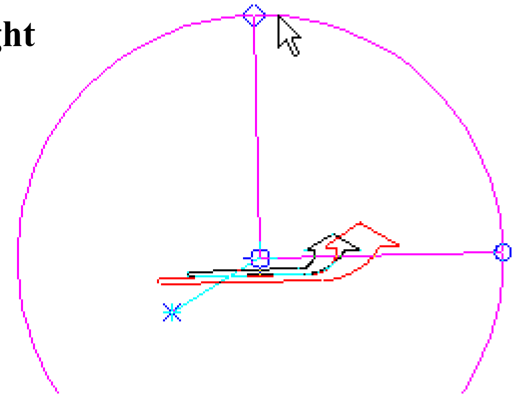
An ***exact*** coordinate can be entered by hitting the <space bar> or by starting to type a coordinate. This brings up the **Enter X Y Z** typed input box. The *x and y coordinates* are typed in, separated by a space, and the <enter> key pressed.

To return to dynamic moving without entering a coordinate, simply select the **X** on the top of the input box. The box will disappear and dynamic moving will resume.

4.15.5 Typing t, p, c or n

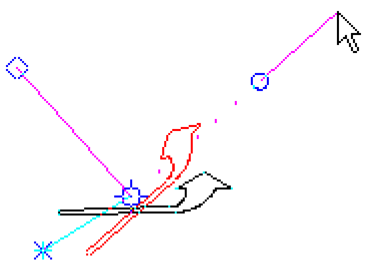
After selecting the ***Height*** grip (diamond) or the ***Rotate*** grip (circle), the screen message area shows that there are the typed option **t**, **p**, **c**, **n**, **()** and **d** available.

Modifying Height



Screen Message Area

<Enter height> (t)angental (p)erpendicular (c)ursor (n)egative ()typed (d)35.467 [picks][fast][Menu]



Modifying Angle

Screen Message Area

<Enter angle> (t)angental (p)erpendicular (c)ursor (n)egative ()typed (d) 38° 4' 9" [picks][fast][Menu]

Type **t**: snap cursor tangential to a selected string - go to Snap Tangential - Typing t

Type **p**: snap cursor perpendicular to a selected string - go to Snap Perpendicular - Typing p

Type **c**: return to cursor movement - go to Cursor Mode - Typing c

Type **n**: return to cursor movement - go to Negative Angle - Typing n

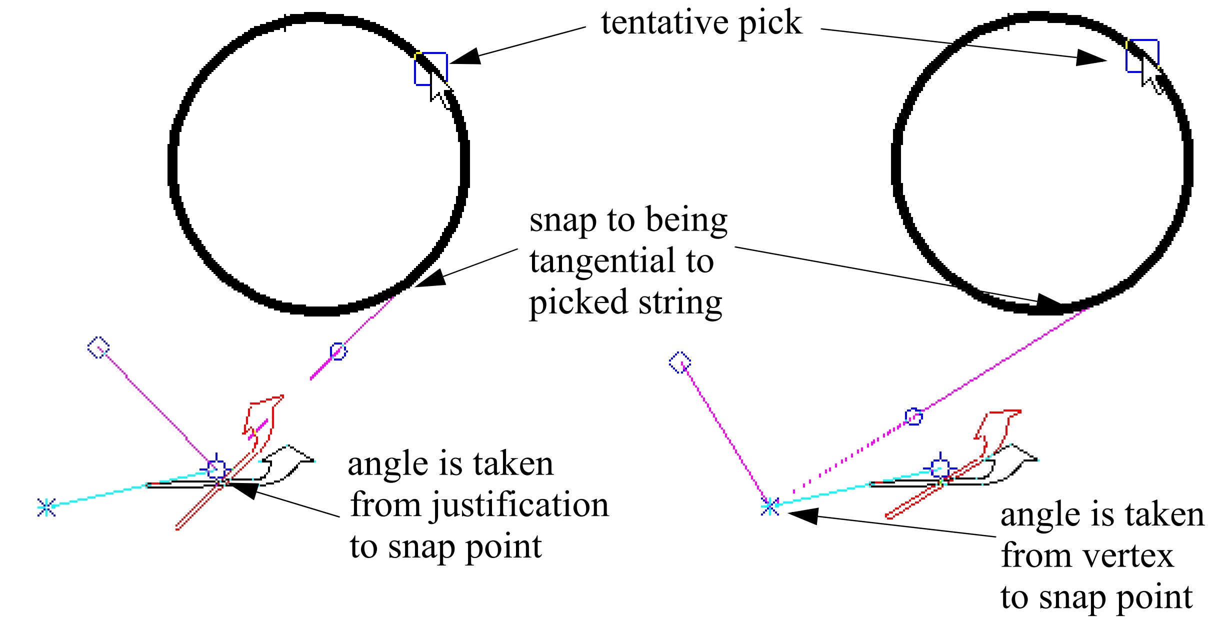
Type <space bar>: bring up typed input box for value - go to Hitting Space Bar

Type **d**: bring up dynamic value - go to Display Dynamic Value - Typing d

Snap Tangential - Typing t

Snap Tangential - Rotation Grip (Circle)

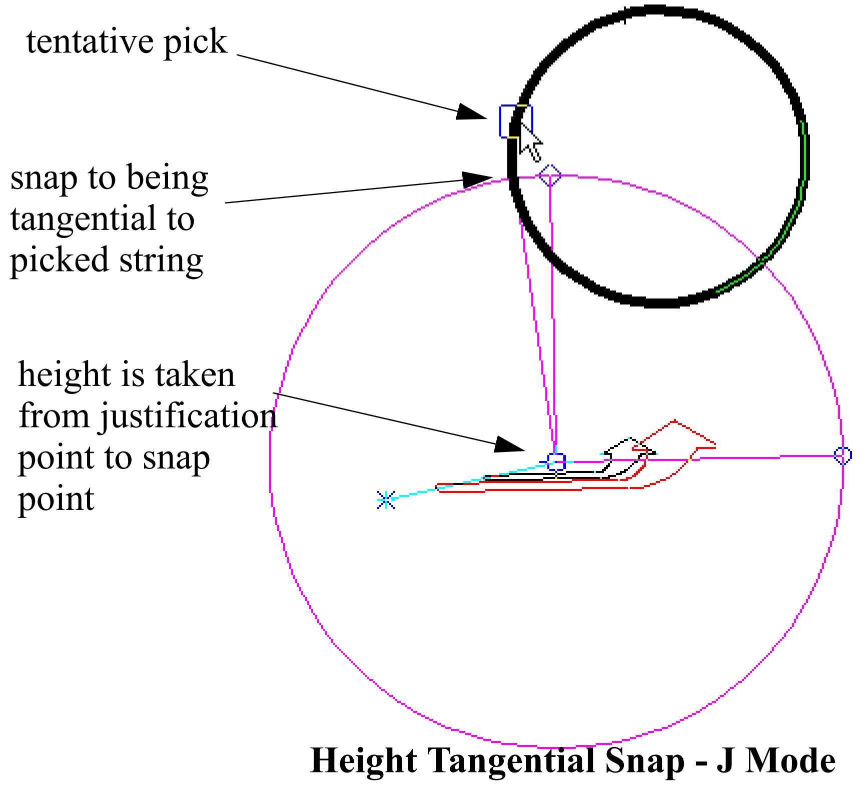
After selecting the ***Rotation*** grip (circle), typing **t** puts the string select into tangential mode and when a string is tentatively picked, the snap point moves to make the line from the snap point to the symbol justification point in J mode (or to the vertex in V-mode) ***tangential*** to the selected string.



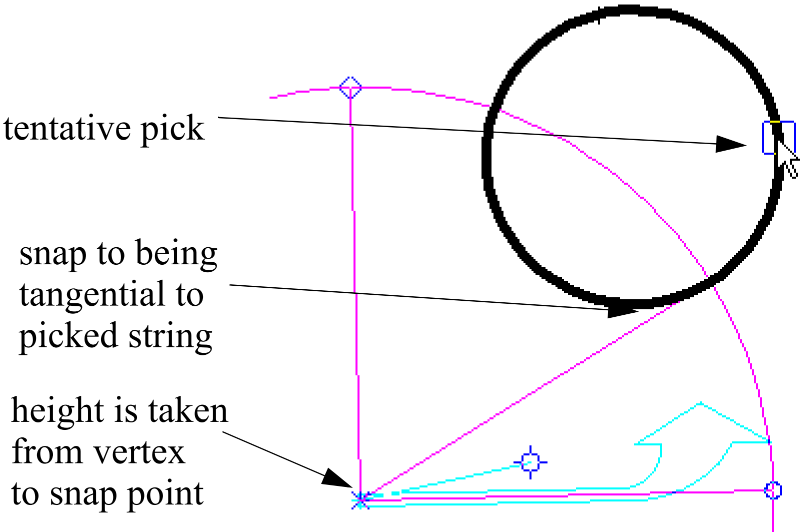
Rotation Tangential Snap - J Mode **Rotation Tangential Snap - V Mode**

Snap Tangential - Height Grip (Square)

After selecting the ***Height*** grip (diamond), typing **t** puts the string select into tangential mode and when a string is tentatively picked, the snap point moves to make the line from the snap point to the symbol justification point (J mode)/vertex (V-mode) tangential to the selected string.



Height Tangential Snap - J Mode



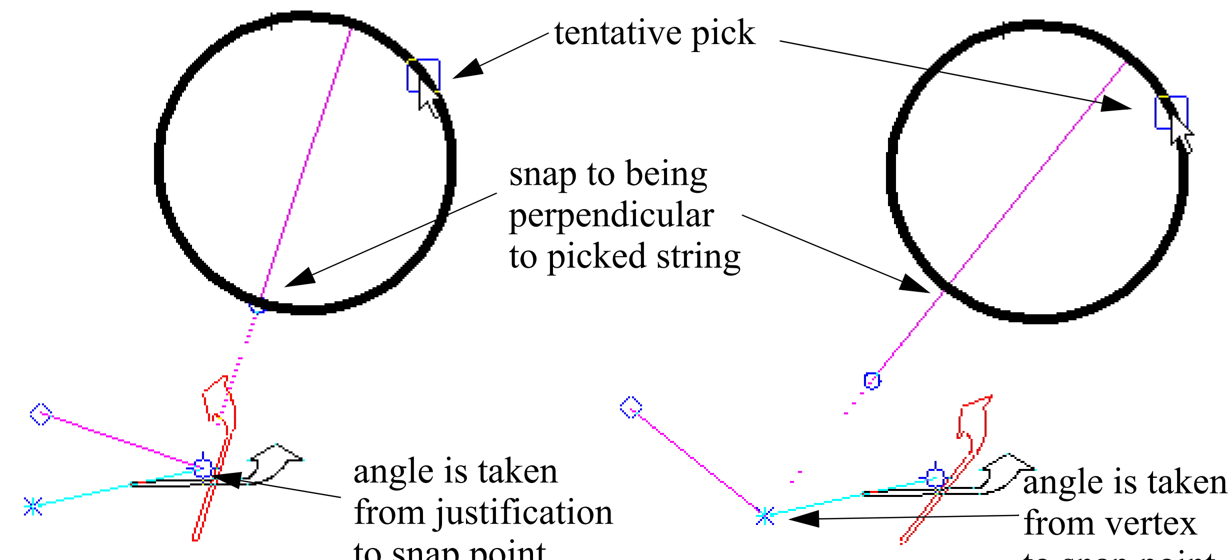
Height Tangential Snap - V Mode

Before the accept button is selected, **p** can be typed to toggle to perpendicular snap mode, **c** to return to using the cursor position or **d** to bring up the dynamic value.

Snap Perpendicular - Typing p

Snap Perpendicular - Rotation grip (Circle)

After selecting the ***Rotation*** grip (circle), typing **p** puts the string select into perpendicular mode and when a string is tentatively picked, the snap point moves to make the line from the snap point to the symbol justification point in J mode (or the vertex in V-mode) perpendicular to the selected string.

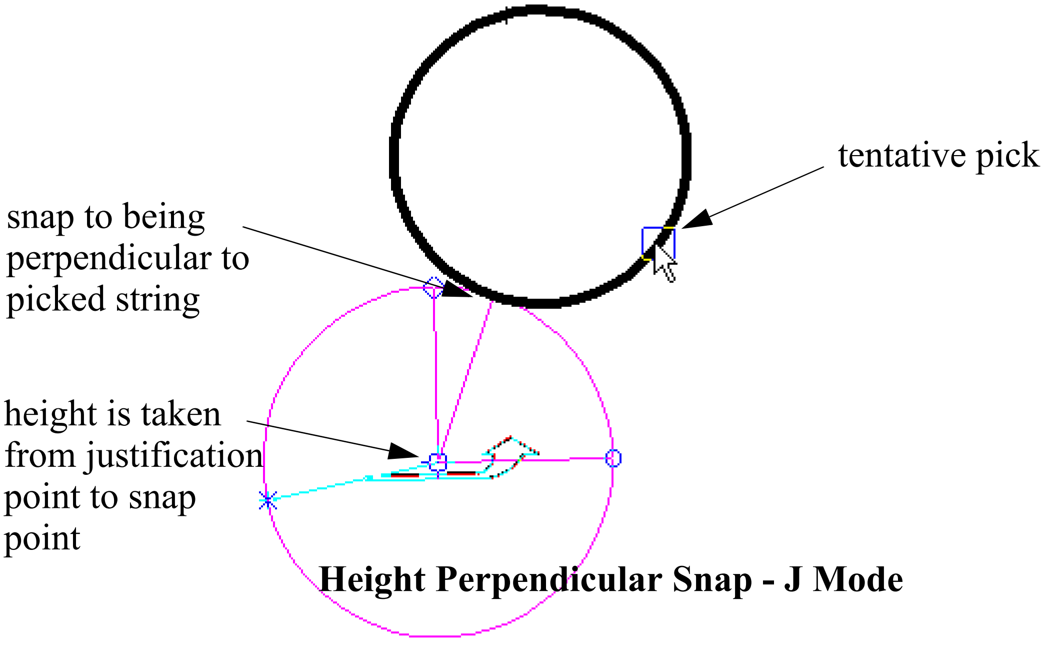


Rotation Perpendicular Snap J Mode

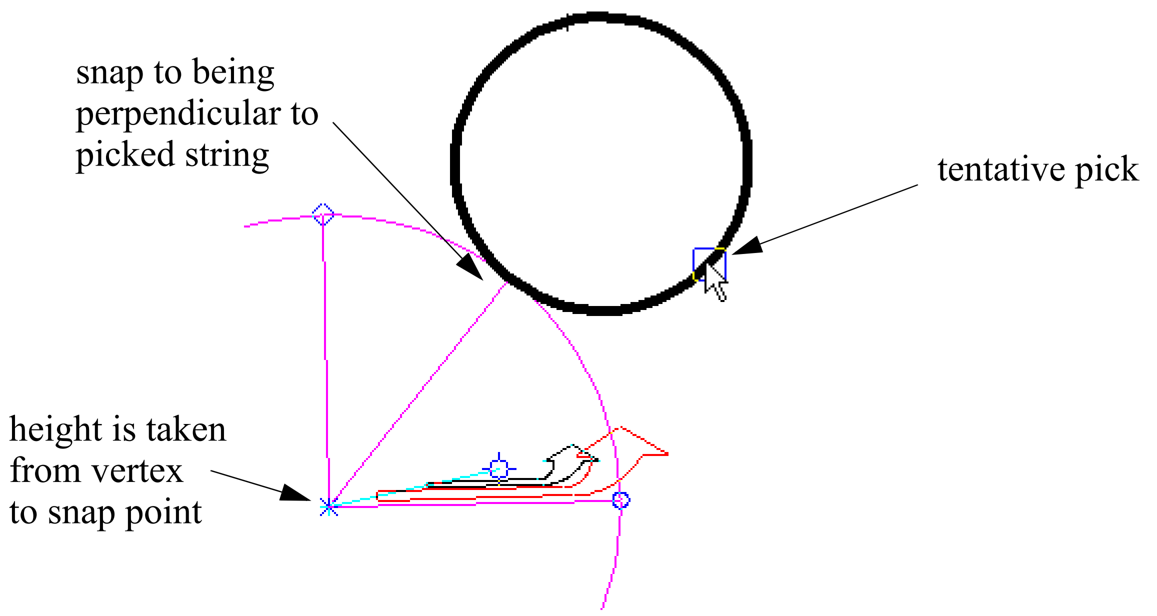
Rotation Perpendicular Snap V Mode

Snap Perpendicular - Height Grip (Square)

After selecting the ***Height*** grip (diamond), typing **p** puts the string select into perpendicular mode and when a string is tentatively picked, the snap point moves to make the line from the snap point to the symbol justification point in J mode (or vertex in V-mode) perpendicular to the selected string.



Height Perpendicular Snap - J Mode



Height Perpendicular Snap - V Mode

Before the accept button is selected, **t** can be typed to toggle to tangential snap mode, **c** to return to using the cursor position or **d** to bring up the dynamic value.

Cursor Mode - Typing c

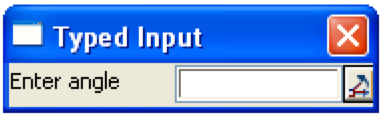
If in either Tangential or Perpendicular mode, typing **c** return to cursor mode.

Negative Angle - Typing n

Adds 180 degrees to the current angle.

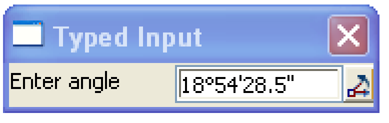
Hitting Space Bar

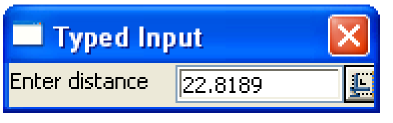
Brings up the **Enter angle** (modifying angle) or **Enter distance** (modifying height) **Typed input** box with no value in it.



Display Dynamic Value - Typing d

Brings up the **Enter angle** (modifying angle) or **Enter distance** (modifying height) **Typed input** box with the *dynamic* value in it.





Please continue to the next section 4.19.1 Expressions in Panel Fields.

4.16 Last Expression

Brings up the last expression or real value typed into the box. For example, if 3*4 is typed and <Enter> pressed, 12 will be displayed. The **Last Expression** pop-up will bring back the 3*4.

Please continue to the next section 4.17 Bearings and Angles.

4.17 Bearings and Angles

4.17.1 HP Notation

Many panels and options take angles or bearings as input. The 12d Model default for most angles or bearings is in degrees, minutes and second (dms).

To save typing, this is written in ***HP Notation*** in the form

ddd.mmssfff

where **ddd.mmssfff** is the angle or bearing expressed in degrees, minutes and seconds as

ddd	whole degrees
.	separator between degrees and minutes
mm	whole minutes
ss	whole seconds
fff	fractions of seconds (as many as required)

Notes

1. The decimal point **.** indicates where the degrees stops and the minutes begin.
2. If there is only whole degrees, the **.mmssfff** can be omitted. However, if there are any minutes, seconds or fractions of seconds, there must be **two digits** of whole minutes.
3. If there are no seconds or fractions of seconds, then the **ssfff** can be omitted. However, if there are any seconds or fractions of seconds, there must be **two digits** of whole seconds.
4. There are as many digits of fractions of seconds as required (possibly none).

For example

35	is 35 degrees
35.09	is 35 degrees and nine minutes
35.0901	is 35 degrees, nine minutes and one second
35.090107	is 35 degrees, nine minutes and 1.07 seconds

4.17.2 Decimal Degrees for Angles

At times, angles or bearings are given as decimal degrees rather than in 4.17.1 HP Notation.

For decimal degrees, positions after the decimal point represent decimal degrees.

Please continue to the next section 4.18 Precision.

4.18 Precision

Double precision variables are used throughout 12d Model for all coordinate values and calculations.

Although this increases the time taken for calculations, it is more than offset by the increase in the accuracy of the data and the results of any calculations.

Because of the accuracy of double precision variables (fourteen significant figures), there is no practical restriction on the coordinate area covered by projects.

The default number of decimal places for displaying values in the *information menu* is three (3).

This number of decimal places is controlled by the **display precision** field in the **System Settings** tab of the **Defaults** panel (option **Utilities=>Defaults**).

The default number of decimal places for displaying values in *boxes* and *panels* is four(4).

This number of decimal places is controlled by the **box precision** field in the **System Settings** tab of the **Defaults** panel (option **Utilities=>Defaults**).

Go to the next section 4.19 Panel Fields.

4.19 Panel Fields

For general information about Panels, *see* 4.3.6 Panels.

For more particular information, see

4.19.1 Expressions in Panel Fields

See

4.19.1.1 Expressions in Real Value Fields
4.19.1.2 Expressions in Bearing, Angle Panel Fields
4.19.1.3 Expressions in Integer Value Fields

4.19.1.1 Expressions in Real Value Fields

See

4.19.1.1.1 Mathematical Expressions in Real Value Fields
4.19.1.1.2 If Else in Real Value Fields

4.19.1.1.1 Mathematical Expressions in Real Value Fields

A **Real** panel field is a panel field that can only take real numbers. That is, numbers that have a decimal place. For example 0.1, 1 and -2.3.

Whenever a ***real value*** such as height or width is required in a **Real** panel field other **than an Angle or Bearing panel field**, mathematical expressions can be typed in and then evaluated by ***12d Model*** when <enter> is pressed. See the section 4.19.1.2 Expressions in Bearing, Angle Panel Fields for what is allowed in angle/bearing panel fields.

Expressions can be made up from the operators

*	multiply
/	divide
+	addition
-	subtraction

where * and / take precedence over + and -.

Nested brackets "(" and ")" are supported to any level.

The following functions are also supported

sin
cos
tan
sqrt
square
null

Note that for the trigonometric functions, the angle is in **degrees, minutes and seconds** (see section on Angles and Bearings) and is either a cartesian angle or a bearing depending on the setting of the **Angle mode** in the *System Settings* tab of **Utilities=>Defaults.**

For example, cos(90) is 0 for a Cartesian angle of 90 or 1 for a bearing of 90 degrees.

Examples of expressions are:

10.0 + 19.7

sin(90.30)

(10 + sin(45))/3.0

After the expression has been evaluated, it is still possible to bring back the last expressions, make modifications to the expression and then re-evaluate it.

To get the last expression, simply click on the **[+]** button at the end of the field to bring up the **measures** menu and select **Last expression** from it. The last expression is then returned to the panel field ready for modifications.

Warning

Only limited expressions are supported for bearing/angle boxes. See the section 4.19.1.2

Expressions in Bearing, Angle Panel Fields for what is allowed in the Angle and Bearing panel fields.

Go to the next section 4.19.1.2 Expressions in Bearing, Angle Panel Fields or return to 4.19.1 Expressions in Panel Fields.

4.19.1.1.2 If Else in Real Value Fields

There is an **if else** conditional expression that can be used in **Real** fields:

if *(logical_expression) value_1* **else** *value_2*

which has the meaning

if *logical_expression* is true then use *value_1* otherwise use *value_2*.

where ***value_1*** and ***value_2*** are expressions that evaluate to a real value.

One restriction is that the l***ogical_expression*** must be enclosed in round brackets.

For example,

if (3*4<13) 3 else 4

This may not seem to be of much use except that it works nicely with Snippets.

For example, you can then have in a Real field

if ($VAL1< 0) -1*VAL1 else $VAL1

where VAL1 is a snippet parameter.

For more information on snippets, see 21.5 Defining and Using Snippets.

Important Note

Note that *value_1* or *value_2* can be an **if else** conditional expressions so you can have **nested conditional expressions**. That is

if *(logical_expression) conditional_expression_1* **else** *conditional_expression_2*

For example

if ($VAL1 < 0) if (3*4<13) 3 else 4 else $VAL1

will be par sed as

if ($VAL1 < 0) (if (3*4<13) 3 else 4) else $VAL1

Hint: if something doesn’t seem to work, put more round brackets in.

Go to the next section 4.19.1.2 Expressions in Bearing, Angle Panel Fields or return to 4.19.1.1 Expressions in Real Value Fields or 4.19.1 Expressions in Panel Fields.

4.19.1.2 Expressions in Bearing, Angle Panel Fields

Bearing and **Angle** panel fields are panel field that can only take angles.

Because bearings (angles) and numbers **can not** be used interchangeably in mathematical expressions, only a limited number of expressions can be supported in a **Bearing** or **Angle** panel field.

Bearings (angles) can be added or subtracted from other bearings (angles) but a number can not be added or subtracted from a bearing (angle). So the addition and subtraction of bearings (angles) is supported but addition/subtraction of a bearing (angle) and a number is invalid.

Bearings (angles) can not be multiplied or divided by another bearing (angle) but a bearing (angle) can be multiplied or divided by a number. However because the input of a bearing (angle) in degrees, minutes and seconds looks like a decimal number (see the previous section 4.17 Bearings and Angles), a rule must be made to distinguish between bearings (angles) and numbers for multiplication and division. In ***12d Model***, the bearing (angle) is on the left of the number it is being multiple or divided by.

So in a bearing (angle) panel field and grid, the following is supported:

(a) add or subtract bearings (angles) i.e. bearing + bearing or bearing - bearing is allowed

(b) type bearing*number + bearing *number - note that the number is on the right of the *

(c) type bearing *number - bearing *number - note that the number is on the right of the *

(d) type bearing /number + bearing *number - note that the number is on the right side of the /

(e) type bearing /number + bearing *number - note that the number is on the right side of the /

Because a user often wishes to add or subtract 90 degrees from a bearing or angle, the Page Down/Page Up keys have a special meaning when the focus in on the bearing (angle) panel field. For a bearing (or angle) panel field (but ***not for a grid***):

(f)	Page up	- subtracts 90 degrees to the bearing/angle
(g)	Ctrl + page up	- subtracts 15 degrees to the bearing/angle
(h)	Shift + page up	- subtracts 10 degrees to the bearing/angle
(i)	Shift + Ctrl + page up	- subtracts 6 degrees to the bearing/angle
(j)	Page down	- adds 90 degrees to the bearing/angle
(k)	Ctrl + page down	- adds 15 degrees to the bearing/angle
(l)	Shift + page down	- adds 10 degrees to the bearing/angle
(m)	Shift + Ctrl + page down	- adds 6 degrees to the bearing/angle

Go to the next section 4.19.1.3 Expressions in Integer Value Fields or return to 4.19.1 Expressions in Panel Fields.

4.19.1.3 Expressions in Integer Value Fields

An **Integer** panel field is a panel field that can only take and integer number. For example 0, 1 and -2.

The arithmetic operations plus (+), subtraction (-), divide (/) and multiplication (*) are now allowed in an **Integer** panel field.

The calculations are all done as real arithmetic and the result is rounded to an integer value at the **end** of all the calculations and not along the way.

Go to the next section 4.19.2 Pre*Postfix in Panel Fields or return to 4.19.1 Expressions in Panel Fields.

4.19.2 Pre*Postfix in Panel Fields

In many options in ***12d Model***, text needs to added to the beginning (prefix) of name and also added to the end (postfix) of a name. For example, the

Instead of needing a panel field for the prefixed text and another for the postfixed text, ***12d Model*** often used a special shorthand notation called pre*postfix to combine the two into one text field.

When the word ***pre*postfix*** is used on a panel field, it has the special meaning that for any text type into the panel field, any text before the * is considered to be text for prefixing, and any text after the ***** is taken to be text for postfixing. Note that spaces are significant.

Hence "E ***** m" means that "E " is prefix text and " m" is postfix text.

If prefix text only is required, just give the text since the * is not required at the end of the text. For example "E " or "E *" will prefix the text "E ".

If postfix text only is required then the text must be preceded by a *. For example "* m" will postfix the text " m".

For example, if a panel field had

Pre*postfix for models	new * data

then "new " would be added to the beginning of the model names and " data" would be added to the end of the model names.

Go to the next section 4.19.3 Data Source or return to 4.19 Panel Fields.

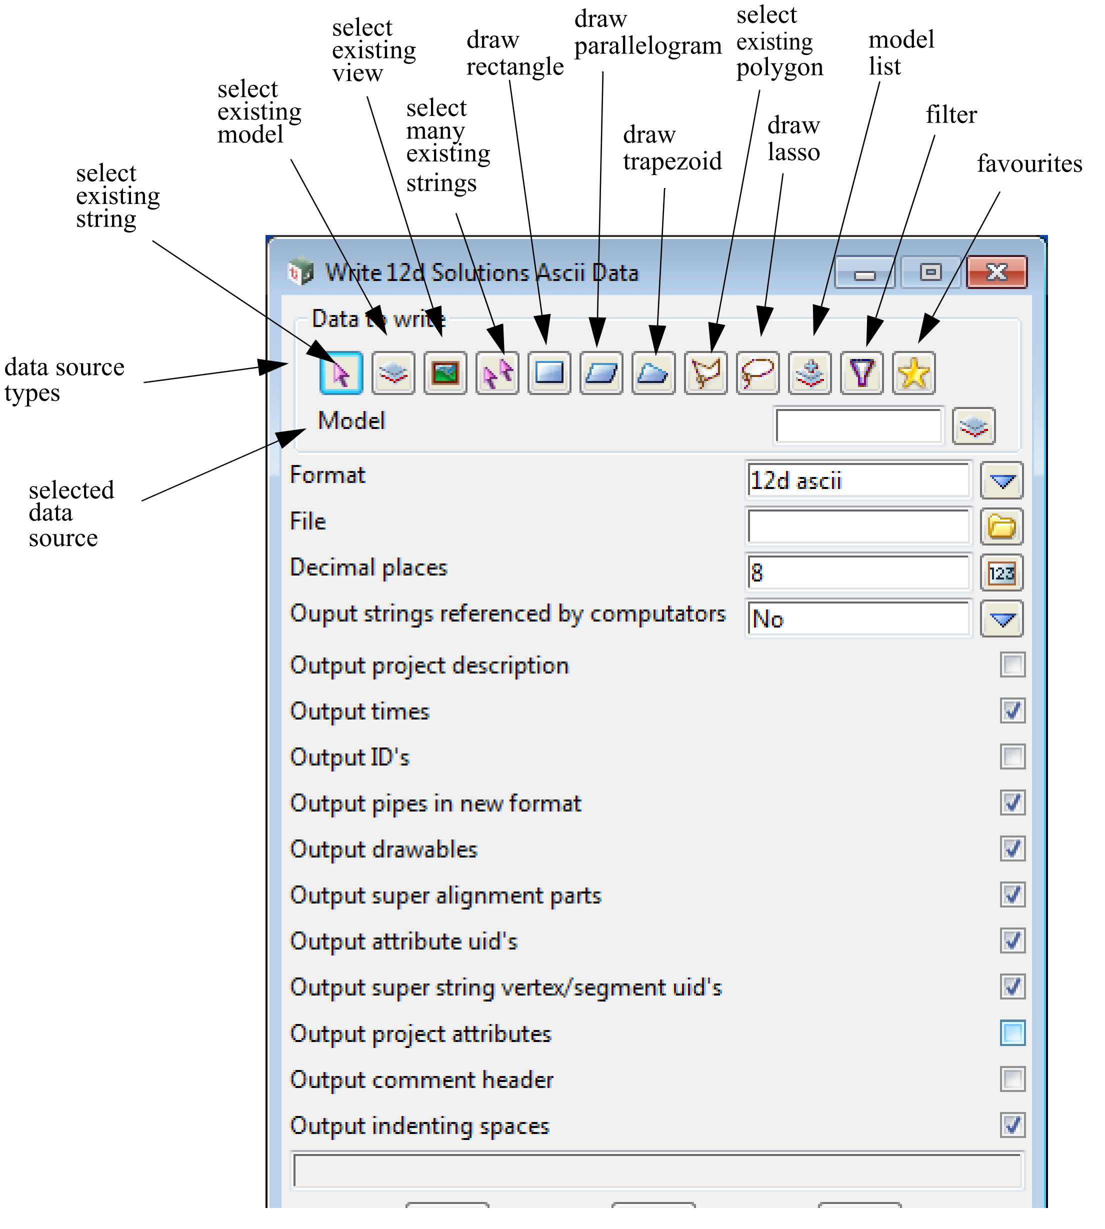
4.19.3 Data Source

Many options contain the panel field **Data source** which may have one or more of the selection choices:

string, model, view, multi-pick strings, rectangle, parallelogram, polygon, lasso, model list, filter, favourites

Depending on the Data Source choice, the panel fields after the Data Source icons will be changed to suite the Data Source choice.

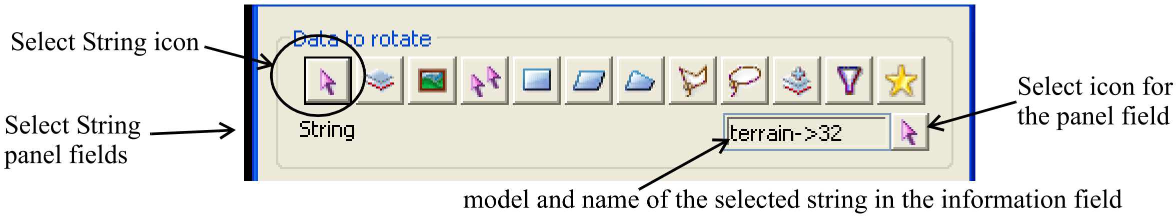
For example, for the choice **Model**, the next field will be **Model**.



See 4.19.3.1 Select Existing String
See 4.19.3.2 Select Existing Model
See 4.19.3.3 Select Existing View
See 4.19.3.4 Select Many Strings
See 4.19.3.5 Select Using a User Drawn Rectangle
See 4.19.3.6 Select Using a User Drawn Parallelogram

See 4.19.3.7 Select Using a User Drawn Trapezoid
See 4.19.3.8 Select an Existing Polygon
See 4.19.3.9 Select Using a User Drawn Lasso
See 4.19.3.10 Select many models
See 4.19.3.11 Select Filter
See 4.19.3.12 Favourites

4.19.3.1 Select Existing String



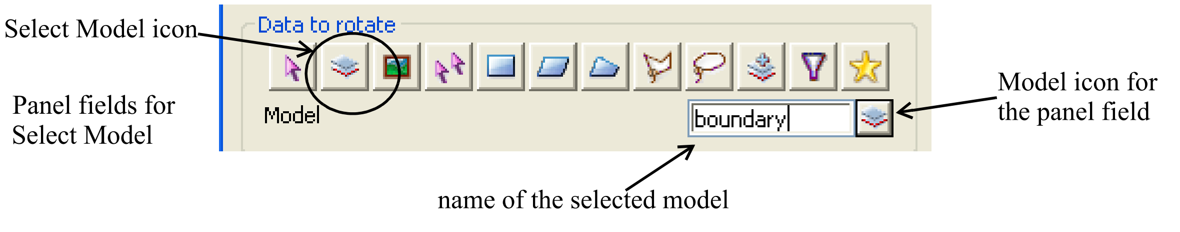
*After clicking on the **Select String** icon, a String Select is started and the Select String panel field called **String** is placed under the Data Source icons.*

When a string is selected, its model and name of the string is displayed in the String Select information field.

To selected a different string, the Select icon for the String Select panel field (to the right of the string name field) must be used as the Data Source Select String icon is now inactive.

Continue to 4.19.3.2 Select Existing Model or return to 4.19.3 Data Source

4.19.3.2 Select Existing Model



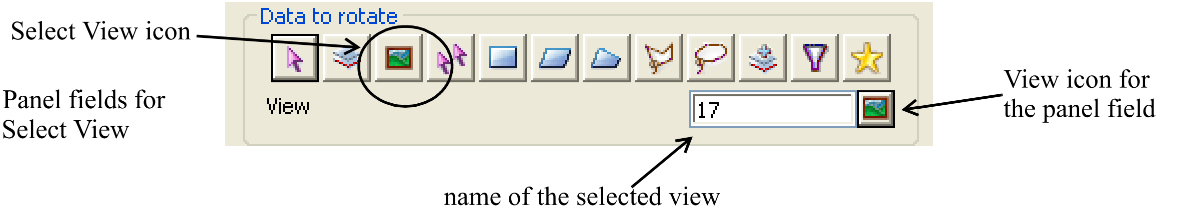
*After clicking on the **Select Model** icon, a Model panel field is placed under the Data Source icons.*

A model name can be typed into the panel field or a model selected from the Model icon from the Model panel field (to the right of the model name field).

To select a different model, the Model icon for the Model panel field must be used as the Data Source Select Model icon is now inactive.

Continue to 4.19.3.3 Select Existing View or return to 4.19.3 Data Source

4.19.3.3 Select Existing View



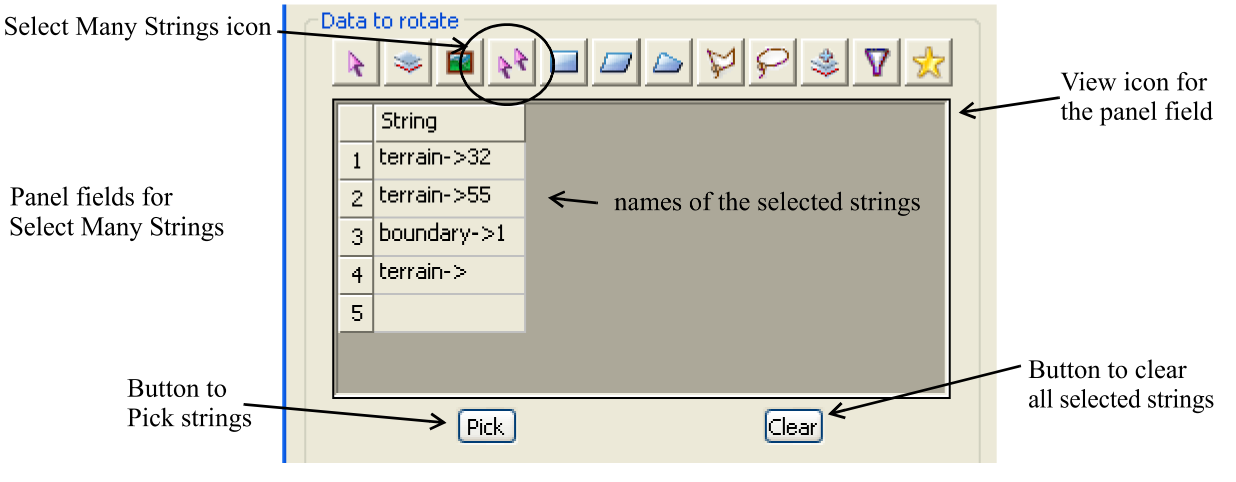
After clicking on the ***Select View*** *icon, a View panel field is placed under the Data Source icons.*

A view name can be typed into the panel field or a view selected from the View icon from the View panel field (to the right of the view name field).

To select a different view, the View icon for the View panel field must be used as the Data Source Select View icon is now inactive.

Continue to 4.19.3.4 Select Many Strings or return to 4.19.3 Data Source

4.19.3.4 Select Many Strings



After clicking on the ***Select Many Strings*** *icon, the panel fields for the Select Many Strings are placed under the Data Source icons.*

The Select Many Strings panel fields consists of a grid to display the model and string name of selected strings, a Pick button to start selecting strings and a Clear button to deselect the currently selected strings.

To begin selecting strings, click on the ***Pick*** *button. Strings are then selected and accepted and this continues until RB is pushed and* ***Cancel*** *selected from the* ***Pick Ops*** *menu. As each string is selected it is highlighted and the selected strings stay highlighted after they are selected.*

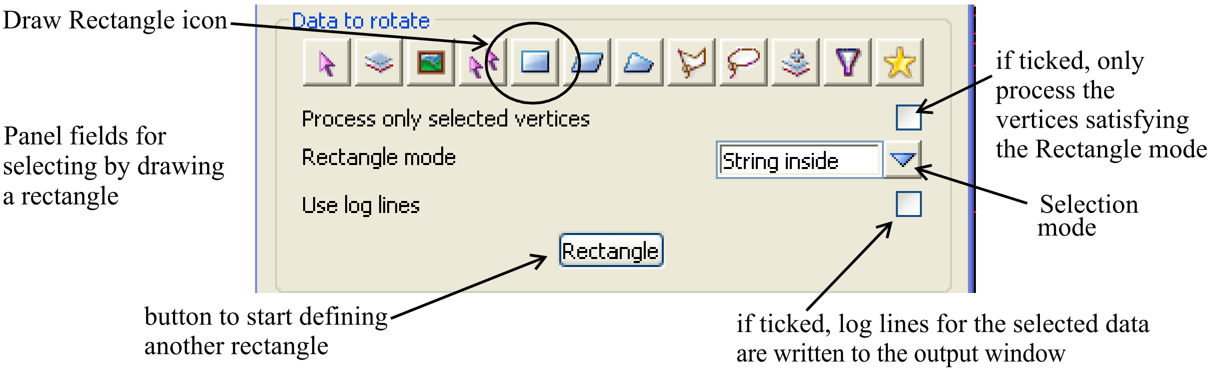
To pick ***more*** *strings, simply click on* ***Pick*** *and start selecting again. The new strings are added to the bottom of the String name grid and all the new strings also remain highlighted.*

To clear all the selected string, simply click on ***Clear.***

The Data Source Select Many Strings icon is made inactive after the option is first selected.

Continue to 4.19.3.5 Select Using a User Drawn Rectangle or return to 4.19.3 Data Source

4.19.3.5 Select Using a User Drawn Rectangle



*After clicking on the **Draw Rectangle** icon, the panels fields for selecting by drawing a rectangle are placed under the Data Source icons and the rectangle drawing process is automatically started.*

First the position of one corner of the rectangle is selected by clicking LB on a plan view and then a rectangle parallel to the x and y axis is drawn to the current cursor position. The rectangle is completed by clicking LB at a second position.

Strings are selected by using the rectangle and the Rectangle mode which is:

*if **Process only selected vertices** is ticked on, **Rectangle mode** choices are:*

Vertices inside or Vertices outside

*if **Process only selected vertices** is not ticked, **Rectangle mode** choices are:*

String inside, String outside, String crossing, String inside/crossing, String outside/crossing

*Any strings/vertices satisfying the **Rectangle mode** will be highlighted when the rectangle is completed.*

*If **Process only selected vertices** or **Rectangle mode** is modified, the new strings/vertices satisfying he new parameters are highlighted.*

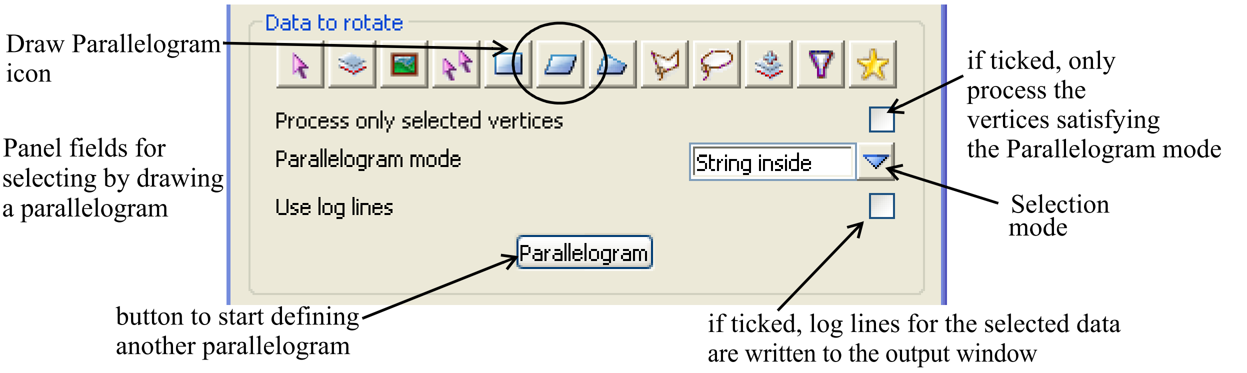
*If **Use log lines** is ticked, log lines for the selected data are written to the output window.*

*To draw a new rectangle, click on the **Rectangle** button and draw a new rectangle.*

The Data Source Draw Rectangle icon is made inactive after the option is first selected.

Continue to 4.19.3.6 Select Using a User Drawn Parallelogram or return to 4.19.3 Data Source

4.19.3.6 Select Using a User Drawn Parallelogram



*After clicking on the **Draw Parallelogram** icon, the panels fields for selecting by drawing a parallelogram are placed under the Data Source icons and the parallelogram drawing process is automatically started.*

First two positions defining ne side of the parallelogram by clicking LB at each position. A parallelogram is then drawn to the current cursor position. The parallelogram is completed by clicking LB at a third position.

Strings are selected by using the parallelogram and the Parallelogram mode which is:

*if **Process only selected vertices** is ticked on, **Parallelogram mode** choices are:*

Vertices inside or Vertices outside

*if **Process only selected vertices** is not ticked, **Parallelogram mode** choices are:*

String inside, String outside, String crossing, String inside/crossing, String outside/crossing

*Any strings/vertices satisfying the **Parallelogram mode** will be highlighted when the parallelogram is completed.*

*If **Process only selected vertices** or **Parallelogram mode** is modified, the new strings/vertices satisfying he new parameters are highlighted.*

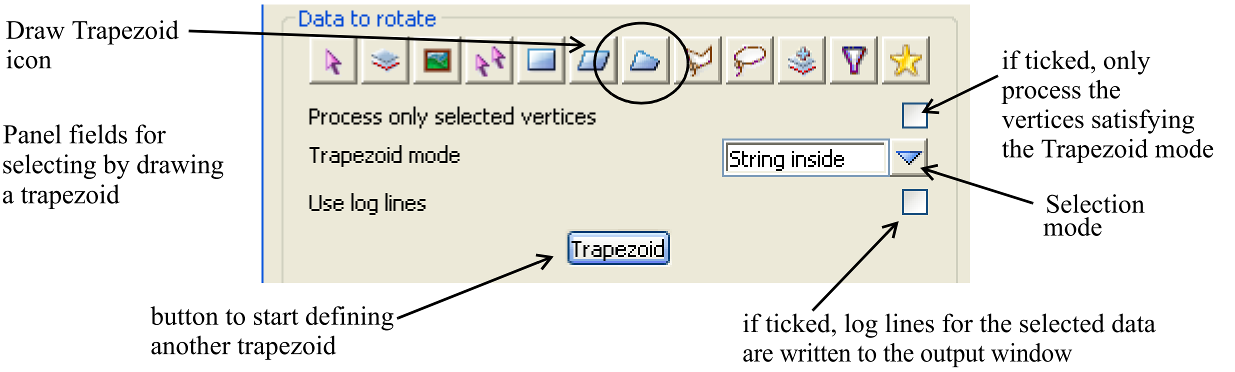
*If **Use log lines** is ticked, log lines for the selected data are written to the output window.*

*To draw a new parallelogram, click on the **Parallelogram** button and draw a new parallelogram.*

The Data Source Draw Parallelogram icon is made inactive after the option is first selected.

Continue to 4.19.3.7 Select Using a User Drawn Trapezoid or return to 4.19.3 Data Source

4.19.3.7 Select Using a User Drawn Trapezoid



*After clicking on the **Draw Trapezoid** icon, the panel fields for selecting by drawing a trapezoid are placed under the Data Source icons and the trapezoid drawing process is automatically started.*

Four positions representing the four vertices of the trapezoid by clicking LB at each of the positions. The trapezoid is completed after the fourth position is selected.

Strings are selected by using the trapezoid and the Trapezoid mode which is:

*if **Process only selected vertices** is ticked on, **Trapezoid mode** choices are:*

Vertices inside or Vertices outside

*if **Process only selected vertices** is not ticked, **Trapezoid mode** choices are:*

String inside, String outside, String crossing, String inside/crossing, String outside/crossing

*Any strings/vertices satisfying the **Trapezoid mode** will be highlighted when the trapezoid is completed.*

*If **Process only selected vertices** or **Trapezoid mode** is modified, the new strings/vertices satisfying he new parameters are highlighted.*

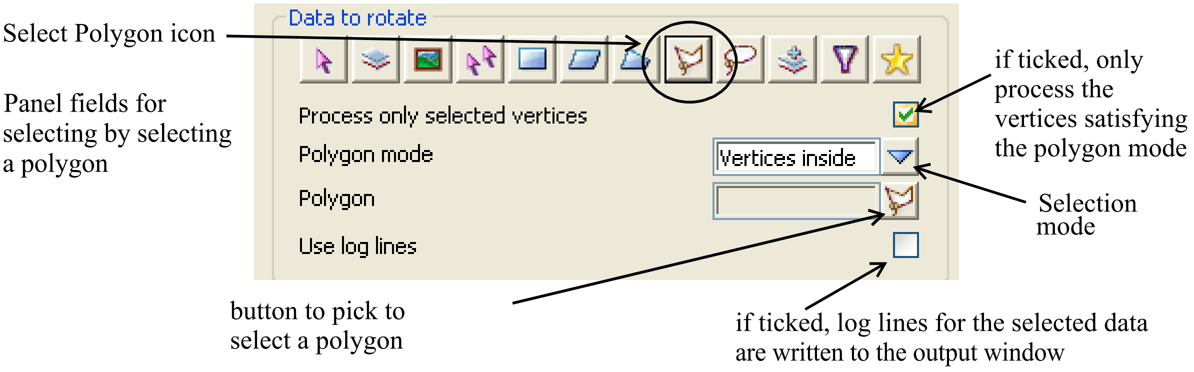
*If **Use log lines** is ticked, log lines for the selected data are written to the output window.*

*To draw a new trapezoid, click on the **Trapezoid** button and draw a new trapezoid.*

The Data Source Draw Trapezoid icon is made inactive after the option is first selected.

Continue to 4.19.3.8 Select an Existing Polygon or return to 4.19.3 Data Source

4.19.3.8 Select an Existing Polygon



After clicking on the ***Select Polygon*** *icon, the panel fields for selecting by selecting a polygon are placed under the Data Source icons.*

A polygon is then selected by clicking on the Select polygon button on the right of the Polygon panel field, and then selecting a polygon.

Note*: a polygon is just a closed string. If an open string is selected then a closed string is automatically created by joining the first and the last vertices of the string.*

if ***Process only selected vertices*** *is ticked on,* ***Polygon mode*** *choices are:*

Vertices inside or Vertices outside

if ***Process only selected vertices*** *is not ticked,* ***Polygon mode*** *choices are:*

String inside, String outside, String crossing, String inside/crossing, String outside/crossing

Any strings/vertices satisfying the ***Polygon mode*** *will be highlighted when the polygon is selected.*

If ***Process only selected vertices*** *or* ***Polygon mode*** *is modified, the new strings/vertices satisfying he new parameters are highlighted.*

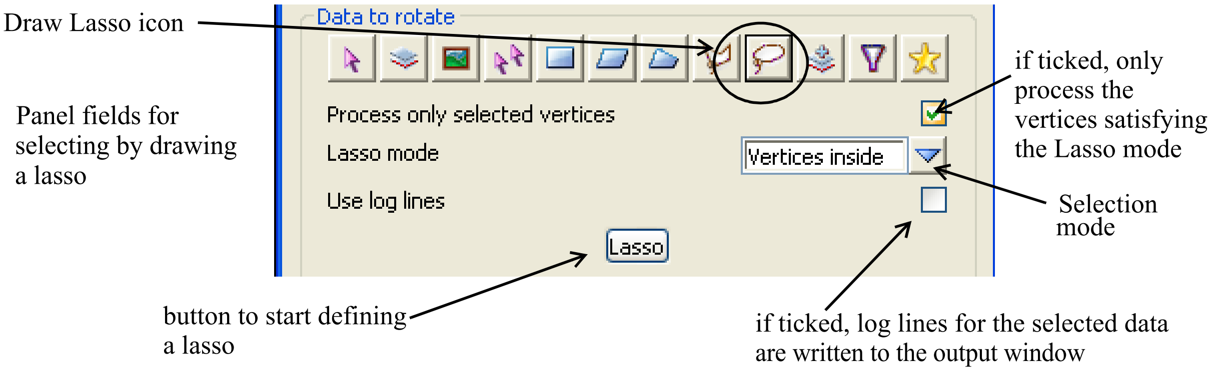
If ***Use log lines*** *is ticked, log lines for the selected data are written to the output window.*

To select a new polygon, click on the Select polygon button on the right of the Polygon panel field and select a new polygon.

The Data Source Select Polygon icon is made inactive after the option is first selected.

Continue to 4.19.3.9 Select Using a User Drawn Lasso or return to 4.19.3 Data Source

4.19.3.9 Select Using a User Drawn Lasso



*After clicking on the **Draw Lasso** icon, the panel fields for selecting by drawing a lasso are placed under the Data Source icons.*

*The lasso drawing process is started by clicking on the **Lasso** button.*

A lasso is then defined by clicking down on the LB and whilst holding the LB down, moving the cursor around to define a freehand lasso. The lasso is completed by letting the LB up and then clicking and releasing MB.

Strings are selected by using the lasso and the Lasso mode which is:

*if **Process only selected vertices** is ticked on, **Lasso mode** choices are:*

Vertices inside or Vertices outside

*if **Process only selected vertices** is not ticked, **Lasso mode** choices are:*

String inside, String outside, String crossing, String inside/crossing, String outside/crossing

*Any strings/vertices satisfying the **Lasso mode** will be highlighted when the lasso is completed.*

*If **Process only selected vertices** or **Lasso mode** is modified, the new strings/vertices satisfying the new parameters are highlighted.*

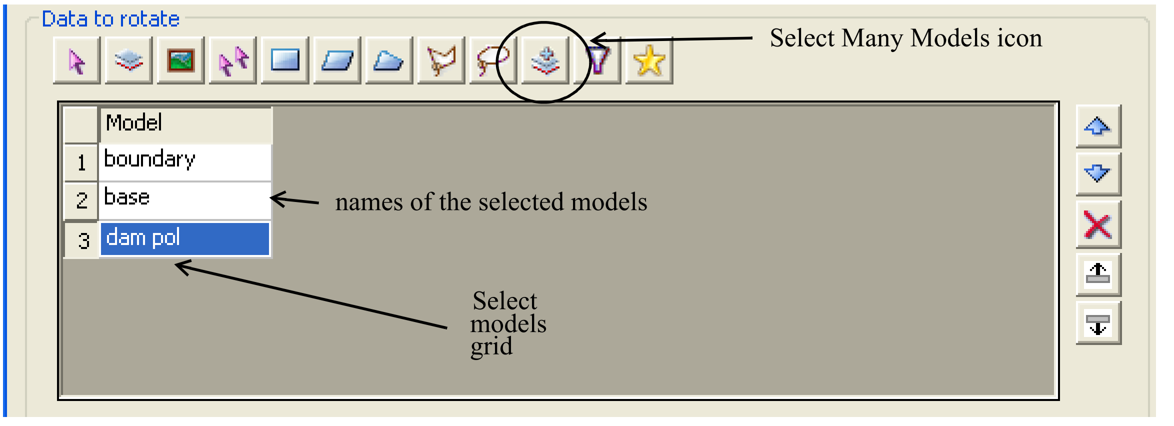
*If **Use log lines** is ticked, log lines for the selected data are written to the output window.*

*To draw a new lasso, click on the **Lasso** button and draw a new lasso.*

The Data Source Draw Lasso icon is made inactive after the option is first selected.

Continue to 4.19.3.10 Select many models or return to 4.19.3 Data Source

4.19.3.10 Select many models



*After clicking on the **Select Many Models** icon, the Select Many Models grid is placed under the Data Source icons.*

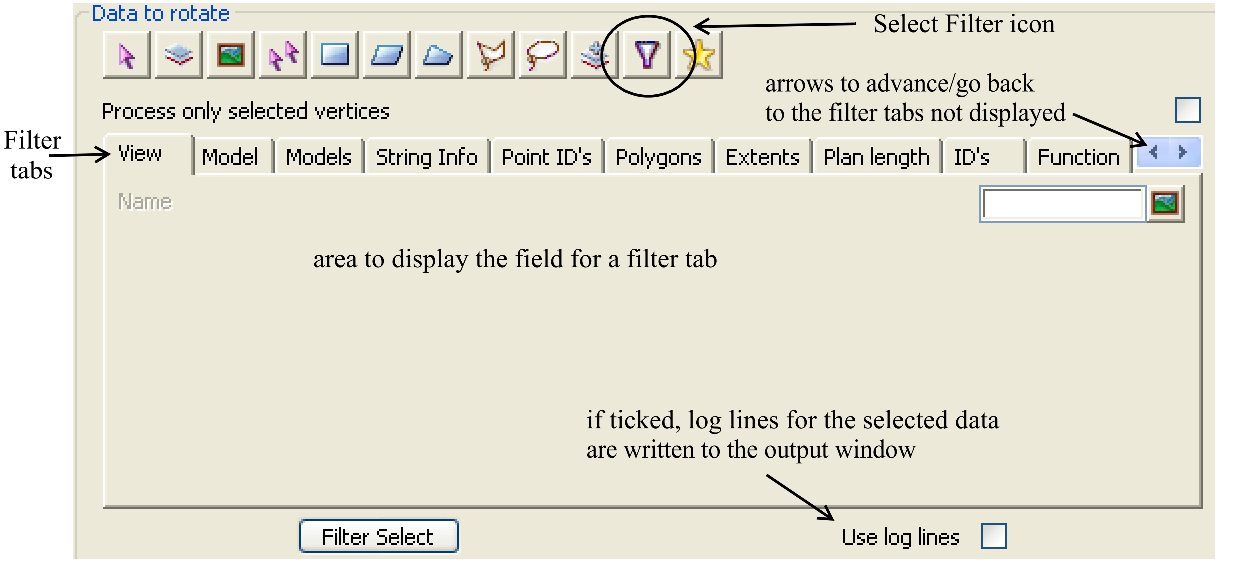
To begin selecting models, type the model name into the a field of the grid, or click RB in the grid and select from the Select Model pop-up (if a pop-up with Browse comes up, select Browse to bring up the Select Model pop-up).

Pressing the <Enter> key will add another blank row to the grid. Or clicking RB on the numbers on the left of the grid will bring up a menu to insert, delete, clear, cut, copy and paste rows. The buttons on the right hand side of the grid will also allow for rows to be moved up or down, delete rows and insert blank rows.

The Data Source Select Many Model icon is made inactive after the option is first selected.

Continue to 4.19.3.11 Select Filter or return to 4.19.3 Data Source

4.19.3.11 Select Filter



*After clicking on the **Select Filter** icon, the **Process only selected vertices** tick box, the **Select Filter tabs**, **Filter Select** button and **User log lines** tick box are placed under the Data Source icons.*

The option works by selecting the data that satisfies EVERY filter tab. That is, the data satisfies ALL the values in ALL the filter tabs.

*So **all** the filter tabs work together to define the selected data.*

For each filter tab required, the user clicks on the tab and fills in the required fields in the filter tabs that are to be satisfied by the selected strings.

*When all the required filter tabs filled in, click on the **Filter Select** button to select the data that satisfies all the filter tabs.*

*If **Process only selected vertices** is ticked, only the vertices of the strings that satisfy the filters are used.*

are selected are

*If **Use log lines** is ticked, log lines for the selected data are written to the output window.*

The full set of filter tabs are:

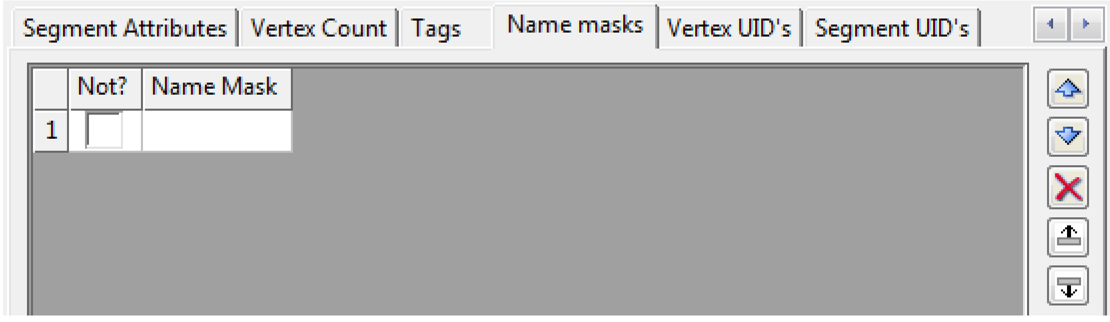
4.19.3.11.18 Name Masks Filter



Name Masks Tab

The Name Masks are used to restrict the strings by comparing the string name with the masks in the Name Mask column.

The order of the Names Masks is important.

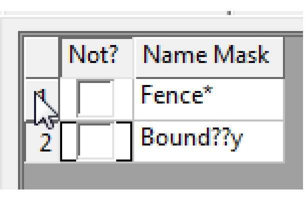
The string name is first compared to the first Name Mask and if the string satisfies the Name Mask, then the string satisfies the Name Masks Tab and no more tests are done for that string.

If the string does not satisfy the first Name Mask, then the string is then compared to the second Name Mask.

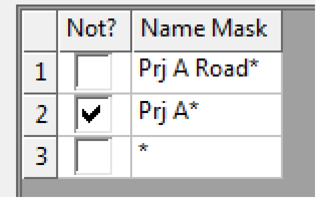
This process is repeated until either the string matches a Name Mask and is selected, or the string matches no Name Mask and so is not selected.

The Name Masks can include the wild card character "" which stands for zero or characters, and the wild character "?" which stands for just one character.*

*If **Not** is ticked, then strings are selected if they **don't satisfy** that Name Mask.*



include all strings starting with "Fence"
include all strings starting with "Bound" then any two characters and then "y"
So only include the "Fence" strings and "Bound??y" strings



include all strings starting with "Prj A Road"
exclude all other strings starting with "Prj A"
include all other strings
So only include the "Prj A Road" strings from "Prj A",*
and all other strings not starting with "Prj A"

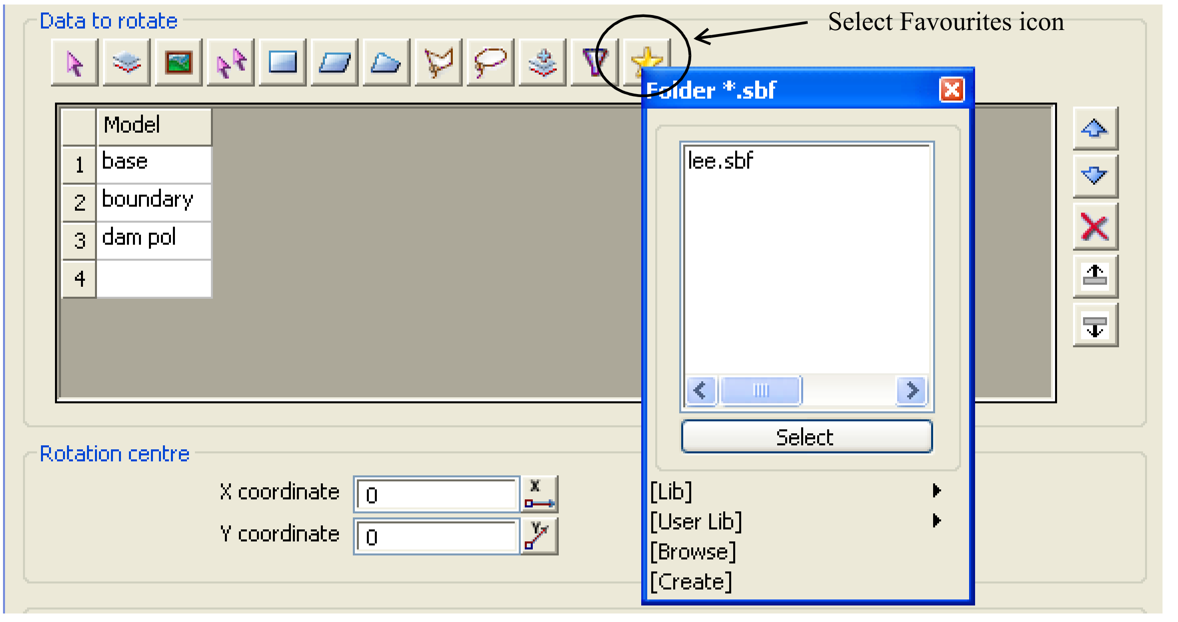
Maximum - if non-blank, then if a string has segments, then this is the maximum value that the UID of the segment can be.

If a field is left blank, then it is not used in the selection process.

Continue to 4.19.3.12 Favourites or return to 4.19.3.11 Select Filter or 4.19.3 Data Source

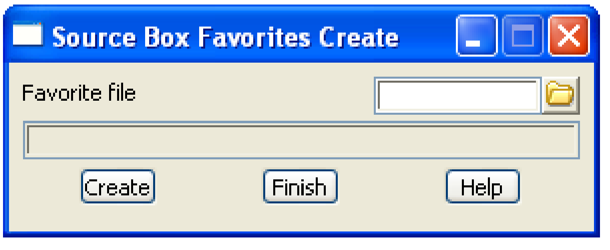
4.19.3.12 Favourites



*After clicking on the **Select Favourites** icon, the Folder *.sbf pop-up is raised showing any local source box favourites files (*.sbf) and with options to look in Lib, User Lib, Customer Lib (if it exists) or to Browse for a sbf file.*

If a sbf file is selected, then the values in it will be used to set up the Data Source Selection.

To write out an sbf file that saves all the parameters for the current Source Box Selection, click on [Create]. This will bring up the Source Box Favourites Create panel.



*To create a sbf file, simply type the name for the sbf file into the Favourite file panel field and then click on **Create**.*

In the documentation for a panel with a data source, only the panel for **Data Source type** *Model* will be shown.

Go to the next section 4.19.4 Data Target or return to 4.19.3 Data Source or 4.19 Panel Fields.

4.19.4 Data Target

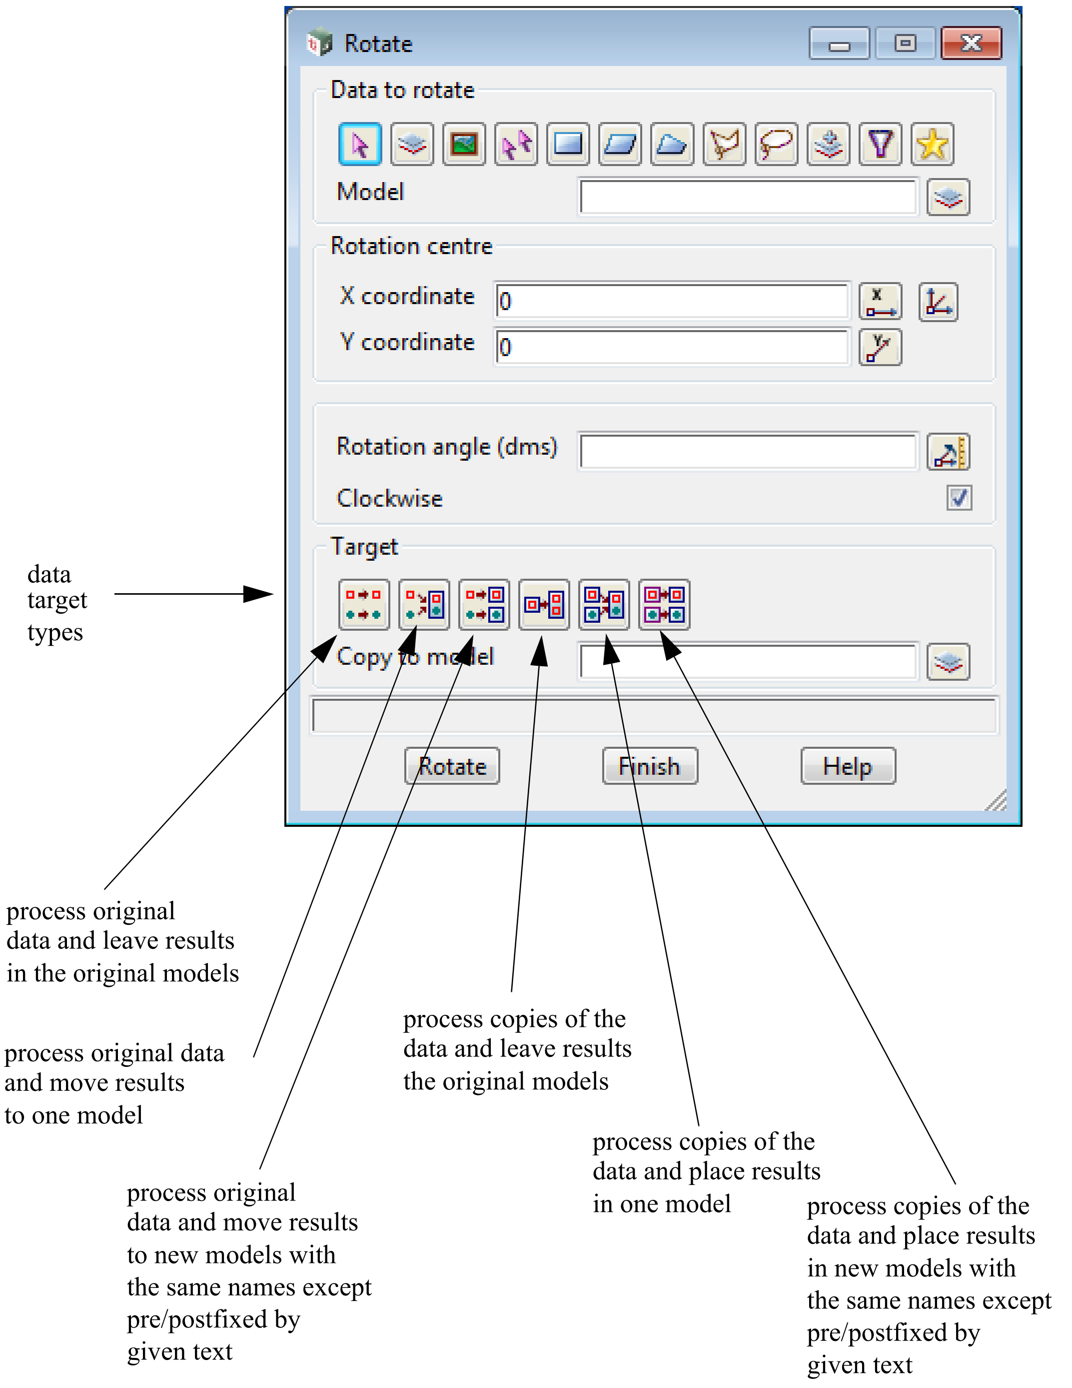
Many options contain the panel field **Data target** which may have one or more of the selection choices:

```
move to original model(s)/replace      // process the original data and leave in models
move to one model                      // move the processed data to one model
move to many models                    // move processed data to models with the same
                                       // names as the original models except the model
                                       // names are pre/postfixed by given text.

copy to original model(s)/replace      // process copies of the data and leave in models
copy to one model                      // process copies of the data and place in one model
copy to many models                    // process copies of the data and place in models with
                                       // the same names as the original models except the
                                       // model names are pre/postfixed by given text.
```

Depending on the choice, the next panel field will be changed to suite the choice of target.

For example, for the choice **Copy to one model**, the next field will be **Copy to model**.



In the documentation for a panel with a data target, only the panel for **Data Target type** *Copy to Model* will be shown.

Go to the next section 4.19.5 Pop-Up Lists and Menus or return to 4.19 Panel Fields.

4.19.5 Pop-Up Lists and Menus

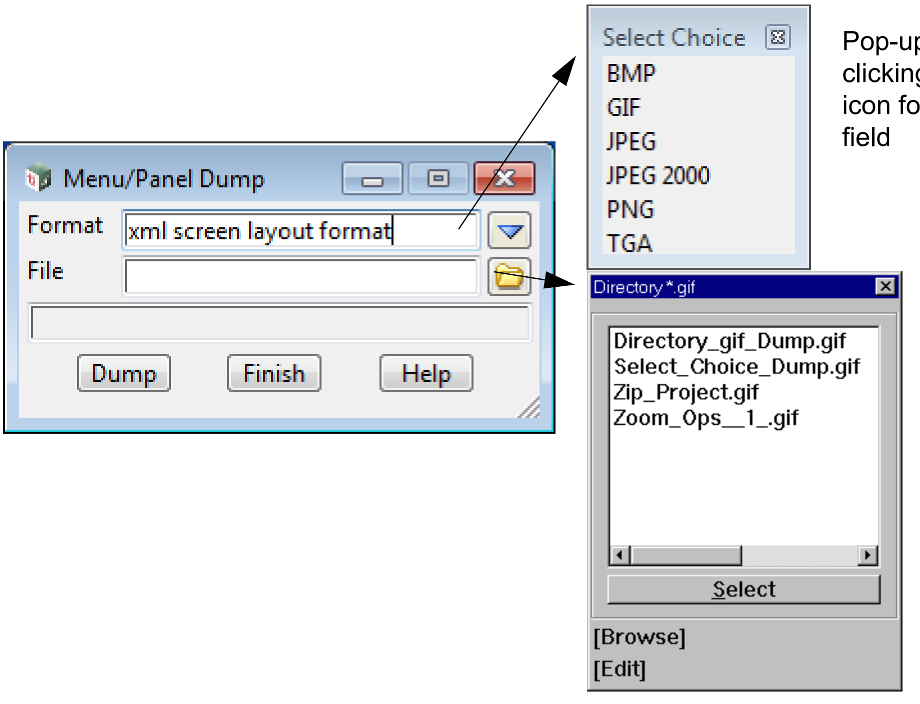
If there are choices available to select from for the panel field, there is a [+] or another special icon displayed at the right hand side of the panel field.

For example, icons that may be used in place of the **+** are:

file/folder	tin	textstyle info
model	choice	line weight
colour when none selected	selected colour	view
line style	polygon	symbol
project	XYZ	X
Y	Z	chainage
string name	select	angle
date/time	function	typed input
ID	plotter/printer	same as

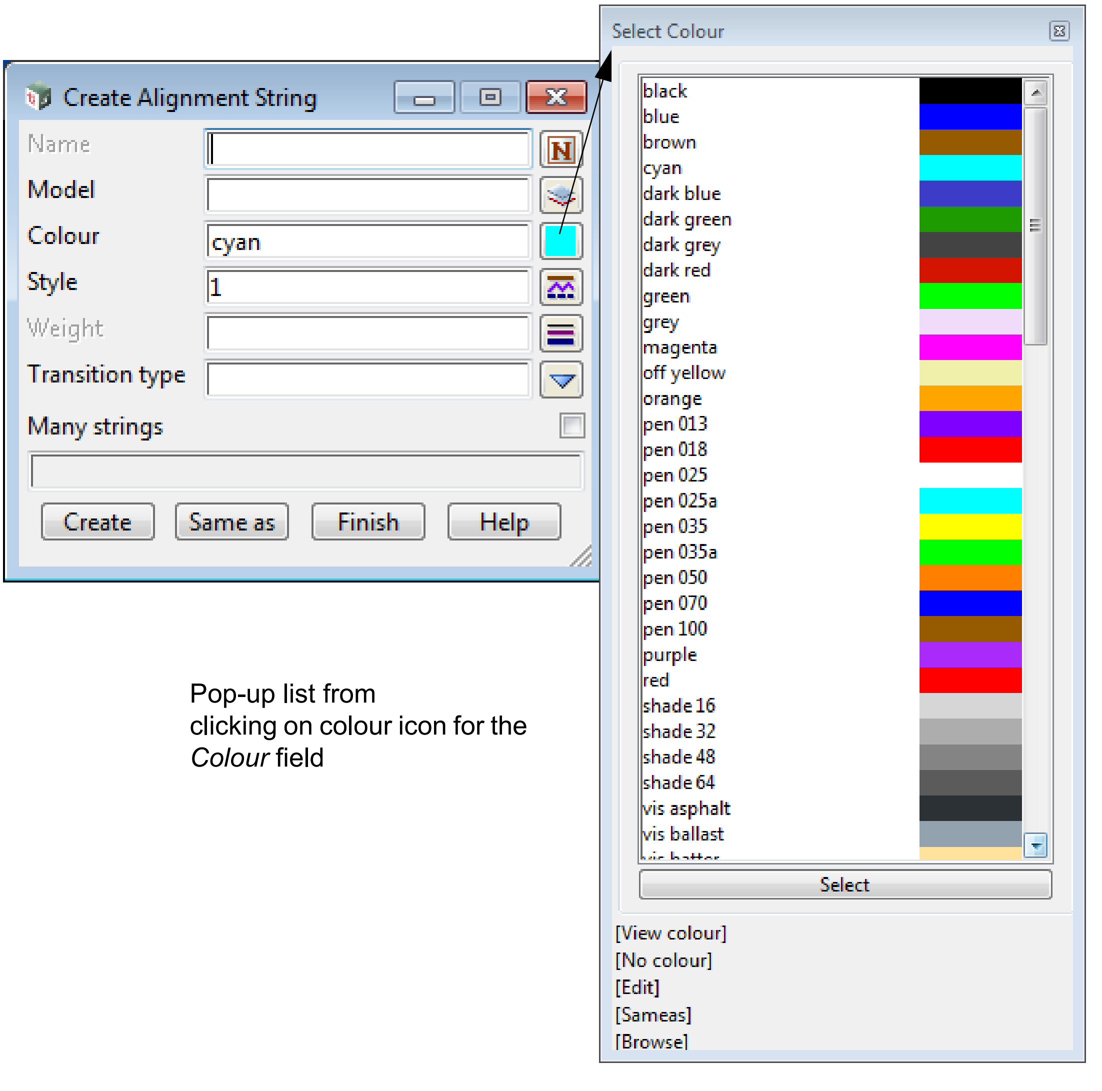
Clicking LB on the one of the above icons or a **[+]** brings up a the **panel field pop-up list** or **pop up menu**.

A panel field pop-up consists of a list of choices which may be displayed as either a *menu* or a *list*



Pop-up menu from clicking on the choice icon for the *Format* field

Pop-up list from clicking on the folder icon for the *File* field



Pop-up list from clicking on colour icon for the *Colour* field

For a *pop-up list*, an answer is chosen from the list by **double** clicking LB over the required answer.This answer is then displayed in the panel field and the pop-up list disappears.

At the bottom of some *pop-up lists* is a:

(a) **[Sameas]** button. If **[Sameas]** is selected then an object with the require property is selected using the mouse and the value from the selected item is written to the panel field.

(b) **[Browse** button. The meaning of **[Browse]** is different for each pop up list.

For some options, more than one selection from a list can be made. In that case, simply use the standard Microsoft methods for multiple selections and then click on **Select**.

For a *pop-up menu*, an answer is chosen from the pop-up menu by clicking LB over the required answer.This answer is then displayed in the panel field and the pop-up menu disappears.

If there are more items to be displayed in a pop-up menu than the number **Popup length** in the panel **Defaults**, the list of choices will have a scroll bar.

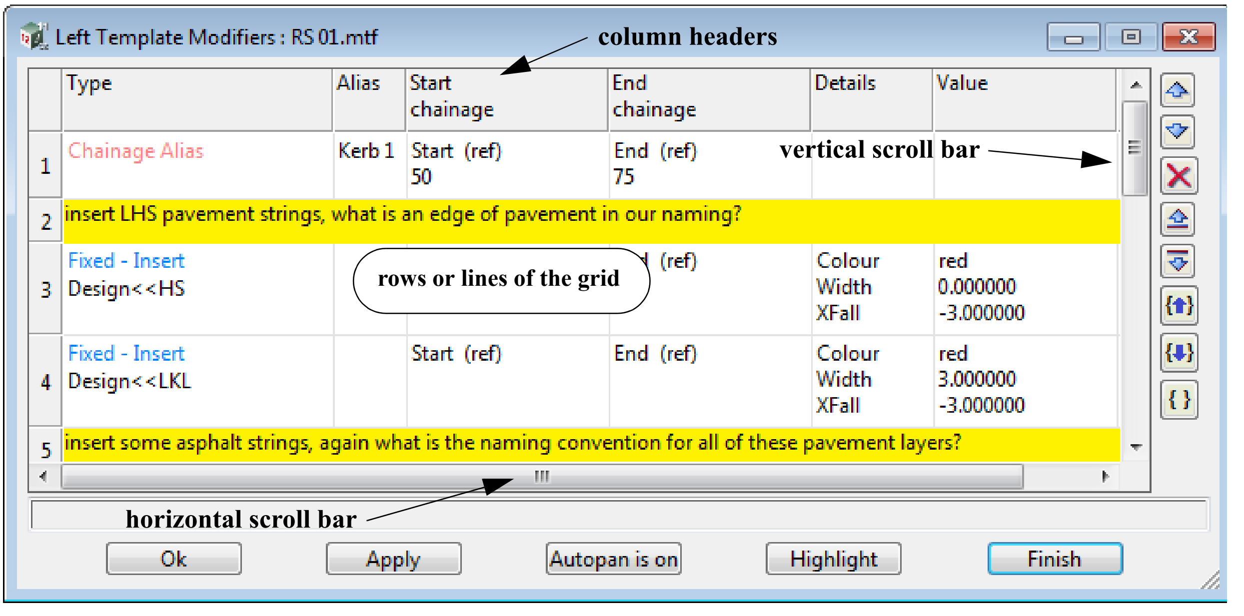
The pop-up list or menu can also be removed without a selection by clicking LB on the **[X]** on the pop-up list or menu, by clicking LB again on the choice icon or **[+]** for the panel field, or by simply typing into any visible part of the panel field that the pop-up is for (some of the field may be obscured by the pop-up itself).

Go to the next section 4.19.6 Grids in Panels or return to 4.19 Panel Fields.

4.19.6 Grids in Panels

Many **12d Model** panels include grids or lists of information which hold an unlimited number of lines or **rows**. The grids may have more than one **column** but the number of columns is usually fixed for that grid.

Each column of the grid normally has a **column header** such as **Type** and **Alias** in the example of the **Left MTF MTF Modifiers** panel.



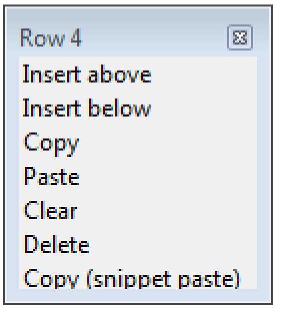
The grid in a panel has only a limited size and so can only display a certain number of rows of the grid. and once the number of rows in the panel exceeds that number, a vertical scroll bar is created on the right hand side of the grid so you can scroll the rows up or down to see the extra rows.

Similarly the grid in a panel can only display a certain number of columns of the grid and once the number of columns in the panel exceeds that number, a horizontal scroll bar is created on the bottom of the grid so you can scroll the columns left and right to see the extra columns.

The **numbers** on the left hand side of the grid indicate the **row** (line) number of the information being displayed and clicking LB on the row number will highlight the row. Additional rows can be highlight at the same time by using the standard Microsoft key combinations on the **row numbers**. For example, <Ctrl>+LB on a row number to add that row to the highlighted rows.

The row numbers are also buttons and when clicked with RB, the **Edit Row n** panel is displayed.

For example



The row that the **Edit Row n** panel was raised on is called the **current** row.

The options on the **Edit Row n** panel have the following functions:

Insert above insert a blank line above the row the current row. The current row and all following rows are pushed down

Insert below insert a blank line below the current row. All the rows below the inserted blank row are pushed down

clear clear the highlighted rows

copy copy the current line into the next line; all following lines are pushed down

delete delete the highlighted rows

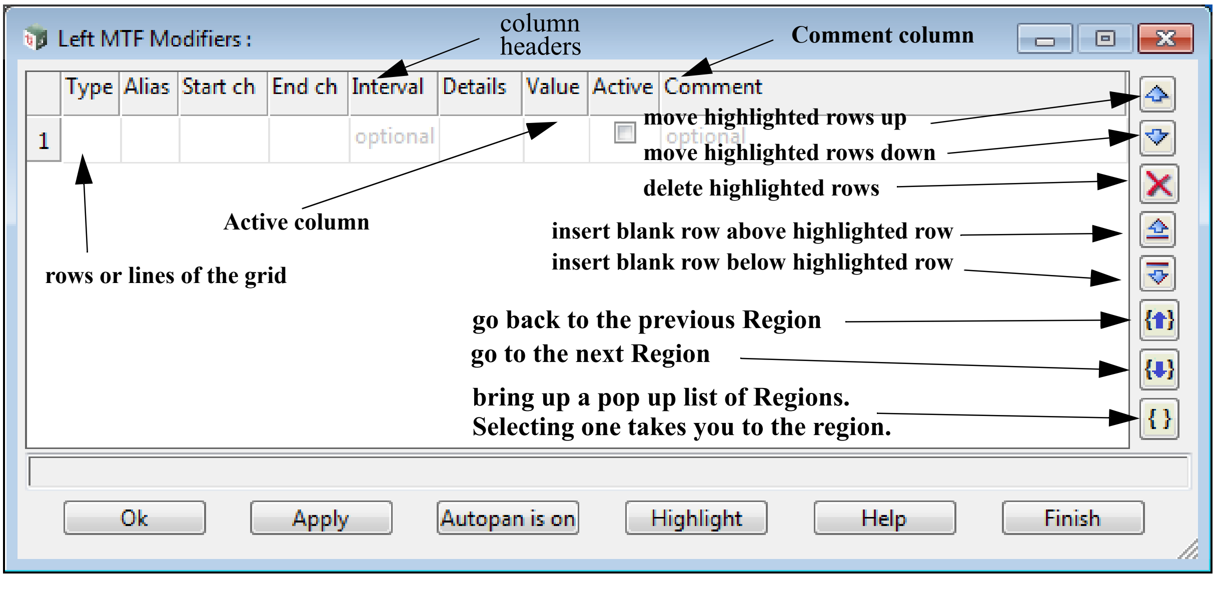
up move each of the highlighted rows up one row.

down move each of the highlighted rows down one row

Also, when rows are highlighted, pressing <Delete> will **delete** the highlighted rows.

There are also icons on the right hand side of the panel that can move highlighted rows up and down, delete highlighted rows, and insert blank lines above and below a selected row.

Plus for some grids, Regions can be defined and their are icons on the right hand side of the grid to go back to the previous region, go forward to the next region, and to go to a region selected from a region pop up list. See 4.19.6.0.1 Regions in Some Grids



Some grids have an **Active** column, which may contain **Tick** boxes, or **Yes/No Choice** boxes.

If the **Active** column for a command is ticked **on**, or **yes**, then the row is used.

If the **Active** column for a command is **not ticked**, or **no**, then the row is not used.

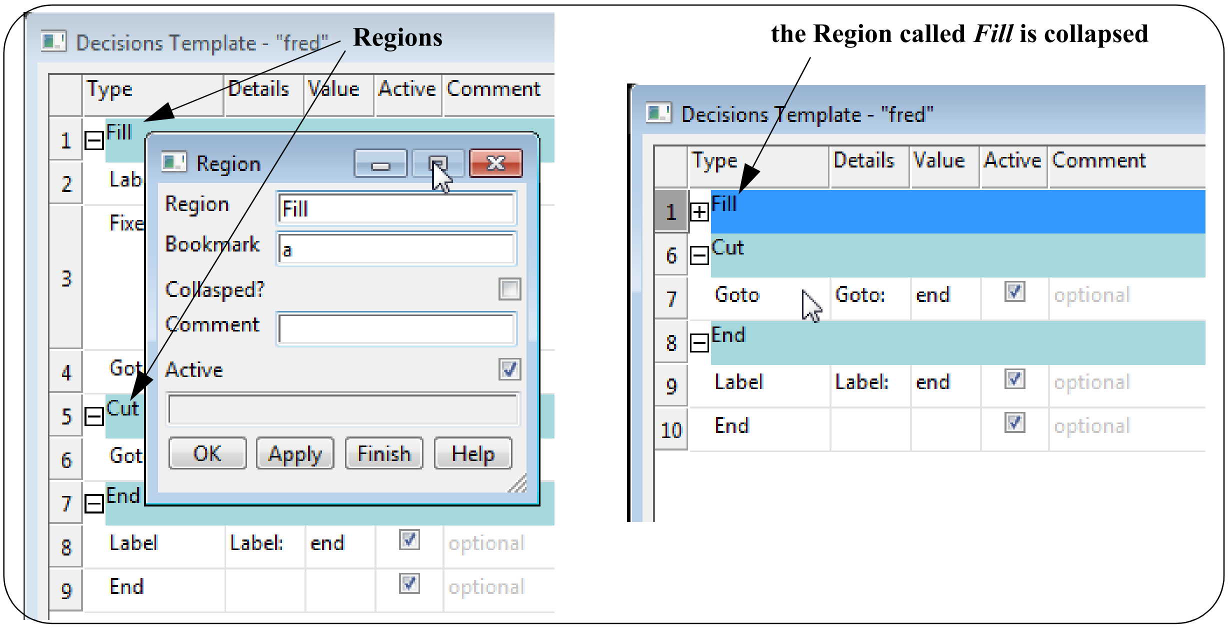
Some grids have a **Comment** column, which may contain text.

4.19.6.0.1 Regions in Some Grids

In some grids there is a **Region** command (or rule).

A **Region** in a grid is a special command that has the property that a Region can be **collapsed**. And *collapsing* a Region means that all the rows after the Region command until the next Region command, are hidden in the grid. The row of the **Region** command is coloured light blue.

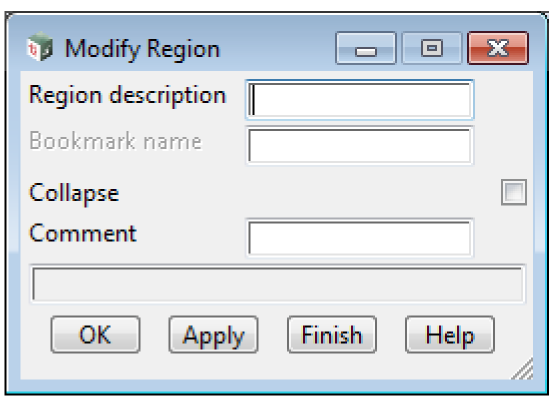
Regions must have a unique name within the grid.



A **Region** can have a secondary name called a **Bookmark**. If no Bookmark is given then when the grid is saved, the **Bookmark** is given the same name as the Region.

All grids that have *Regions* also have a command in the Grid for ***creating a Region***.

For example, for the **Left/Right MTF Modifiers** Grid, the panel to create a Region is **Modify Region**



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Region description	text box		

name for the Region.

Bookmark name	text box		

*if **not blank**, this is a secondary name, often a shorter name, that is used in the **Region** pop up rather than using the **Region description.***

*If **blank**, then when the grid is saved, the* **Bookmark name** *is set to be the same as the* **Region description**.

Collapse tick box

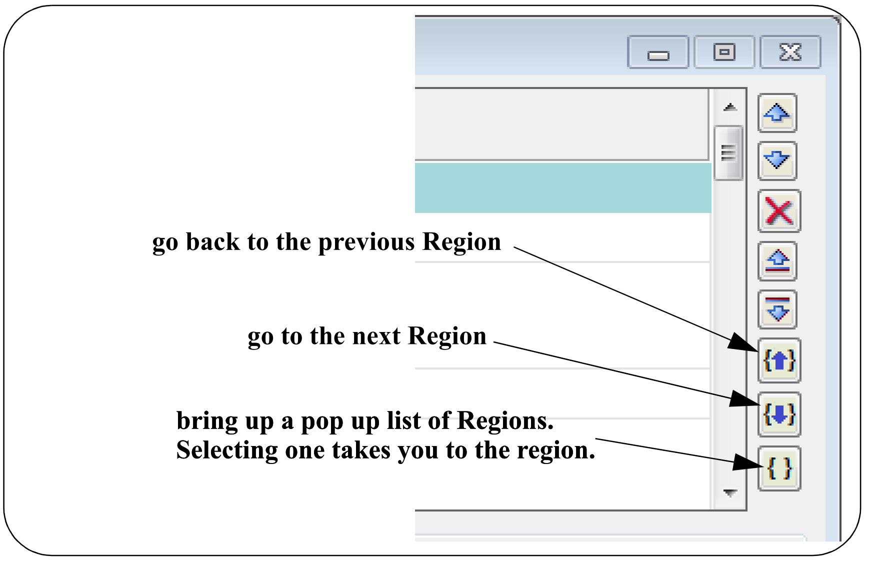
*if **ticked**, all the commands in the grid until the next **Region** command are collapsed into this Region command.*
*If **not ticked**, the commands in the grid until the next **Region** command are not collapsed.*

Once one or more *Regions* have been created in the grid, there are icons **Regions**, **Previous region** and **Next region**, on the right hand side of the grid that can then be used.

Clicking on the **Regions** icon will bring up a list of all the **Bookmarks** in the grid, and clicking on a **Bookmark** in the list will take you to that Region/Bookmark.

Previous region will take you from the highlighted row to the Region before the highlighted row.

Next region will take you from the highlighted row to the next Region after the highlighted row.



Go to the next section 4.19.7 Scrolling Panel Tables or return to 4.19 Panel Fields.

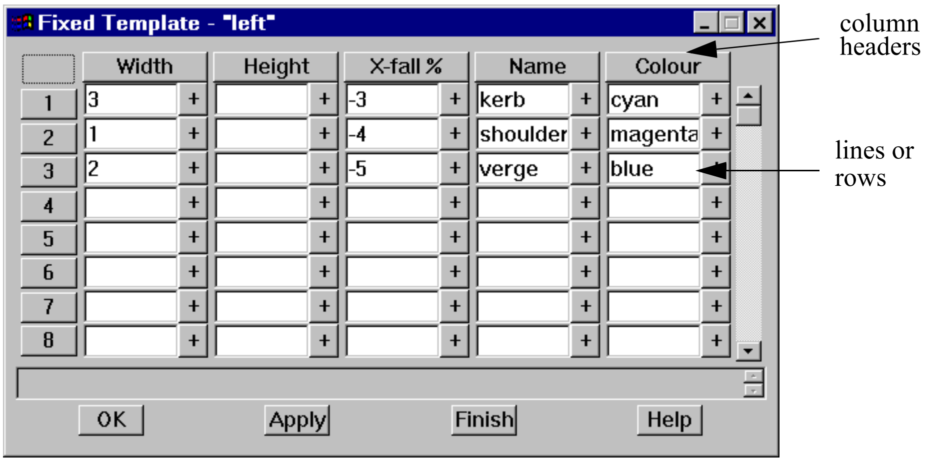
4.19.7 Scrolling Panel Tables

Scrolling Panel Tables have been mainly replaced by 4.19.6 Grids in Panels.

Some **12d Model** panels include tables or lists of information which hold an unlimited number of lines or **rows**. The tables may have more than one **column** but the number of columns is fixed for that table.

Such tables are displayed and edited in a **scrolling panel table**.

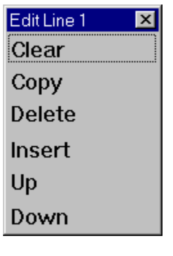
For example, the **Fixed Template** panel can contain an unlimited number of lines (rows) defining fixed links for the template.



Normally a set number of lines of the table are displayed in the **scrolling panel table** and once the number of lines exceeds the set number, the up and down arrows on the right hand side of the scrolling panel table are needed to scroll the lines up or down to see the extra information.

Each column of the panel table normally has a **column header** such as **width** and **height** in the above example of the **Fixed Template** scrolling panel table.

The **numbers** on the left hand side of the scrolling panel table indicate the line (row) numbers of the information being displayed and the line numbers are also buttons which when selected, bring up the **Edit Line n** panels. For example



The options on the **Edit Line n** panel have the following functions:

clear	clear the current line
copy	copy the current line into the next line; all following lines are pushed down
delete	delete the current line
insert	insert a blank line; the current line and all following lines are pushed down
up	swap the current line with the preceding line
down	swap the current line with the following line

Also, when the **number** on the left is selected, typing <del> will **delete** the line
<insert> will **insert** a line.

Go to the next section 4.19.8 File Box or return to 4.19 Panel Fields.

4.19.8 File Box

12d Model panels frequently include a field for entering a **file** name. This type of panel field is called a **file panel** field or box, or simply **file box**.

When RB is clicked on the **[+]** at the right of the panel field to bring up the list of available files, the pop-up menu can contain several different types of items:

(a) list of **local** files satisfying the file ending for the file box

(b) [Lib] button

(c) [User lib] button

(d) [Browse] button

(e) [Open] button for some special files which have an internal 12d Model editor

(f) [Open file]

(g) [Edit file]

(h) [Unicode format]

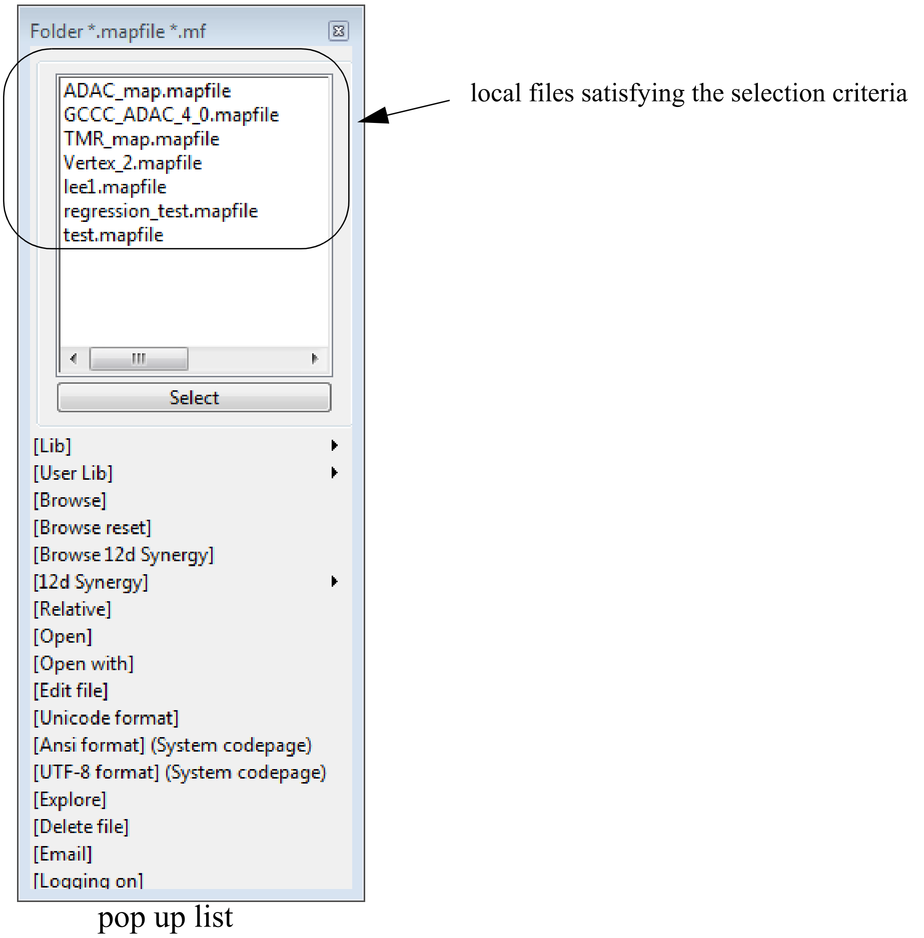
(i) [Ansi format]

(j) [UTF-8 format]

(k) [Explore]

(l) [Delete file]

For example,



pop up list

The special menu items under the list of local files satisfying the selection criteria (usually file endings) have the following meanings:

[Lib]

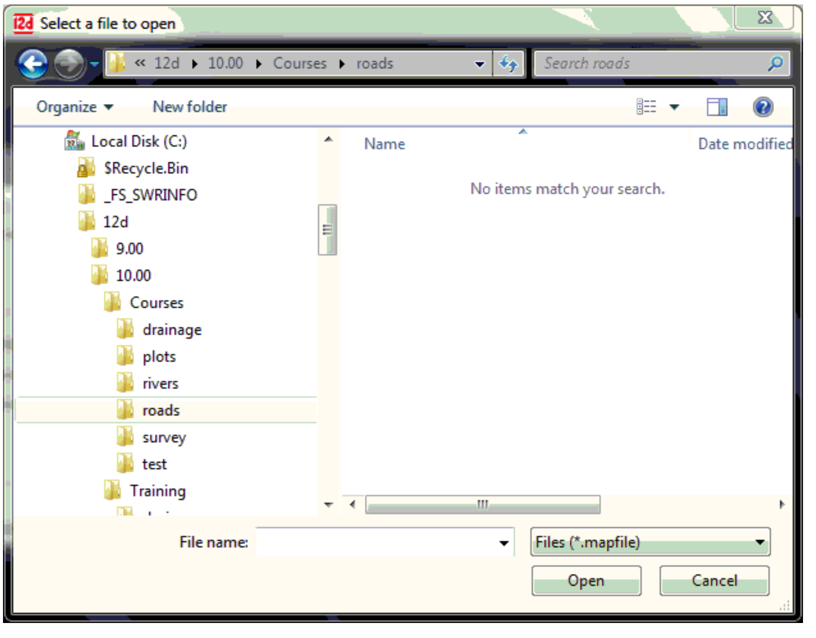
the walk-right lists all files satisfying the file box ending, in the library pointed to by the environment variable LIB_4D (see Appendix A)

[User Lib]

the walk-right lists all the files satisfying the file box ending, in the user library pointed to by the environment variable USER_LIB_4D (see Appendix A)

[Browse]

selecting **Browse** brings up the **Microsoft File Browser** which can be used to search for a file with a specified ending in the local or other folders. Note that the appearance of the Browser dialog depends on the version of Windows you are using. If a file is selected via the Open button in the current 'browsing' folder, the file name is loaded. If the file is selected from another folder, the full path and name for the file is loaded and the 'browsing' folder is updated to the file's folder.



[Browse reset]

selecting **Browse reset** sets the 'browsing' directory back to the working directory of the project, and then starts [Browse]. CAUTION: selecting Cancel will make the current file invalid if the file is not in the working folder or the file does not have a full path specified.

[Browse 12d Synergy]

selecting **Browse 12d Synergy** browses 12d Synergy folders. You need to have 12d Synergy installed for this to appear.

[12d Synergy]

walking right on **12d Synergy** brings up a menu containing options to Browse 12d Synergy for files or Add files to 12d Synergy folders. You need to have 12d Synergy installed for this to appear.

[Relative]

selecting **Relative** will take a full path name in the file box and convert it to a relative pathing. Note that this is only possible if the file is on the same disk as the Project. The path to the file in the file box will be updated so that it is relative to project's working folder.

[Open]

selecting **Open** will bring up the special ***12d Model*** editor for the file. If not a special ***12d Model*** file, the standard Windows File Associations will be used to open the file. So if the file is an Adobe PDF file, and a PDF 'Viewer' is installed, then the PDF file will be opened in that viewer. Note that in earlier versions of ***12d Model***, this was known as [Edit].

[Open with]

selecting **Open with** will bring up the Windows Open with program selector to allow the user to choose which program to open the selected file with. If there is one or more than one program associated with a file type, the dialog gives you the choice. Note that the appearance of the Open dialog depends on the version of Windows you are using.

[Edit file]

selecting **edit file** when there is a file name already in the file box, will edit the file using the editor pointed to by the EDITOR_4D environment variable.

[Unicode format]

selecting **Unicode format** sets the output format of currently selected file to the ***Unicode*** format with UTF-16 encoding.

Unicode allows for most languages of the world to be used concurrently. The resulting file will be marked with the Unicode BOM (byte order mark - see 4.4.6 Endian and BOM) so that other programs know this file is in Unicode format with UTF-16 encoding (see 4.4 Ascii, Ansi and Unicode and 4.4.5 Unicode Encoding: UTF-16).

Note ***12d Model*** is Unicode enabled to the UTF-16 level and allows the use of non-Latin alphabets supported by UTF-16. Not all programs can work with Unicode files so if the file being outputted is to be used by another program, you need to check if UTF-16 files can be read by the intended software.

[Ansi format]

selecting **Ansi format** sets the output format of currently selected file to the ’Ansi’ format (see 4.4 Ascii, Ansi and Unicode). The resulting file will not be marked with any BOM (byte order mark - see 4.4.6 Endian and BOM). Writing Unicode information to an Ansi file may result in the lost of information.

[UTF-8 format]

selecting **UTF-8 format** sets the output format of currently selected file to the ’UTF-8’ format which is a special Unicode format (see 4.4 Ascii, Ansi and Unicode and 4.4.4 Unicode Encoding: UTF-8). The resulting file will also marked with the UTF-8 BOM (byte order mark - see 4.4.6 Endian and BOM) so that other programs know this file is in UTF-8 format.

Note ***12d Model*** is Unicode enabled to the UTF-16 level and allows the use of non-Latin alphabets supported by UTF-16. Not all programs can work with Unicode files so if the file being outputted is to be used by another program, you need to check if UTF-8 files can be read by the intended software.

[Explore]

selecting **Explore** opens a new Windows Explorer window to the currently ’browsed’ folder.

[Delete file]

selecting **Delete file** will prompt the user to send the currently file to the Windows Recycle Bin if it exists for the drive that the file is on. Note this depends on which drive the file resides. Many network drives do not support Recycle Bins and so a deleted file is lost. It is up to the user to implement good backup procedures to avoid permanent loss of files.

[Email]

selecting **Email** emails the file given in the File Box. See .

[Logging off/on]

Toggle between *Logging on* and *Logging off*. This is only used for Map files and when ***Logging on*** is set, then entries are made a log lines in the Output Window that show what tabs in the Map File were used in creating and attributing the string.

Note that certain ’types’ of File Box many have additional [...] fields.

Go to the next section 4.19.9 Model Panel Field or return to 4.19 Panel Fields.

4.19.9 Model Panel Field

See

[4.19.9.1 [Options] on Model Box Pop Up](#)
[4.19.9.2 Adding Model to Views in Model Panel Field](#)

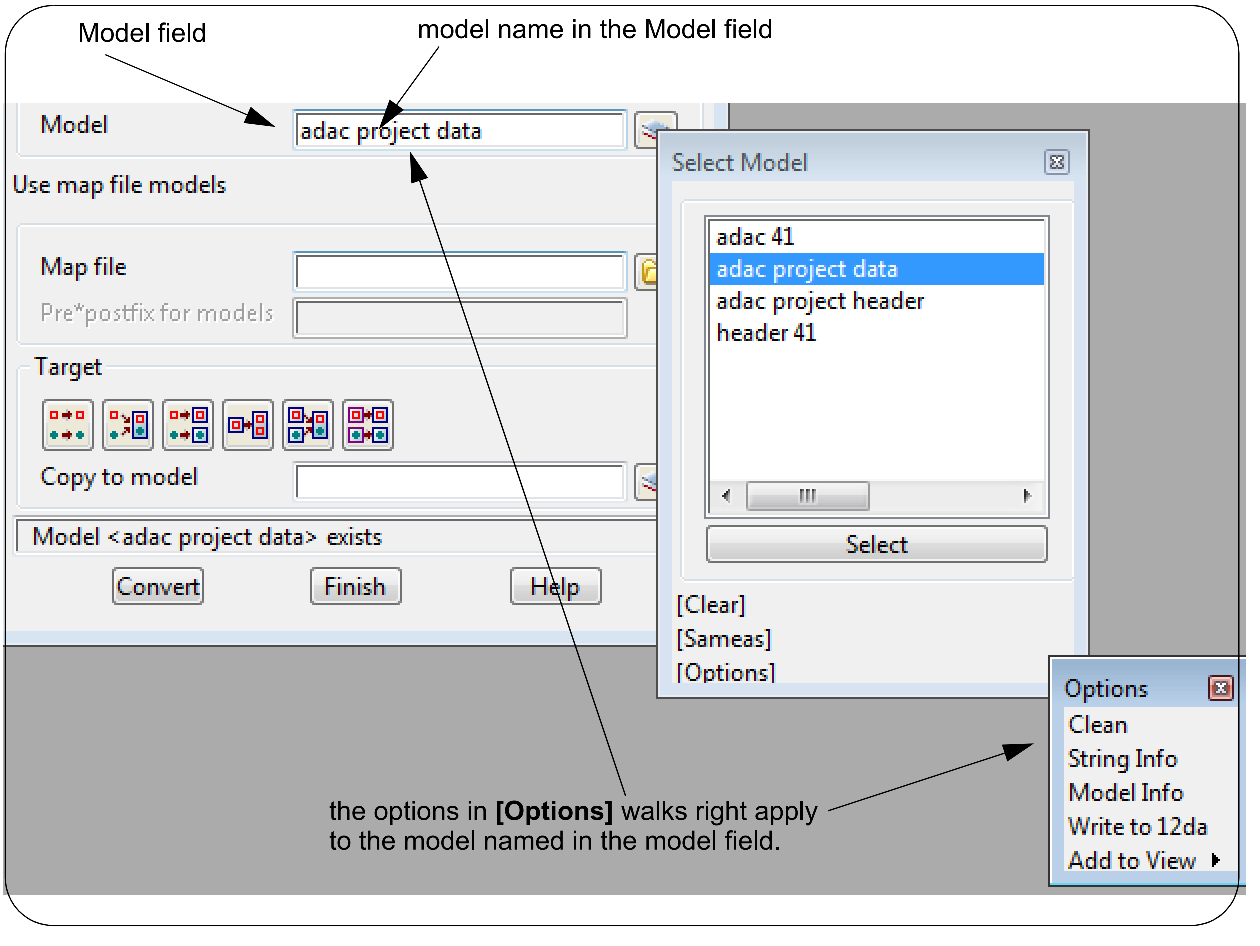
4.19.9.1 [Options] on Model Box Pop Up

When you have a **Model** field with a model name of an existing model in it, the **Select Model** pop up for the **Model** icon at the end of the **Model** field has an **[Options]** at the bottom of the pop up with a walk right list of options that apply to the model in the **Model** field.

Note that the model must exist so if the **Model** field in a panel is one that creates the model, then using **[Options]** will only make sense **after** the panel has been run and the model has been created.

Warning

The options on **[Options]** apply to the model in the **Model** field, **NOT** the model highlighted in the **Select Model** pop up.



Clean - cleans the model given in the **Model** field.

String Info - brings up the **String Information Table** panel and runs it for the model given in the **Model** field.

Model Info - brings up the **Model Information** panel and runs it for the model given in the **Model** field.

Write to 12da - brings up the **Write 12d Solutions Archive Data** panel with the model given in the

Model field set as the *Data Source*.

Add to View - adds the model given in the **Model** field to the view selected from the Add to View walk right list.

Go to the next section 4.19.9.2 Adding Model to Views in Model Panel Field or return to 4.19.9 Model Panel Field or 4.19 Panel Fields.

4.19.9.2 Adding Model to Views in Model Panel Field

12d Model panels frequently include a field for entering the name of a model. These fields are called **model panel** fields or simply model fields.

Because models are often required to be displayed on views and hence, need to be **added** to a view, there is a short-hand method for adding models to views when using a model field.

After the model name is entered into the model field, the name of the view that the model is to be added to is typed in, preceded by a comma. If the model is to be added to more than one view, simply type in each of the view names separated by commas.

For example, to add the model **fred** to the views **1**, **3**, and **5**, type

fred,1,3,5

into the model field.

Alternatively, the view names can be enclosed in round brackets.

For example,

fred (1,3,5)

Go to the next section 4.19.11 String Select Panel Field or return to 4.19.9 Model Panel Field or 4.19 Panel Fields.

4.19.10 Tin Panel Field

See

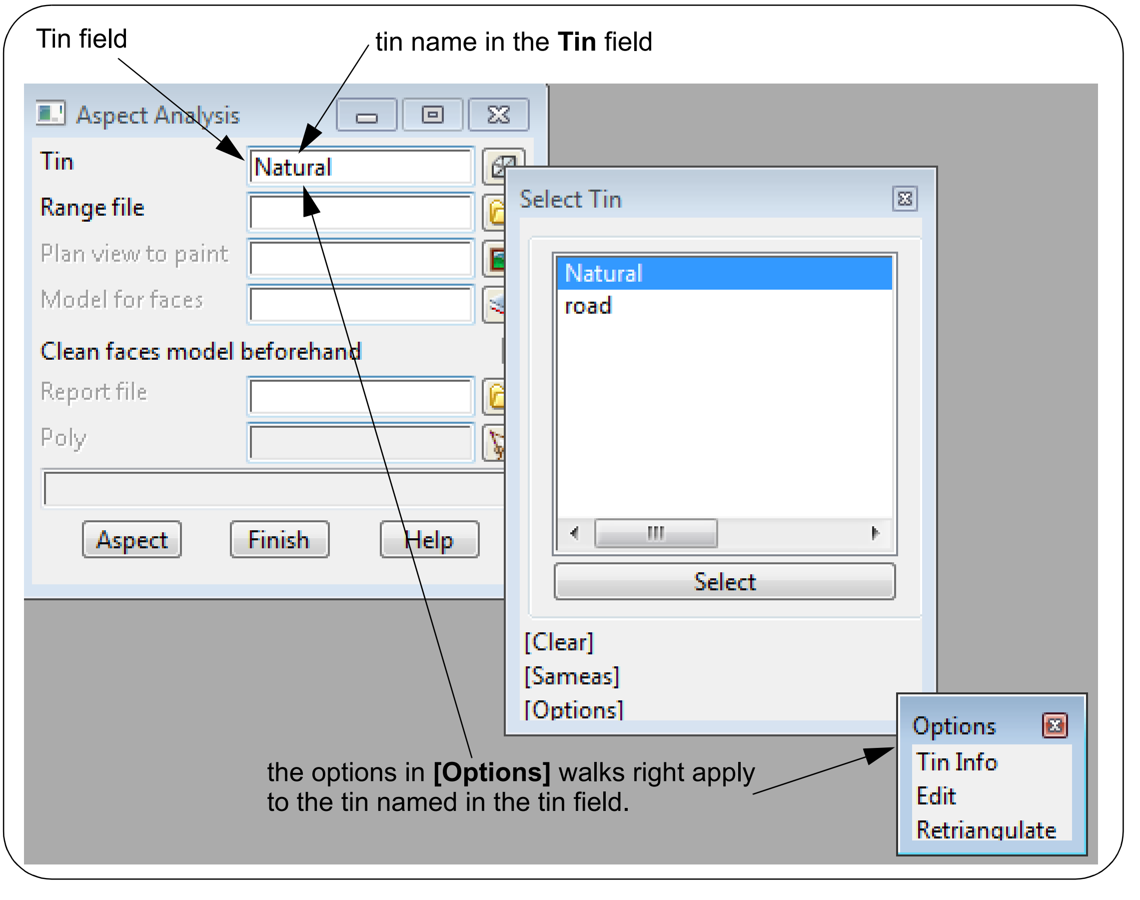
4.19.10.1 [Options] on Tin Box Pop Up

4.19.10.1 [Options] on Tin Box Pop Up

When you have a **Tin** field with a tin name of an existing tin in it, the **Select Tin** pop up for the **Tin** icon at the end of the **Tin** field has an **[Options]** at the bottom of the pop up with a walk right list of options that apply to the tin in the **Tin** field.

Note that the tin must exist so if the Tin field in a panel is one that creates the tin, then using **[Options]** will only make sense **after** the panel has been run and the tin has been created.

Warning
The options on **[Options]** apply to the tin in the **Tin** field, **NOT** the tin highlighted in the **Select Tin** pop up.



Tin Info - brings up the **Tin Information** panel and runs it for the tin given in the **Tin** field.

Retriangulate - runs retriangulate for the tin given in the **Tin** field.

Edit - brings up the **Retriangulate Tin** panel with the tin given in the **Tin** field set as the *Tin* and the information for that tin loaded into the panel.

Return to 4.19.9 Model Panel Field or 4.19 Panel Fields.

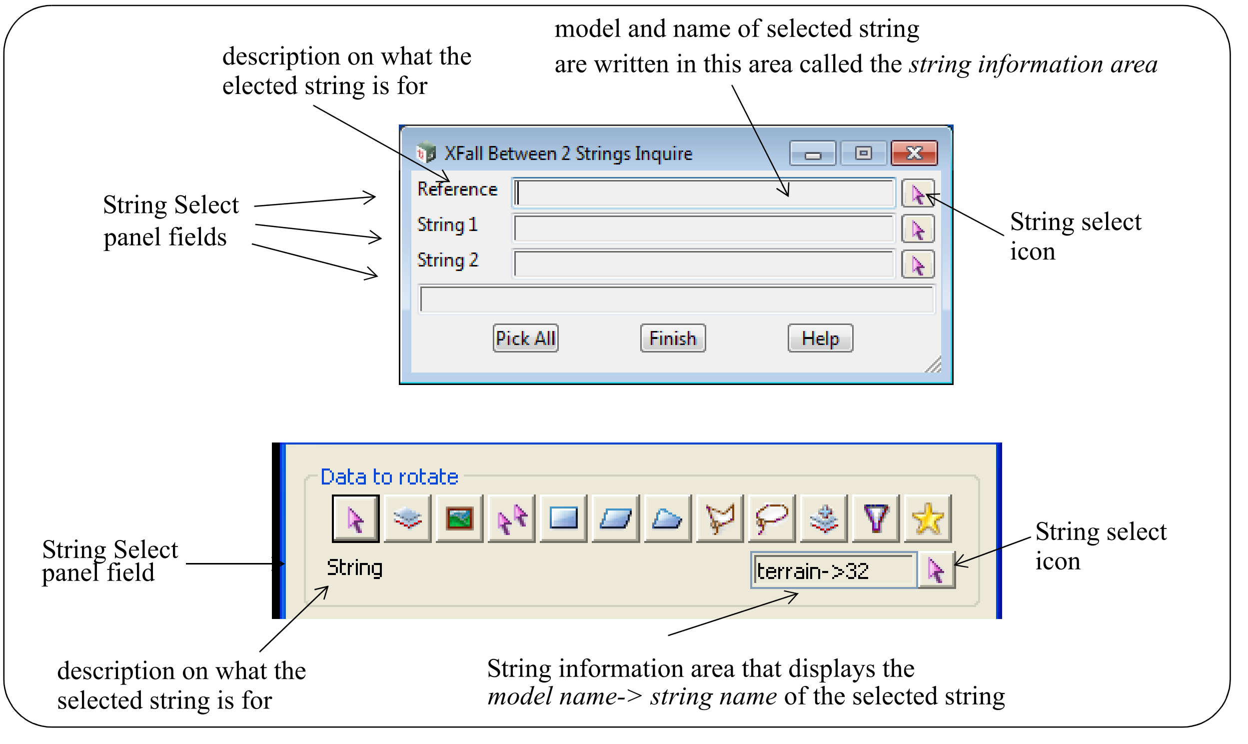
4.19.11 String Select Panel Field

There is a special panel field called a **string select** panel field which is used for **selecting** a string and **recording** the string and model name in the panel field. The string select panel field consists of

(a) a description of what the field is for

(b) n string information area where the model and string name of a selected string are displayed and

(c) the **string select** icon which is clicked on to start selecting a string.



Clicking LB on the *String Select* icon will start the string selection process.

Clicking MB on the *String Select* icon does nothing.

Clicking RB on the *String Select* icon brings up the Choice menu which has options to

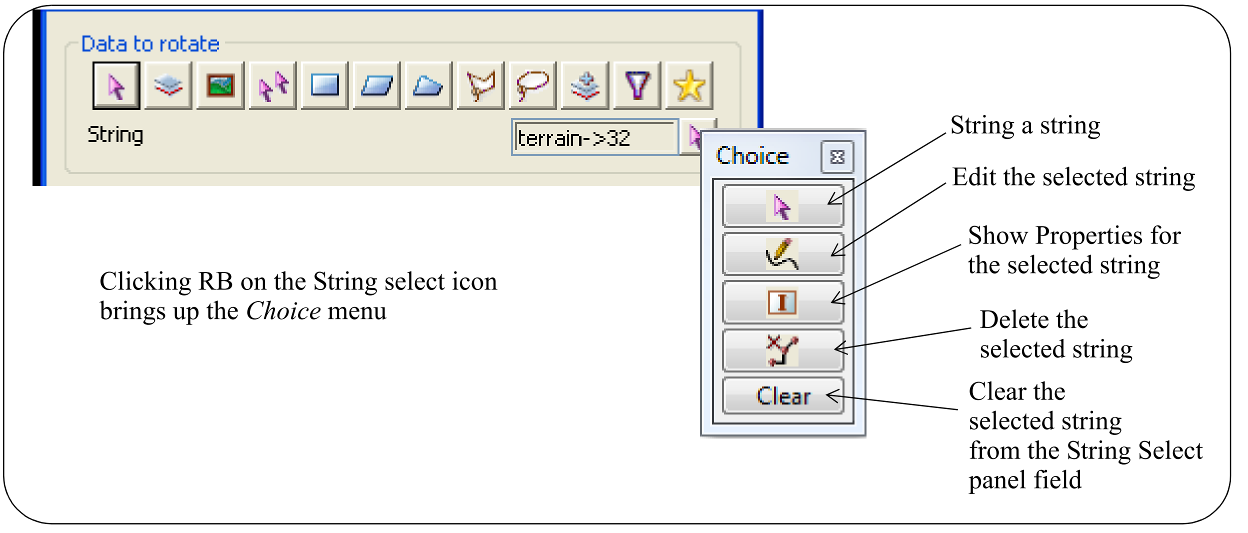
(a) Select a string (same as clicking LB on the *String Select* icon)

(b) Edit the string that has already been selected for the String Select field. The string to be edited will have its model name and string name shown in the string information area.

(c) Show the Properties panel for the string that has already been selected for the String Select field.

(d) Delete the string that has already been selected for the String Select field. The string to be deleted will have its model name and string name shown in the string information area.

(e) Clear the String Select panel of the string that had already been selected.



If a *String Select* operation has been started, it can be cancelled by clicking *RB* to bring up the **Pick Ops** menu and selecting **Cancel** from the menu.

Go to the next section 4.19.12 MB for Same As Pick for Panel Fields or return to 4.19 Panel Fields.

4.19.12 MB for Same As Pick for Panel Fields

For most panel fields/input boxes, clicking the middle mouse button (MB) in the field will activate a **Same As** pick which allows the user to get information from other objects.

(a) For a **View** panel field:

After clicking MB in the **View** panel field, you then select a string, plot frame *etc.* from a view and the **name** of the **View** that the string is on will be written to the **View** field

When a view name is selected this way, <Enter> must be pressed for the **View** field to validate and perform any other actions that the **View** field automatically does if the view name was selected from the **View** icon popup.

(b) For most panel field, other than a **View** panel field:

After clicking MB in the panel field, you then select a string, plot frame *etc.* from a view and the same value as the panel field type will be extracted from the selected item and piped into the panel field.

For example, for a **Model** field, the model that the selected item is in will be piped into the **Model** field.

When a panel field value is selected this way, <Enter> must be pressed for the panel field to validate and perform any other actions that the panel field automatically does when the panel field value was selected from the panel field icon popup.

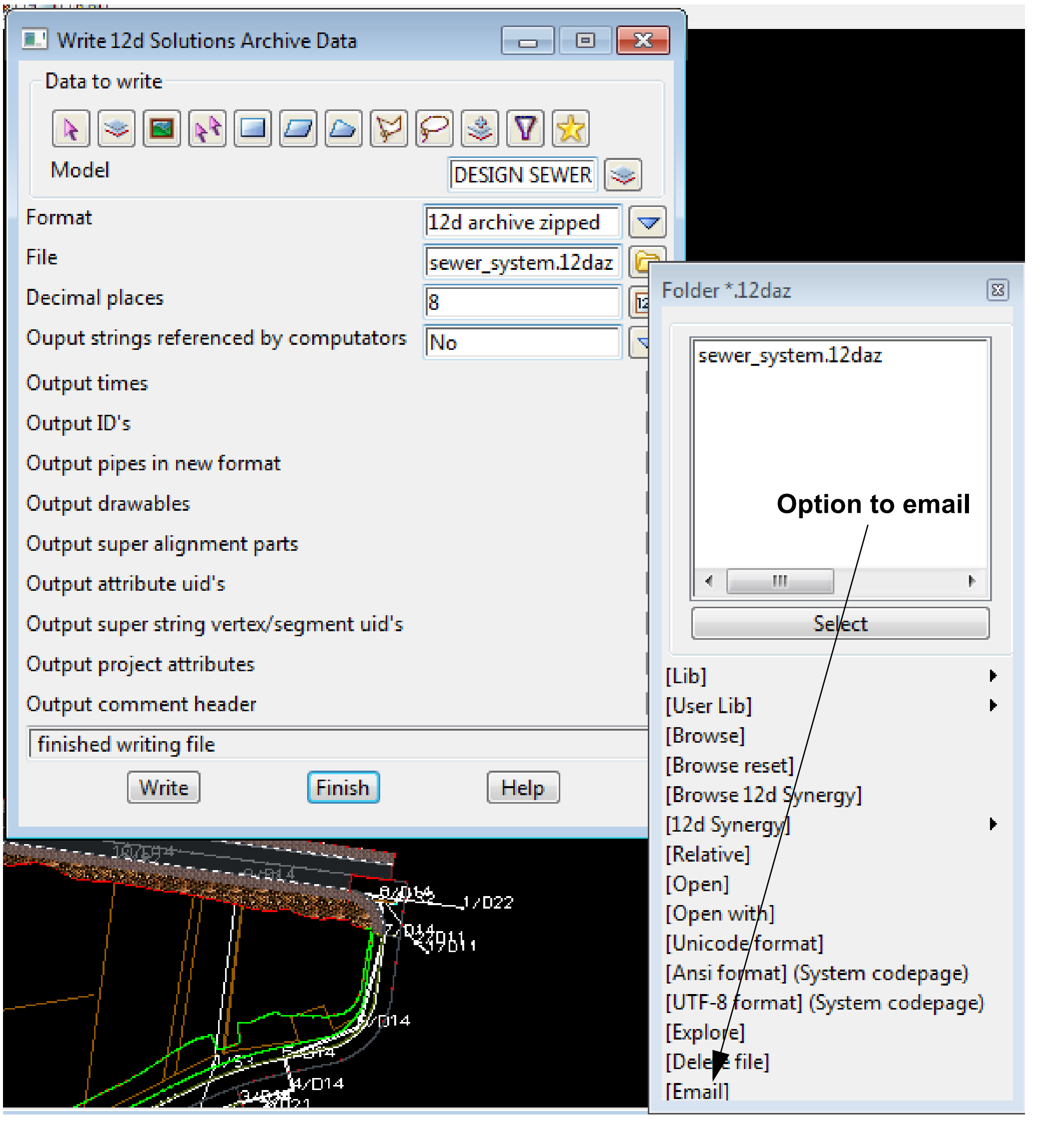
MB **Same As Pick** works for most panel fields including

Views
Models
Colours
Justify
Text styles
Text units
Names
Plotter (from plot frames)
Sheet size (from plot frames)
Line styles

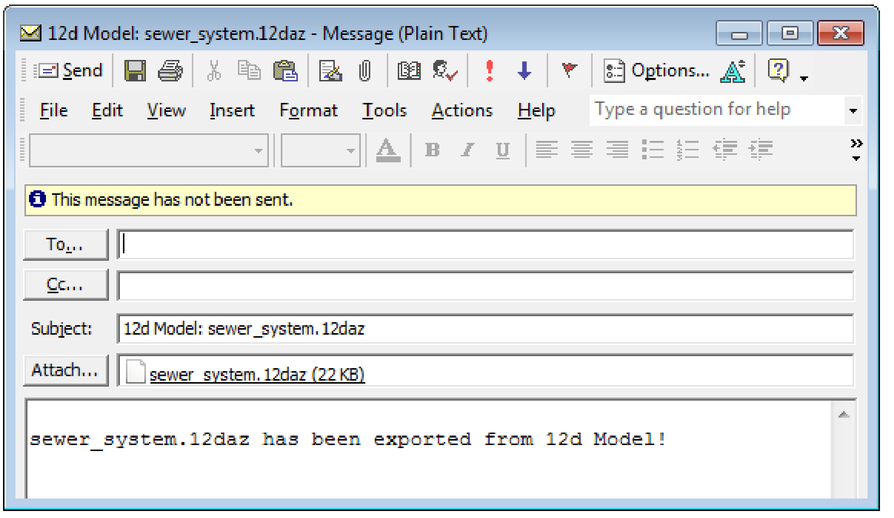
Go to the next section 4.20 Emailing from File Boxes or return to 4.19 Panel Fields.

4.20 Emailing from File Boxes

When a **File box** has a file name in it and the file exists (this usually means the option has to be run first), clicking on the **File** icon at the end of the field will bring up the **Folder** pop-up and at the bottom there is now an **[Email]** choice.



If you have *Outlook 2002* and above (or another **MAPI** registered application), clicking on **[Email]** will create an email with that file as an attachment ready for you to give the email address and any extra information you would like to put in the email.

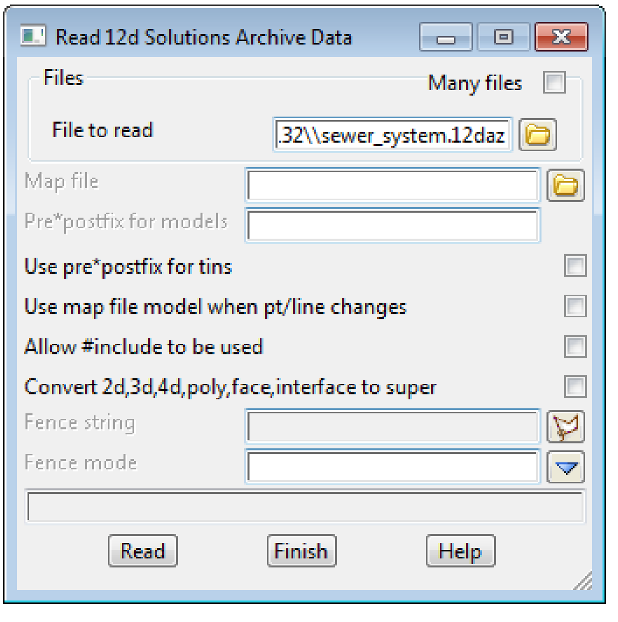


This will work with Outlook 2002 and above, and should also work with other **MAPI** registered applications.

In the above example, the 12d Archive File was written out as a zipped 12da file (a 12daz file).

Zipping the 12da file can result in files a twentieth of the size of the original 12da file (*i.e.* 5% of the original), which makes it much better for emailing around.

Also, when you receive a 12daz or a 12da file as an attachment to an email, you can drag and drop it onto an open 12d project and it will automatically open the **Read 12d Solutions Archive Data** panel with the dropped file name already filled in as the **File to read**.



Important Note

The file must already exist **before** the **[Email]** on the pop up can be used so usually the Panel option must be run first to create the file, and then go back and click on the **File** icon to bring up the pop up for the file to be emailed.

Please continue to the next section 4.21 Measures.

4.21 Measures

Whenever a real value is required in a box (e.g. height, width), the pop-up menu on the **[+]** button includes a **measures** menu.

The **Measures** menu allows the user to pick a selected measure value from existing strings, and the picked value is displayed and piped into the panel field.

For example, the x, y, or z coordinate of a point or the plan distance between two points.

If default values already exist for the pop-up menu, the options on the **measures** menu will be added to the bottom of the default list.

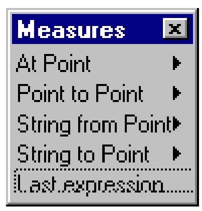
The measures functions support dynamic measures to give the user more visual feedback. This includes the drawing of a rubber line in the case of **Point Point** and **String to Point** measures, or a cross in the case of **At Point.**

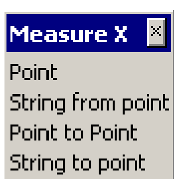
The measures and their dynamic aspect can be easily explored via the option

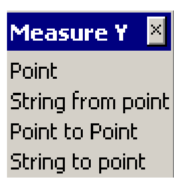
Utilities=>Measure=>Value

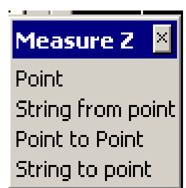
The walk-right **Measure** menus are documented in the next four sections.

The stand alone **Measures** menus is









For the option At point, go to 4.21.1 Measure At Point
Point to point 4.21.2 Measure Point to Point
String from point 4.21.3 Measure String from Point
String to point 4.21.4 Measure String to Point
Last expression 4.16 Last Expression

If information on measures is not required, please continue to the next section 4.16 Last Expression.

4.21.1 Measure At Point

get x co-ordinate of selected point
y co-ordinate
z co-ordinate
chainage at the point
instantaneous angle
instantaneous bearing
cross-fall of selected point
slope at the point
radius (0 if no curve)

The **At Point** measures calculate and display the picked measure at a selected point.

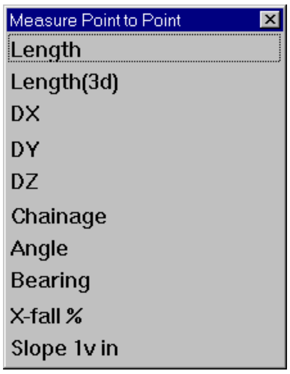
For example, **X** gets the x-coordinate of a selected point.
Bearing gets the instantaneous bearing of a selected point.

The dynamic aspect of the **at point** measures is as follows:

> after the desired **at point** option is picked and the string for the **at point** measure is tentatively selected but not yet accepted, and if the cursor is moved around, then the cursor position is dynamically dropped perpendicularly onto the highlighted string and a cross displayed on the string at the dropped point, and the picked measure value is dynamically displayed in the panel field.

For example, if the **x** measure was picked from the **Measure Point** menu and a string highlighted but not yet accepted, then as the cursor is moved around the screen, the cursor position is dropped perpendicularly onto the highlighted string and displayed as a cross and the x-coordinate of the cross is displayed in the panel field.

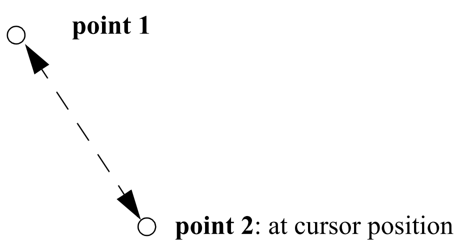
4.21.2 Measure Point to Point



get 2d length between selected points
3d length
delta x
delta y
delta z
delta chainage
angle of line joining selected points
bearing of line
cross-fall of line
slope of line

The **Point to Point** measures calculate and displayed the picked measure between two selected points.

For example,	**Length**	gets the plan distance between two selected points.
	X-fall %	gets the % cross fall of the line joining two selected points.



The **point to point** measures are calculated between point 1 and point 2

The dynamic aspect of the **point to point** measures is as follows:

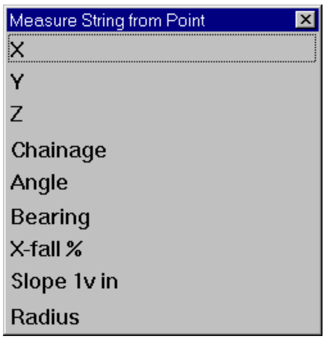
after the desired **point to point** measure is picked, and the first point for the **point to point** measure is selected, then a rubber line is dynamically drawn between the selected point and the current cursor position and the picked measure value is dynamically displayed in the panel field.

Further, if the selected string for the **second** point is tentatively selected but not yet accepted, and if the cursor is moved around, then the cursor position is dynamically dropped perpendicularly onto the highlighted string and the picked measure value to the second string is dynamically displayed in the panel field.

For example, if the **length** measure was picked from the **Measure Point to Point** menu and the first point selected, then a rubber line is dynamically drawn between the selected point and the cursor position and the plan length from the selected point to the current cursor position is dynamically displayed in the panel field.

If a string is selected for the second point but not yet accepted, the cursor position is dynamically dropped onto the highlighted string and the plan distance from the first point to the dropped point is dynamically displayed in the panel field.

4.21.3 Measure String from Point



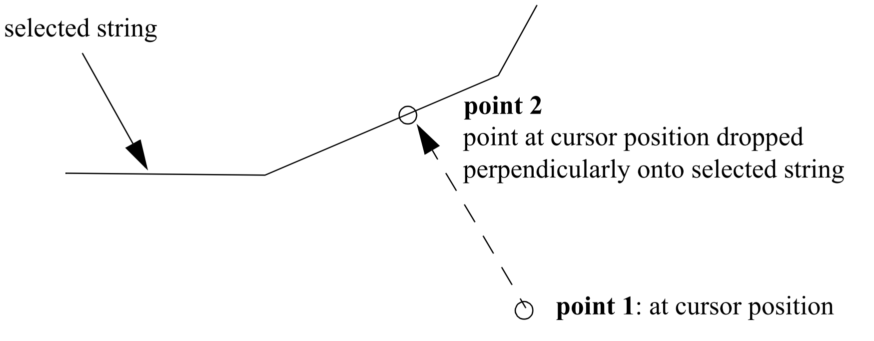
get x co-ordinate of point dropped onto string
y co-ordinate
z co-ordinate
chainage at the point
instantaneous angle
instantaneous bearing
cross-fall of selected point
slope at the point
radius (0 if no curve)

The **String from Point** measures calculate the picked measure *from the selected string* by taking the current cursor position and dropping it perpendicularly onto the selected string and using the dropped point on the string to get the measure value.

For example, **X** gets the x-coordinate from the string of the cursor dropped onto the selected string.

Z gets the z-coordinate from the string of the cursor dropped onto the selected string

Bearing gets the instantaneous bearing from the string of the cursor dropped onto the selected string.



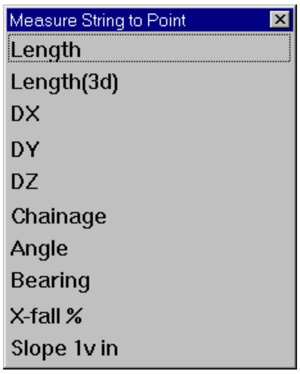
The **string from point** measures are calculated at point 2

The dynamic aspect of the **string from point** measures is as follows:

after the desired **string from point** measure is picked and the string for the **string from point** measure is selected, then as the cursor is moved around, a rubber line is dynamically drawn between the cursor and the cursor position dropped perpendicularly onto the selected string, and the picked measure value of the dropped cursor position is dynamically displayed in the panel field.

For example, if the **z** measure was picked from the **Measure String from Point** menu and a string selected, then as the cursor is moved around the screen, the cursor position is dropped perpendicularly onto the selected string. The perpendicular line is dynamically redrawn and the z-coordinate of the dropped point on the string is dynamically displayed in the panel field.

4.21.4 Measure String to Point

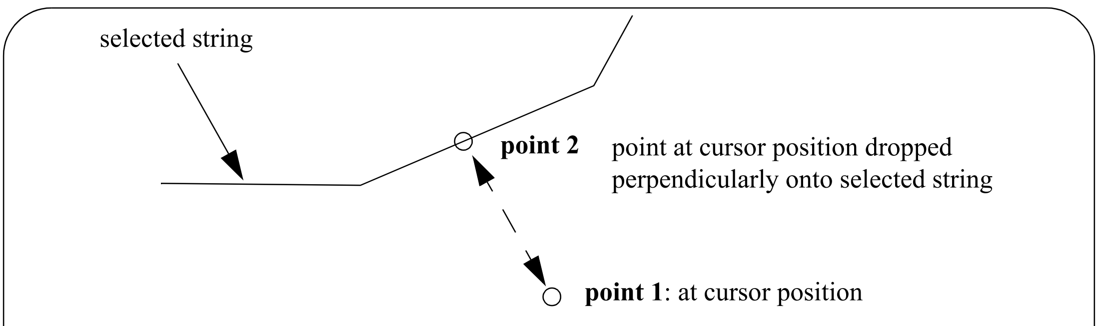


get 2d length between selected points
3d length
delta x
delta y
delta z
delta chainage
angle of line joining selected points
bearing of line
cross-fall of line
slope of line

The **String to Point** measures are similar to the *point to point* measures and calculate the picked measure from a point and the point ***dropped perpendicularly*** onto the selected string.

For example, **Length** gets the plan distance between the point and the point dropped perpendicular on a selected string.

Bearing gets the bearing of line joining the point and the point dropped perpendicularly onto a selected string



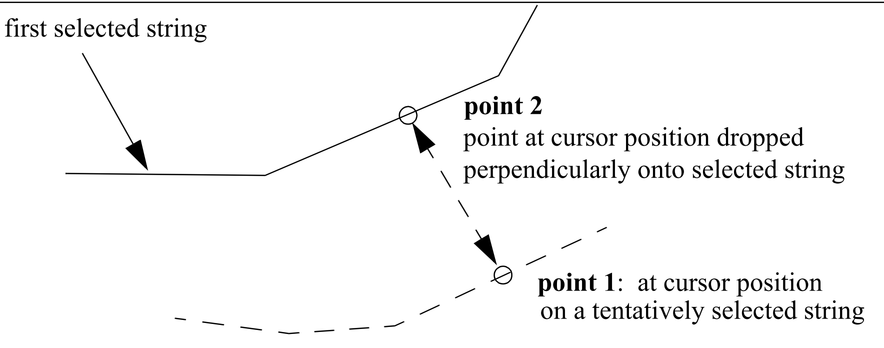
The **string to point** measures are calculated between point 1 and point 2

The dynamic aspect of the **string to point** measures is as follows:

after the desired **string to point** measure is picked, and a *string* selected, then a line is dynamically drawn between the cursor position and the cursor position *dropped perpendicularly* onto the selected string. The **string to point** value is dynamically displayed in the panel field as the cursor is moved around.

Further, if the cursor position is on a string which has been selected but not accepted and the cursor is moved around, then the cursor is *constrained* to remain on the tentatively selected string. It is dynamically dropped perpendicularly onto the original string and the measure value to the dropped point displayed in the panel field.

Hence the selected point is ***constrained*** to remain on the tentatively picked string and the measure dynamically calculated and displayed.



The **string to point** measures where point 1 is constrained to be on a tentatively selected string.

For example, if the **length** measure was picked from the **Measure String to Point** menu and the first string selected, then a line is dynamically drawn perpendicularly between the selected string and the current cursor position and the plan length from the string to the current cursor position is dynamically displayed in the panel field.

If a string is tentatively selected (picked but not yet accepted), the cursor position is dynamically dropped onto the first string and the plan distance measured perpendicularly from the point to the first string is dynamically displayed in the panel field.

Please continue to the next section 4.16 Last Expression.

Please continue to the next section 4.22 Colours.

4.22 Colours

See

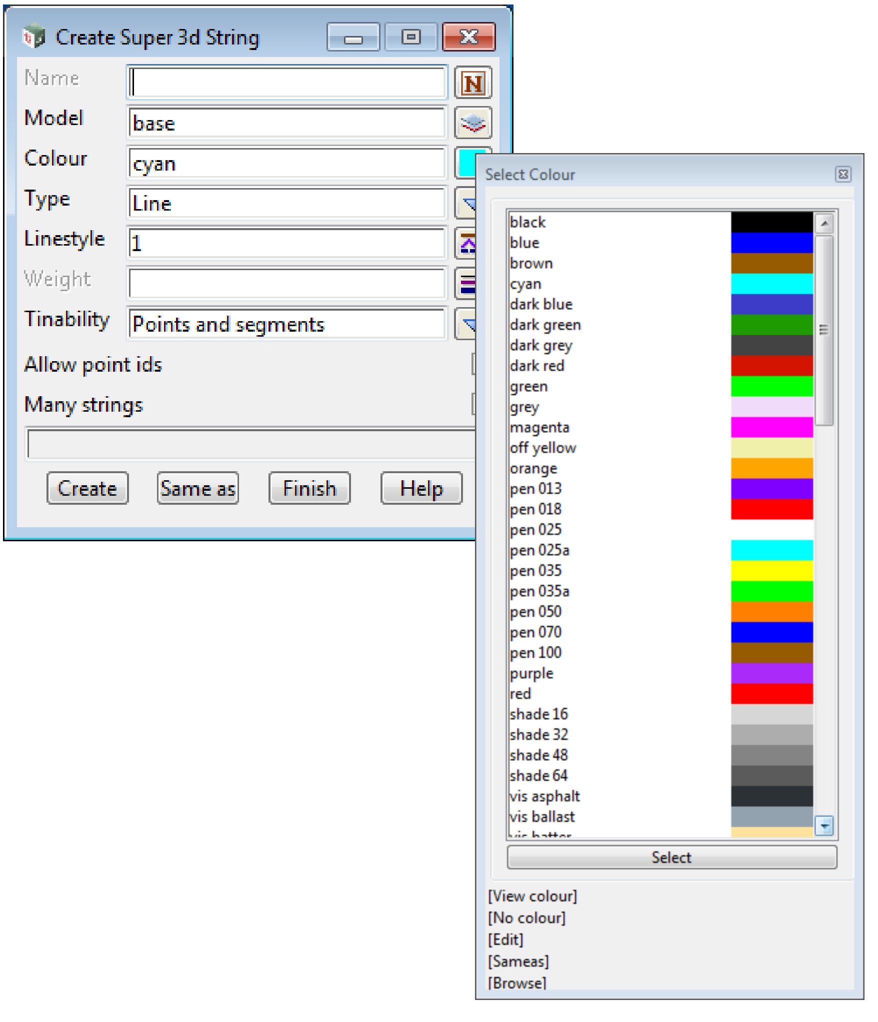
[4.22.1 Colours on the Screen](#)
[4.22.2 Colours on a Plot](#)

4.22.1 Colours on the Screen

For ***12d Model*** elements, there is a palette of up to 10,240 colours that can be used for displaying elements and parts of elements on a view. Each of the colours has a unique number, the colour number, and it is the ***colour numbers*** that are **saved** in the ***12d Model*** database.

How each colour number appears when drawn on a view is defined by giving the values of the intensities of red, green, and blue (rgb) for the colour number.

When a panel requests a colour using a colour box, clicking on the colour icon will bring up the **Select Colour** choice box to choose a colour.



What the rgb is for a colour number, its text name that is shown in the **Select Colour** choice box and other properties are defined in the ***colours.4d*** file.

The *colours.4d* file is read in whenever a project is opened so it is only possible to use a new *colours.4d* file by restating a project. A default *colours.4d* file is distributed with ***12d Model*** and is in the *set_ups* folder.

Note: for viewing, creating and editing a *colours.4d* file, see 4.22.3 Editing Colours.4d and for the actual definition of the *colours.4d* on disk, see 39.2.7.2 Colours File (colours.4d).

Colour Box Panel Field

Either colour numbers or the unique colour name associated with the colour number, can be typed in any Colour box in a panel field. The Colour box converts a colour name to its colour number for storing in the *12d* ***Model*** database.

Limiting the Number of Colour Shown in Select Colours

When a large number of colours have been defined, the **Select Colour** pop-up list can get unwieldy so there is a default parameter, **Display colours** which gives the number of colours to use in a pop-up. **Display colours** is on the **System Settings** tab of the **Defaults** panel which brought up by **Project=>Management=>Defaults**. See 7.6.1 Defaults.

Hence it is possible to have thousands of defined colour numbers but still have only a selected number displayed in the **Colour** pop-ups.

The order that the colours are selected from the *colours.4d* file for the pop-up is ***not*** by the colour number but the ***Pop-up number*** *order* which can be completely different. This means that the user can add extra colours after the standard 2000 ***12d Model*** colours number and have the new colours coming up in the *Colours* pop-up even thought it is restricted on how many colours. The Pop-up number is given in the *colours.4d* file.

Order in the Select Colours Pip-Up

Finally the order that the colours are sorted in the Colours pop-up can be by pop-up number or alphabetically by colour name. See 4.22.3.1 Colours Sort Order in Select Colour Pop-Up.

Note:

In ***12da*** files, colours are written out by their *colour names,* ***not*** by *colour numbers. S*o when reading in a 12da file, the colour name in the 12da file gets mapped to the colour number that matches it in the ***12d Model*** project that the *12da* file is being read into.

For viewing, creating and editing a *colours.4d* file, see 4.22.3 Editing Colours.4d and for the actual definition of the *colours.4d* on disk, see 39.2.7.2 Colours File (colours.4d).

For more information on panel file pop-ups, see 4.19.5 Pop-Up Lists and Menus.

Continue to the next section 4.22.2 Colours on a Plot or return to 4.22 Colours.

4.22.2 Colours on a Plot

How a *colour* is drawn on a view is one thing, but how it appears on a plot can be completely different. And how the colours appears on one plot may be different for another plot. For example, all the strings on a view are in colour and you produce a coloured plot but you may also want to produce a and black and white plot of exactly the same data.

These cases are covered by defining different *12d* ***Model*** plotters where plotter has a unique name, a plot engine to say what type of device it is being plotted to, and colour to pen mappings to specify what the rgb and thickness is used for a pen.

All the*12d* ***Model*** plotters are defined in the *plotters.4d* file.

The *plotters.4d* file is read in whenever a project is opened so it is only possible to use a new *plotters.4d* by restating a project. A default plotters.4d is distributed with ***12d Model*** and is in the *set_ups* folder.

For more information *12d* ***Model*** plotters and plotters.4d, see 43.1 12d Model Plotters.

For more information on creating and editing a *colours.4d* file, see 4.22.3 Editing Colours.4d and for the actual definition of the *colours.4d* on disk, see 39.2.7.2 Colours File (colours.4d).

Return to 4.22 Colours.

4.22.3 Editing Colours.4d

For each colour number, the red, green, blue (rgb) for each colour number, an alternate text name, pop-up number and pen number are defined in the *colours.4d file.* Up to 10,240 colours can be defined. See 39.2.7.2 Colours File (colours.4d)

A default file is distributed with ***12d Model*** and resides in the *set_ups* folder.

To view, add or modify the definitions for the colour numbers in *colours.4d*, use the **Edit Colours** panel which is brought up by clicking on the **[Edit]** section of the **Select Colours** pop-up for a colour box, or by the option ***Plots =>Plotting setups =>Pen mapping***.

	Colour No.	Pop-up No.	Colour Name	Legacy Name	Colour Group	Red	Green	Blue		Pen No.	Comment
1	0	-9017	black		12d	0	0	0		0	black
2	7	-9016	white		12d	255	255	255		7	white
3	1	-9015	red		12d	255	0	0		1	red
4	2	-9014	green		12d	0	255	0		2	green
5	3	-9013	blue		12d	0	0	255		3	blue
6	5	-9012	yellow		12d	255	255	0		5	yellow
7	6	-9011	magenta		12d	255	0	255		6	magenta
8	4	-9010	cyan		12d	0	255	255		4	cyan
9	12	-9009	grey		12d	240	220	250		12	grey
10	316	-9008	dark_grey		12d	67	67	67		316	dark_grey
11	11	-9007	dark_red		12d	210	20	0		11	dark_red
12	9	-9006	dark_green		12d	30	155	0		9	dark_green
13	13	-9005	dark_blue		12d	60	60	200		13	dark_blue
14	10	-9004	purple		12d	170	42	250		10	purple
15	15	-9003	brown		12d	150	90	0		15	brown
16	8	-9002	orange		12d	255	165	0		8	orange
17	14	-9001	off_yellow		12d	240	240	170		14	off_yellow

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Grid Cells

Colour No. integer

number of the colour. A unique integer value between 0 and 10,239.

Pop-up No. integer

a unique integer - positive, 0 or negative.

The number of colours in the colours pop-up can be restricted (see 7.6.1 Defaults*) and if this is the case, the colours are selected for display in the pop-up by the pop-up number.*

Also the pop-up number can be used as the sorting order for the colours in the colours pop-up. See 4.22.3.1 Colours Sort Order in Select Colour Pop-Up.

Colour Name text

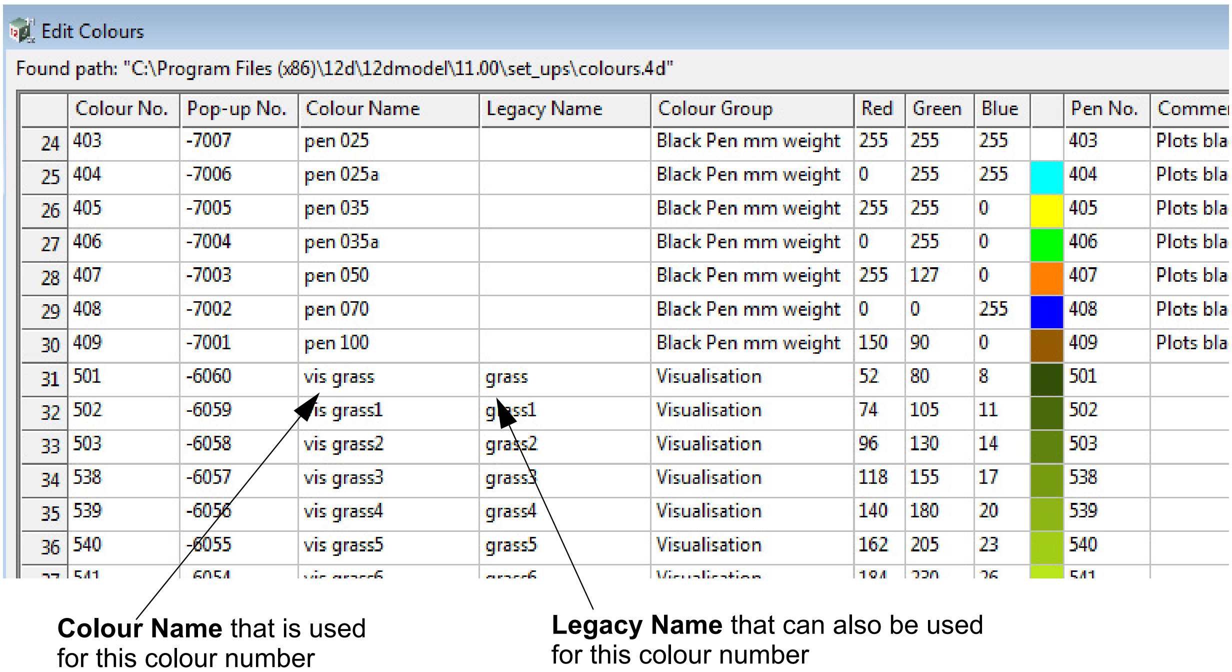
text name for the colour. The colour names must all be unique within the Colours.4d file.

Colour names are restricted to having alphanumeric characters and decimal points (.*). Upper and lower case characters can be used but colour names are case insensitive for uniqueness checks. So Red is considered the same as RED.*

Legacy Name text

*whenever a colour name is searched for, the **Legacy Name** column will also be searched for if there is no match with the **Colour Name** column.*

*The **Legacy Name** was introduced so that some 12d Model colours can be given new names without upsetting the colour number that went with the original name.*



Edit Colours

Colour Group text

group for the colour. This is not currently used.

Red/Green/Blue integer

amount of red/green/blue in the colour when it is displayed on a view. The value is between 0 and 255.

Pen No. text box

the default pen number to map the colour to.

Comment text box

optional comment.

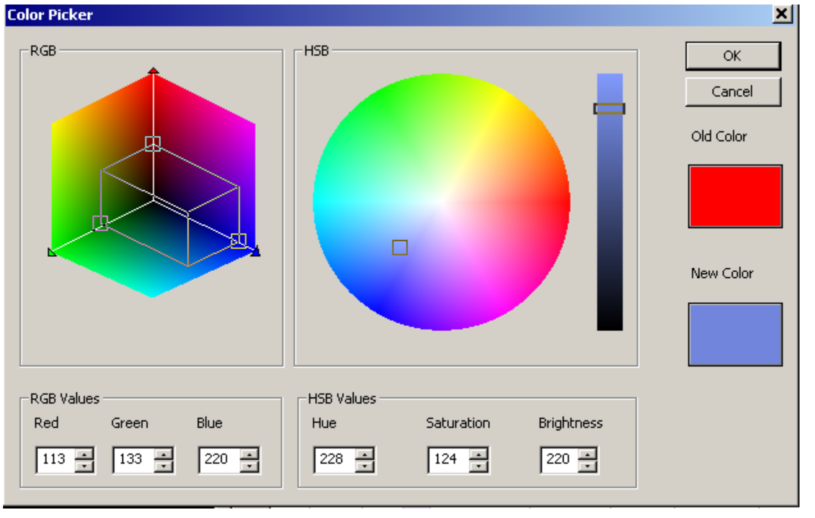
Buttons

Sort button

sort the table with respect to the column given in the adjacent field.

Picker button

if a row of the table is highlighted, selecting **Picker** *brings up the* **Color Picker** *to interactive define the RGB for new colours.*



Write button

write the table out to a colours.4d file.

WARNING

Do not change the colour numbers and definitions for colour numbers 0 to 2000 - they are restricted for ***12d Solutions*** use only.

In the ***12d Model*** database, only the colour number is saved so if the rgb of any colour numbers are changed then the display of colours in existing projects may change.

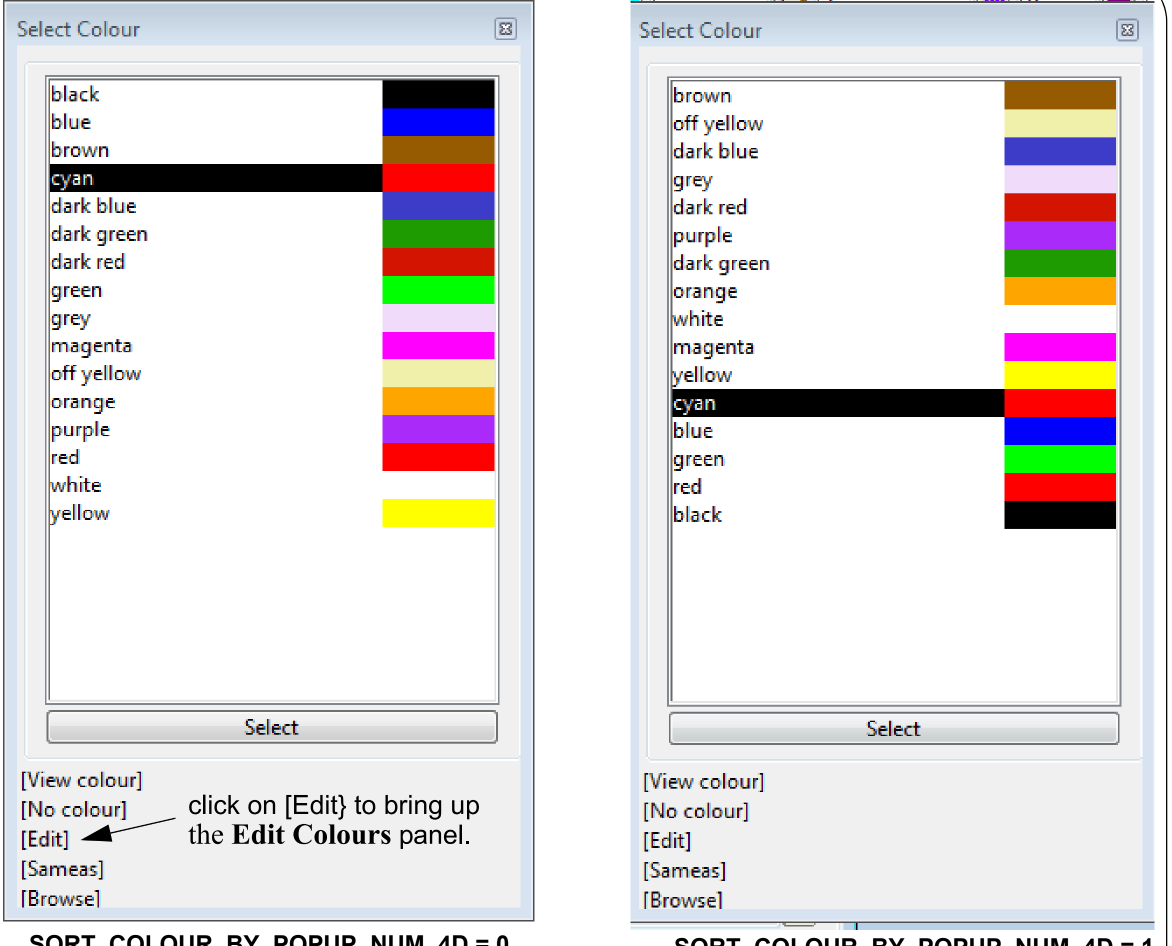
Please continue to the next section 4.22.3.1 Colours Sort Order in Select Colour Pop-Up or return to 4.22 Colours.

4.22.3.1 Colours Sort Order in Select Colour Pop-Up

There is an environment variable SORT_COLOURS_BY_POPUP_NUM_4D that controls the display order of the colours in the **Select Colour** popup that you get when you click on a **Colour** icon:

If **SORT_COLOURS_BY_POPUP_NUM_4D** is **1,** the colours in the **Select Colour** popup are sorted by the Pop-up Number given for the colours in the **Colours.4d** file.

If **SORT_COLOURS_BY_POPUP_NUM_4D** is **0,** the colours in the **Select Colour** popup are sorted alphabetically.



SORT_COLOUR_BY_POPUP_NUM_4D = 0

SORT_COLOUR_BY_POPUP_NUM_4D = 1

Note - Remember that the number of colours shown in the **Select Colour** popup is controlled by the ***Display colours*** value in the **Defaults** panel.

To edit the **Colours.4d** file to edit the popup number, click on **[Edit]** in the **Select Colour** popup. You can then edit the Pop-Up Number column and after any changes are made and write out the new **Colours.4d** file.

	Colour No.	Pop-up No.	Colour Name	Colour Group	Red	Green	Blue		Pen No.	Co
1	0	-100	black		0	0	0		0	
2	1	-101	red		255	0	0		1	
3	2	-102	green		0	255	0		2	
4	3	-103	blue		0	0	255		3	
5	4	-104	cyan		0	255	255		4	
6	5	-105	yellow		255	255	0		5	
7	6	-106	magenta		255	0	255		6	
8	7	-107	white		255	255	255		7	
9	8	-108	orange		255	165	0		8	
10	9	-109	dark_green		30	155	0		9	
11	10	-110	purple		170	42	250		10	
12	11	-111	dark_red		210	20	0		11	
13	12	-112	grey		240	220	250		12	
14	13	-113	dark_blue		60	60	200		13	
15	14	-114	off_yellow		240	240	170		14	
16	15	-115	brown		150	90	0		15	
17	16	16	red_032		32	0	0		16	
18	17	17	red_040		40	0	0		17	

Note - The sort order used when displaying the **Colours.4d** file has no effect on the order in the **Select Colour** popup.

To see the **Colours.4d** file sorted in different ways, click on the **Sort Order** choice pop-up, select the required sort order and then click on the **Sort** button.

You need to do a **Project Restart** for any changes in **Colours.4d** to take effect.

Please continue to the next section 4.23 Plotters or return to 4.22.3 Editing Colours.4d or 4.22 Colours.

4.23 Plotters

When creating a **plot**, 12d Model has a variety of options about where the potting data goes to. The user can:

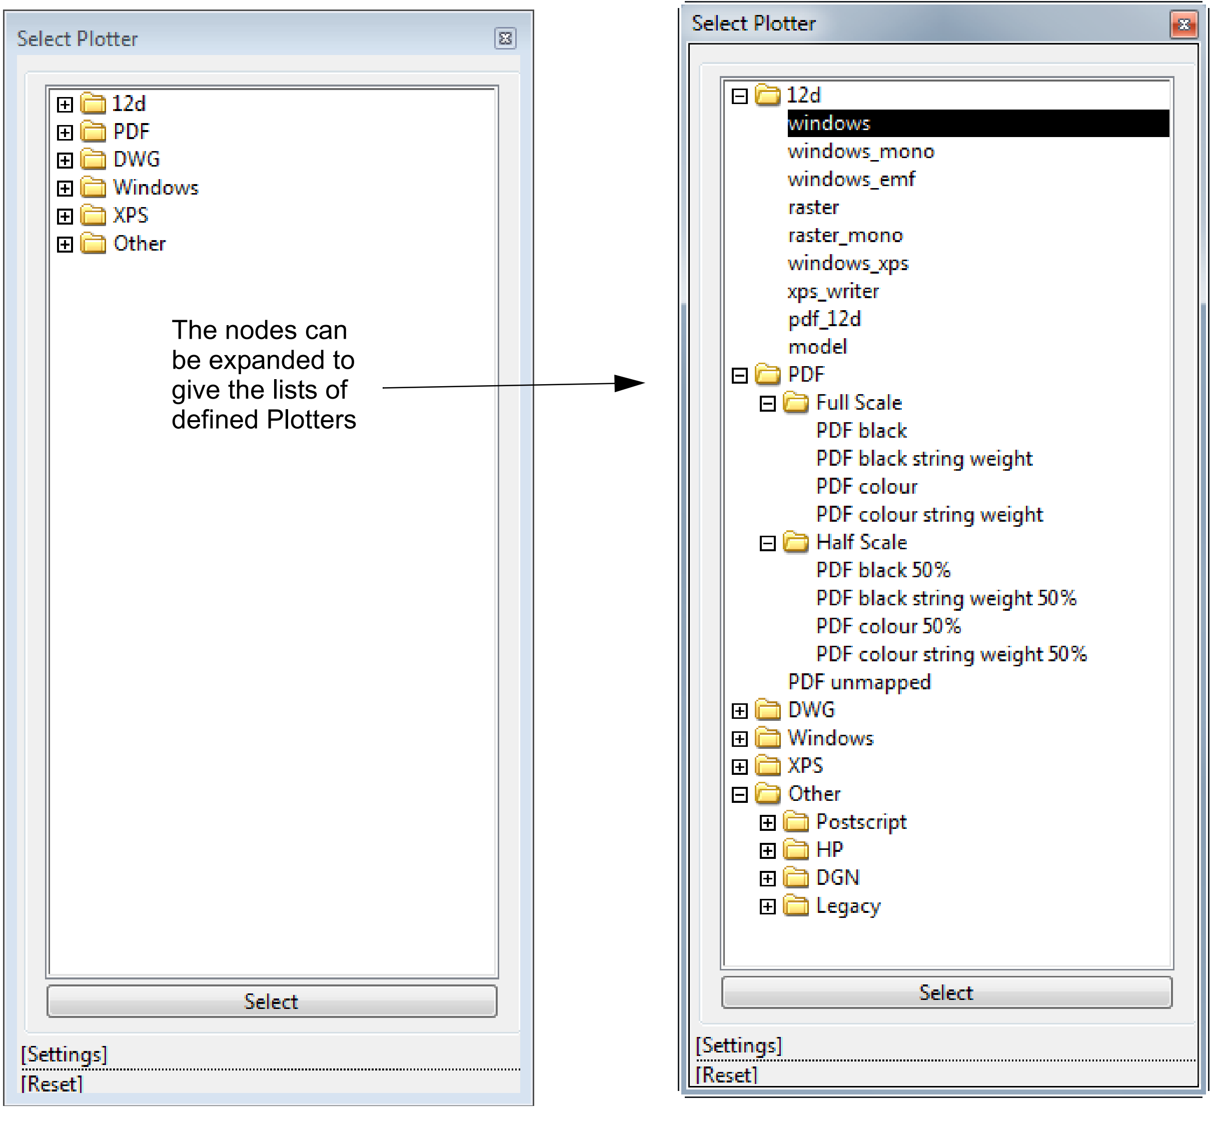
(a) drive the plotters **directly** using Windows printer drivers or raster plotter drivers

(b) plot **indirectly** by creating a computer disk file (the plot file) in a variety of formats containing the relevant plotter instructions for producing the plot. The formats include pdf, XPS, DWG and DGN.

(c) plot **indirectly** to a ***12d Model* model**

In all of these cases, their are **plotter mapping files** that control how the colours appear on the plot and with what weights. For example, for some plots, you may want all the colours to be mapped to black and shades of grey rather than actual colours. There are plotter mapping files that are installed with ***12d Model*** and users can define their own.

The choice of the device to plot to plot to and the plotter mapping file go together to define a **Plotter** and in plotting options, the choice of plotters that is available is shown in the **Select Plotter** pop-up menu. The default ***12d Model*** list is



From the list you will see that there can be a number of Plotters using the same output type (e.g. windows or pdf) but there are different entries in the list depending on a particular plotting mapping file (pmf) is being used.

For example:

Full Scale >PDF black

The 12d standard **colour numbers 1-15** & **316** plot with **0.25mm black** pens.

The "**pen***" (**400 series**) colour numbers plot with **black pens** of **specific weights**.

All "**ppf***" (**900 series**) colour numbers plot with black/grey scale pens of specific weights.

Full Scale >PDF black string weight

If the string has no weight then it is the same as **Full Scale >PDF black** but if the string has a weight then the string weight is used.

So if a non standard weight is required for a particular string then you set the weight for that string. Otherwise do not give the string a weight.

When the plot file is created, it can be passed to a user specified program or batch file which can automatically direct the plot file to a plotter. See 43.4 Sending Plots to a Plotter.

For more information on plotters and defining plotters, see 43 Plotters and Plotting.

The file *plotters.4d* is described in 43.2 Defining Plotters - Plotters.4d.

The *plotter mapping file* is described in 43.3.2 Plotter Mapping File.

Please continue to the next section 4.24 Defaults.

4.24 Defaults

4.24.1 Defaults

Many options in 12d Model require settings which are almost always the same. To save repetitous typing, *12d Model* provides a number of user defined defaults that are used throughout *12d Model*.

For example, the chord to arc tolerance, point cross size and highlight cross size and colour.

Certain default values are read in from a file when a new project is created. These defaults can also be modified inside 12d Model using the **Defaults** panels.

The lay out of the file used to define the default values for a new project is given in the appendix **Set Ups**.

User defaults can also be set for entire panels - see the section 4.3.6.6 Panel Defaults - ddx Files.

Go to the next section 4.24.2 Default Panel Values or return to 4.24 Defaults.

4.24.2 Default Panel Values

When a panel is opened, ***12d Model*** may set some default values.

However for most panels ***the user can supply the values*** to be used ***for*** all the ***panel fields*** each time a panel is opened. This information is stored in a defaults file for a panel.

For more information on the panel default files and how to create them, go to the section 4.3.6.6 Panel Defaults - ddx Files.

Go to the next section 4.24.3 Default File Ending or return to 4.24 Defaults.

4.24.3 Default File Ending

In any panel pop-up requiring a file name, default file endings are used to restrict the names of the files selected from the current folder to be displayed in the pop-up.

The list of special file endings is given in the section 42.1 Default File Ending in the appendix 42 Special File Formats.

Return to 4.24 Defaults or continue to the next section 4.25 Miscellaneous Panels.

4.25 Miscellaneous Panels

The value is entered into the typed-input box, terminated with <enter>.

The **Enter Value** typed-input box then disappears.

The length is entered into the typed-input box, terminated with <enter>.

The **New Length** typed-input box then disappears.

The radius is entered into the typed-input box, terminated with <enter>.

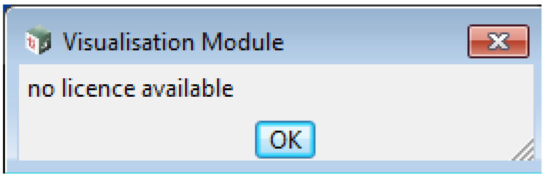
The **New Radius** typed-input box then disappears.

4.26 No Option Available

12d Model consists of a base module of varying point sizes and optional modules.

If a module has not been purchased and any options included in that option are selected then a ***No licence available*** message will be displayed.

The missing module can be purchased by contacting your ***12d Model*** distributor or **12d Solutions Pty Ltd.**



4.27 No Information Available

There is no information available on this panel or menu.

4.28 Options on Toolbars

For general information *Toolbars* and *Controlbars*, go to 4.3.5 Toolbars and Controlbars

Each *Toolbars* is described in detail in:

Cad	15.2 CAD Options
Cad Arcs	15.13 CAD Arc
Cad Circles	15.12 CAD Circle
Cad Controlbar	15.1 Controlbars
Cad Delete	15.25 CAD Delete
Cad Fills	15.18 CAD Fill
Cad Holes	15.17 CAD Hole
Cad Images	15.19 CAD Image
Cad Intersect	15.10 CAD Intersection
Cad Lines	15.11 CAD Line
Cad Modify	15.20 CAD Modify
Cad Points	15.9 CAD Point
Cad Polygons	15.14 CAD Polygon
Cad Segment	15.22 CAD Segment
Cad String	15.23 CAD Edit Strings
Cad Symbols	15.16 CAD Symbol
Cad Text	15.15 CAD Text
Design	4.28.1 Design Toolbar
Cad Vertex	15.21 CAD Vertex

Label chainage / offset	24.8 Chainage/Offset Label Inquire
Dimension *Create/edit*	24.7 Create/Edit Dimensions

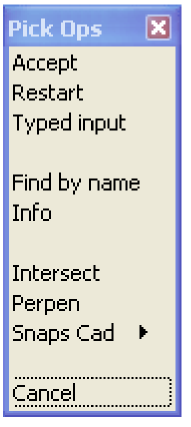
4.28.4 Snaps Cad

Position of option on menu: various

The Snaps Cad Menu can be accessed the following ways:

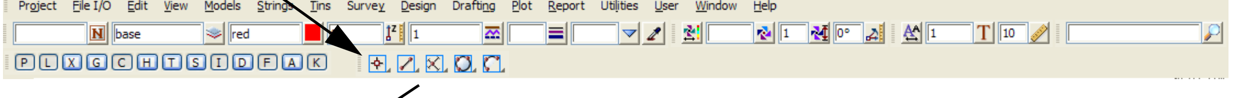
(a) by selecting **Snaps Cad** from the **Pick Ops** menu

(b) by walking right on **Snaps Cad** on the **Pick Ops** menu



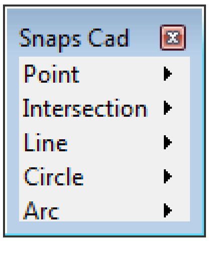
(c) From the toolbar, as long as **Snaps Cad** is ticked in the **Customize toolbars** panel (**View =>Toolbars).**

snaps cad toolbar



When you unpin the **Snaps Cad toolbar**, it will then appear on the screen as a floating toolbar.

The **Snaps Cad Menu** walk- right menu is:

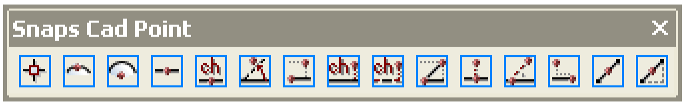


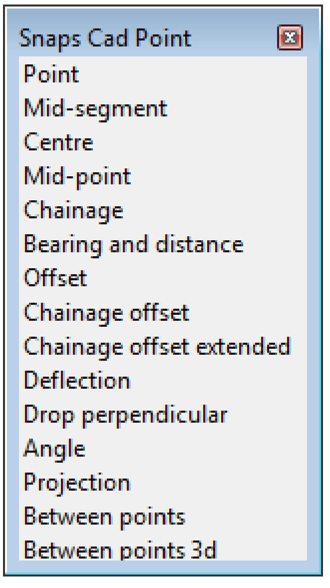
For the option *Point*, go to	4.28.5 Snaps Cad Point
Intersection	4.28.5.1 Snaps Cad Intersection
Line	4.28.5.2 Snaps Cad Line
Circle	4.28.5.3 Snaps Cad Circle
Arc	4.28.5.4 Snaps Cad Arc

Note: Snap Cads work in a very similar pattern to the normal Cad options.However, they create virtual points and segments which can be used by either **Cad** or **Snap Cad** options. **Snap Cad** options don’t create any points or strings.

4.28.5 Snaps Cad Point

This section of documentation is a work in progress and will be updated in subsequent releases.





at a user selected position
at middle of a selected segment
at the centre point of an arc
at the middle of the two selected points
at the position of a chainage along a selected string
a given bearing and distance from a selected position
at the offset position of a point on a selected string
at the offset position of a chainage along a selected string
at the offset position of a chainage along a selected string which can be extended
a given distance at right angles to a selected string
dropped perpendicularly onto a selected string
a given distance at a given angle to a selected string
projected a chainage distance along a selected string

For the option *Point*, go to		Point
	Mid- segment	Mid- segment
	Centre	Centre
	Mid-point	Mid point
	Chainage	Chainage
	Bearing and distance	Bearing and distance
	Offset	Offset
	Chainage offset	Chainage offset
	Chainage offset extended	Chainage offset extended
	Deflection	Deflection
	Drop perpendicular	Drop perpendicular
	Angle	Angle
	Projection	Projection
	Between points	Between Points
	Between points 3d	Between points 3d

Point

On selecting **Point**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

The user can select a position with the mouse and on accepting that point (Middle mouse button or enter) the virtual point is created at the selected position and ready to be used by the calling option.

The snap mode will influence the mouse selection. For example if cursor snap is on, the user can choose a position not yet defined. If point snap is on and the selection snaps to an existing point, the option will place another point at that location.

The user can also activate the selection menu used with the mouse (right button) that allows various positioning options.

Mid- segment

This option creates a virtual point in the middle of a selected line or arc segment.

On selecting **Mid- segment**, the user is prompted to select a segment and a virtual point is created at the mid point of the segment.

Centre

This option creates a virtual point at the centre of a selected segment.

On selecting **Centre** the user is prompted to select a segment and a virtual point is created at the centre of the segment.

Mid point

This option creates a virtual point in the middle of two selected positions.

On selecting **Mid point,** the user is prompted to select the first position and then the second position. A virtual point is created at the mid point of the two selected positions.

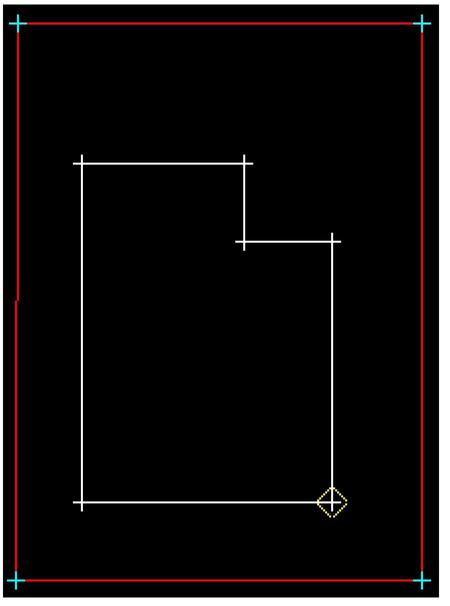
Chainage

This option creates a virtual point at the position of a user specified chainage of an existing string.

On selecting **Chainage**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

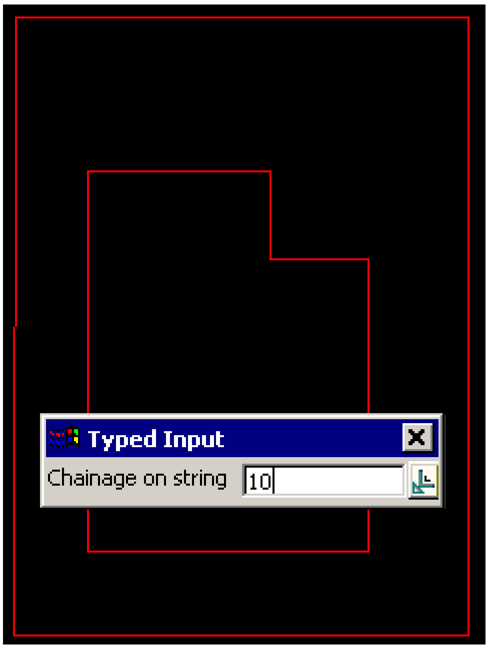
STEP 1:

The user selects a valid string (left mouse button) and accepts that string (Middle mouse button or enter).



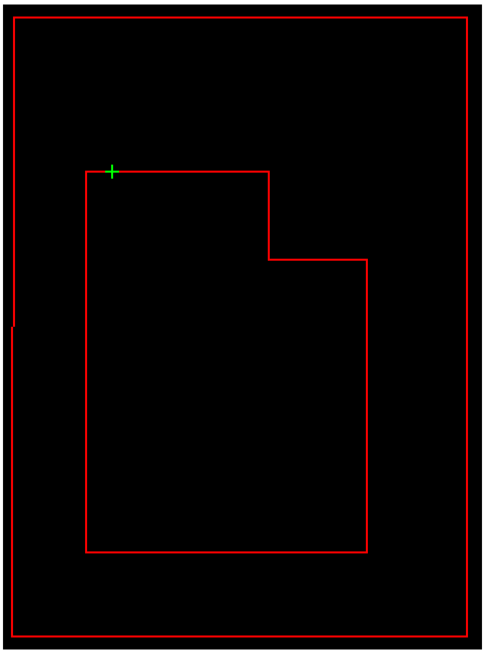
STEP 2:

The user enters a chainage value where a point should be placed followed by the enter key. This chainage is with respect to the selected string.



STEP 3:

A virtual point is created at the positioned on the string at the given chainage.



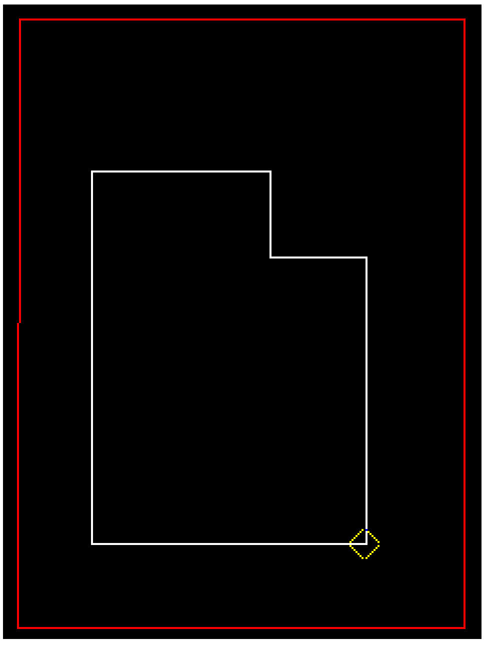
Bearing and distance

This option calculates a virtual point that is located at a given bearing and distance from a start position.

On selecting **Bearing and distance**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A start position is selected and accepted.

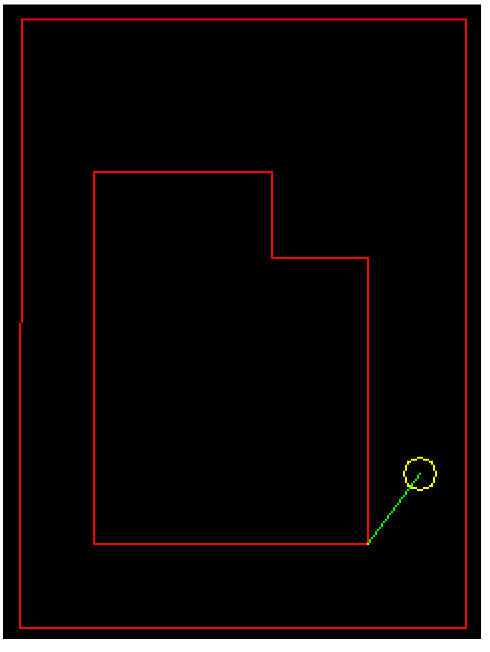


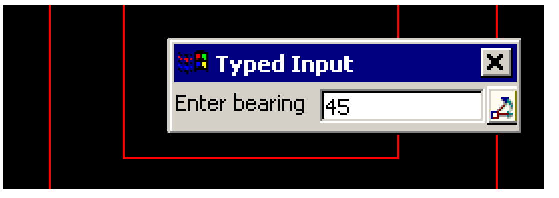
STEP 2:

A bearing is selected with the mouse or entered in via the keyboard. For typed entry, simply start typing or press the space bar to bring up the bearing entry box. The value is entered into the input box followed by the Enter key.

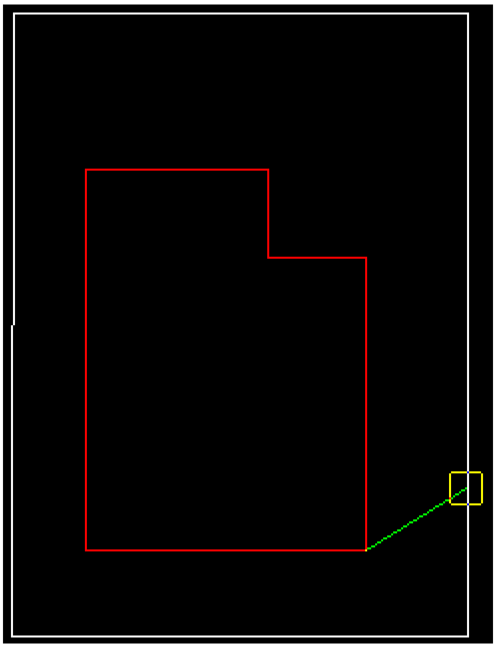
The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the bearing continued.

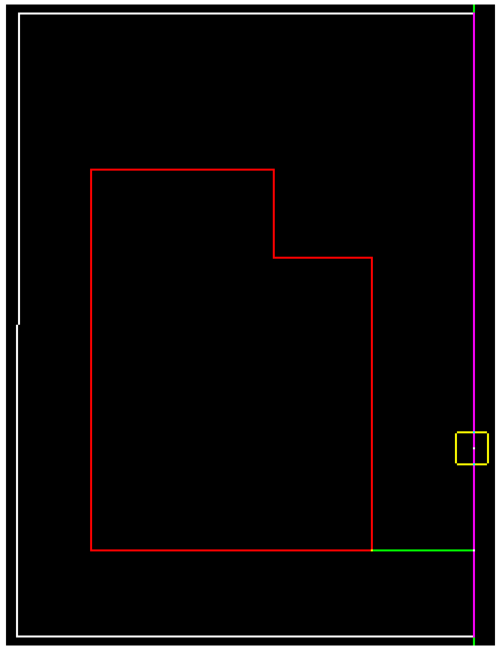
Note: **The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.**





This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

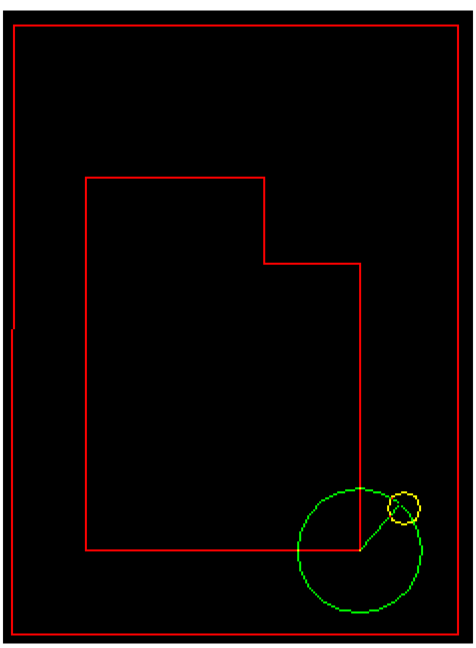


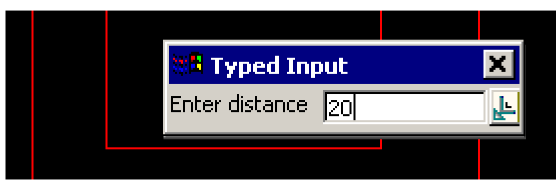


STEP 3:

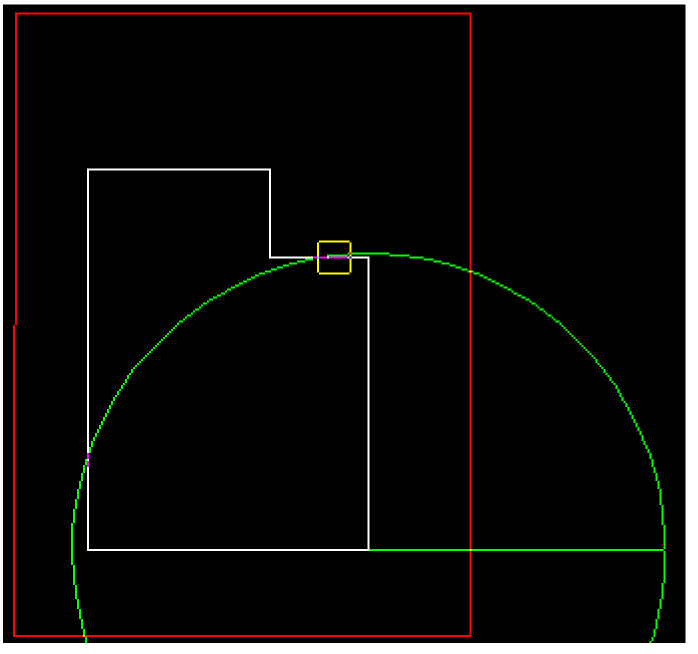
A distance is selected and accepted with the mouse or entered in via the keyboard. For typed entry, simply start typing or press the space bar to bring up the distance entry box. The value is entered into the input box followed by the enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

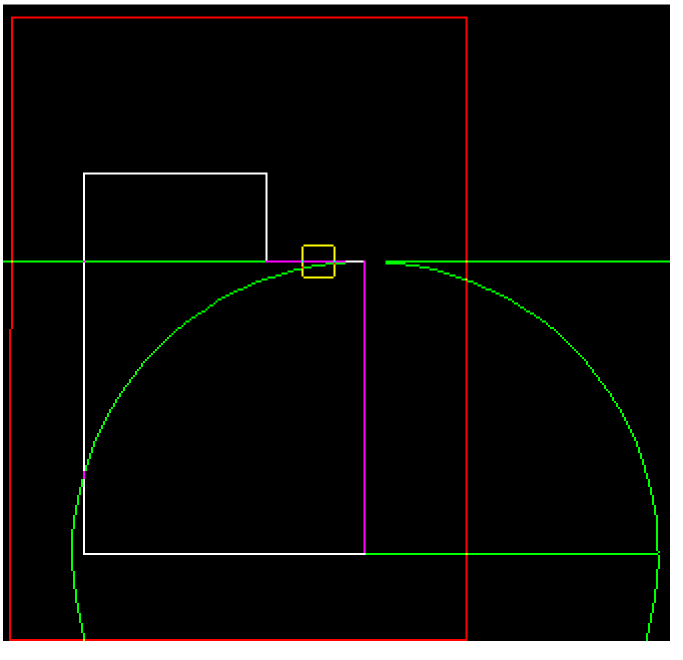




This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

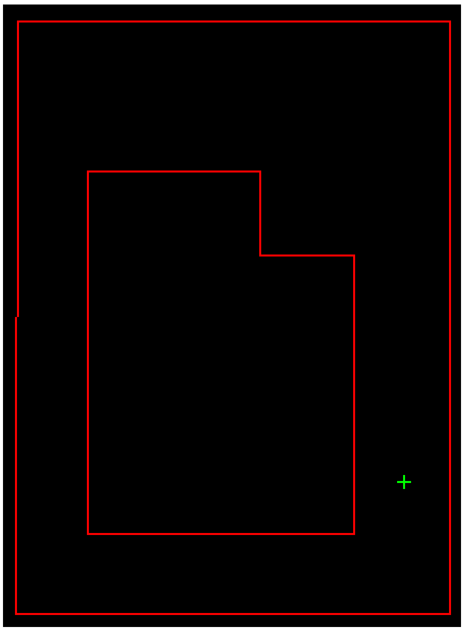


The perpendicular distance shown below by the purple line will be use at the defined bearing to create the point.

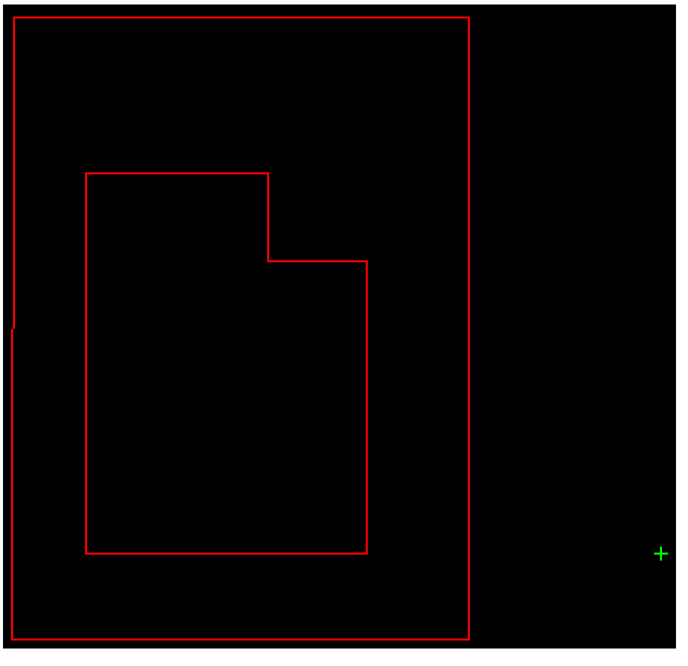


STEP 4:

A virtual point is created using created using the information supplied. By entry into the input boxes:



Or by using the perpendicular/tangential tools:



Offset

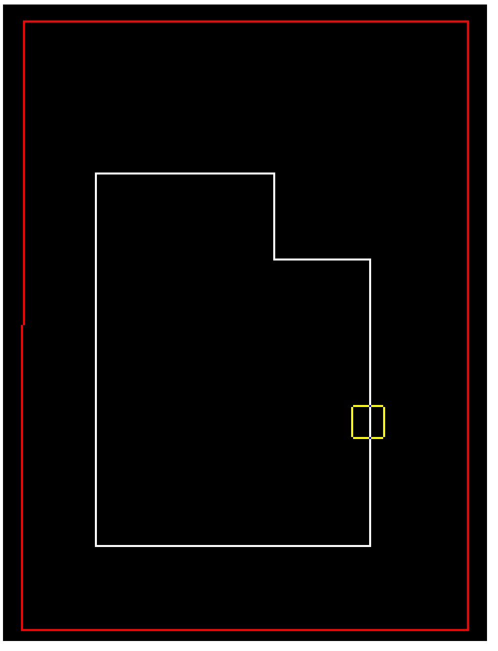
This option creates a virtual point that is located by reference to a string, a control point, a chainage distance along the string from the control point and an offset to the selected string.

After selection and acceptance of a string, a control point is selected and accepted. This point is dropped perpendicular onto the string. The distance along the string is measured from this dropped point. Positive distances are in the direction that the string was picked. Finally a offset to the string can be specified for the placement of the new virtual point.

On selecting **Offset**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

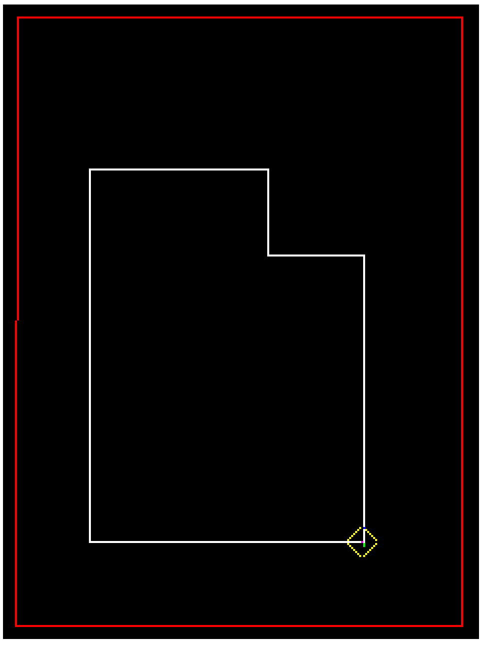
STEP 1:

The user selects and accepts a string with direction. This defines what side the offset applies to.



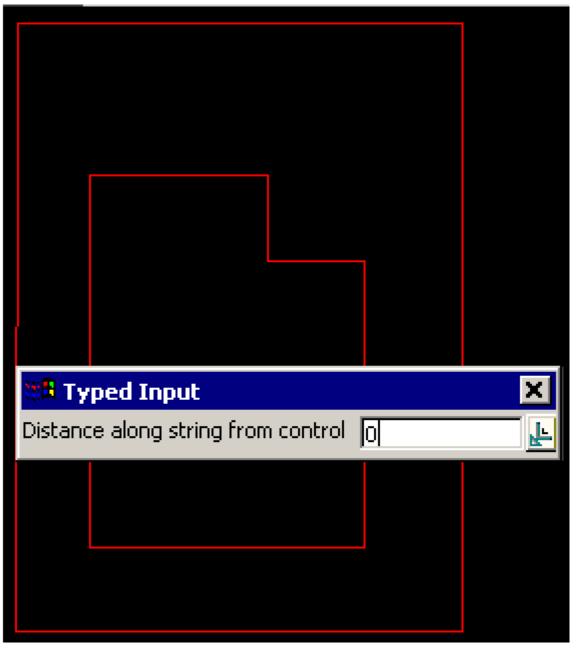
STEP 2:

The user picks and accepts a control point to be dropped onto the selected string.



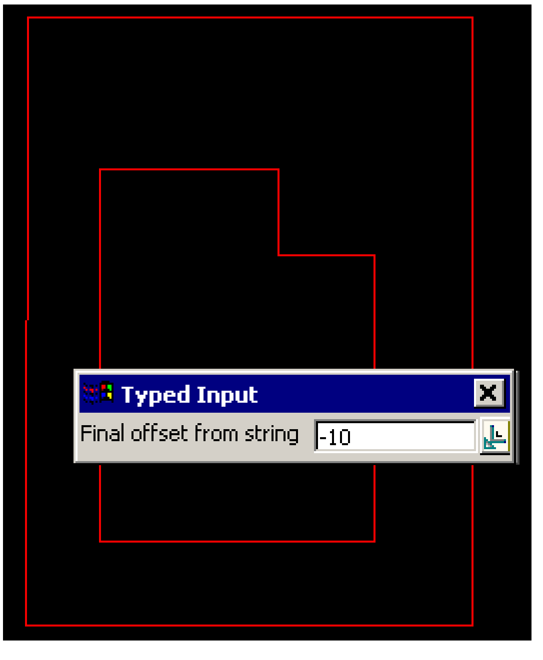
STEP 3:

A distance along from the dropped point is specified. Positive distances are in the direction of the string selection pick. The value is entered into the input box followed by the Enter key.



STEP 4:

An offset relative to the selected string (and direction) is specified in the input box followed by the Enter key.



STEP 5:

A virtual point is created using the information supplied.

Chainage offset

This option creates a virtual point that is located perpendicular to the reference string with a defined offset.

STEP 1:

The user selects the reference string with direction.

STEP 2:

The user specifies a chainage on the reference string.

STEP 3:

The user specifies an offset distance from the reference string.

A virtual point is created using the information supplied.

Chainage offset extended

Is similar to chainage offset except the specified chainage can be extended beyond the start and end chainages of the selected string.

Deflection

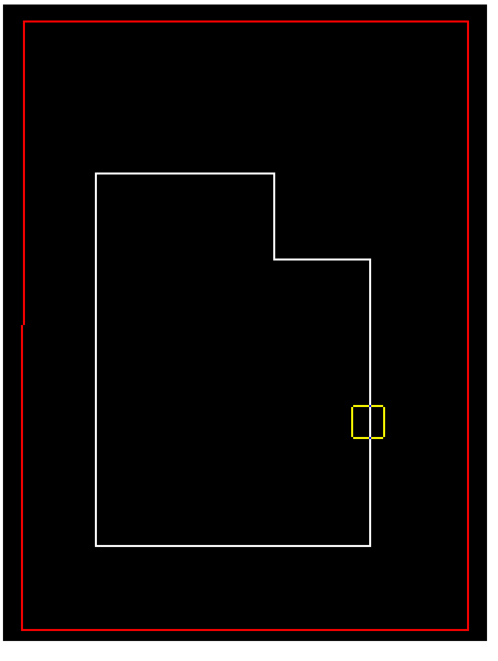
This option creates a virtual point that is located by reference to a string, a control point, a distance along the string from the control point, a deflection angle and deflection distance.

After selection of a string, a control point is selected. This point is dropped perpendicular onto the string. A distance along the string can be entered to move the measure point. Positive distances are in the direction that the string was picked. A deflection angle is specified which is a clockwise angle from the measure point. The deflection distance is the distance from the measure point to the point which is to be created.

On selecting **Deflection**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

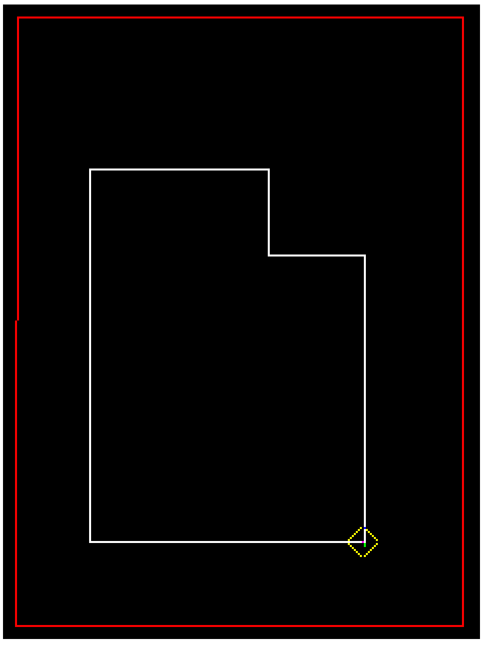
STEP 1:

The user selects and accepts a string with direction.



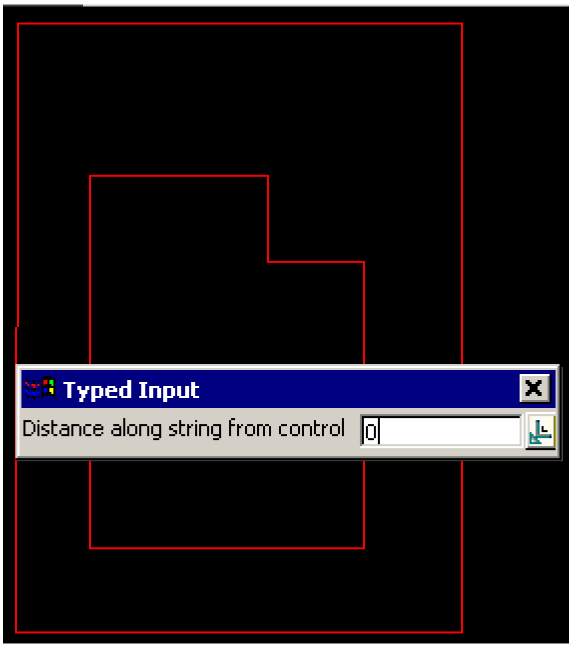
STEP 2:

The user picks and accepts a control point to be dropped onto the selected string.



STEP 3:

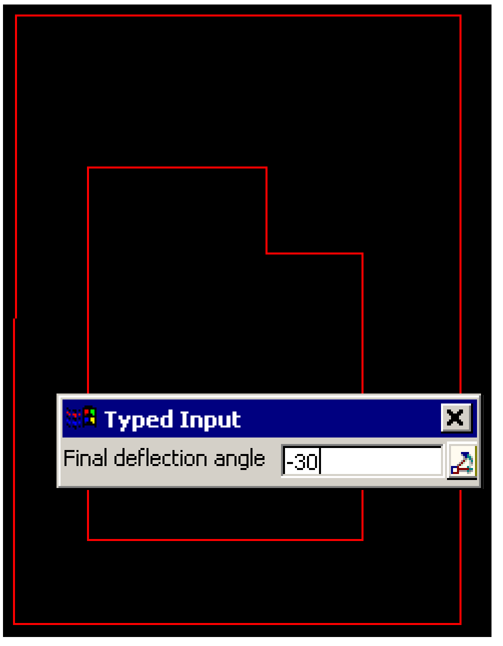
A distance along from the dropped point is specified. Positive distances are in the direction of the string selection pick. The value is entered into the input box followed by the Enter key.



STEP 4:

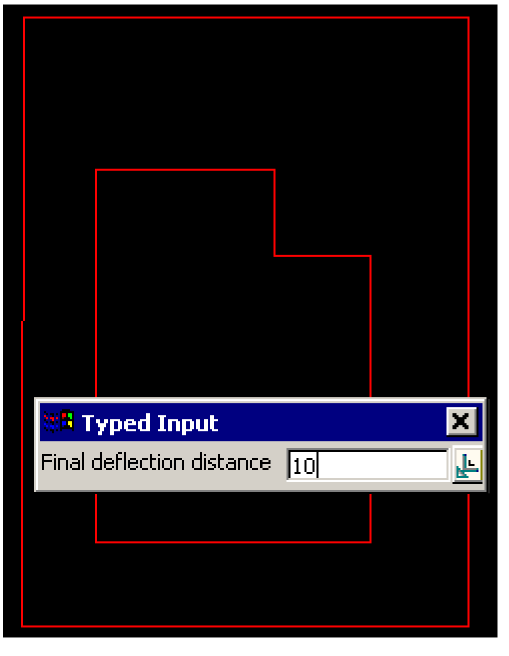
A deflection angle is specified. This angle is clockwise, relative to the direction of the string selection pick. The value is entered into the input box followed by the enter key.

Note: **The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.**



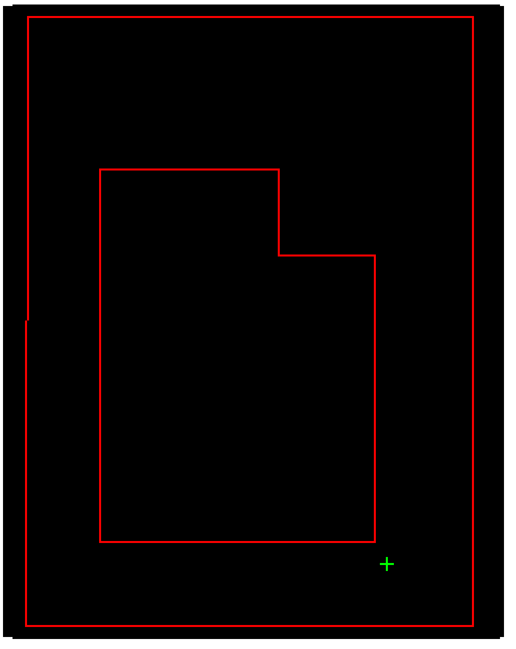
STEP 5:

A deflection distance is supplied. Positive is in the direction of the string selection pick. The value is entered into the input box followed by the Enter key.



STEP 6:

A virtual point is created using the information supplied.



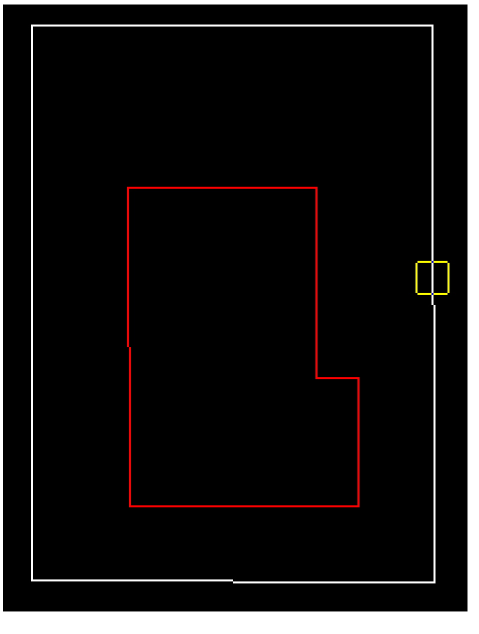
Drop perpendicular

This option creates a virtual point by dropping from a user selected position perpendicularly onto a user selected string.

On selecting **Drop perpendicular**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

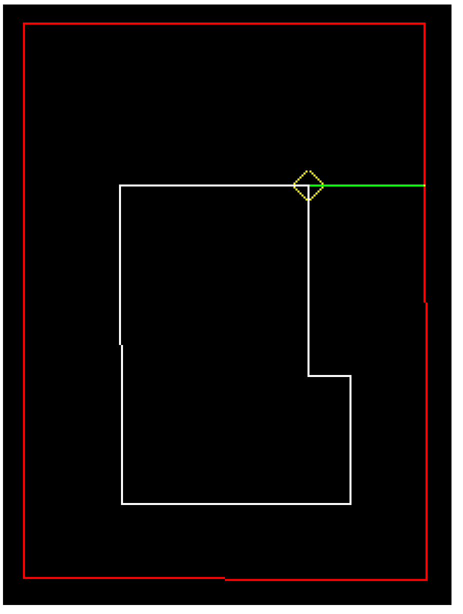
STEP 1:

The user selects a string and accepts (with direction) to have the point dropped onto.



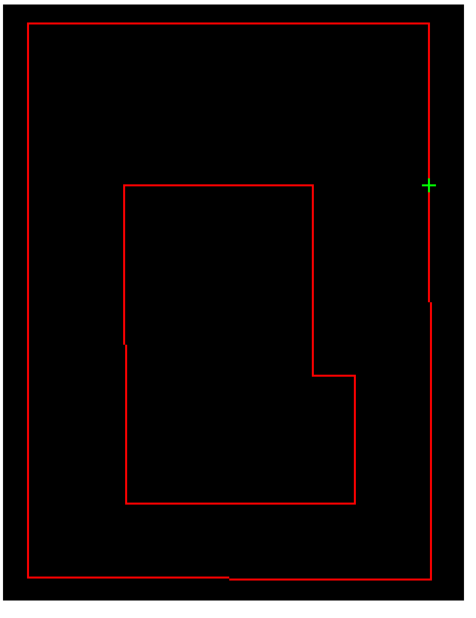
STEP 2:

The user picks and accepts a position to drop onto the nominated string



STEP 3:

A virtual point is created at the perpendicular drop point.



Angle

This option creates a virtual point that is located by projecting a selected position back to a string by a specified angle.

STEP 1:

User selects and accepts a string to have the point projected onto.

STEP 2:

User specifies an angle for the projection.

STEP 3:

User selects a position on the screen to be projected back to the string.

STEP 4:

A virtual point is created, which form the nominated angle with the selected position on **STEP 3.**

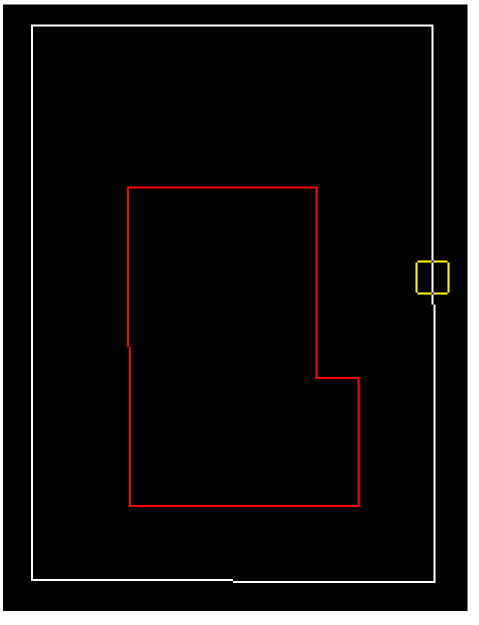
Projection

This option creates a virtual point that is located by firstly dropping a point onto a string and then giving a distance along the string from the dropped point.

On selecting **Projection**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

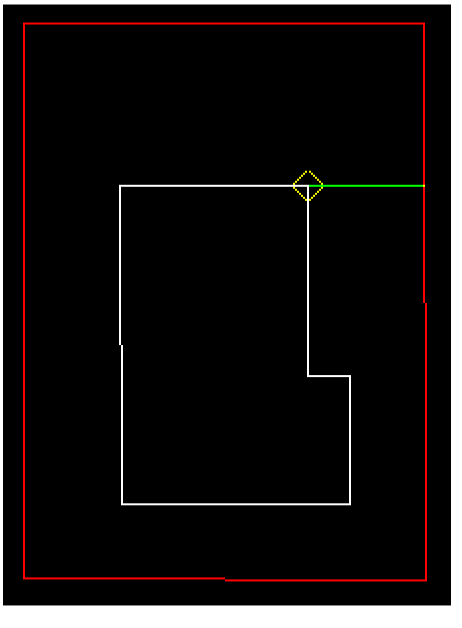
STEP 1:

The user selects and accepts a string (with direction) to have the point dropped onto



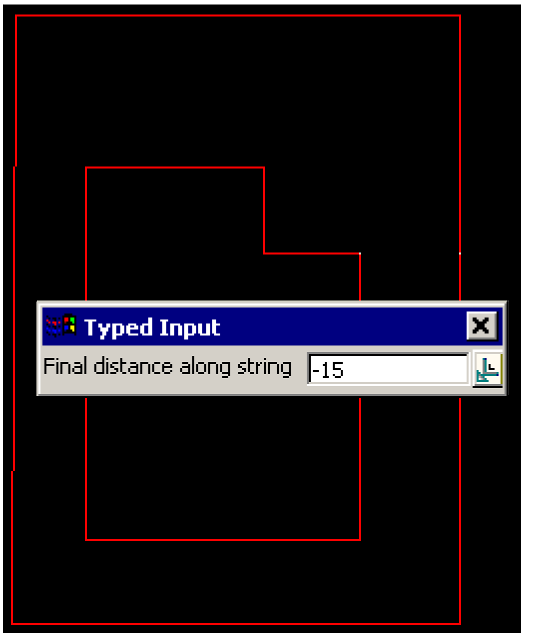
STEP 2:

The user picks and accepts a position to drop onto the nominated string



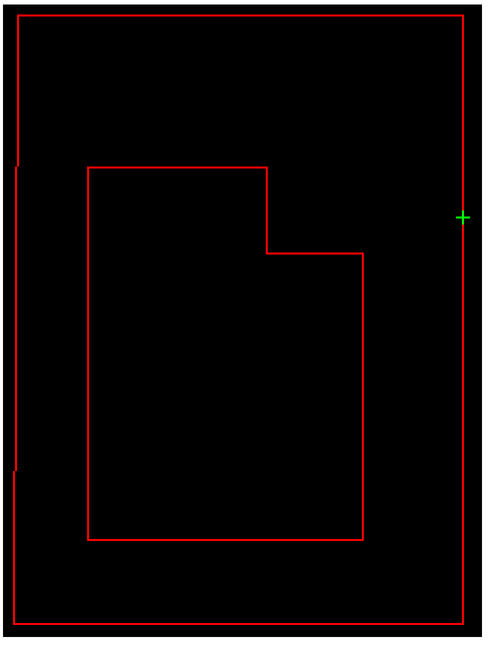
STEP 3:

The user is prompted for the distance along the string. Positive distances are in the direction that the string was picked. A value is entered into the input box followed by the Enter key.



STEP 4:

The virtual point is created the nominated distance along the string from the dropped point.



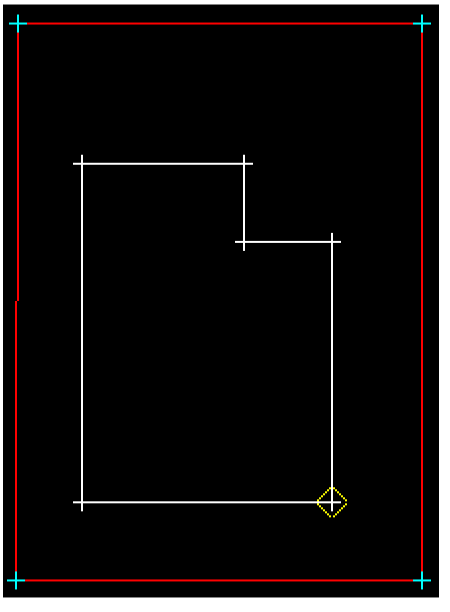
Between Points

This option creates a virtual point that is on the line between two selected positions and a given distance from the first point.

On selecting **Between points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

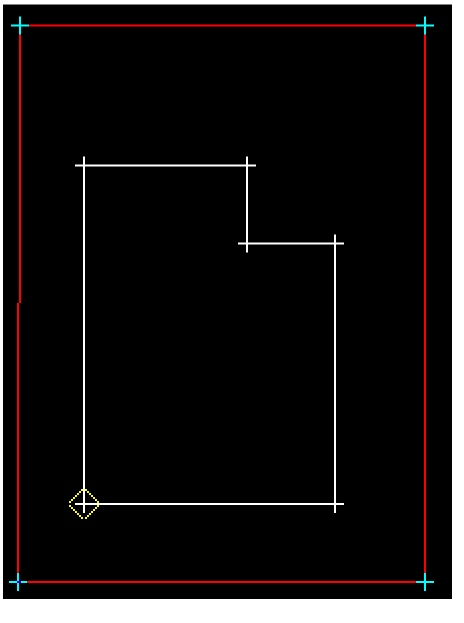
STEP 1:

The user selects a start point. Specification of a position can be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel or by typing of the value to bring up the XYZ panel. The user can also select a point with the mouse and accepts that point (Middle mouse button or enter).



STEP 2:

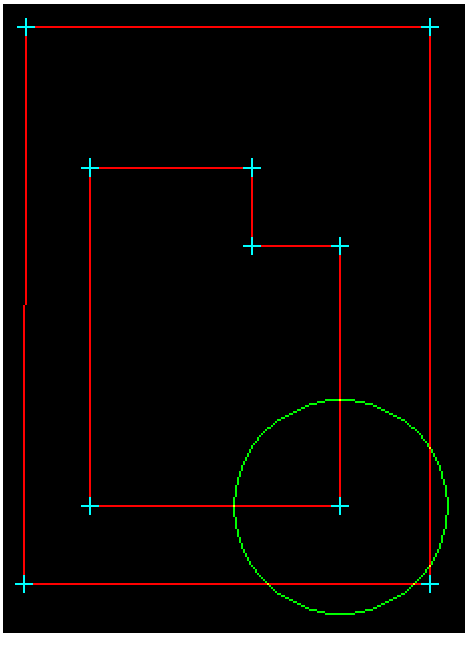
The user picks a 2nd point and accepts that point (Middle mouse button or enter) to define the reference line.

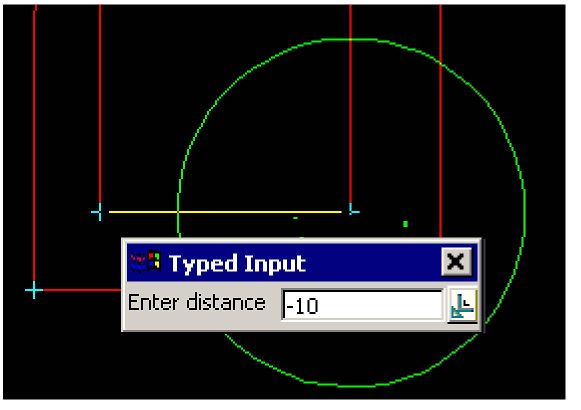


STEP 3:

A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. Enter the value and then the enter key.

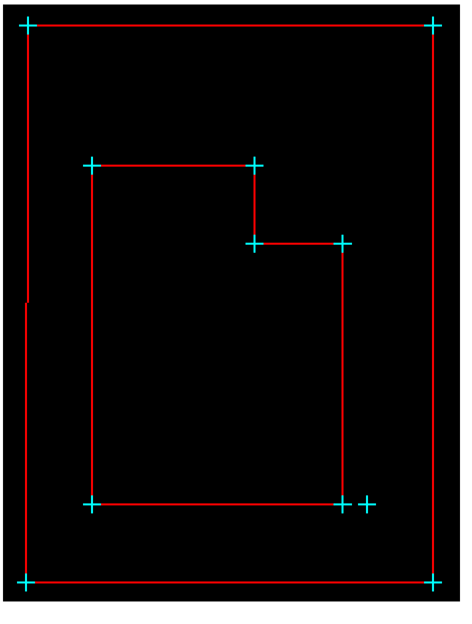
The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.





STEP 4:

A virtual point is created on the segment specified by the selection of the 1st and 2nd points, at the nominated distance. Negative distances can be entered as in this example.



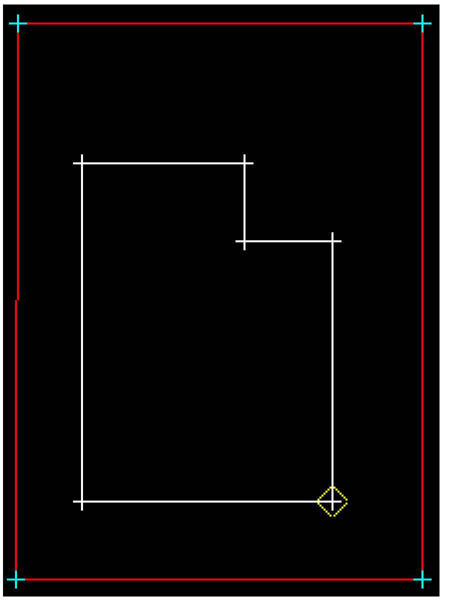
Between points 3d

This option creates a virtual point that is on the line between two selected positions and a given distance from the first point. The z-value of the string is interpolated from the two selected positions.

On selecting **Between points 3d**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

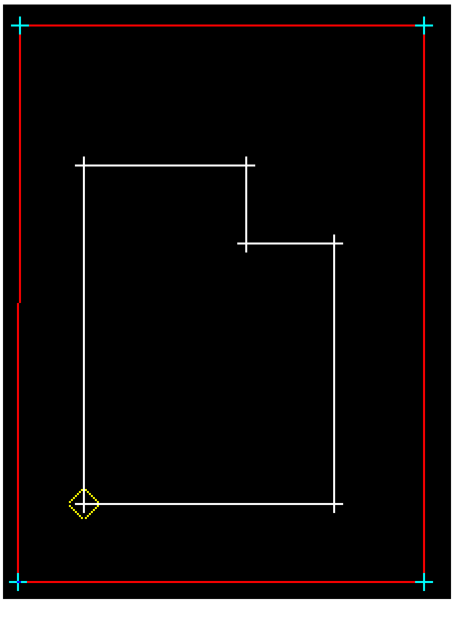
STEP 1:

The user selects a start point. Specification of a position can be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel or by typing of the value to bring up the XYZ panel. The user can also select a point with the mouse and accepts that point (Middle mouse button or Enter).



STEP 2:

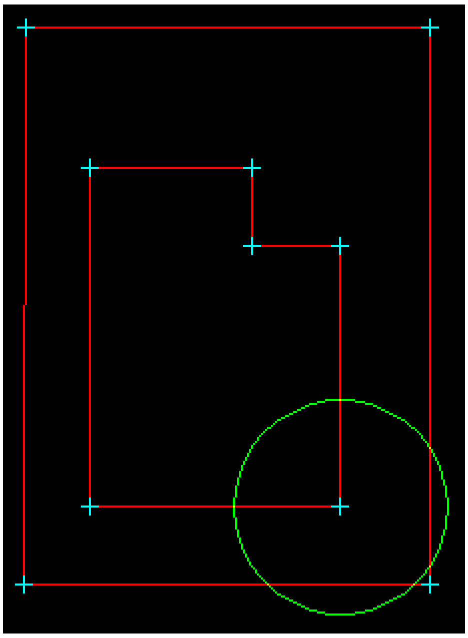
The user picks a 2nd point and accepts that point (Middle mouse button or <Enter>) to define the reference line.

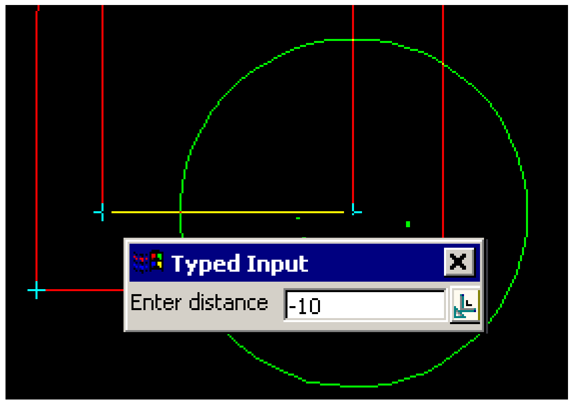


STEP 3:

A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. Enter the value and then the enter key.

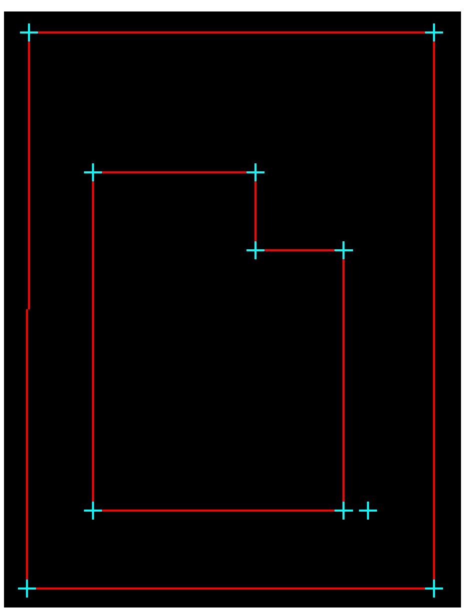
The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.





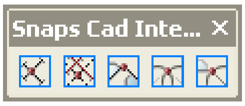
STEP 4:

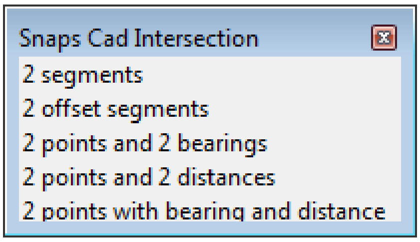
A virtual point is created on the segment specified by the selection of the 1st and 2nd points, at the nominated distance. Negative distances can be entered as in this example.



4.28.5.1 Snaps Cad Intersection

This section of documentation is a work in progress and will be updated in subsequent releases.





for the option 2 segments, go to the section [2 segments](#)
2 offset segments [2 offset segments](#)
2 points and 2 bearings [2 points and 2 bearings](#)
2 points and 2 distances [2 points and 2 distances](#)
2 points with bearing and distance [2 points with bearing and distance](#)

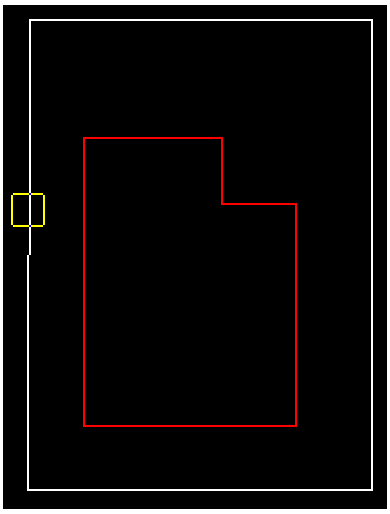
2 segments

This option creates a virtual point at the intersection of the projections of two line or arc segments.

On selecting **2 segments**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

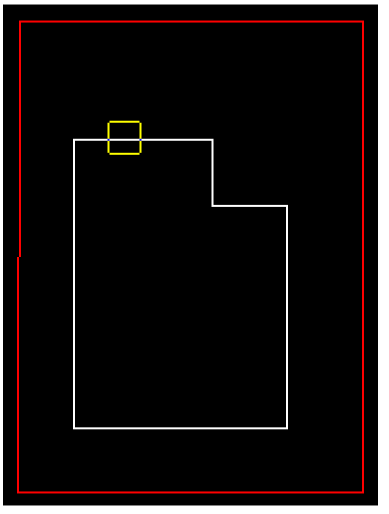
STEP 1:

The 1st segment is selected and accepted.



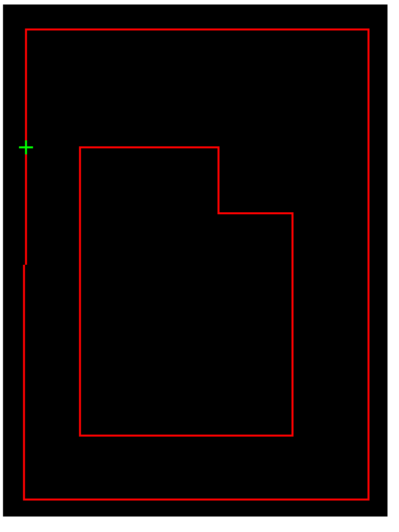
STEP 2:

The 2nd segment is selected and accepted.



STEP 3:

A virtual point is created at the intersection of the two segments (if a solution exists). Note that the 2nd segment in this case has been projected to enable a solution to be calculated.



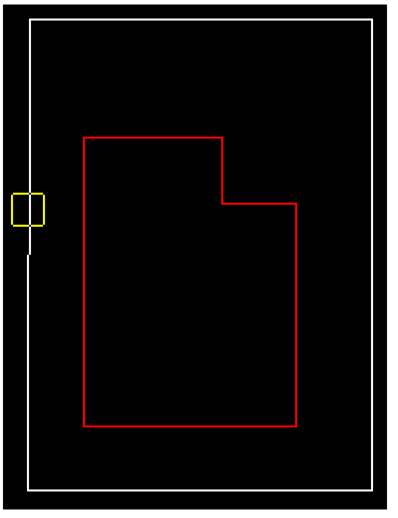
2 offset segments

This option creates a virtual point at the intersection of the offsets of two selected segments.

On selecting **2 offset segments**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

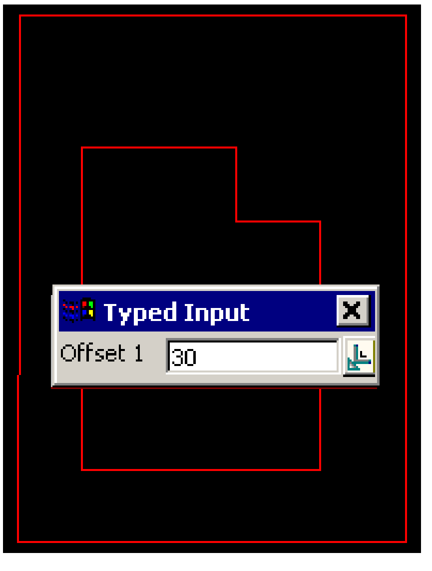
STEP 1:

The 1st segment is selected and accepted with direction. This sets the positive direction of the offset to the right of the direction of pick.



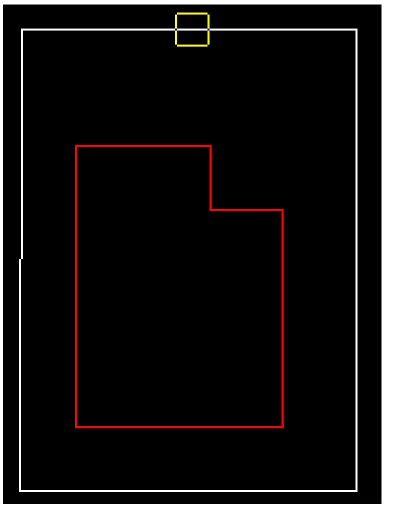
STEP 2:

The offset is given by into an offset input box. The positive direction is at 90 degrees to the direction of pick for the segment. The value is entered into the input box followed by the Enter key.



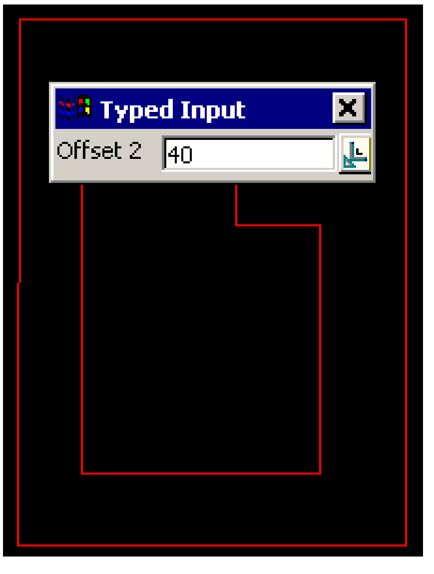
STEP 3:

The 2nd segment is selected with direction and accepted. This sets the positive direction of the offset to the right of the direction of pick.



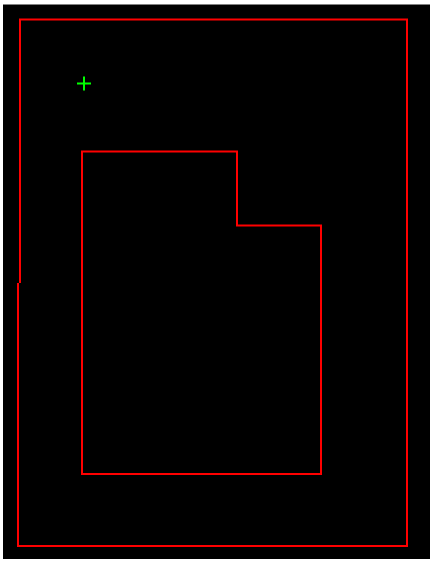
STEP 4:

The offset is given by into an offset input box. The positive direction is at 90 degrees to the direction of pick for the segment. The value is entered into the input box followed by the Enter key.



STEP 5:

A virtual point is created at the intersection of the projected lines offset to the segments (if a solution exists).



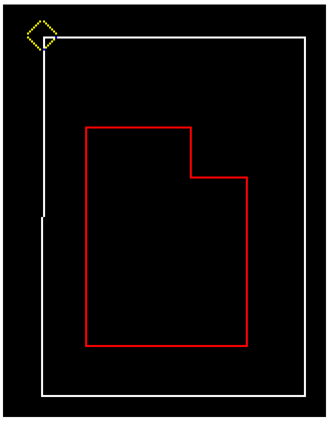
2 points and 2 bearings

This option creates a virtual point by using two points and two bearings.

On selecting **2 points and 2 bearings**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The 1st point is selected and accepted.

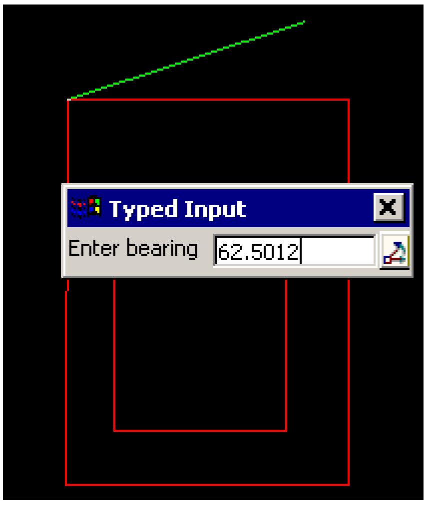


STEP 2:

A bearing from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the bearing will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the Enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the line continued.

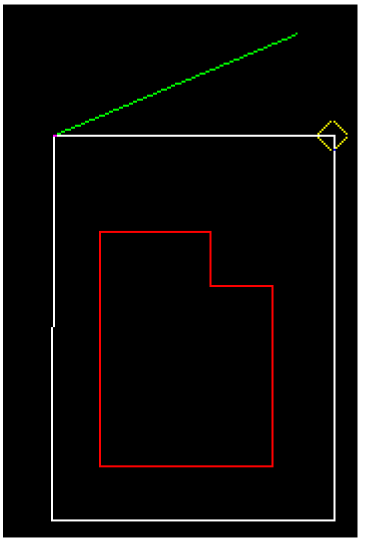
Note: **The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.**



This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

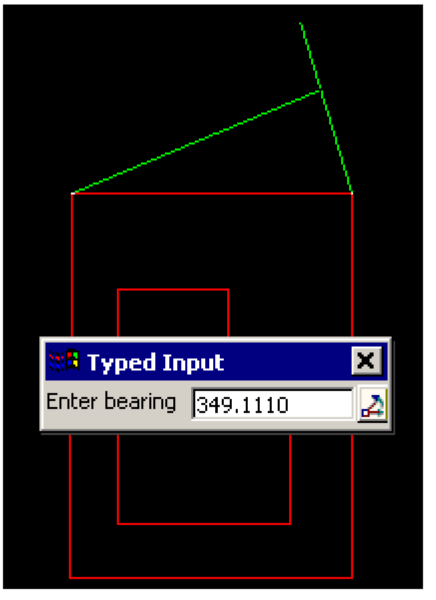
STEP 3:

The 2nd point to create the point from is selected and accepted.



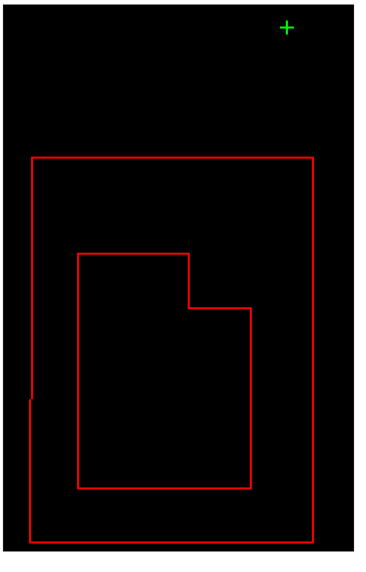
STEP 4:

A bearing from the 2nd point to create the point is given using the optional outlined in **STEP 2** above.



STEP 5:

The virtual point created if there is a valid solution.



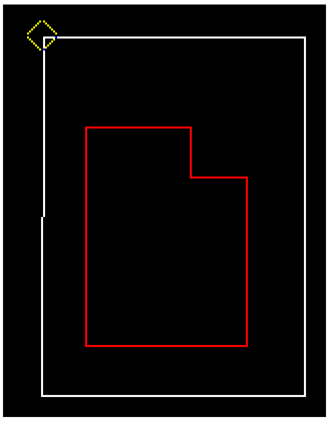
2 points and 2 distances

This option creates a virtual point using two points and two distances.

On selecting **2 points and 2 distances**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

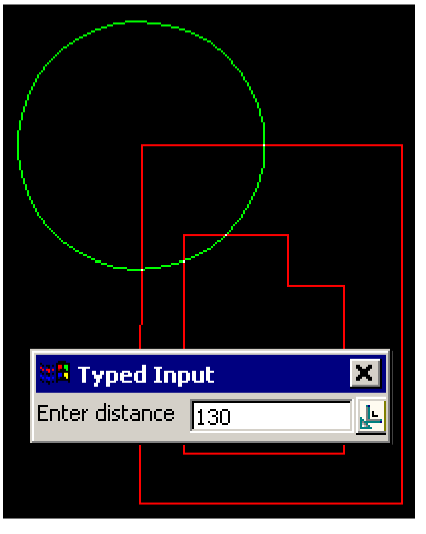
The 1st point is selected and accepted.



STEP 2:

A distance from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the enter key.

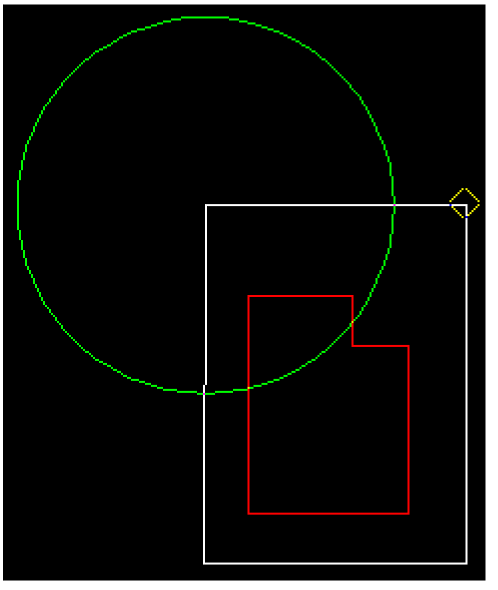
The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.



This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

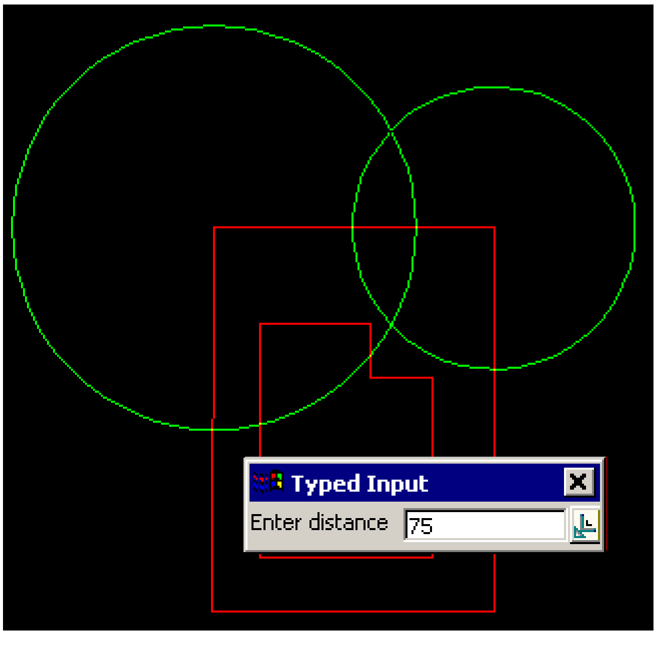
STEP 3:

The 2nd point to create the point from is selected.



STEP 4:

A distance from the 2nd point to create the point is given using the optional outlined in **STEP 2** above.

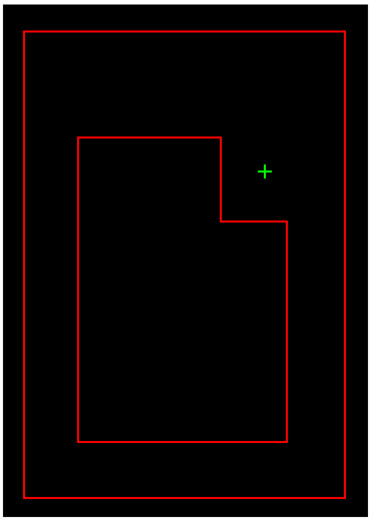


STEP 5:

As there is two solutions, the user can select the correct one depending on the method of construction. This can be done by the direct entry of distances or by use of the mouse.

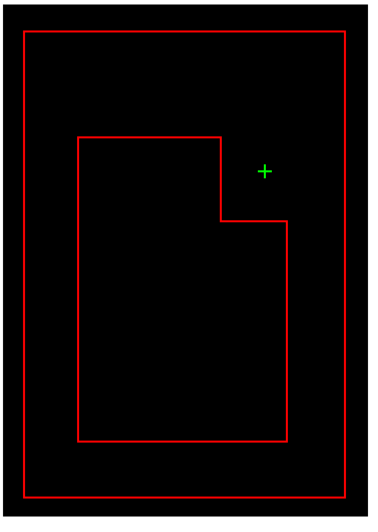
1. Distance entry. After the entry of the 1st distance, the 2nd point is selected. Following the selection of the 2nd point, the 2nd radius is shown (rubber banding). The user can select one of the two solutions by choosing with a **LB** mouse click over the approximate position of the required solution. The solution chosen is the closest solution to the selected point. The final radius can then be entered via the keyboard by simply starting typing which brings up the radius entry panel automatically. This panel can also be activated by pressing the space bar.
2. Use of the mouse. The 1st point is selected and the radius entered by using the mouse or by direct entry from the keyboard. The 2nd point is then selected and the 2nd radius is displayed

(rubber banding). A solution can be chosen by selecting with a **LB** mouse click over the required solution. The final solution will be the closest one to the selection. **MB** to accept the intersection and create the point.



STEP 6:

The virtual point is created if there is a valid solution.



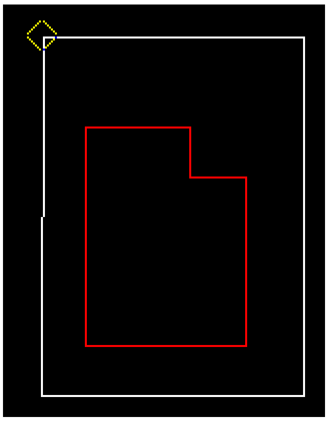
2 points with bearing and distance

This option creates a virtual point from a given point and a bearing, and a second point and a distance.

On selecting **2 points with bearing and distance**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The 1st point is selected and accepted.

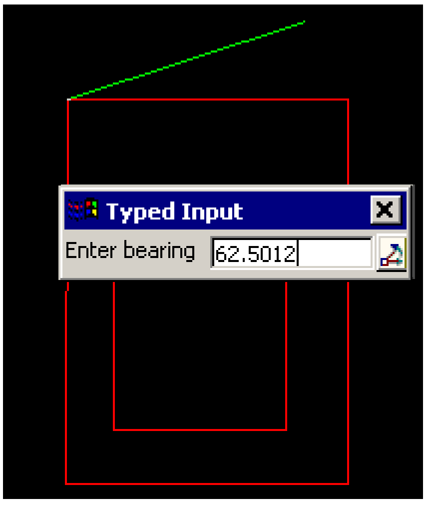


STEP 2:

A bearing from the 1st point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the bearing will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the Enter key.

The line drawn represents the bearing value and changes with movement of the mouse. If the user wants to see what the current value of the bearing is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the line continued.

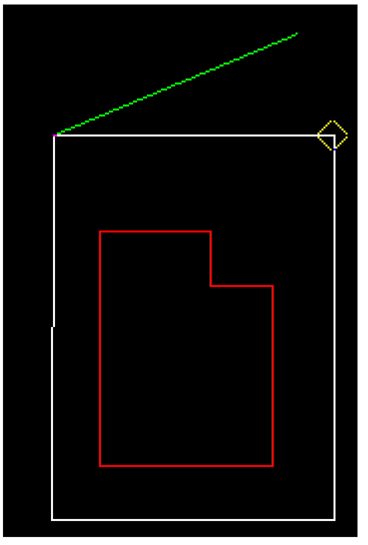
Note: **The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.**



This option also allows the definition of the bearing by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

STEP 3:

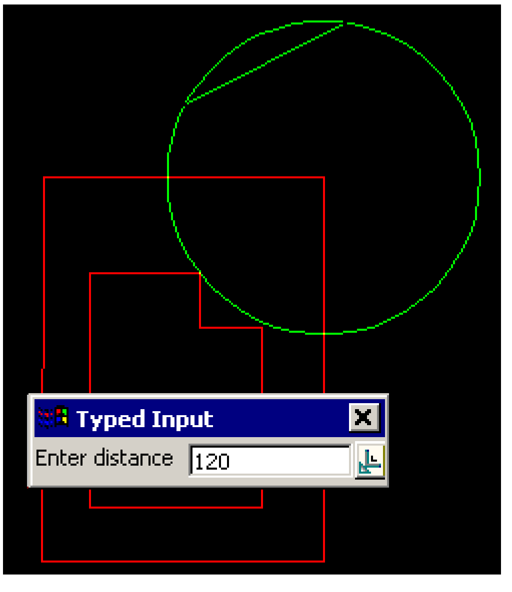
The 2nd point to create the point from is selected and accepted.



STEP 4:

A distance from the 2nd point to create the point is given either by selection with the mouse or by typing a value. To type a value, simply start typing and the input box for the distance will appear. Alternatively you can press the space bar to bring up the input box. The value is entered into the input box followed by the Enter key.

The circle drawn represents the distance value and changes with movement of the mouse. If the user wants to see what the current value of the distance is, simply press the **D** key (dynamic value). This puts the value into the input box where it can be accepted to create the point or the input box can be closed and the rubber banding (graphically changing) of the circle continued.

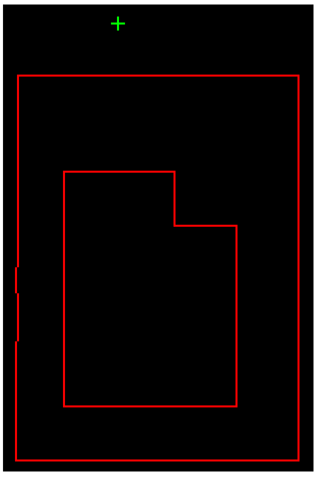


This option also allows the definition of the distance by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next. The example shown below is the perpendicular case.

A line is drawn between the two possible solutions.

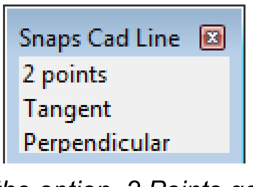
STEP 5:

As there is two solutions, the user can select the correct one with the mouse.



4.28.5.2 Snaps Cad Line

This section of documentation is a work in progress and will be updated in subsequent releases.



For the option, 2 Points go to 2 Points
Tangent Tangent
Perpendicular Perpendicular

2 Points

This option creates a virtual line segment.

On selecting **2 points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

The user can select a position with the mouse and on accepting that point (Middle mouse button or enter) the point is created at the selected position.

The snap mode will influence the mouse selection. For example if cursor snap is on, the user can choose a position not yet defined. If point snap is on and the selection snaps to an existing point, the option will place another point at that location.

The user can also activate the selection menu used with the mouse (right button) that allows various positioning options.

Specification of a position can also be done by the direct input of the xyz coordinate of the point by pressing the space bar to bring up the enter XYZ panel. **NOTE:** The z value will default to the value entered into the **Cad Control Bar** whether or not it is specified in the XYZ box. If no height value exists in the **Cad Control Bar**

The 2nd virtual point is selected in the same way as the 1st virtual point. The line is created after successful selection and acceptance of the 2nd virtual point.

Tangent

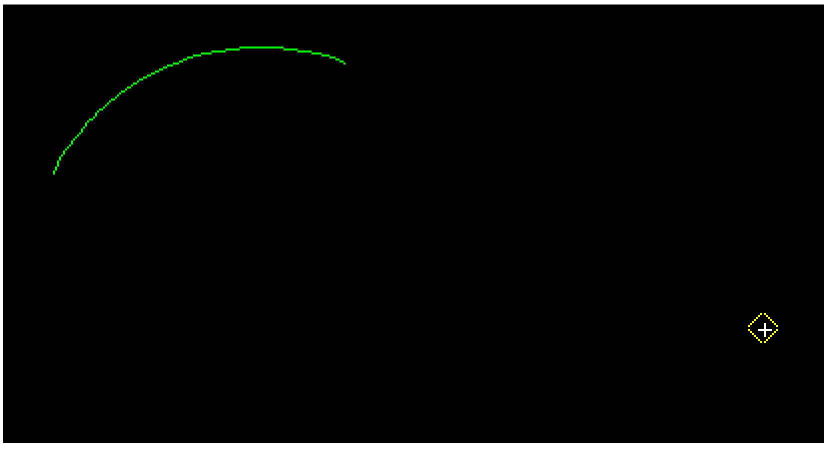
This option creates the virtual tangential line between two elements.

NOTE: When Selecting an arc or circle, the selection must be a line snap with direction. If a point is selected on the arc/circle the line will be draw between the selected points and not the tangent.

On selecting **Tangent**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

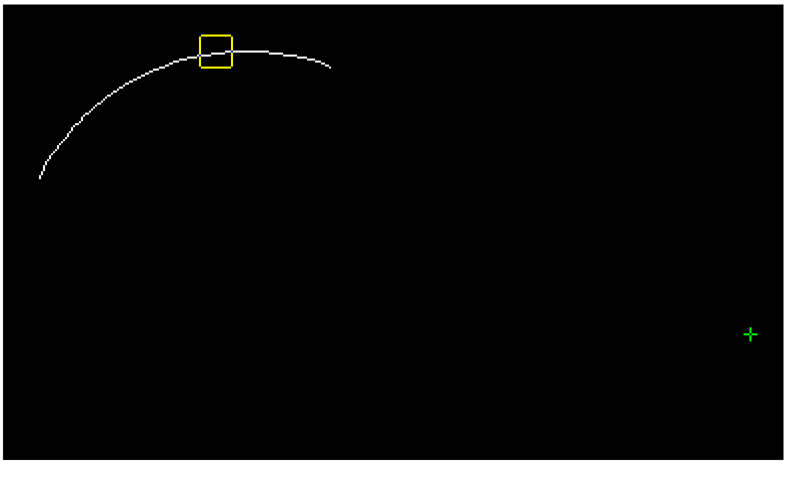
STEP 1:

A start position of the reference line is selected and accepted.



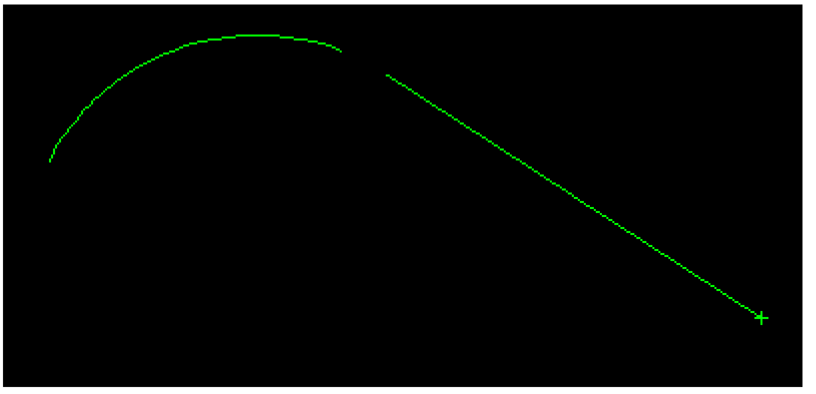
STEP 2:

The user selects and accepts the arc/circle segment with direction. The direction is required because there are two possible solutions. In this case, the direction was anti clockwise.



STEP 3:

After accepting the segment, a line is draw from the 1st selected point to the tangent point. Note that in this example, the arc is produced around so that a solution can be found.



Perpendicular

This option creates a virtual line by selecting a reference string and a reference point the create a line from the reference point perpendicular to the reference string.

On selecting **Perpendicular**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A reference string is selected and accepted.

STEP 2:

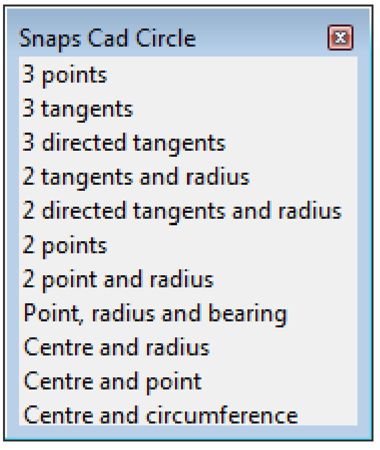
A line is drawn from the current mouse position perpendicular to the reference string

STEP 3:

After the final position is accepted, a virtual line is created which start from the selected position and perpendicular to the reference string.

4.28.5.3 Snaps Cad Circle

This section of documentation is a work in progress and will be updated in subsequent releases.



For the option *3 points, go to*	3 points
3 tangents	3 tangents
3 directed tangents	3 directed tangents
2 tangents and radius	2 tangents and radius
2 directed tangents and radius	2 directed tangents and radius
2 points	2 points
2 point and radius	2 point and radius
Point, radius and bearing	Point, radius and bearing
Centre and radius	Centre and radius
Centre and point	Centre and point
Centre and circumference	Centre and circumference

3 points

This option creates a virtual circle through three selected points.

On selecting **3 points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

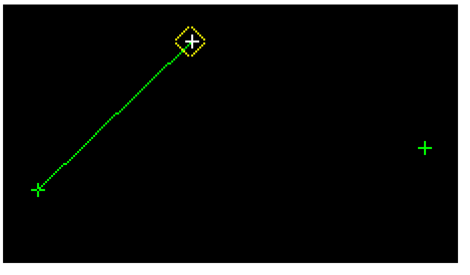
STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

STEP 2:

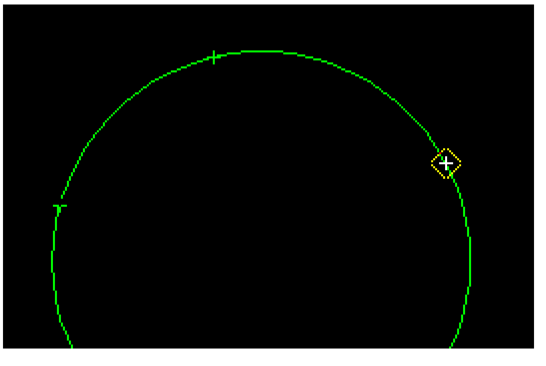
The 2nd point is selected and accepted.

After the 2nd point is accepted a circle will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until the 3rd point is selected and accepted.



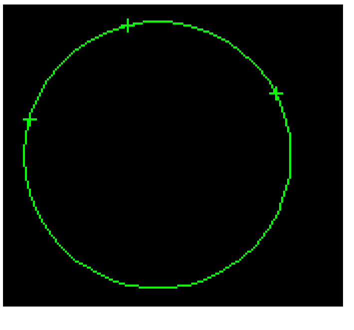
STEP 3:

The 3rd point is selected and accepted.



STEP 4:

A virtual circle is constructed through the three selected points



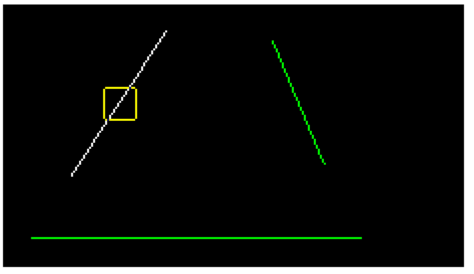
3 tangents

This option creates a virtual circle that is tangential to three selected segments.

On selecting **3 tangents**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

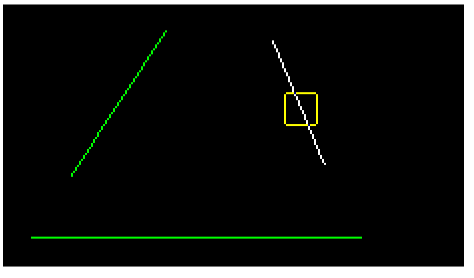
STEP 1:

The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).



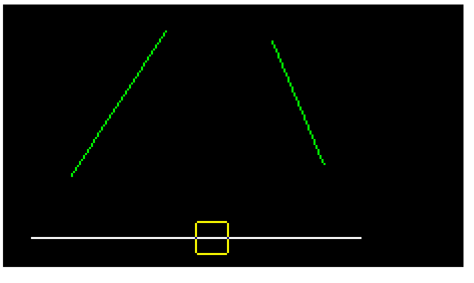
STEP 2:

The 2nd tangent is selected and accepted.



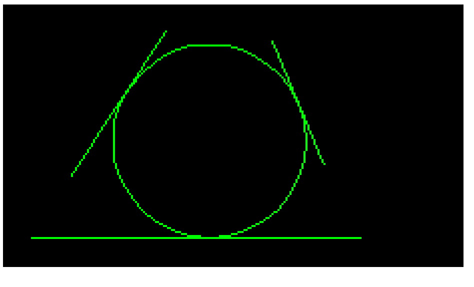
STEP 3:

The 3rd tangent is selected and accepted.



STEP 4:

A virtual circle is constructed that touches each of the three selected tangents.



3 directed tangents

This option creates a virtual circle that is tangential to three selected segments. The segments are selected in order and with direction and the circle is to the right of the direction of the selected segments.

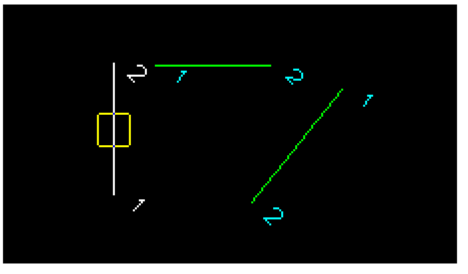
On selecting **3 directed tangents** the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

Select and accept the 1st tangent.

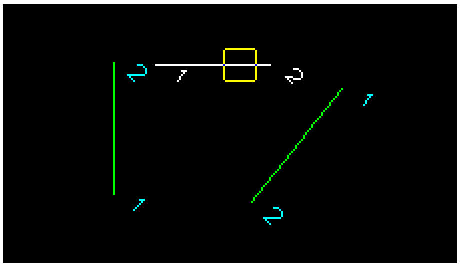
Note: For this option the direction of the selected tangents is important. The circle will be constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting the tangent *with direction*. For further notes on picking tangents with direction, see Picking with Direction.

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.



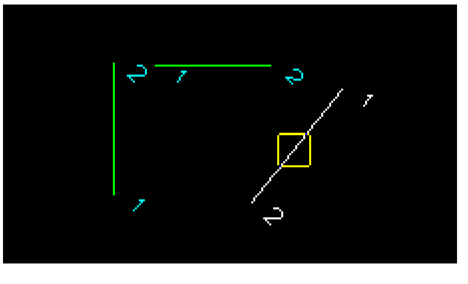
STEP 2:

The 2nd tangent is selected and accepted.



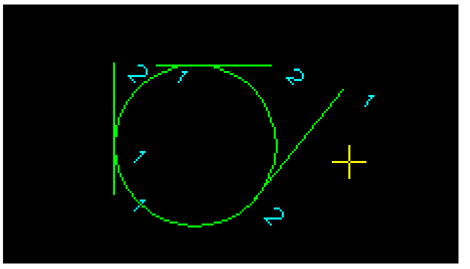
STEP 3:

The 3rd tangent is selected and accepted.



STEP 4:

If a solution exists, a virtual circle is constructed using the given information.



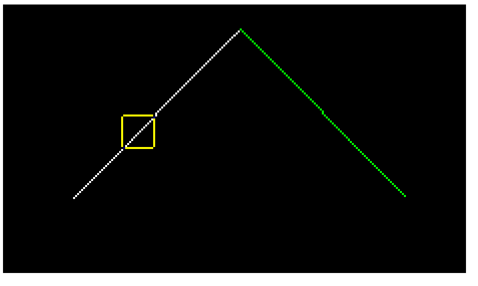
2 tangents and radius

This option creates a virtual circle with a given radius that is tangential to two selecting segments.

On selecting **2 tangents and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

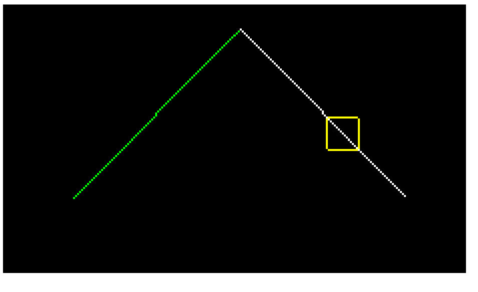
STEP 1:

Select the 1st tangent with the mouse (Left Button) and accept it (Middle Button).



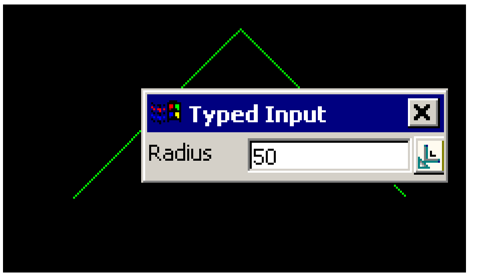
STEP 2:

Select the 2nd tangent and accept it.



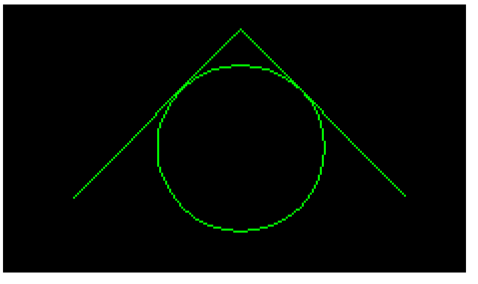
STEP 3:

After the 2nd tangent is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the Enter key. The browse button  on the Input box can be used to define the radius by measuring existing elements.



STEP 4:

If a solution exists, a virtual circle is fitted touching the two selected tangents using the given radius.



2 directed tangents and radius

This option creates a virtual circle with a given radius that is tangential to two selected segments that are picked with direction.

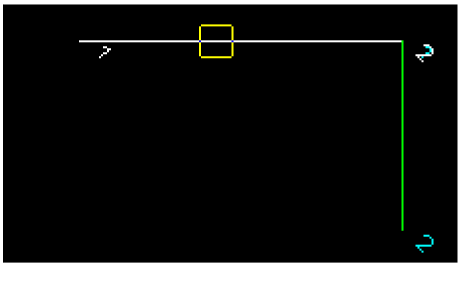
On selecting **2 directed tangents and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

Select and accept the 1st tangent.

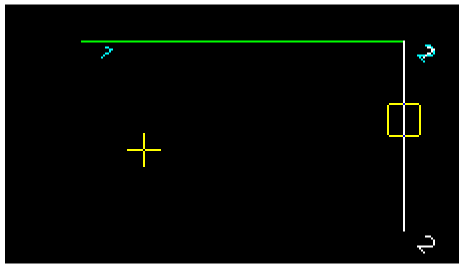
Note: For this option the direction of the selected tangents is important. The circle will be constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting the tangent *with direction*. For further notes on picking tangents with direction, see Picking with Direction.

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.



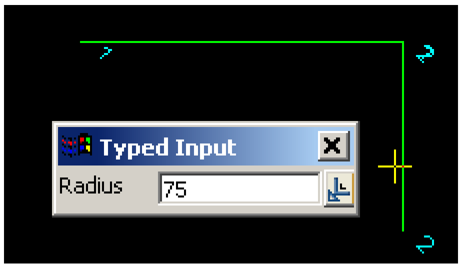
STEP 2:

The 2nd tangent is selected and accepted.



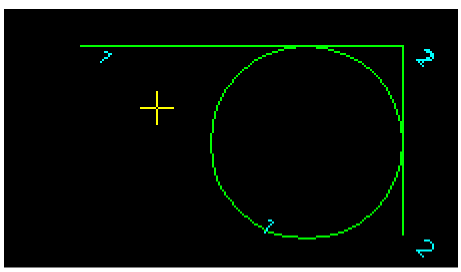
STEP 3:

After the 2nd tangent is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.



STEP 4:

If a solution exists, a virtual circle is constructed using the given information.



2 points

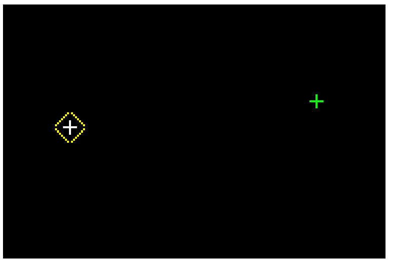
This option creates a virtual circle by selecting two points that define the diameter of the circle.

On selecting **2 points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

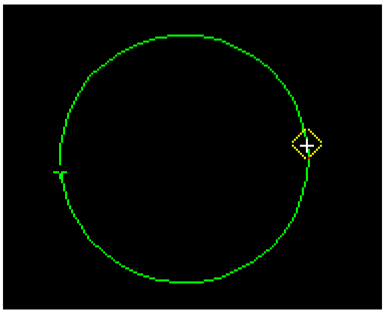
The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a circle will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor (cursor position taken as the other end of a diameter). This will continue until the 2nd point is selected and accepted.



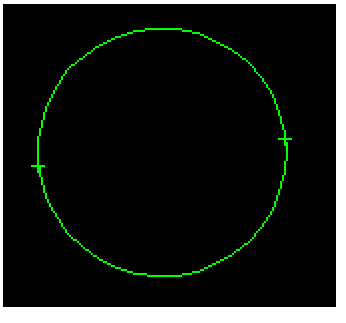
STEP 2:

The 2nd point is selected and accepted.



STEP 3:

The virtual circle is constructed through the two selected points. The two points define the diameter.



2 point and radius

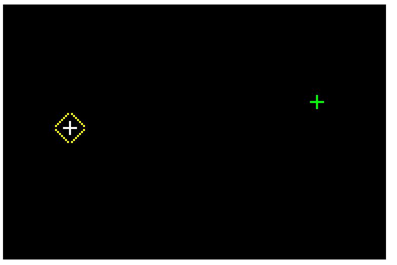
This option creates a virtual circle of a given radius that goes through two selected points.

On selecting **2 point and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

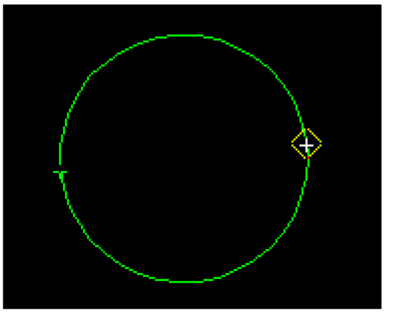
The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

After the 1st point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the 2nd point is selected and accepted.



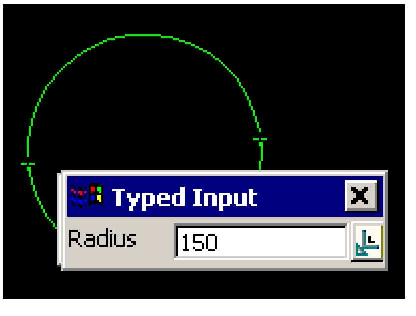
STEP 2:

The 2nd point is selected and accepted.



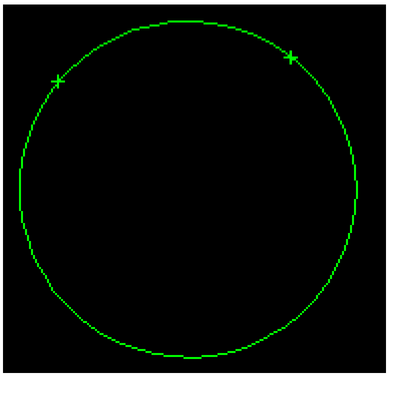
STEP 3:

After the 2nd point is accepted, the Radius Input box will appear. The radius value is entered into the input box followed by the Enter key.



STEP 4:

If a solution exists, the virtual circle is fitted through the two selected points using the given radius.



Point, radius and bearing

This option creates a virtual circle of a given radius, a selected point on the circle and the bearing of the tangent to the circle at that point.

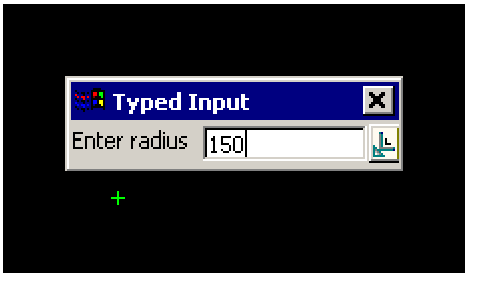
On selecting **Point, radius and bearing**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

STEP 2:

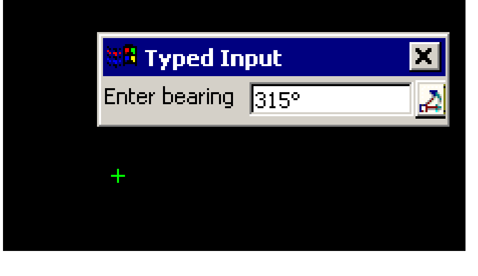
After the 1st point is accepted, the **Enter radius** input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.



STEP 3:

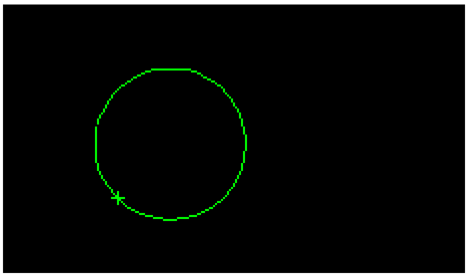
After the radius has been entered, the **Enter bearing** input box will appear. Type the bearing into the Input box and press the enter key. The browse button on the Input box can be used to define the bearing by measuring existing elements.

Note: **The Page Up and Page Down keys can be used when the Enter Bearing input box comes up to add or subtract intervals of 90 degrees.**



STEP 4:

If a solution exists, a virtual circle is fitted from the given bearing at the selected point using the selected radius.



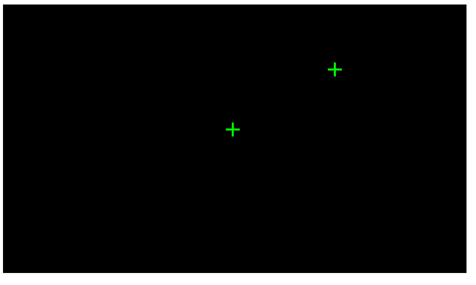
Centre and radius

This option creates a virtual circle of a given radius and a selected centre point

On selecting **Centre and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.



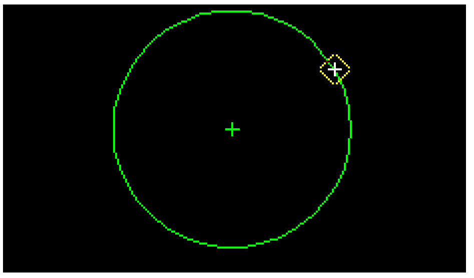
STEP 2:

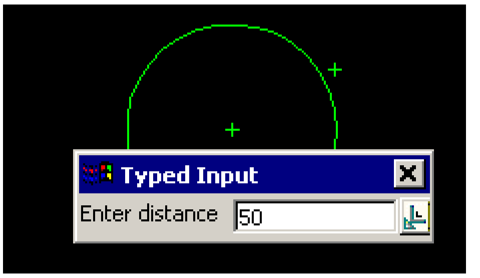
After the centre point is accepted a circle will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until a radius value is entered.

A radius value is selected with the mouse or entered in via the keyboard.

To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). This option also allows the definition of the radius by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

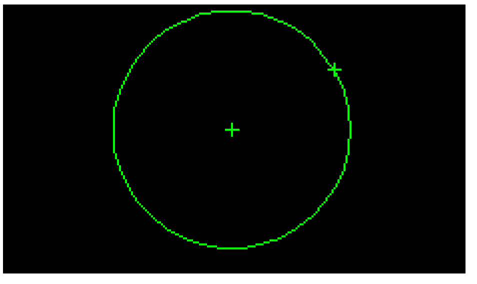
To enter a radius value with the keyboard, simply start typing or press the space bar to bring up the Radius Input box. Type the radius value into the Radius Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.





STEP 3:

The virtual circle is constructed through the centre point using the specified radius.



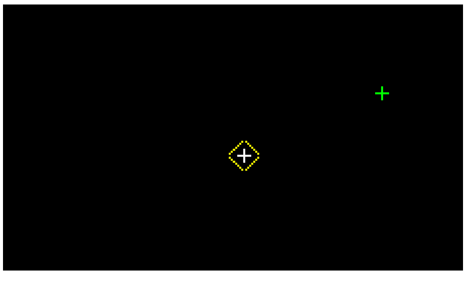
Centre and point

This option creates a virtual circle by selecting a centre point and then using the cursor to select a second point that in on the circle.

On selecting **Centre and point**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.



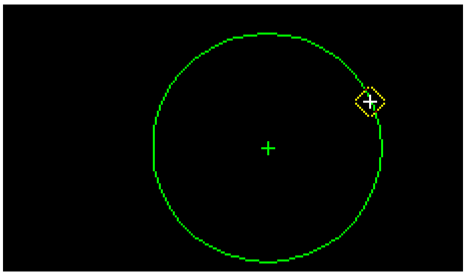
STEP 2:

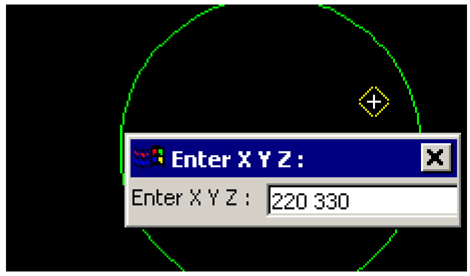
After the centre point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until a radius value is entered.

A radius value is selected with the mouse or entered in via the keyboard.

To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). This option also allows the definition of the radius by the selection of the 2nd point perpendicular or tangential to a selected segment. For this, the line snap should be on. The user selects the segment (line or arc) and then by pressing **P** for perpendicular or **T** for tangential a solution is shown. As there is often two solutions with respect to arcs, the user can move the mouse to change from one solution to the next.

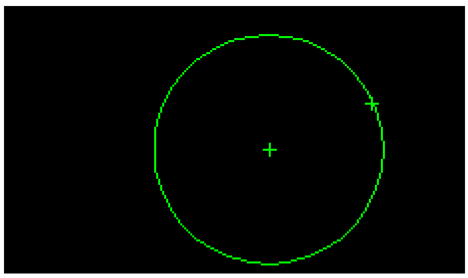
To enter a radius value with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the point into the Input box and press the Enter key.





STEP 3:

A virtual circle is constructed using the two points defined by the user.



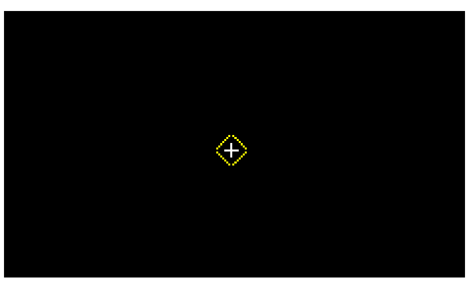
Centre and circumference

This option creates a virtual circle by selecting the centre point and giving a circumference value.

On selecting **Centre and circumference**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

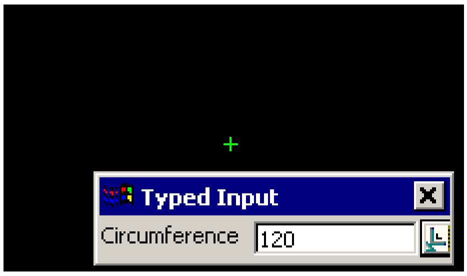
STEP 1:

A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.



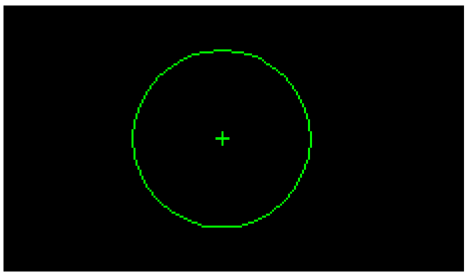
STEP 2:

After the centre point is accepted, the **Circumference** Input box will appear. Type the circumference length into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.



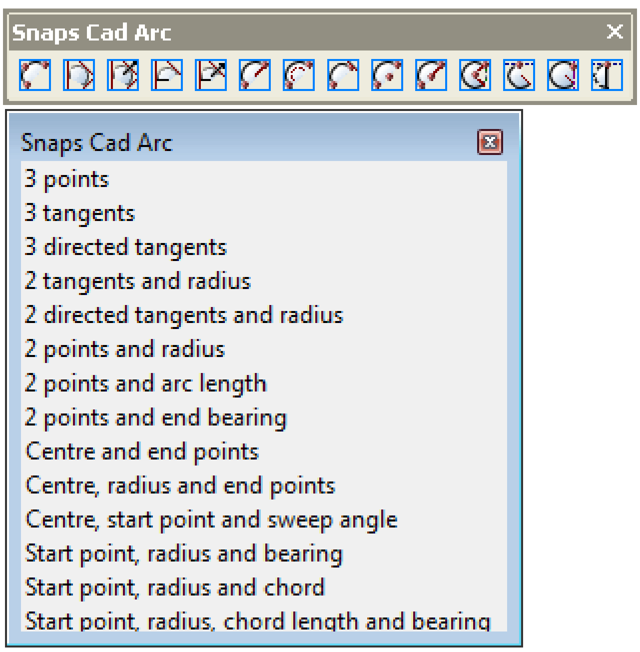
STEP 3:

A virtual circle is constructed using the centre point and the given circumference.



4.28.5.4 Snaps Cad Arc

This section of documentation is a work in progress and will be updated in subsequent releases.



For the option *3 points, go to* 3 Points
3 tangents 3 Tangents
3 directed tangents 3 directed tangents
2 tangents and radius 2 tangents and radius
2 directed tangents and radius 2 directed tangents and radius
2 points and radius 2 points and radius

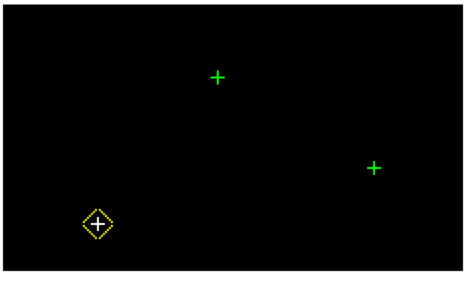
3 Points

This option creates a virtual arc through three selected points and the first and third points are the start and end of the arc.

On selecting **3 points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

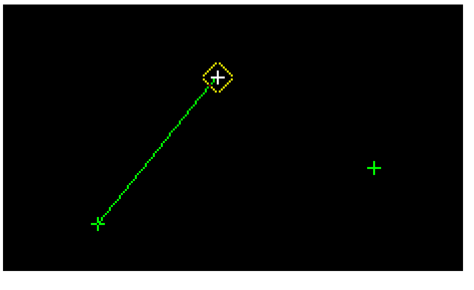
The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.



STEP 2:

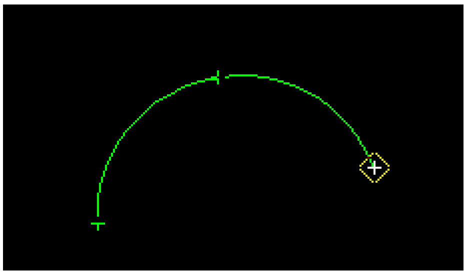
The 2nd point is selected and accepted.

After the 2nd point is accepted an arc will be displayed ‘rubber banding’ to the various solutions according to the position of the cursor. This will continue until the 3rd point is selected and accepted.



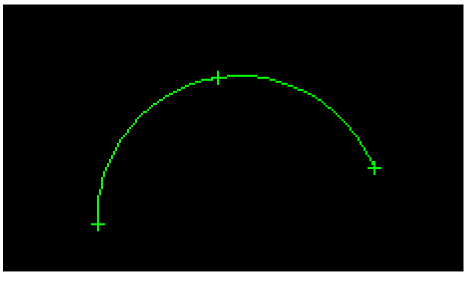
STEP 3:

The 3rd point is selected and accepted.



STEP 4:

A virtual arc is constructed through the three selected points.



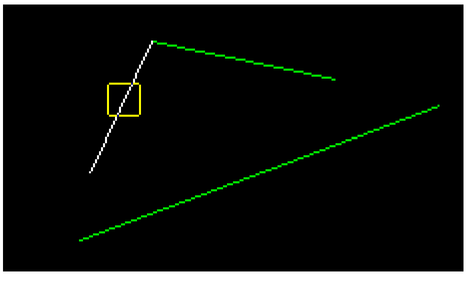
3 Tangents

This option creates a virtual arc that is tangential to three selected segments. The first and third segments are the start and end of the arc.

On selecting **3 tangents**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

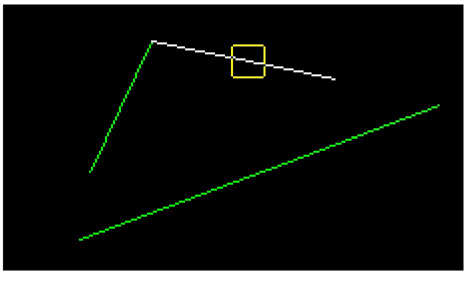
STEP 1:

The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).



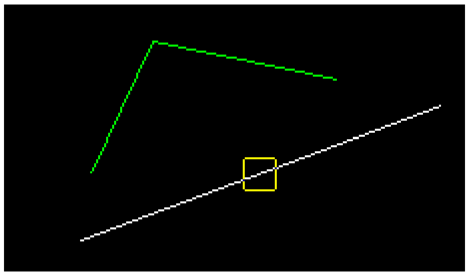
STEP 2:

The 2nd tangent is selected and accepted.



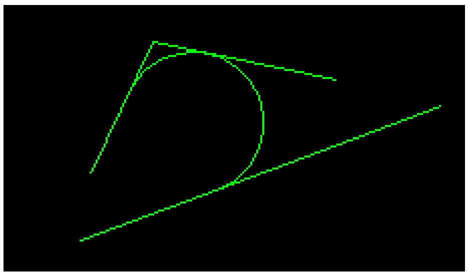
STEP 3:

The 3rd tangent is selected and accepted.



STEP 4:

The virtual arc is constructed touching the three selected tangents.



3 directed tangents

This option creates a virtual arc that is tangential to three selected segments. The segments are selected in order and with direction and the arc is to the right of the direction of the selected segments. The first and third segments are the start and end of the arc.

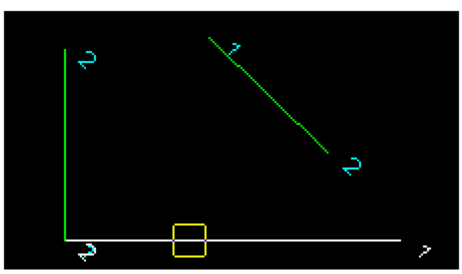
On selecting **3 directed tangents**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

Select and accept the 1st tangent.

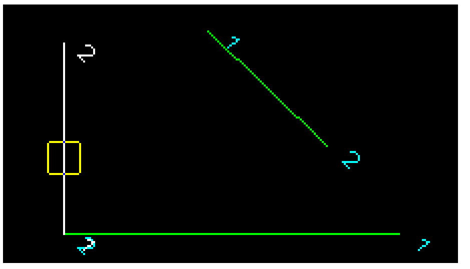
Note: For this option the direction of the selected tangents is important. The arc will be constructed to the right of the tangent. A user may reverse the direction of the tangent by selecting a tangent *with direction*. For further notes on picking tangents with direction, see Picking with Direction.

Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.



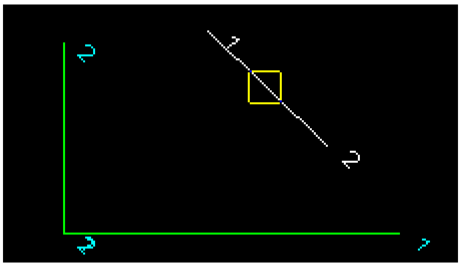
STEP 2:

The 2nd tangent is selected and accepted.



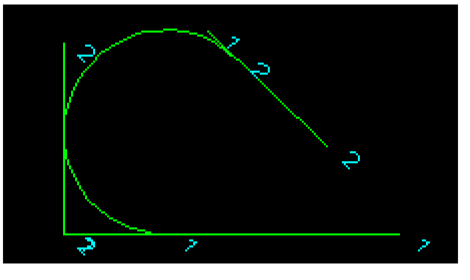
STEP 3:

The 3rd tangent is selected and accepted.



STEP 4:

If a solution exists, a virtual arc is constructed using the given information.



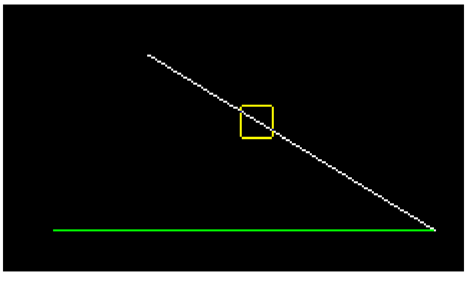
2 tangents and radius

This option creates a virtual arc with a given radius that is tangential to two selecting segments. This is the same as a fillet.

On selecting **2 tangents and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

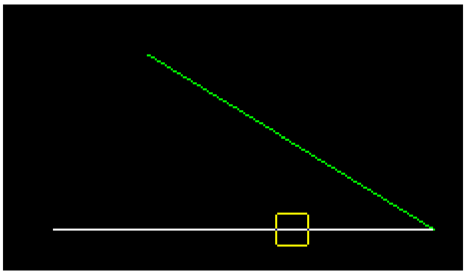
STEP 1:

The 1st tangent is selected with the mouse (Left Button) and accepted (Middle Button).



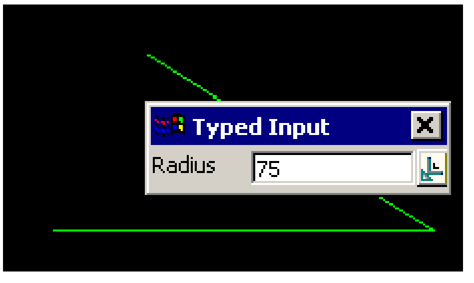
STEP 2:

The 2nd tangent is selected and accepted.



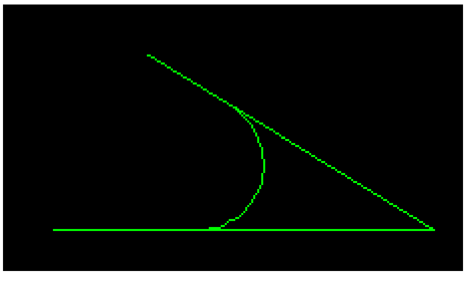
STEP 3:

After the start point is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.



STEP 4:

If a solution exists, the virtual arc is fitted through the two selected tangents using the given radius.



2 directed tangents and radius

This option creates a virtual arc with a given radius that is tangential to two selected segments that are picked with direction.

On selecting **2 directed tangents and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

Select and accept the 1st tangent.

Note: For this option the direction of the selected tangents is important. The arc will be constructed to the right of a tangent. A user may reverse the direction of a tangent by selecting the tangent *with direction*. For further notes on picking tangents with direction, see Picking with Direction.

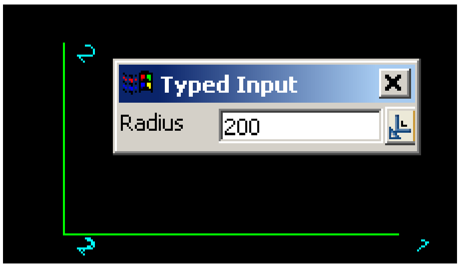
Note: The Vertex indices can be displayed by toggling the option on the Toggle Menu.

STEP 2:

The 2nd tangent is selected and accepted.

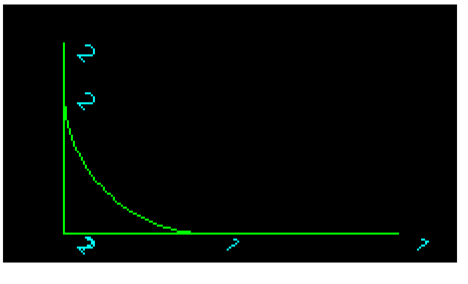
STEP 3:

After the start point is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the Enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.



STEP 4:

If a solution exists, the virtual arc is fitted through the two selected tangents using the given radius.



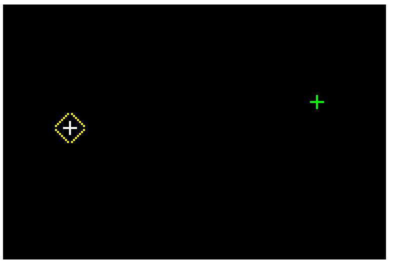
2 points and radius

This option creates a virtual arc of a given radius that starts and ends on two selected points.

On selecting **2 points and radius**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

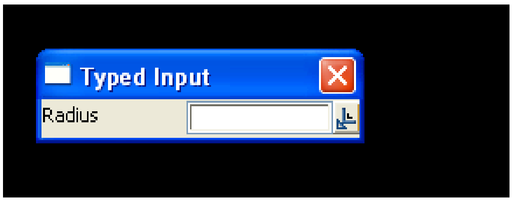
STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.



STEP 2:

After the start point is accepted, the Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc radius by measuring existing elements.

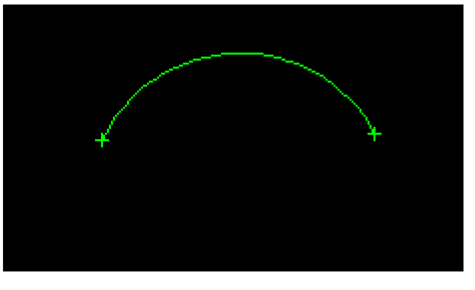


STEP 3:

The 2nd point is selected and accepted.

STEP 4:

If a solution exists, an arc is constructed using the given information.



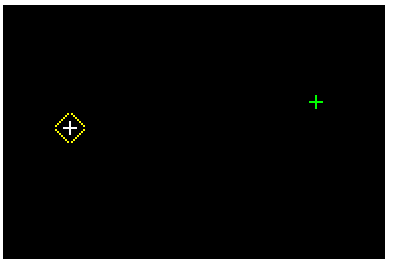
2 points and arc length

This option creates a virtual arc of a given arc length that starts and ends on two selected points.

On selecting **2 points and arc length**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

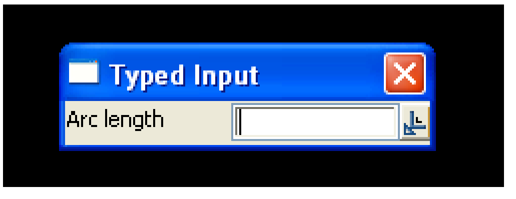
STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.



STEP 2:

After the start point is accepted, the Arc length Input box will appear. Type the arc length value into the Input box and press the enter key. The browse button  on the Input box can be used to define the arc length by measuring existing elements.

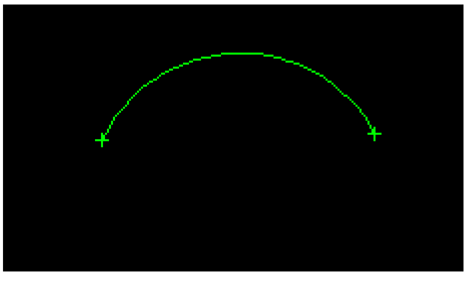


STEP 3:

The 2nd point is selected and accepted.

STEP 4:

If a solution exists, an arc is constructed using the given information.



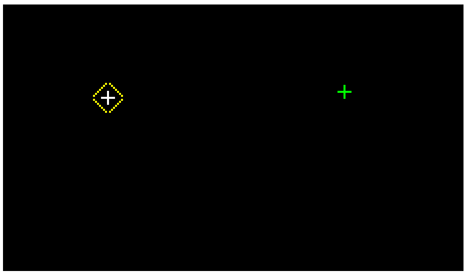
2 points and end bearing

This option creates a virtual arc that starts and end on two selected points and has a given bearing of the tangent at the end point (the end bearing).

On selecting **2 points and end bearing**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

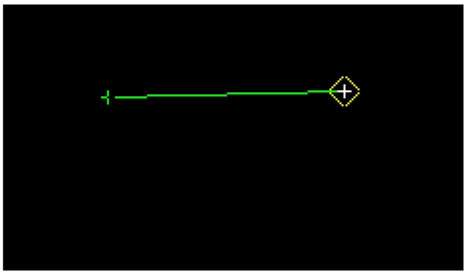
STEP 1:

The 1st point is selected with the mouse or entered in via the keyboard. To specify the 1st point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 1st point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.



STEP 2:

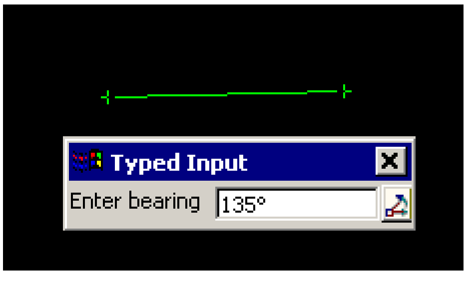
The 2nd point is selected and accepted.



STEP 3:

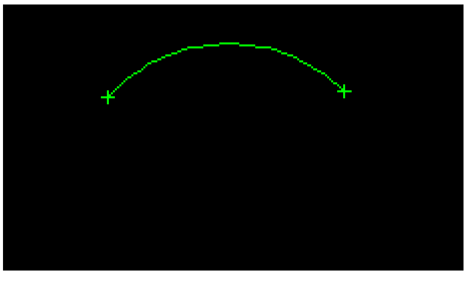
After the 2nd point is accepted, the Enter bearing input box will appear. Type the bearing into the Input box and press the enter key. The browse button on the input box can be used to define the bearing by measuring existing elements.

Note: **The Page Up and Page Down keys can be used when the Enter Bearing input box comes up to add or subtract intervals of 90 degrees.**



STEP 4:

If a solution exists, the arc is fitted through the two selected points with the end point of the given bearing.



Centre and end points

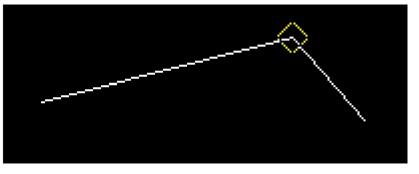
This option creates a virtual arc by selecting in order, the centre point and the start and end points. The radius of the arc is the distance between the centre and the start point.

On selecting **Centre and end points**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

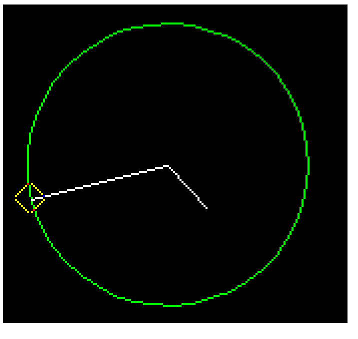
A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

After the centre point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the start point is selected and accepted.



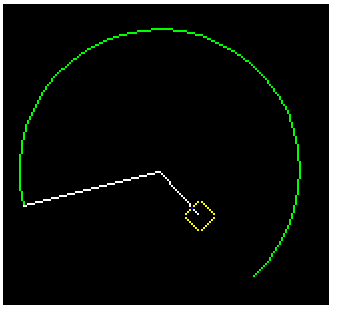
STEP 2:

Select and accept the start point. This point defines the radius and the start of the arc.



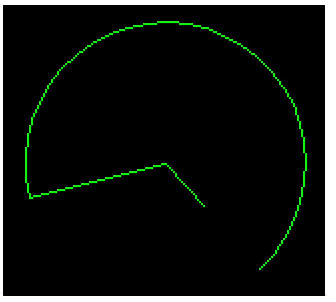
STEP 3:

The end point of the arc is specified.



STEP 4:

The virtual arc is constructed using the given information.



Centre, radius and end points

This option allows the creation of a virtual arc given a centre point, radius, start and end points.

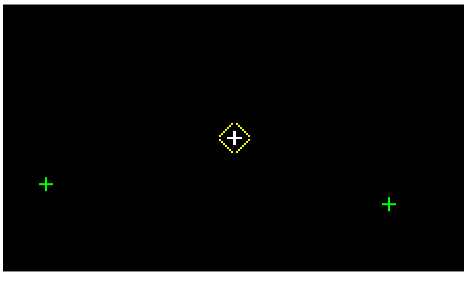
This option creates an arc of a given radius by selecting in the centre point and the start and end positions.

On selecting **Centre, radius and end points** the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

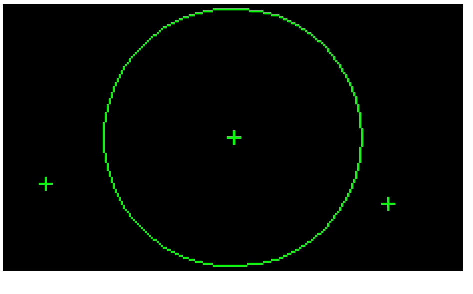
A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

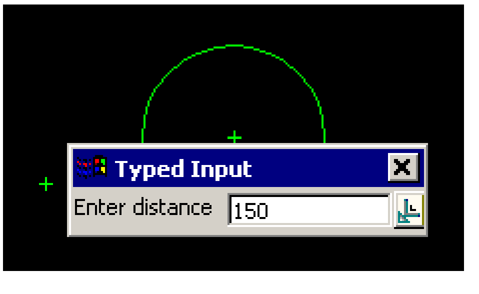
After the centre point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the start point is selected and accepted.



STEP 2:

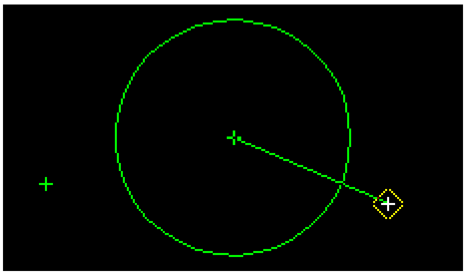
A radius value is selected with the mouse or entered in via the keyboard. To specify a radius value with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter radius value with the keyboard, simply start typing or press the space bar to bring up the Radius Input box. Type the radius value into the Radius Input box and press the Enter key. The browse button on the Input box can be used to define the arc distance by measuring existing elements.

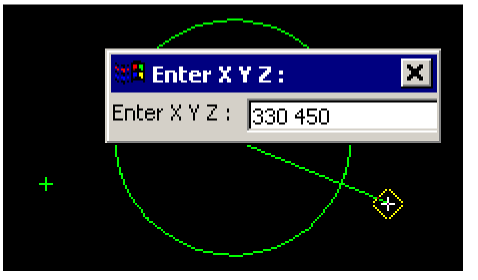




STEP 3:

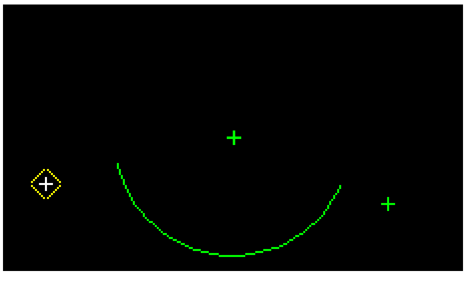
A start point defines the start of the sweep angle to define where to start the arc. It can be selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

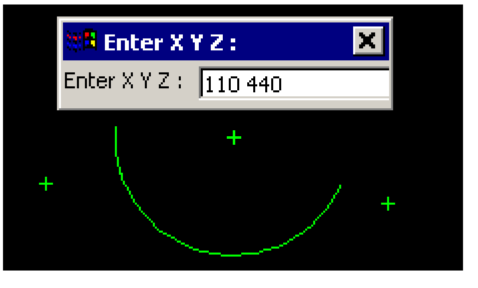




STEP 4:

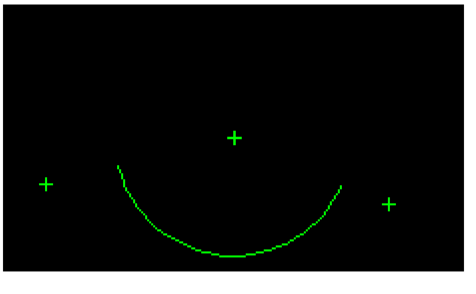
The end point of the arc is specified. The start and end points define the sweep angle to define the arc. The rubber banding of the arc will use the cursor position as the end position until a end point is selected and accepted. It can be selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key. The end point does not have to be on the arc itself. It is used to define the sweep angle.





STEP 5:

The arc is constructed using the given information.



Centre, start point and sweep angle

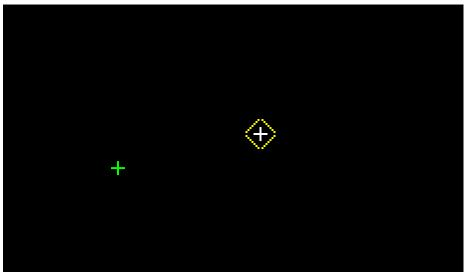
This option creates a virtual arc by selecting a centre point and a start points and giving a sweep angle. The radius of the arc is the distance between the centre and start point.

On selecting **Centre, start point and sweep angle**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

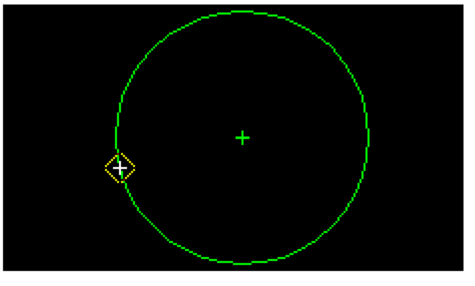
A centre point is selected with the mouse or entered in via the keyboard. To specify a centre point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a centre point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

After the 1st point is accepted a circle will be displayed 'rubber banding' to the various solutions according to the position of the cursor. This will continue until the 2nd point is selected and accepted.



STEP 2:

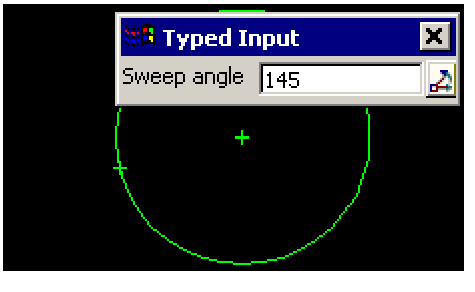
The 2nd point is selected with the mouse or entered in via the keyboard. This point defines the radius as well as the start point of the arc.To specify the 2nd point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the 2nd point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.



STEP 3:

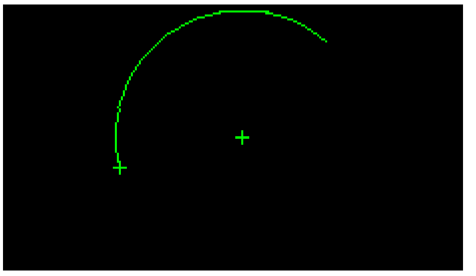
After the 2nd point is accepted, the **Sweep Angle** input box will appear. Type the sweep angle value into the input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.

Note: **The Page up and page down keys can be used when the input angle box comes up to add or subtract intervals of 90 degrees.**



STEP 4:

The virtual arc is created using the information supplied



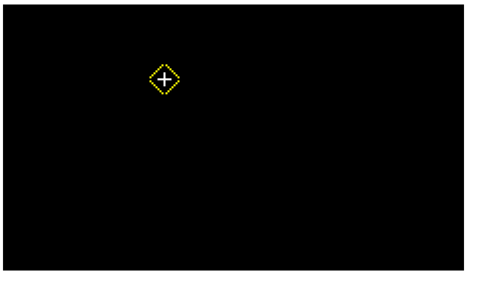
Start point, radius and bearing

This option creates a virtual arc of a given radius, starting at a selected point and bearing of the tangent at the start point and going for a given arc length.

On selecting the **Start point, radius and bearing** option, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

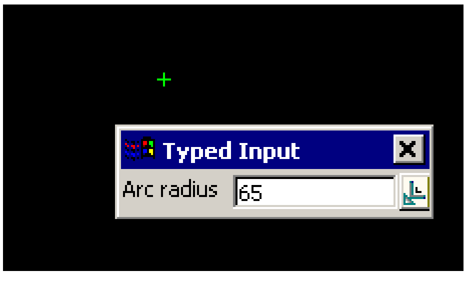
STEP 1:

A start point is selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.



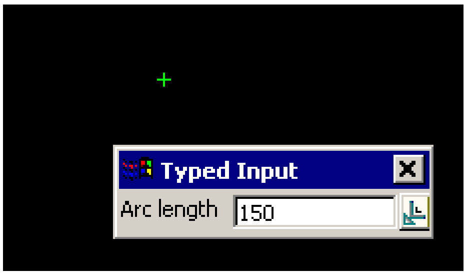
STEP 2:

After the start point is accepted, the Arc Radius Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.



STEP 3:

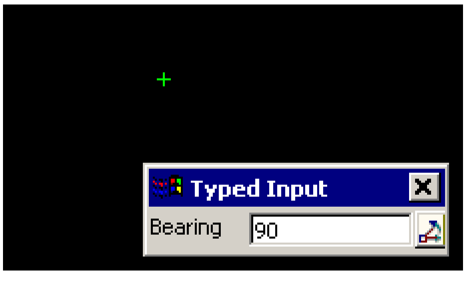
After the radius has been entered, the **Arc Length** Input box will appear. Type the arc length into the Input box and press the enter key. The browse button on the Input box can be used to define the arc distance by measuring existing elements.



STEP 4:

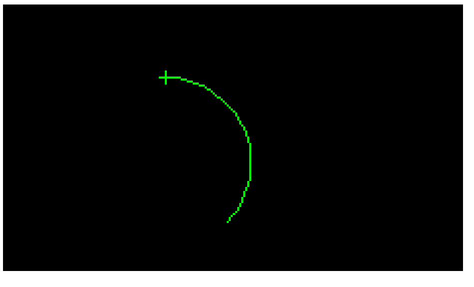
After the arc length is accepted, the Bearing Input box will appear. Type the bearing into the Input box and press the enter key. The browse button  on the Input box can be used to define the bearing by measuring existing elements.

Note: **The Page Up and Page Down keys can be used when the Bearing Input box comes up to add or subtract intervals of 90 degrees.**



STEP5:

The virtual arc is created with the given information.



Start point, radius and chord

This option creates a virtual arc of a given radius, starting from a selected point and with a given chord bearing at the start point and a given arc length.

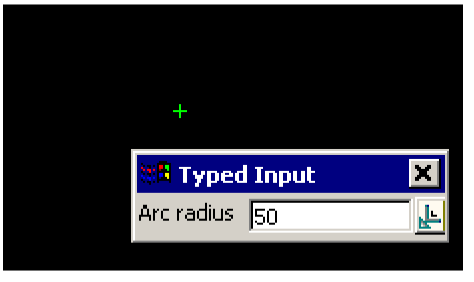
On selecting **Start point, radius and chord**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

The start point is selected with the mouse or entered in via the keyboard. To specify the start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter the start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the Enter key.

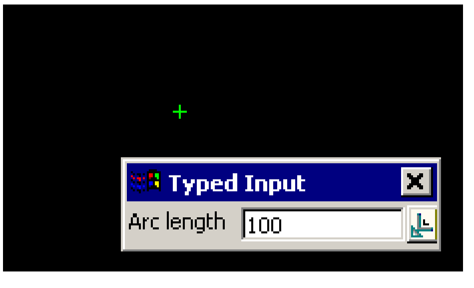
STEP 2:

After the start point is accepted, the **Arc Radius** Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.



STEP 3:

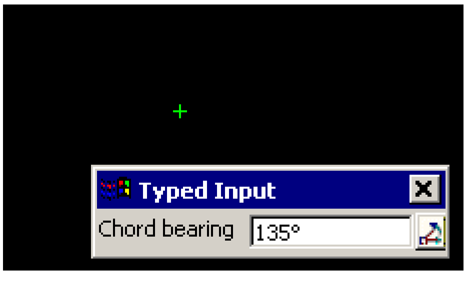
After the arc radius is entered, the **Arc Length** Input box will appear. Type the arc length into the Input box and press the enter key. The browse button on the Input box can be used to define the arc distance by measuring existing elements.



STEP 4:

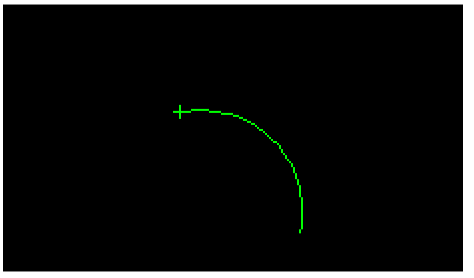
After the arc length is entered, the **Chord Bearing** Input box will appear. Type the bearing into the Input box and press the enter key. The browse button on the Input box can be used to define the bearing by measuring existing elements.

Note: **The Page Up and Page Down keys can be used when the Chord Bearing Input box comes up to add or subtract intervals of 90 degrees.**



STEP 5:

A virtual arc is created with the given information.



Start point, radius, chord length and bearing

This option creates a virtual arc of a given radius, starting from a selected point, with a given bearing of the tangent at the start point and a given chord length from the start point.

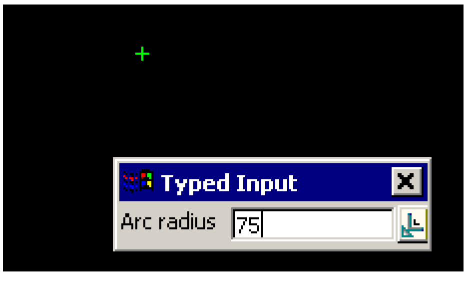
On selecting **Start point, radius, chord length and bearing**, the user is prompted for the relevant data in the screen message box located at the bottom left hand corner of the ***12d Model*** application window.

STEP 1:

A start point is selected with the mouse or entered in via the keyboard. To specify a start point with the mouse, a point must be selected (Left Button) and accepted (Middle Button). To enter a start point with the keyboard, simply start typing or press the space bar to bring up the XYZ Input box. Type the coordinates into the XYZ Input box and press the enter key.

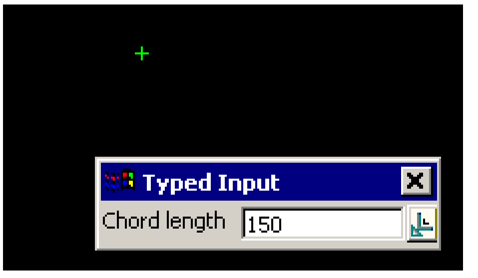
STEP 2:

After the start point is accepted, the **Arc Radius** Input box will appear. Type the radius value into the Input box and press the enter key. The browse button on the Input box can be used to define the arc radius by measuring existing elements.



STEP 3:

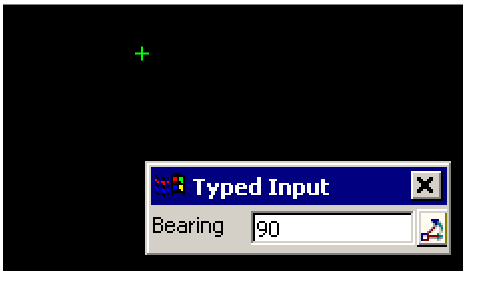
After the radius has been entered, the **Chord Length** Input box will appear. Type the chord length into the Input box and press the enter key. The browse button on the Input box can be used to define the chord length by measuring existing elements.



STEP 4:

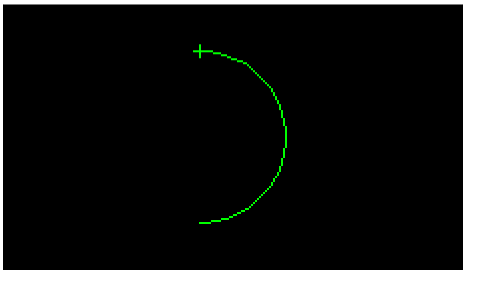
After the chord length has been entered, the **Bearing** Input box will appear. Type the bearing of the start tangent into the Input box and press the enter key. The browse button on the Input box can be used to define the bearing by measuring existing elements.

Note: **The Page Up and Page Down keys can be used when the Bearing Input box comes up to add or subtract intervals of 90 degrees.**



STEP 5:

The virtual arc is created with the given information.



4.28.6 String Edits Toolbar

Position of option on menu: **various**

The **String edits** toolbar is:

Options on Toolbar

edit string

edit vertex

edit segment properties

edit vertex properties

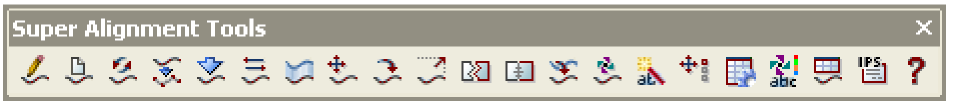
change strings

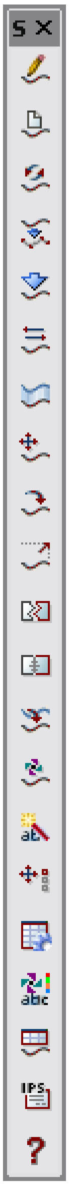
For the option *Edit string,* go to	14.4 Editor
Edit vertex	14.5.11 Edit Vertex
Edit segment properties	14.12.4 Segment
Edit vertex properties	14.12.3 Vertex
Change string	14.6.1 Change

4.28.7 Super Alignment Tools Toolbar

Position of option on menu: various

The **Super Alignment Tool** toolbar is:





Options on Toolbar

edit super alignment

To return to the beginning of this chapter, click on 4 Tools and Concepts.

4.29 Drag and Drop

Some files can be dragged and dropped onto ***12d Model*** and panels automatically open for them, and some can be dragged and dropped as attachments to Outlook 2002 and above.

.project files can be dragged and dropped to open a new project and files can be dragged and dropped onto a file box and the full path name to the file will be automatically entered into the file box.

The files that can be dragged and dropped include

4.29.1 File Box

If you drag a file from *Windows Explorer* onto a **File Box** on any panel, the full file path name of the file is entered into the **File Box**.

Return to 4.29 Drag and Drop.

4.29.2 .12daz, 12da Files

If you drag a ***.12daz*** or ***.12daz*** file onto an open ***12d Model*** project, it opens up the **Read 12d Solutions Archive Data** panel with the full path name of the ***.12daz*** or ***.12da*** file entered into the **File to read** box.

This will work for files from folders, 12d Synergy, Skype and most other places that allow drag and drop.

It will also work for files that are email attachments in *Outlook 2002 and above.*

If you are dragging and dropping more than one ***12daz*** or ***12da*** file at a time, then the one **Read 12d Solutions Archive Data** panel will be opened and all the dropped files listed in the ***Many Files*** grid.

Return to 4.29 Drag and Drop.

4.29.3 .dat Files

If you drag a ***.dat*** file onto an open ***12d Model*** project, it opens up the **Read x y z s Data** panel with the full path name of the ***.dat*** file entered into the **File to read** box.

This will work for files from folders, Skype and most other places that allow drag and drop.

It will also work for files that are email attachments in *Outlook 2002 and above.*

If you are dragging and dropping more than one .dat file at a time, then the one **Read x y z s Data** panel will be opened and all the dropped files listed in the ***Many Files*** grid.

Return to 4.29 Drag and Drop.

4.29.4 .chain,.rcn Files

If you drag a ***.chain*** or ***.rcn*** file onto an open ***12d Model*** project, it opens up the **Create/Edit Chain** panel with the full path name of the ***.chain*** or ***.rcn*** file entered into the **Chain file** box and the chain file is automatically read in.

This will work for files from folders, 12d Synergy, Skype and most other places that allow drag and drop.

If you are dragging and dropping more than one **chain** file at a time, then a separate **Create/Edit Chain** panel is opened for each chain file.

Return to 4.29 Drag and Drop.

4.29.5 .mtf Files

If you drag a ***.mtf*** file onto an open ***12d Model*** project, it opens up the mtf in the **MTF Edit** panel.

This will work for files from folders, 12d Synergy, Skype and most other places that allow drag and drop.

If you are dragging and dropping more than one **mtf** file at a time, then a separate **MTF Edit** panel is opened for each mtf file.

Return to 4.29 Drag and Drop.

4.29.6 .mapfile Files

If you drag a ***.mapfile*** file onto an open ***12d Model*** project, it opens up the **Map File Create/ Edit** panel with the full path name of the ***.mapfile*** file entered into the **Map file** box and the Map File is automatically read in.

This will work for files from folders, 12d Synergy, Skype and most other places that allow drag and drop.

If you are dragging and dropping more than one **Map File** at a time, then a separate **Map File Create/Edit** panel is opened for each Map File.

Return to 4.29 Drag and Drop.

4.29.7 .slx Files

If you drag an ***.slx*** file onto an open ***12d Model*** project, it opens up all the panels as specified in the **SLX** file.

This will work for files from folders, 12d Synergy, Skype and most other places that allow drag and drop.

If you are dragging and dropping more than one **SLX** at a time, then all the panel in all the SLX files are opened.

Return to 4.29 Drag and Drop.

4.29.8 .4do Files

If you drag a ***.4do*** file onto an open ***12d Model*** project, it runs the macro.

This will work for files from folders, 12d Synergy, Skype and most other places that allow drag and drop.

If you are dragging and dropping more than one **.4do** file at a time, then each macro will be started.

Return to 4.29 Drag and Drop.

4.29.9 .project Files

If you drag a ***.project*** file (the ***12d Model*** project) onto an open ***12d Model*** project, the current open ***12d Model*** project is closed (it will ask whether you want to save) and the dragged ***.project*** is opened in ***12d Model***.

Return to 4.29 Drag and Drop.

4.29.10 .dwg,.dxf Files

If you drag a ***.dwg*** or ***.dxf*** file onto an open ***12d Model*** project, it opens up the read **Read DWG/ DXF Data** panel with the full path name of the ***.dwg/.dxf*** file entered into the **File** box.

This will work for files from folders, 12d Synergy, Skype and most other places that allow drag and drop.

If you are dragging and dropping more than one **DWG/DXF File** at a time, then a separate **Read DWG/DXF Data** panel is opened for each DWG/DXF file.

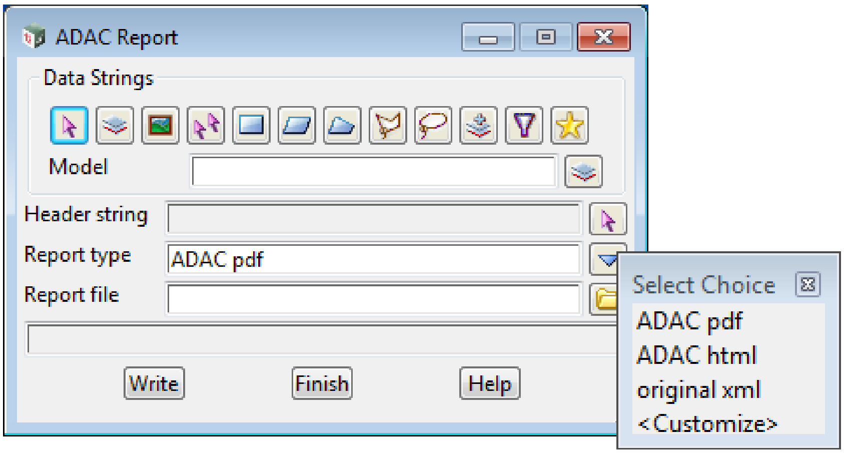
Return to 4.29 Drag and Drop.

4.30 Setting Up XML Reports

Many options now have ***XML reports*** and this allows users to create their own customised reports.

Once you have a customised report for a panel, it can be added to the list of reports given in the **Report type** field for that panel.

For example, the ADAC Report is shipped with 3 report types - ADAC.pdf, ADAC.html and original.xml - but a user may will to add their own customised report.



Hence in ***12d Model***, there is an XML file called **report_templates.xml** that defines which reports, 12d supplied or user customised, are available for a panel.

For each of the reports for a panel, the **report_templates.xml** file contains

(a) the name in the **Report type** pop-up list

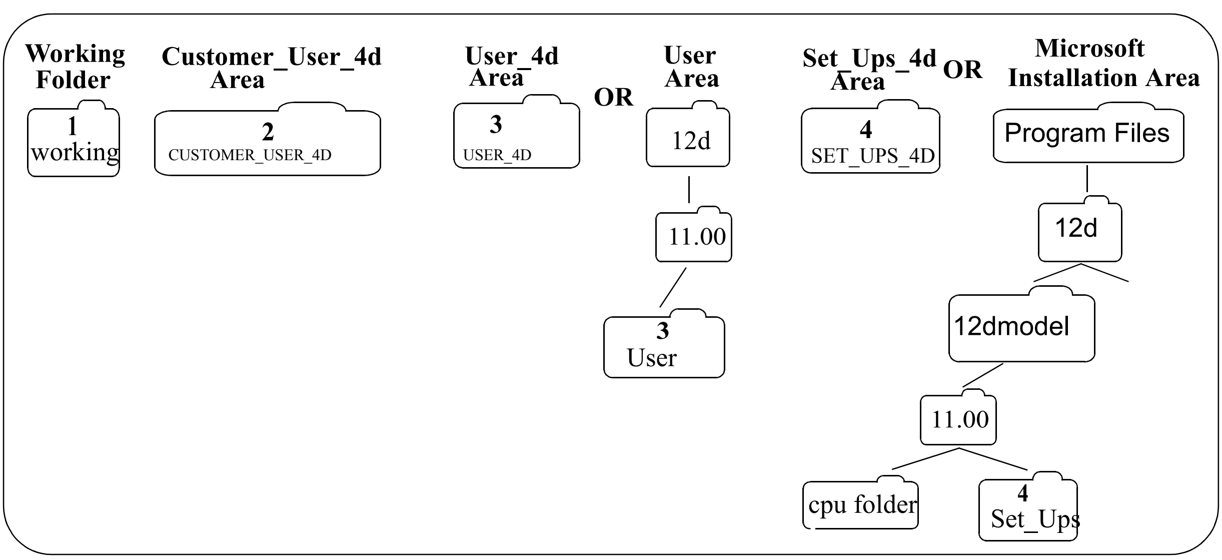
(b) the xslt that generates the report

(c) the file ending for the report file

(d) the number of decimal places in the report

(e) a comment about the report

The **report_templates.xml** are all **Set_Ups** files like *colours.4d files*, and folders are searched in a specific order to find **report_templates.xml** files.



HOWEVER, unlike *colours.4d*, it doesn't matter if the ***report_templates.xml*** file is found in a folder, the search **continues** and **all** the **folders** that **contain the file** are found.

And, again unlike *colours.4d*, the reports used are the **merger** of **all** the **found files**.

The search order is still important because if the **same name for a report for a panel** exists in more than one file in the found folders, the **first** occurrence in the files in the search order is the one that **is used**.

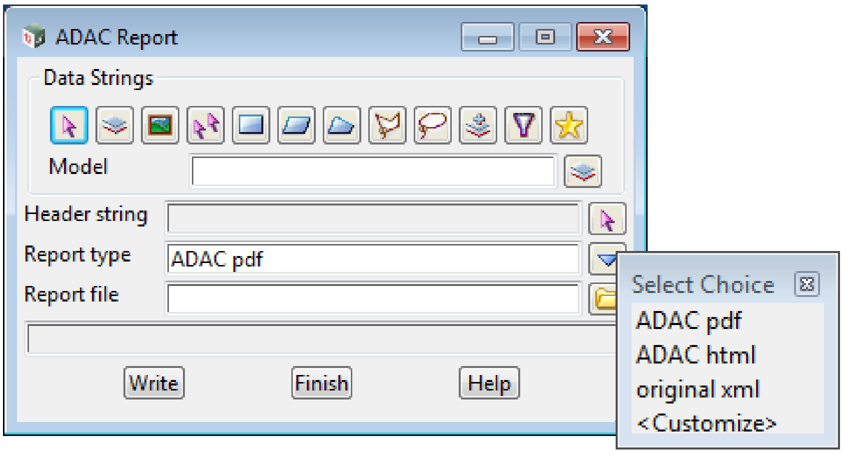
For example, if you had a report called **ADAC pdf** in the file *report_templates.xml* in your working folder, and one called **ADAC pdf** in the file *report_templates.xml* in Programs files\12d\12dmodle\11.0\set_ups, then the **ADAC pdf** in your **working folder** is the one that will be used and seen in the **Report type** pop-ups in panel **ADAC Report**.

To create and/or edit the **Report types** for a panel, see 4.30.1 Create/Edit Report Types

Go to the next section 4.30.1 Create/Edit Report Types or return to 4.30 Setting Up XML Reports.

4.30.1 Create/Edit Report Types

To create and/or edit the **Report types** for a panel, click on the choice icon for the **Report types** field and select **<Customise>**



The **Edit Report_templates.xml** panel is then brought up and it shows the standard areas for looking for the **report_templates.xml** files - Working folder, Customer (User), User, Set_Ups and Other - and displays whether the appropriate xml file:

(a) exists and is available for editing (**Edit**)

If the xml file exists in the folder and you have access to edit it, then the folder name is written in the panel and **[Edit]** is written on the right hand side of the line.

(b) does not exist but can be created (**Create**) by the editor

If the xml file does not exist in the folder and you have access to create it, then the folder name is written in the panel and **[Create]** is written on the right hand side of the line.

In this case a new file is created and written out to the given folder.

(c) is in a folder that has no access for editing and so can only be viewed (**View**)

If there is no access to the folder to create/edit the file, then the folder name is written in the panel and **[View]** is written on the right hand side of the line. Although the styles can’t be edited, they can be **copied**.

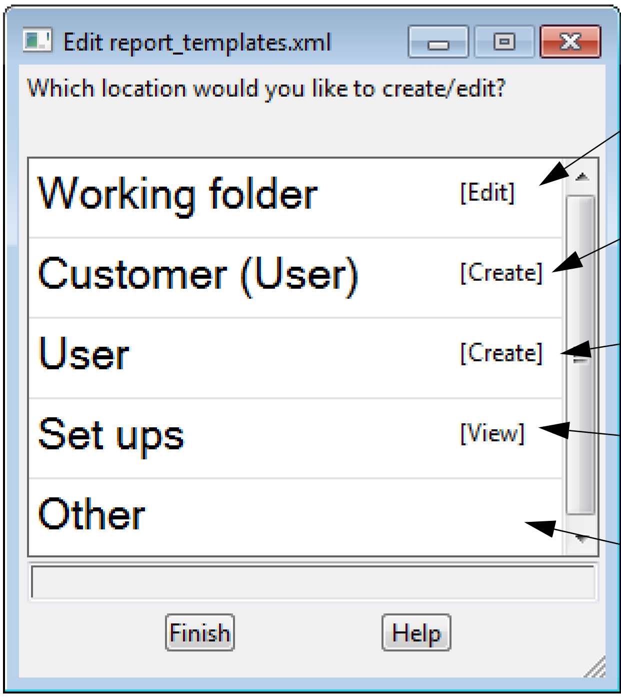
This usually applies to the **Set Ups** folder which normally requires Admin privileges for it to be written to.

(d) is in **Customer (User)**.

This only appears if a *Customer User* area has been defined.

(e) is defined separately by the user and then **Other** is displayed.

In this case, the full path name of the XML file is given by the user.



[Edit] - there is an xml file and it can be edited

[Create] - there is no xml file but one can be created. **Customer (User)** only appears if you have defined a Customer User area

[Create] - there is no xml file but one can be created.

[View] - no xml file can be created because there is no access, just viewed.

nothing means that the user has not defined any additional files to use

See

4.30.1.1 [Create] for Report Types
4.30.1.2 [Edit] for Report Types

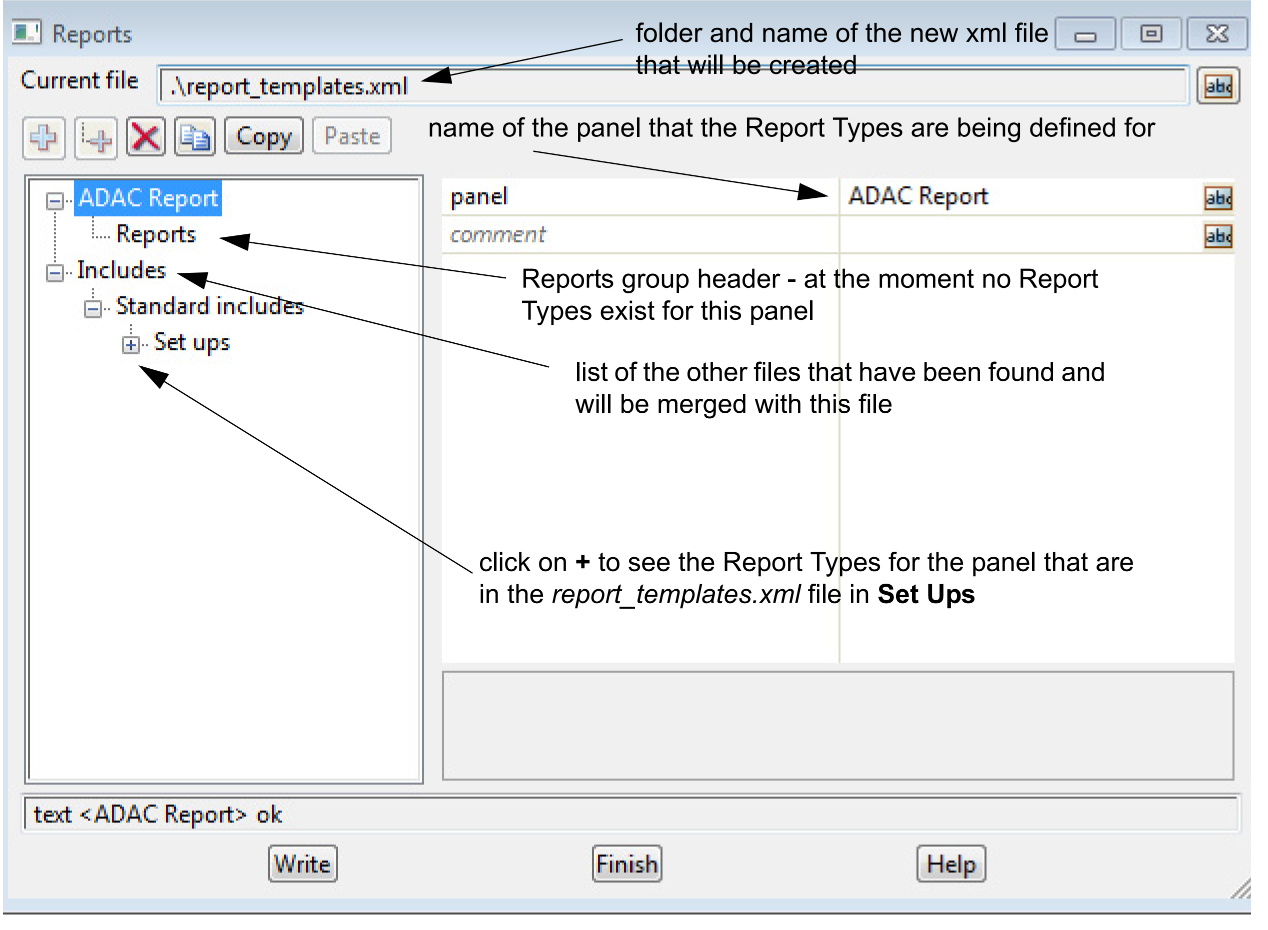
Go to the next section 4.30.1.1 [Create] for Report Types or return to 4.30 Setting Up XML Reports.

4.30.1.1 [Create] for Report Types

When **[Create]** is shown, a new xml file can be created in that folder.

Click on the line with **[Create]** and the **Editor** for a **report_templates.xml** starts up with a **Reports group header** but reports in it.

All the other **report_templates.xml** files that are found are listed in the **Includes** section displayed at the bottom of the tree.



The included files can not be edited whilst create/editing this file BUT you can copy items from them and paste them into items in this file.

New items for the **Report type** pop up can now be created (see 4.30.1.2.1 Creating New Report Types) and a new XML created by clicking on the **Write** button.

Creating and editing of *report_templates.xml* files is the same as for **[Edit]** and so is documented in that section. See 4.30.1.2 [Edit] for Report Types.

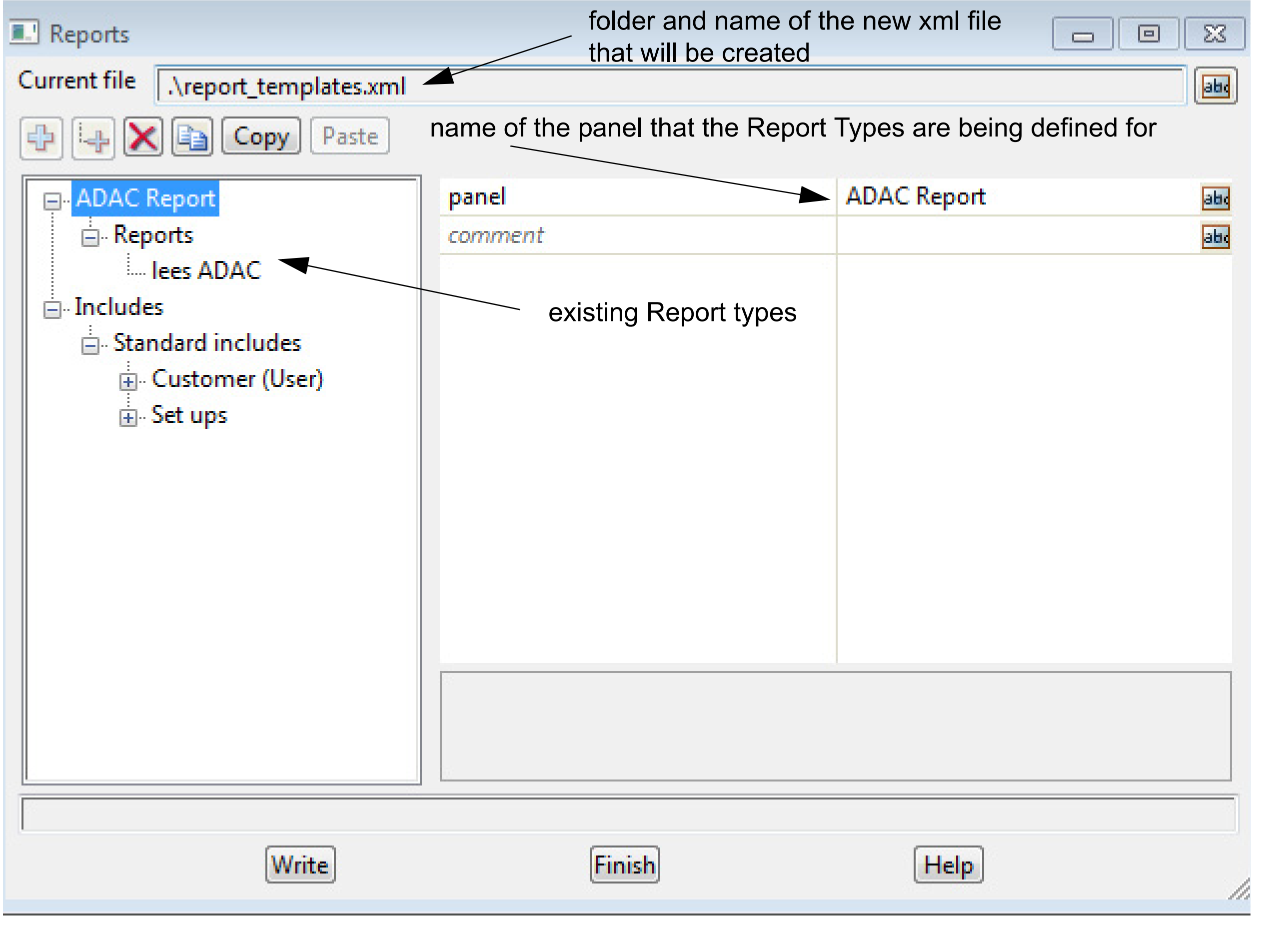
Write - writes out the information in the panel to the files name given in **Current file**.

Go to the next section 4.30.1.2 [Edit] for Report Types or return to 4.30 Setting Up XML Reports.

4.30.1.2 [Edit] for Report Types

When **[Edit]** is shown, an xml file already exists and can be edited.

Click on the line with **[Edit]** and the **Editor** for the *report_templates.xml* starts up and displays from the file, all the existing **Report types** for the panel.



After completing any editing, the XML is saved by clicking on the **Write** button.

As in the **[Create]** case, all the other appropriate files that are found are listed in the Includes section are displayed at the bottom of the tree (see 4.30.1.1 [Create] for Report Types).

The included files can not be edited whilst create/editing this file BUT you and copy items from them and paste them into items in this file.

For editing in the panel, see

4.30.1.2.1 Creating New Report Types

4.30.1.2.2 Copy and Paste

4.30.1.2.3 Deleting a Report Type

4.30.1.2.4 Duplicating a Report Type

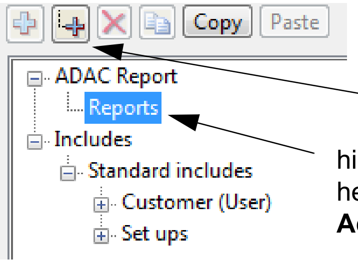
4.30.1.2.5 Editing a Report Type

Go to the next section 4.30.1.2.1 Creating New Report Types or return to 4.30 Setting Up XML Reports.

4.30.1.2.1 Creating New Report Types

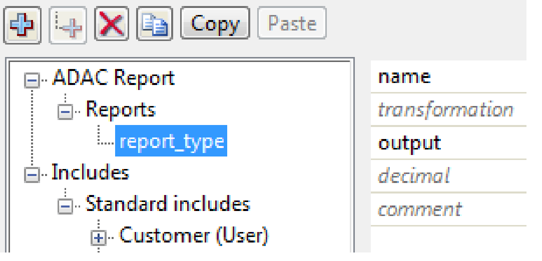
To create a **new Report type** from scratch when there are **no Report types**, highlight the **Reports group header** and click on the **Add Child** icon.

Note - the **Add Child** icon adds a node as a subnode of the highlighted node.

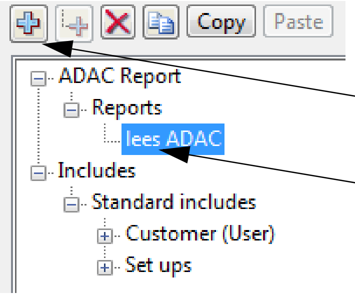


Add Child icon

highlight the Reports group header before clicking the **Add Child** icon



Too create a **new Report type** from scratch when **some Report types already exist**, you can highlight the **Report type name** and click on the **Add** (Add Sibling) icon.

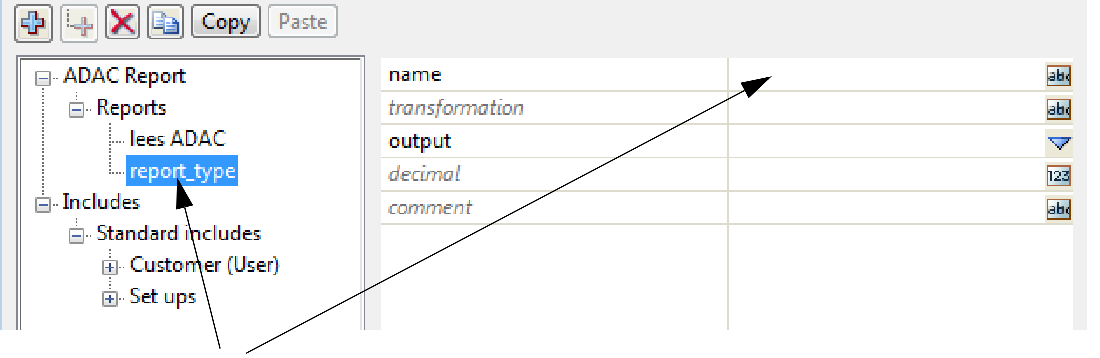


Add sibling icon

highlight the existing Report type name before clicking the **Add** sibling icon

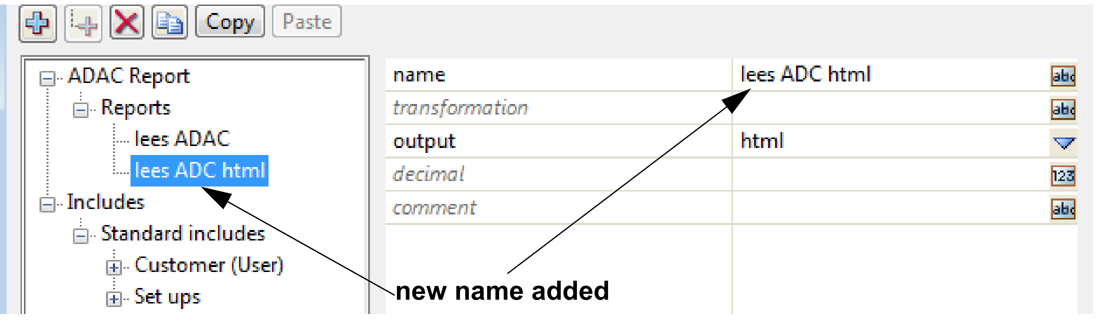
The **Add** icon adds a new item at **the same level** (a sibling) as the highlighted item and that is why a Report type must already exist so that one can be selected.

In both cases a new *Report type* is created with no name and so the general name **report_type** is written in the *Reports* list until the *Report type* is given a name.



new Report type added - no name as yet

Once the new *Report type* is given a name then that name will appear in the tree.



Once the new *Report type* is created then it can be edited by going into each field of the *Report type* and making changes.

Other Methods for Creating New Report Types

Duplicate can be used if there are already existing *Report types* for the panel in the file (4.30.1.2.4 Duplicating a Report Type).

Copy and **Paste** is particularly useful when there are **no** *Report types* for the panel in the file but there are *Report types* for the panel in other files listed in the **Includes** node. Although these *Report types* can't be edited, they can be copied (4.30.1.2.2 Copy and Paste).

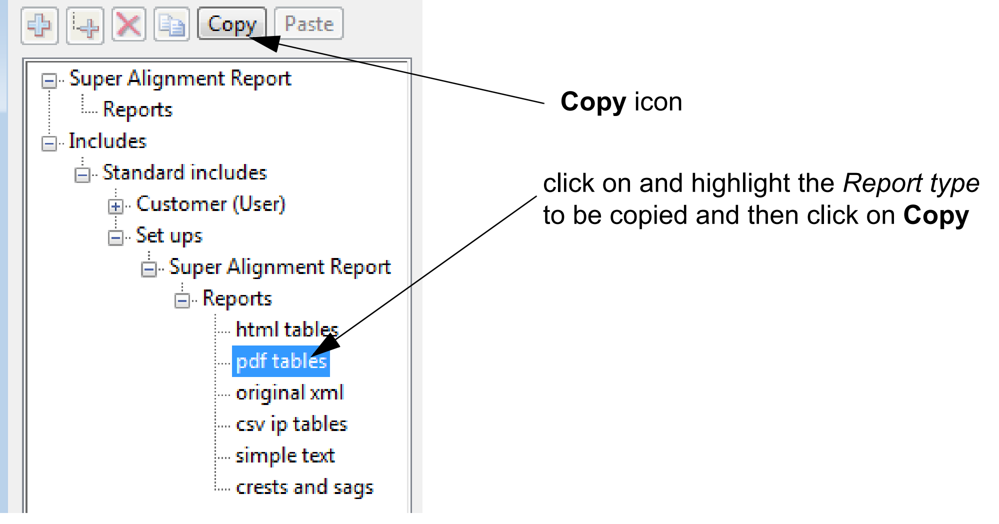
Go to the next section 4.30.1.2.2 Copy and Paste or return to 4.30 Setting Up XML Reports.

4.30.1.2.2 Copy and Paste

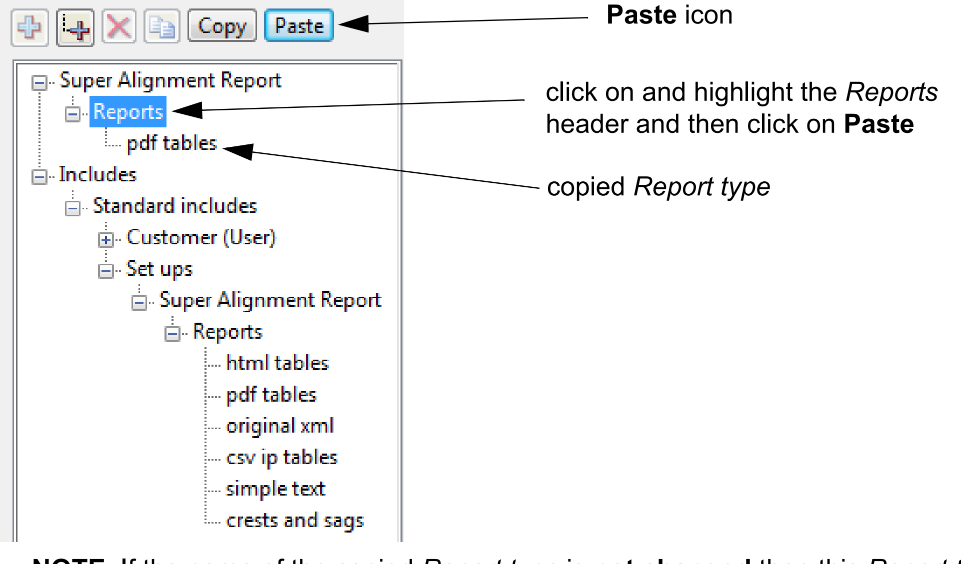
Copy and **Paste** can be used to create a copy of an existing *Report type*, and then the copied *Report type edited*.

Although there may be no *Report types* in the folder you are creating *Report types* for, there will usually be some *Report types* in the XML file in **Set Ups** that can be copied.

In the tree in the Editor, click on the **+** in front of **Set Ups** to expand the tree and then click on the item in the tree that you want to copy. Then click on the **Copy** icon.



Next click on and highlight the *Reports* header and click on **Paste**. The *Report type* will then appear under the *Reports* header with the same name as the original *Report type*. The copied *Report type* can then be edited.

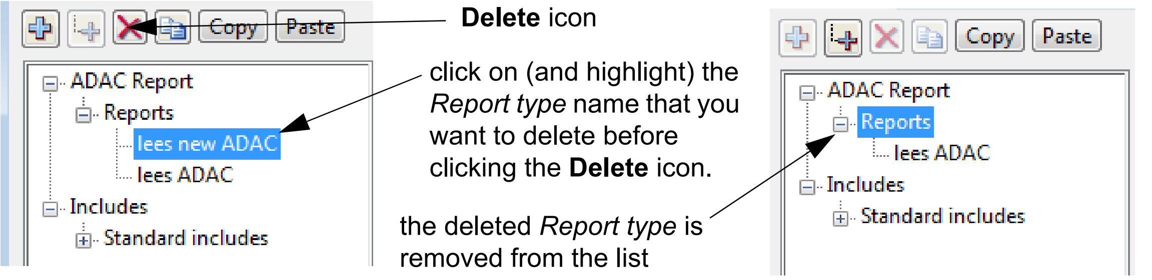


NOTE: If the name of the copied *Report type* is **not changed** then this *Report type* will be used instead of the one in **Set Ups**.

Go to the next section 4.30.1.2.3 Deleting a Report Type or return to 4.30 Setting Up XML Reports.

4.30.1.2.3 Deleting a Report Type

To **delete** a *Report type*, simply click on and highlight the *Report type* **name,** and then click on the **Delete** icon.

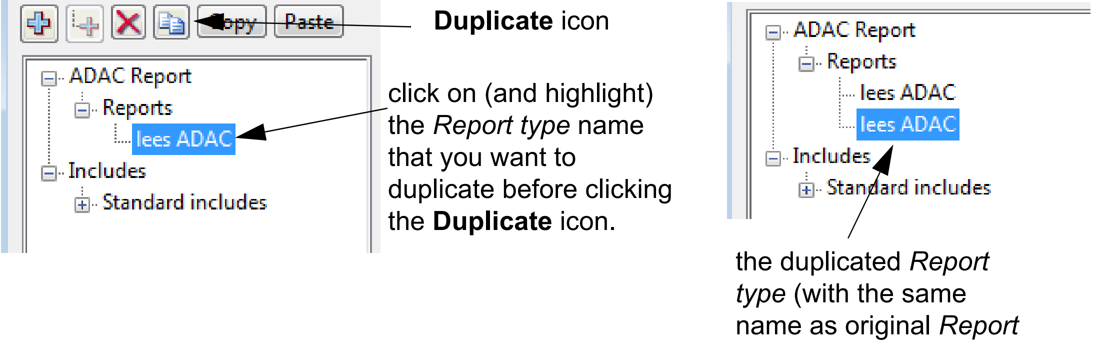


Go to the next section 4.30.1.2.4 Duplicating a Report Type or return to 4.30 Setting Up XML Reports.

4.30.1.2.4 Duplicating a Report Type

To **duplicate** a *Report type*, simply click on and highlight the *Report type* **name,** and then click on the **Duplicate** icon.

A copy of the *Report type*, with exactly the same name, is created and added to the end of the list of *Report type*.

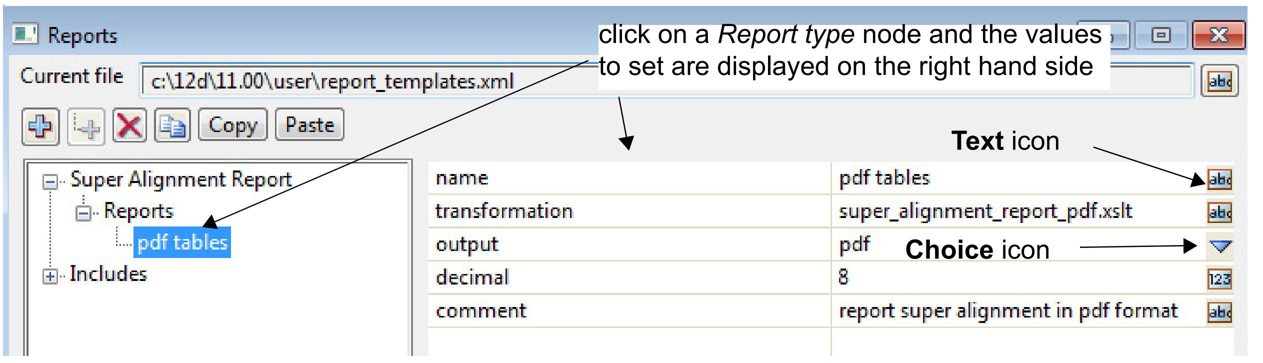


The name of the *Report type* needs to be changed, and any other edits done that are required.

Go to the next section 4.30.1.2.5 Editing a Report Type or return to 4.30 Setting Up XML Reports.

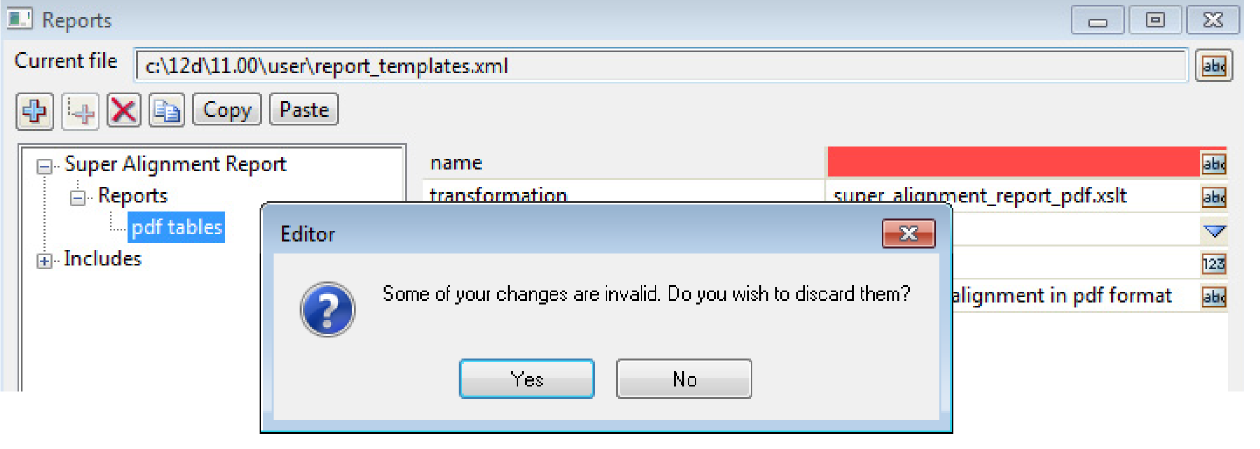
4.30.1.2.5 Editing a Report Type

To edit a **Report type**, click on the *Report type* name and all the values for that *Report type* will be displayed on the right hand side of the panel.



The panel fields on the right hand side of the panel have the same icons as in other ***12d Model*** panels and the standard pop ups are all available. For example, text, number and choice icons.

When clicking to go to another *Report type,* all the fields currently on the right hand side are validated and if there are any problems, the first line with an error is coloured red and an **Editor error** box is displayed.



If **Yes** is selected, then all the **invalid field** values are **discarded**, the **Editor error** panel removed, and the data for the new selected node displayed on the right hand side of the panel.

If **No** is selected, then the right hand side of the panel does not change and can undergo further edits.

Go back to the section 4.30.1.2 [Edit] for Report Types or return to 4.30 Setting Up XML Reports.

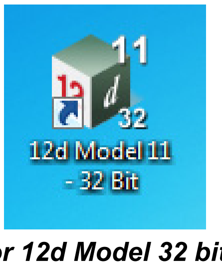
5 Starting Up

This chapter contains information about how to start ***12d Model***, organising ***12d Model*** error logging and how to run chains and macros when starting up ***12d Model***.

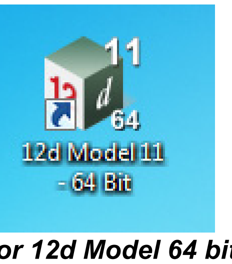
Go to
5.1 Front Panel - Open a Recent Project
5.4 Options for the Highlighted Project
5.5 Organizing Working Areas
5.6 Project Shortcuts
5.7 Creating Project Shortcuts by Hand
5.8 Environment Variables Shortcut
5.9 Running Macros and Chains on Start Up
5.10 Error Logging File

5.1 Front Panel - Open a Recent Project

When ***12d Model*** is installed from the 12d Installation CD, the 12d icon ***12d Model*** **11** is created.



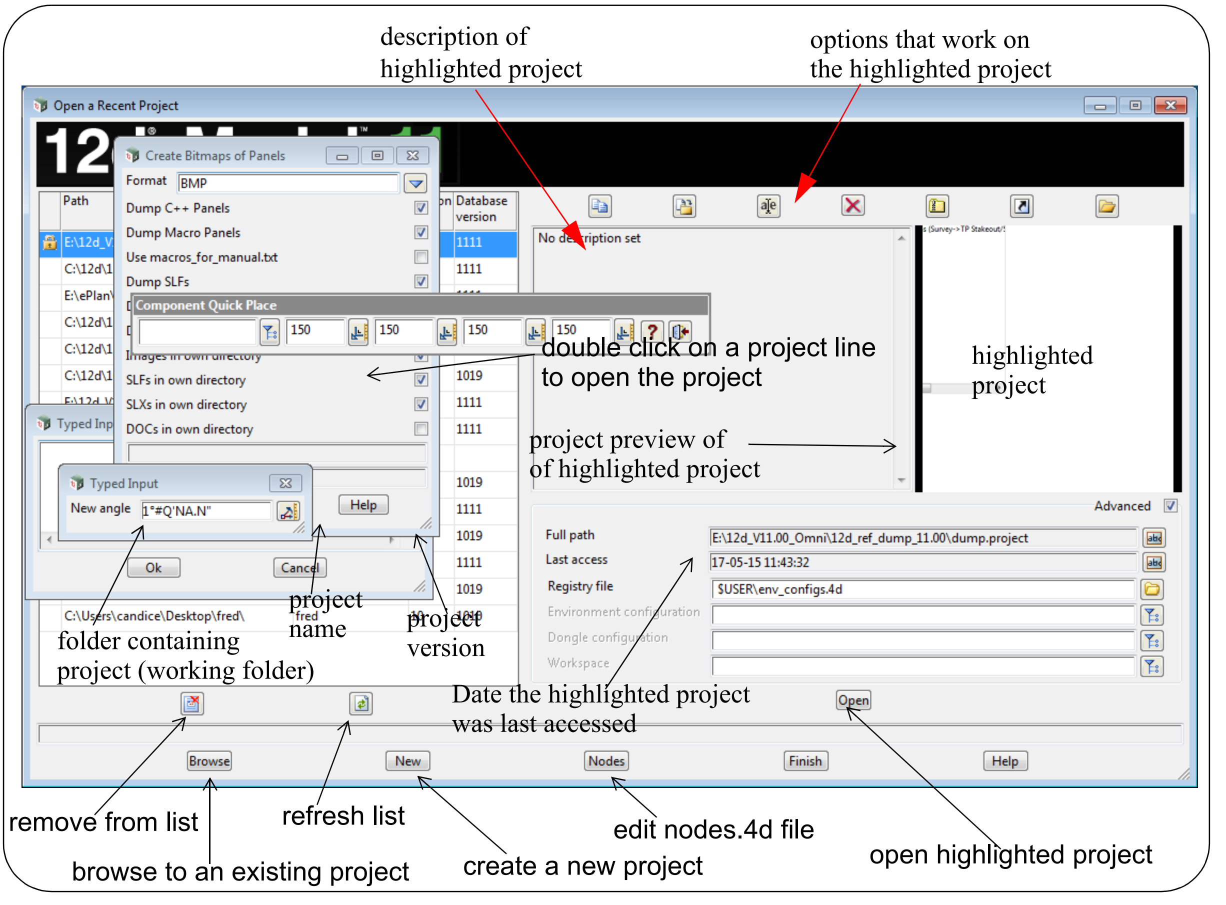
icon for 12d Model 32 bit exe



icon for 12d Model 64 bit exe

The ***12d Model*** icon is a **shortcut** to start ***12d Model*** and then attach to the folder *C:\12d\11.00*.

Clicking the 12d Model icon starts 12d Model. First the 12d Model splash screen will appear and then the initial ***12d Model*** screen with the **Open a Recent Project** panel.



If this does not work, please contact your ***12d Model*** administrator to check the procedure to be used on your system. For a detailed description on how to install ***12d Model***, please refer to the *Installing* ***12d Model*** chapter in the *Getting Started* manuals.

To select a project is the ***Recent projects list***, simply double click on the entry in the list and ***12d Model*** will open the project up.

The description of the functions of the fields and buttons in the **Open a Recent Project** panel are:

Field Description	Type	Defaults	Pop-Up
Recent projects list	output	recent projects	

names and folders of project recently select. Single clicking on an entry in the list displays the projects description in the Project description area. Double clicking on an entry in the list changes to this project

Project description output

description of the project highlighted in the Recent projects list.

Advanced tick box

if tick, environment configurations can be assigned to the project and extra panel fields are displayed to allow for this. For more information, please go to the section 7.2.1 Project Open/Create Panel with Advanced Ticked.
If not tick, no extra panel fields are displayed.

Full path output

name of the full path to the project.

Last accessed output

date that the project was last accessed.

The icon **Remove from list** - removes the project from the *recent projects* list

The icon **Refresh list** - refreshes the *recent projects list*

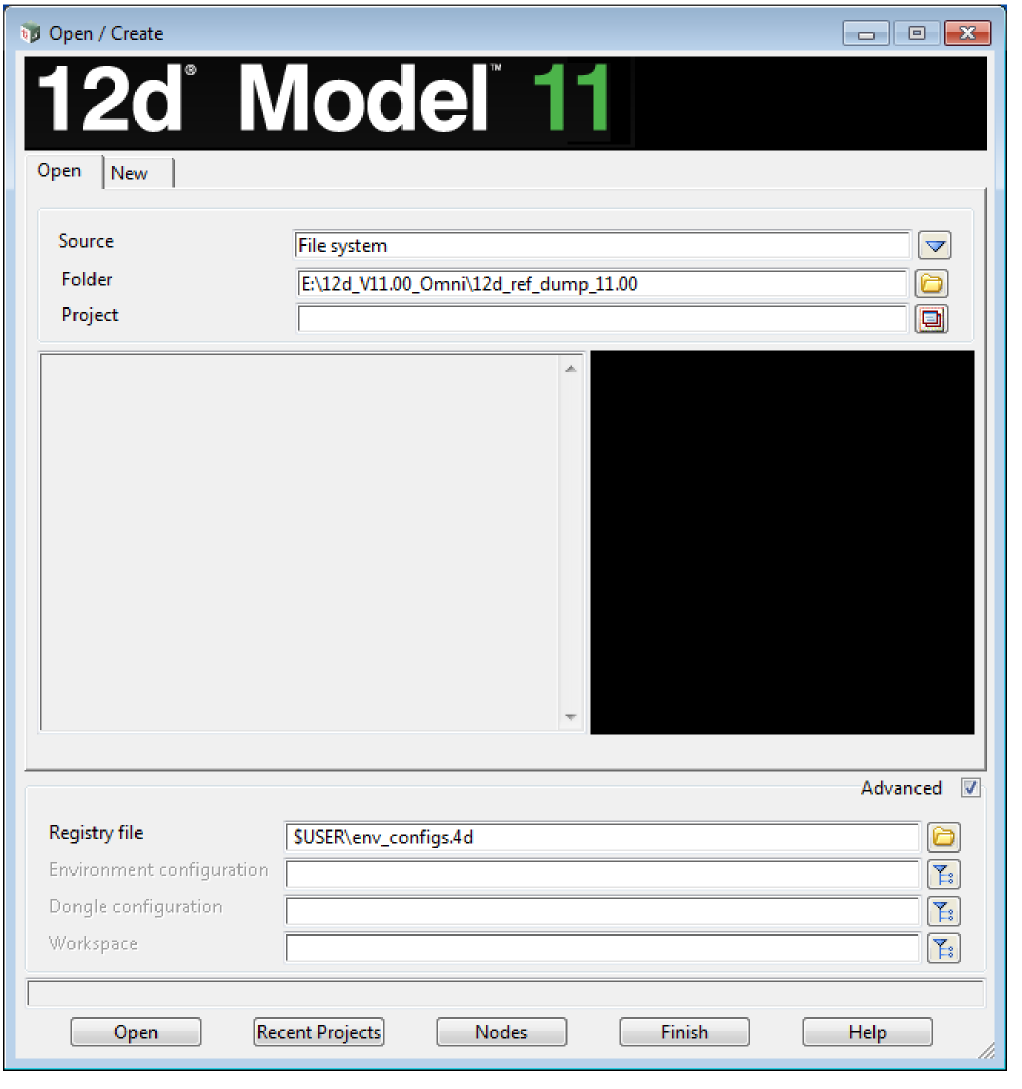
For the icons that work on the highlighted project, go to 5.4 Options for the Highlighted Project

For the **Browse** button, go to 5.2 Browse Button and Open Tab
For the **New** button, go to 5.3 New Button and New Tab
For the **Nodes** button, go to 7.6.5.6 Nodes.4d Editor

5.2 Browse Button and Open Tab

Clicking on the **Browse** button brings up the **Open** tab that allows you to browse and open an **existing** project. This is used when opening a project that is not in the *Recent Projects* list.

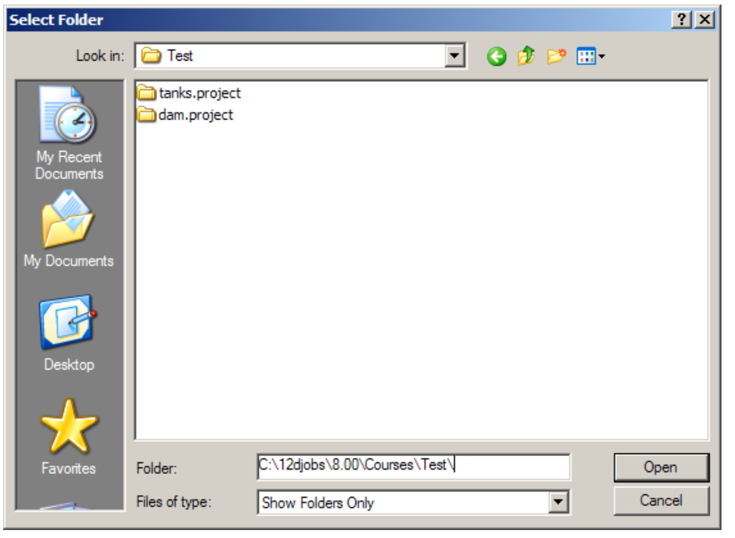
The **Open** button opens the project that has been browsed to.



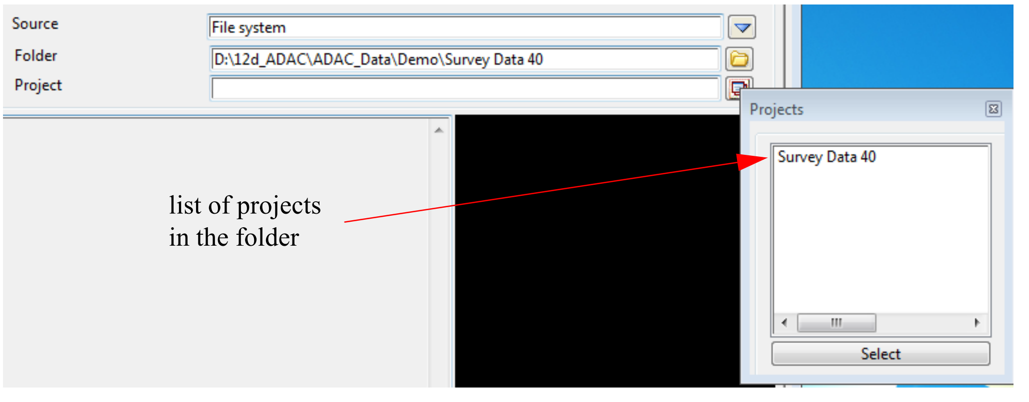
Folder input current folder Microsoft browser

name of the folder to look for the project. This will become the working folder.

If the displayed folder does not contain the required project, clicking LB on the folder icon on the right side of the field will bring up the Microsoft browser which is used to navigate to the folder containing the required project.



If the selected folder contains ***12d Model*** *projects, then a pop-up with a list of projects in the folder is displayed in the* Project name *field and the required project can be selected from the list.*



Project input none projects in folder

name of the project to become the working project.

Open button

after selecting this button, the working folder is changed to the folder specified in the folder *field and the selected project opened. If the project does not exist, and error message appears.*

Recent Projects button

takes you back to the original front screen. See 5.1 Front Panel - Open a Recent Project.

Quit button

exit ***12d Model****.*

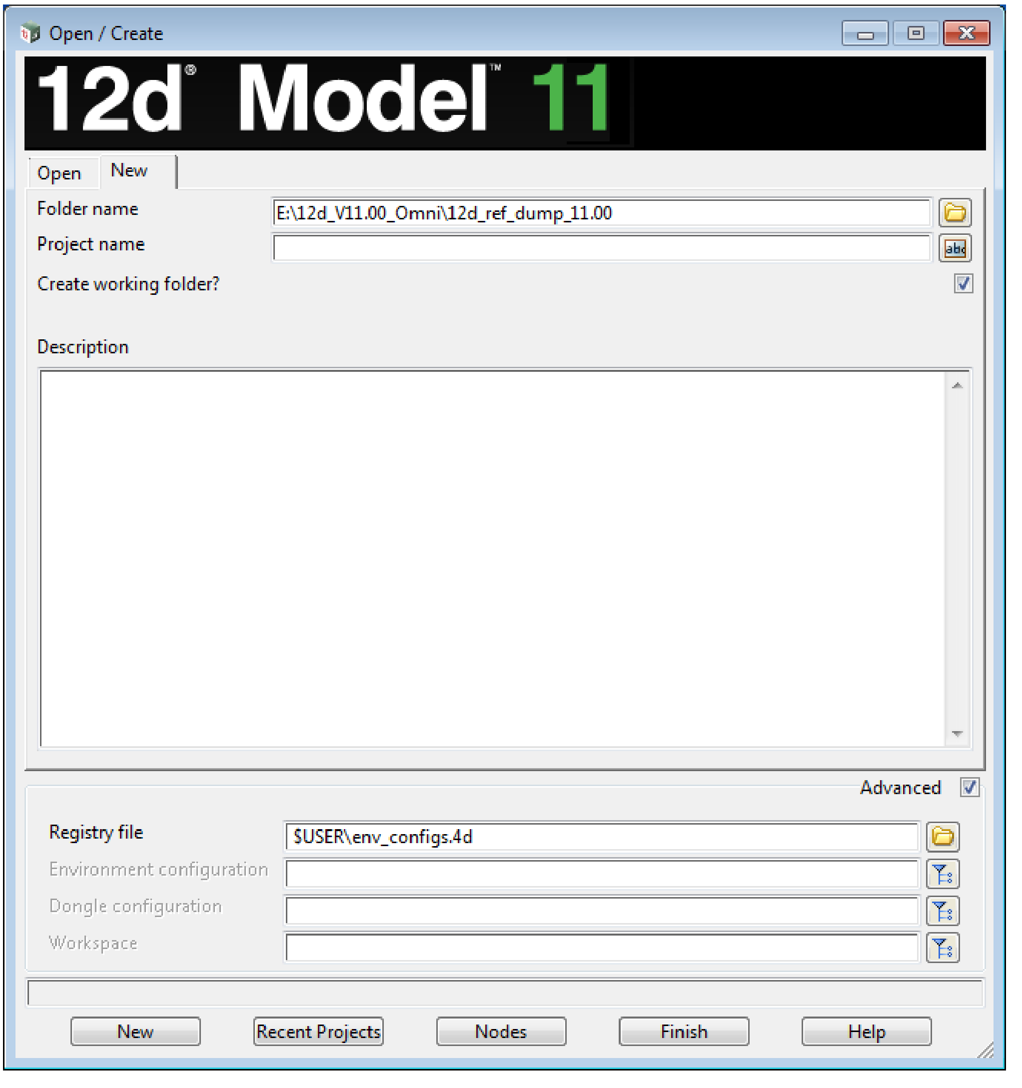
Note

The **New** tab takes you to the tab for creating a new project. See 5.3 New Button and New Tab.

5.3 New Button and New Tab

Clicking on the **New** button brings up the **New** tab that allows you to create a **new** project.

The **New** button creates the new project.



To create a ***new*** project, fill in the Folder name and Project name and click on the **New** button.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder	folder box	current folder	select folder panel

if **Create working folder** *is ticked, a folder with the same name as the project is created in the folder given in this panel field, and the project will be created inside this folder with the same name as the project. This is to encourage the habit of creating a folder of the same name of the project and then creating the project inside the folder.*

If **Create working folder** *is not ticked, the project is created in the folder given in this panel field.*

Project name	typed input		

name of the new project to be created.

Create working folder tick box

if tick, a folder of the same name as the project is created in the folder **Folder***, and the project is created inside this folder. The folder with the same name as the project is then the working folder.*

If not tick, the project is created in the folder **Folder** *and this folder is the working folder.*

Description typed input

a description of the project can be typed into this field. This is stored with the project.

Advanced tick box

if tick, environment configurations can be assigned to the project and extra panel fields are displayed to allow for this. For more information, please go to the section 7.2.1 Project Open/ Create Panel with Advanced Ticked*.*
If not tick, no extra panel fields are displayed.

New button

after selecting this button, the new project created in either the **Folder** *or if* **Create working folder** *is ticked, inside a folder created in the* **Folder** *of the same name as the project.*

12d Model *then opens the newly created project.*

Recent Projects button

takes you back to the original front screen (5.1 Front Panel - Open a Recent Project).

Quit button

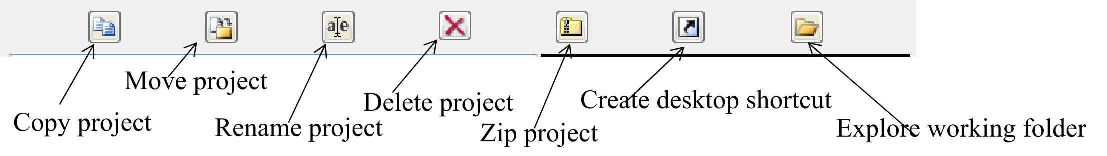
exit out of ***12d Model.***

Note

The **Open** tab takes you to the tab for browsing to open an existing project (5.2 Browse Button and Open Tab).

5.4 Options for the Highlighted Project

When a project is highlighted in the list of **recent projects**, icons for options are activated on the right hand side of the **Project Selection** panel.



Copy project - copy the project and the working folder

Move project - move the project and working folder to a new folder

Rename project - rename the project and the working folder

Delete project - delete the project and the working folder

Zip project - zip up the project and the working folder

Create desktop shortcut - create a shortcut on the desktop that starts ***12d Model*** and opens the project - see 5.6 Project Shortcuts

Explore working folder - open Windows Explorer and show the contents of the working folder

These options are documented in the section 7.2.4 Options Active When Recent Project Highlighted.

Go to the next section 5.5 Organizing Working Areas.

5.5 Organizing Working Areas

For each project,***12d Model*** creates a unique sub-folder of the working folder with the name consisting of the project_name followed by ***.project***.For example, for the project ***Olympic***, and folder called ***Olympic.project*** is created.

This sub-folder (Olympic.project) is called the **project area**. All the internal ***12d Model*** information for that project is kept inside the project area.

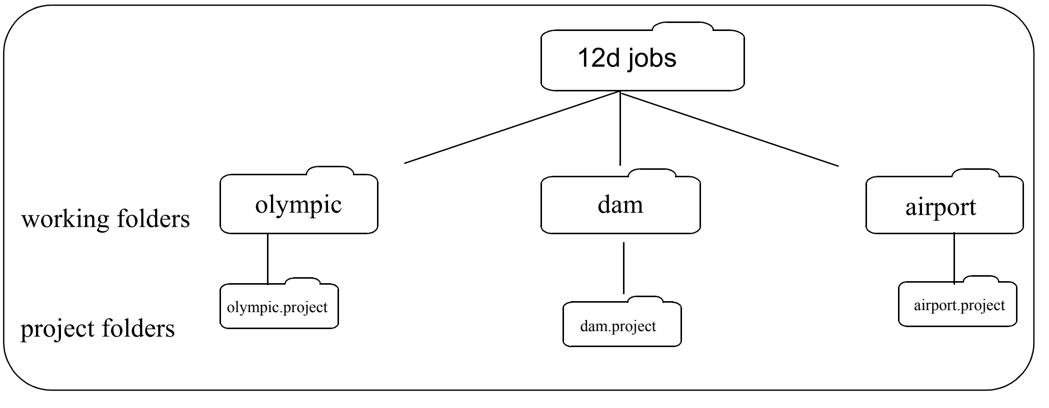
All outputs, reports and plots are written to the working folder (the folder containing the project) and are **not** held inside the project area.

Hence to get a complete backup of the project and all associated information, it is best to ***backup the entire working folder***.

The project name, which can be up to 256 alphanumeric characters and can include spaces, must be unique within the working folder but other folders may include ***12d Model*** projects with the same name - these projects are distinct and are not related in any way.

There is no limit to the number of projects in a particular working folder but because all the outputs, reports and plots for each project in the same working folder would be mixed in together, ***it is recommended to have each project in its own working folder***. That way the inputs files, output files, plots, reports etc. from the separate projects do not end up in the same working folder. Each separate working folder can then be easily backed up.

As an example, if three unrelated projects - olympics, airport, and dam - are to be created in a folder called **12d jobs**, it is suggested that the project ***olympic*** is created in a **sub folders** of **12d jobs** called ***olympic***, ***dam*** is created in a **sub folders** of **12d jobs** called ***dam*** and ***airport*** is created in a **sub folders** of **12d jobs** called ***airport***.



To help users adhere to this convention, when creating new projects, there is a Create working folder tick box which if ticked, will first create a folder of the same name as the project being created and then create the project in that folder.

Go to the next section 5.6 Project Shortcuts.

5.6 Project Shortcuts

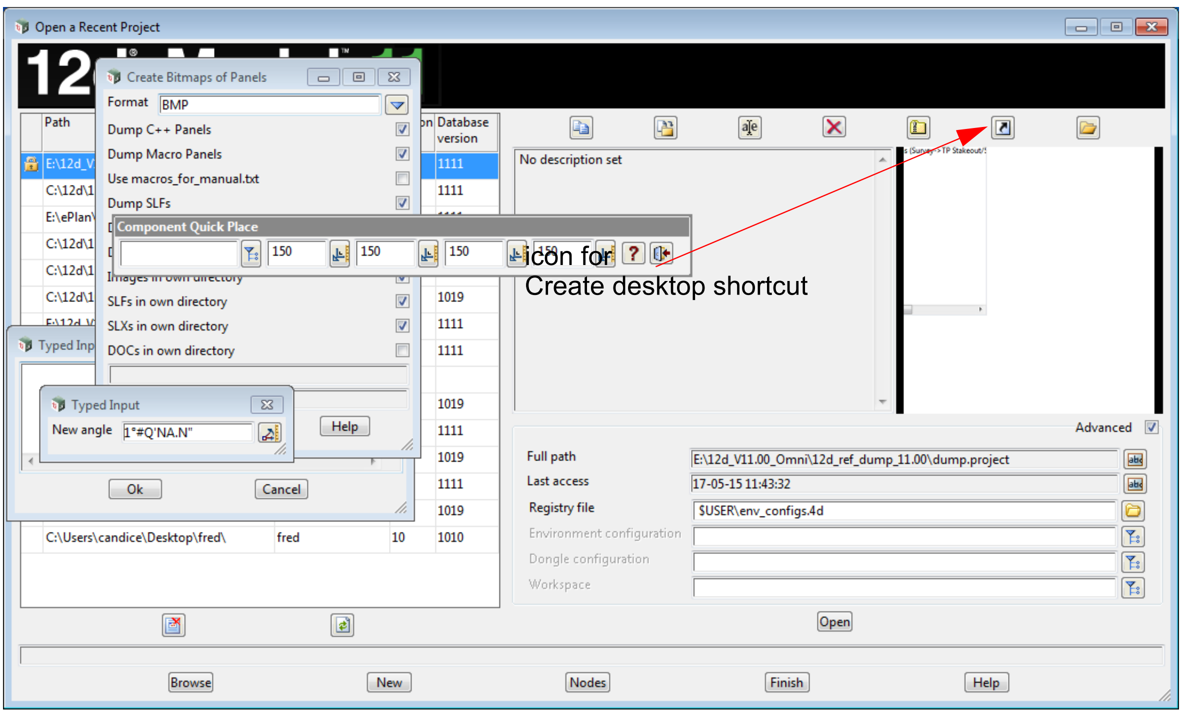
The list of most recent projects makes it very easy for 12d operators to get into their projects.

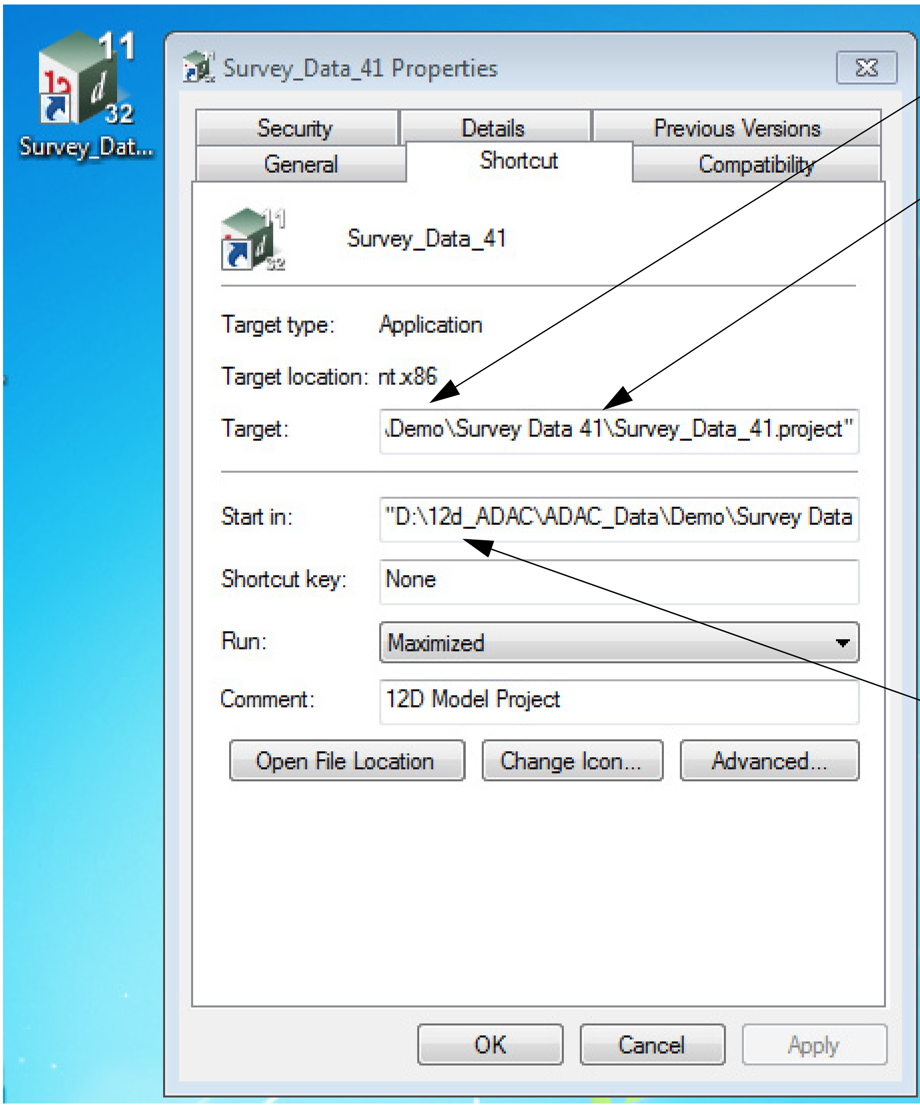
However if there is a folder of projects, or even a particular project, that a user wants to get into by simply double clicking on an Icon on the screen, then a Windows shortcut can be used to do it.

The easiest way to create the shortcut is to first make sure that the project is in the recent projects list. To do this, just open up the project and then exit ***12d Model***.

Then start up ***12d Model*** again by clicking on the ***12d*** icon on the desktop, highlight the project in the ***recent projects list*** and select the icon for Create desktop shortcut on the icons on the right hand side of the project list.

This will create a shortcut on the desktop with the name of the project, and the shortcut is set to open up the project when the icon is double clicked.





Target: has the path to **12d.exe**

This is optional and can be the full path name to an existing project (including the project name) and this is opened when the icon is clicked

OR

just an existing project and this must be in the folder given in **Start in:** and it is opened

Start in: is used as the working folder when no full project path is given in **Target:**

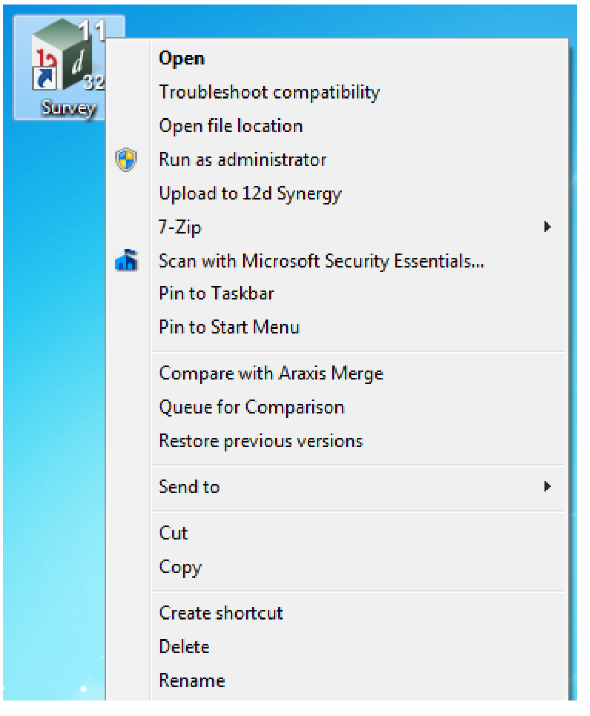
Go to the next section 5.7 Creating Project Shortcuts by Hand.

5.7 Creating Project Shortcuts by Hand

Creating an icon to open up in an existing ***12d Model*** project can also be done by hand by copying a ***12d*** icon that is already on the screen, renaming the copied icon to the name of the project (say *survey).*

The Properties for the icon *survey* is then modified by changing what is in the **Target:** box and maybe the **Start in:** box.

To display and modify the properties of a desktop icon, click RB over the ***12d*** icon and select *Properties* from the menu. Then click on the *Shortcut* tab



The Properties for the icon *survey* can now be modified to:

(a) open an existing project

If an icon is to open a given project, then the full path to the projects (including the project folder name) in given in the **Target:** field after the path to the 12d exe.

For example, if the ***12d Model*** project *survey* was in the folder "12d jobs\survey ", set the **Target:** for the icon ***survey*** to:

"C:\Program Files\12d\12dmodel\11.00\nt.x86\12d.exe" "C:\12d jobs\survey\wurvey.project"

The icon *survey* would then automatically open up the project

C:\12d jobs\survey\survey.project

Note that if the path name for the project in **Target:** contain spaces, then it must be enclosed in double quotes (**"**).

If the *survey* icon was double clicked on, it would now open the project *survey.*

The **Start in:** is ignored.

(b) open an existing project

Another way that an existing project can be opened is that if a project such as *survey* already exists in the folder given by the **Start in:** field, then in the **Target:** field, the project name is added after the path to 12d. exe.

For example, the **Target**:

"C:\Program Files\12d\12dmodel\11.00\nt.x86\12d.exe" survey

would automatically open the project **survey** in the **Start in:** folder of the shortcut.

So **Target:** and **Start in:** are used to obtain the existing project to open whereas in (a), only Target: is used.

Note that if either the path names for the **Target:** or **Start in:**, or the project name contain spaces, then they must be enclosed in double quotes (**"**).

Note

The **Target:** field is actually a command line to start up ***12d Model***. For more information see 39.8 Arguments When Starting 12d Model in Appendix 39 Setting Up & Configuring 12d.

Please continue to the next section 5.8 Environment Variables Shortcut.

5.8 Environment Variables Shortcut

If a file of ***12d Model*** environment variables has been set up by the user (see section 39.4 Environment Variables in Appendix 39 Setting Up & Configuring 12d), then instead of setting the environment variable ENVIRONMENT_4D to point to the file or setting it up with the default name, env.4d, the environment file can be passed to ***12d Model*** using the **Target** of the icon properties.

For example, the **Target**:

"C:\Program Files\12d\12dmodel\11.00\nt.x64\12d.exe" -env F:\12d\env.4d

would fire up the 64-bit ***12d.exe*** using the file of environment variables called F:\12d\env.4d

The **Target**:

"C:\Program Files\12d\12dmodel\11.00\nt.x64\12d.exe" -env F:\12d\env.4d airport

would fire up the 64-bit ***12d.exe*** using the file of environment variables called F:\12d\env.4d **and** also automatically open the project **airport** in the **Start in:** folder of the shortcut.

Again if any of the path names contain spaces, then they must be enclosed in double quotes (**"**).

The **Target:** field is actually a command line to start up ***12d Model***. For more information see 39.8 Arguments When Starting 12d Model in Appendix 39 Setting Up & Configuring 12d.

Please continue to the next section 5.9 Running Macros and Chains on Start Up.

5.9 Running Macros and Chains on Start Up

To allow for tailoring *12d Model* when a new project is created or an existing project opened, *12d Model* runs user supplied files of macros and/or chains.

For ***new*** projects, the default name of the file is

macros.4d

This can be changed to a different file by setting the environment variable

RUN_MACROS_FILE_4D *file_of_macros_to_run_for_new_projects*

For ***existing*** projects, the default name of the file is

project_macros.4d

This can be changed to a different file by setting the environment variable

RUN_PROJECT_MACROS_FILE_4D *file_of_macros_to_run_for_existing_projects*

(the environment variables can be set on the ***Extra A*** tab of the env.4d editor - see 7.6.3 env.4d)

The files consist of macros and/or chains, one per line, where

for macros, just the ***name of the macro*** is needed on the line

and for chains, the command **run_chain** *name_of_the_chain* is needed on the line.

The macros and chains are run in the order that they occur in the file.

Please continue to the next section 5.10 Error Logging File.

5.10 Error Logging File

When ***12d Model*** starts up, it tries to create an **error logging file**, called

log?????.4de

where ????? is a hashed number using your login name, process id & the current time.

When 12d Model terminates, the error log file is deleted if no errors were logged.

The **folder** that the error log file is created in is given by the environment variable LOG_DIR_4D

If LOG_DIR_4D is not used,***12d Model*** tries to create the log file in the current folder, the HOME folder, the TMP folder and the TEMP folder.

If creating a **error log file** fails in all these areas, ***12d Model*** will not start up. This should never happen.

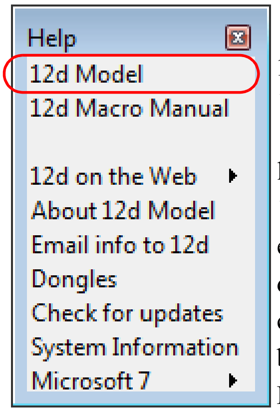
To return to the beginning of this chapter, click on 5 Starting Up.

6 12d Model Help

Position of option on menu: **Help =>12d Model**

All the information in the ***12d Model*** **Reference** manual is also available as electronic **Help** accessed from within ***12d Model*** (also know as the ***12d Model*** **Context Sensitive Help)**.

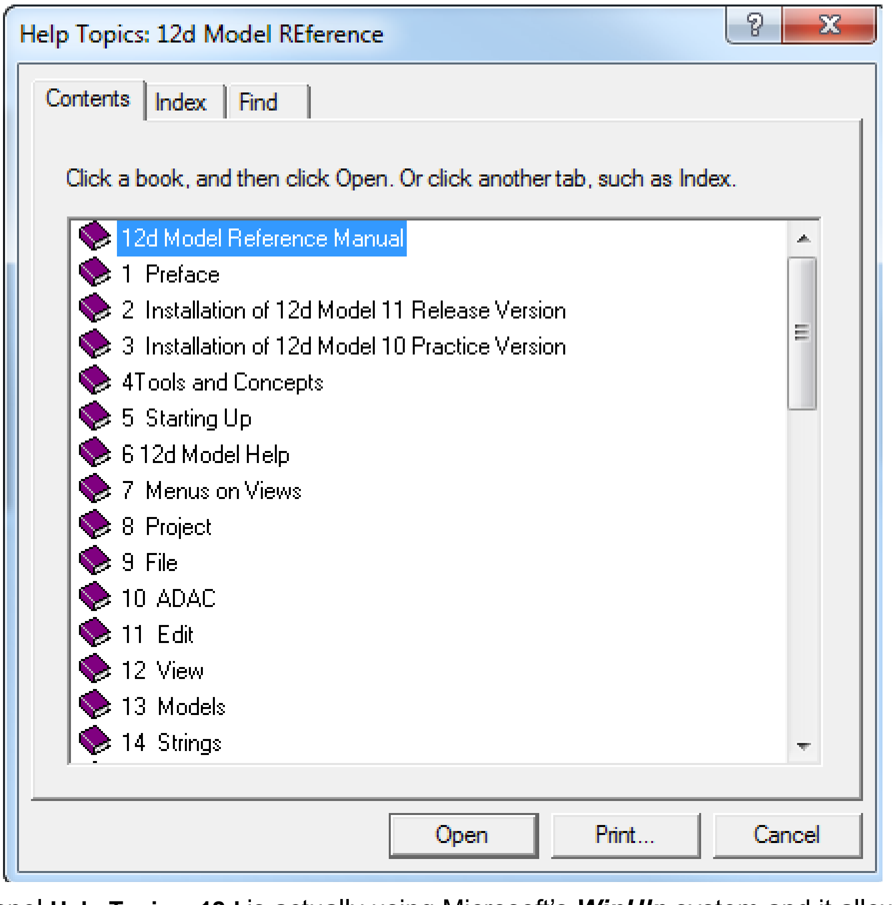
The entire ***12d Model Help*** manual can be accessed by selecting ***12d Model*** on the **Help** menu item on the main ***12d Model*** menu.



12d Model help
12d macro programming language help

links to web site www.12d.com.
12d Model modules authorized, dongle number
email details of your 12d Model to 12d Solutions
dongle testing panel
check for newer versions of 12d Model
brings up Microsoft's System Information panel
For Windows 7 links to the WinHlp32.exe

Clicking on ***12d Model*** brings up **Help Topics: 12d Model Reference**



The panel **Help Topics: 12d** is actually using Microsoft's ***WinHlp*** system and it allows you to look at the overall structure of the ***12d Model*** *Help* and access any part of it. More information on using the tabs **Contents**, **Index** and **Find** will follow in the next section.

Alternatively, individual topics for a panel or menu can be invoked by pressing the F1 key whenever the focus is on the menu or panel, or by clicking on the *Help* button on any ***12d Model*** panel (see F1 Key). This is the *context sensitive* nature of the ***12d Model*** Help.

For some options, there is also additional help files and videos. This is denoted by a * after **Help** on the **Help** button. That is **Help*** (see Extra Help).

It is also possible to have a **Help** button and **F1** key available for ***12d Model*** PLs (macro) programs written by 12d Solutions or by Users. Please see the ***12d Model*** *Programming Language* manual for more information on this feature.

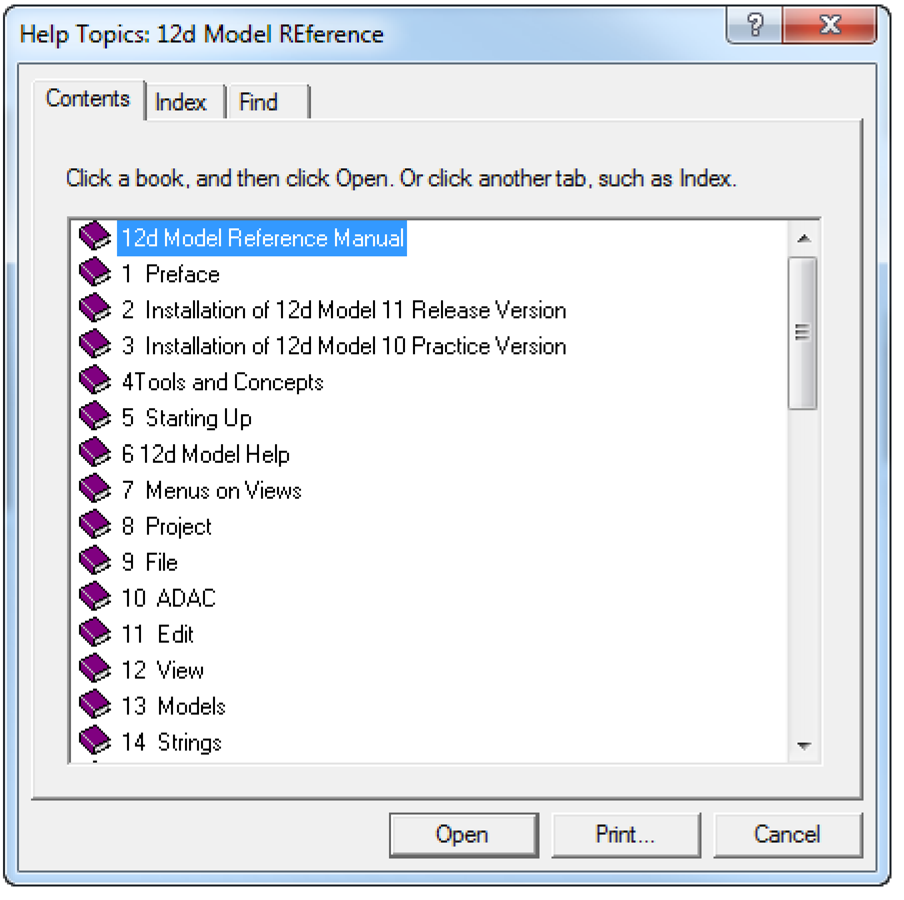
Note: The ***12d Model*** *Reference* manual is available in pdf on the ***12d Model*** installation DVD, or on the 12d web site www.12d.com.

More information on the **Help** system is given in the sections:

Contents
Index
Find
Panel Help Button
F1 Key
Navigating in Help
Extra Help

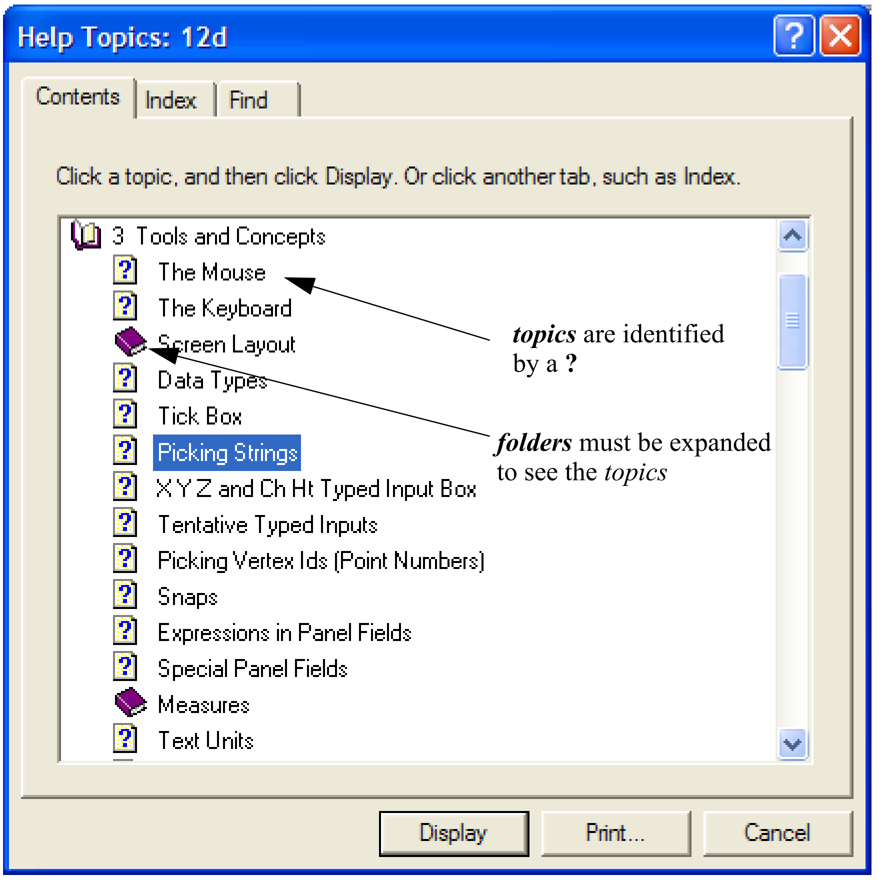
Contents

The **Contents** tab allows you to look at the overall structure of the ***12d Model*** *Help* and access any part of it.



Warning - only *topics* in the *Contents* can be viewed in *Help* so any folders in *Contents* folders must be expanded until *topics* are displayed. *Topics* can be easily identified because they have a question mark beside them indicating that *Help* is available and can be viewed.

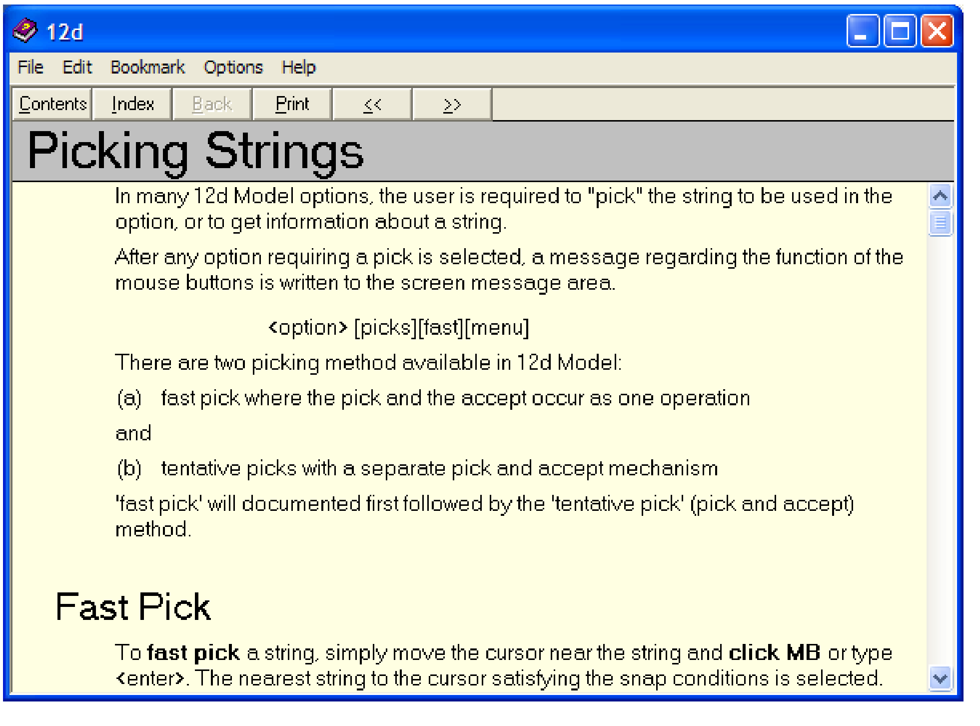
For example, double clicking on ***Tools and Concepts*** expands the next level of ***Tools and Contents***.



and topics are *The Mouse*, *The Keyboard* etc.

Double clicking on the topic ***Picking Strings*** will then display the topic.

The ***Contents*** then disappear leaving *Help* open at the selected topic.



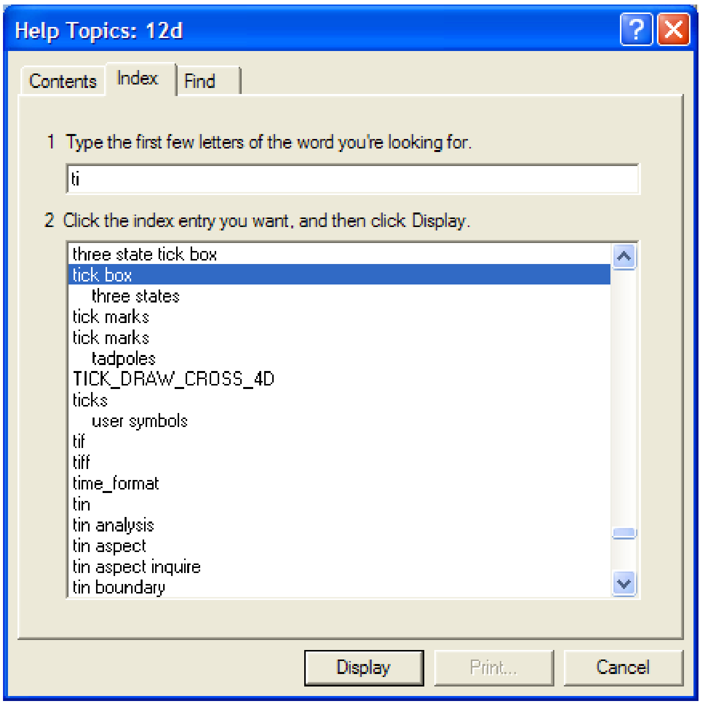
Double clicking on ***Contents*** on the top of the *Help* will bring the Contents listing back up.

Continue to Index or return to 6 12d Model Help.

Index

The *Index* tab searches through all entries in the Index of the Help.

As the first few characters of the required entry are typed in, the matching index entries are displayed.



Double clicking on the displayed entries will go to the topic in the Help containing the selected index entry. If more than one topic includes the index entry, then the list of topics is displayed.

If the index has sub-indices, they can be searched by first typing in the main index followed by a comma, then a space and the first few characters of the sub-index.

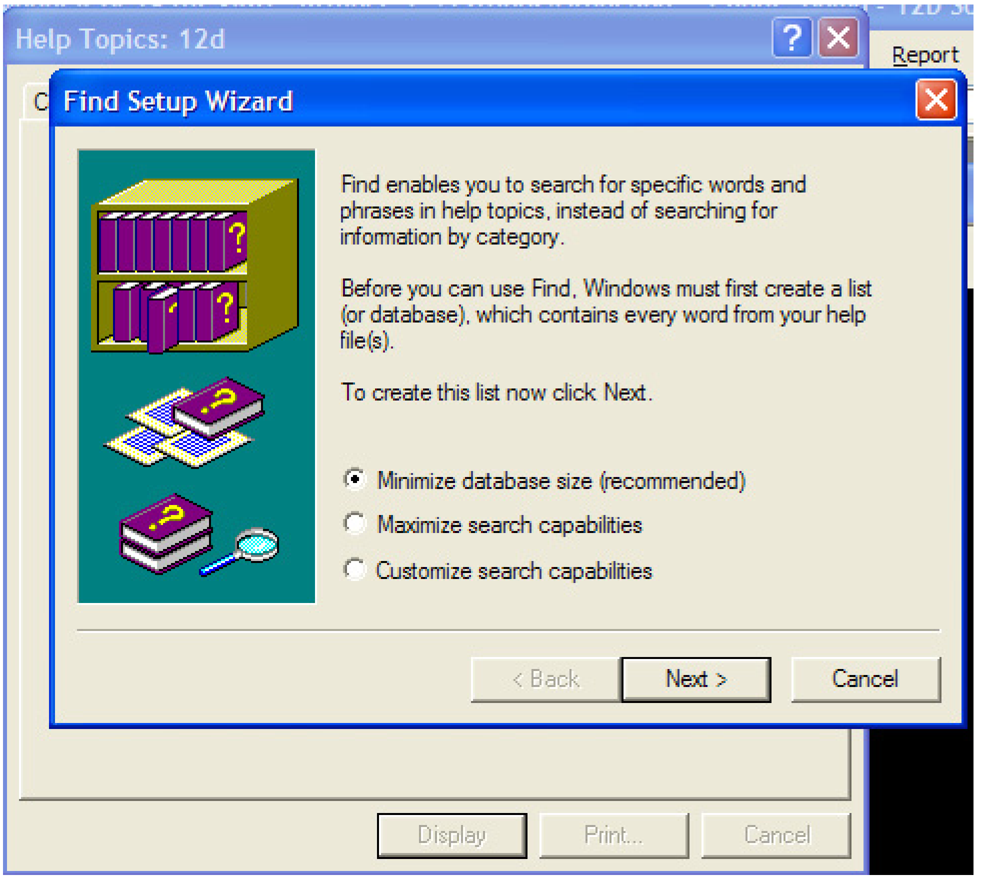
Continue to Find or return to 6 12d Model Help.

Find

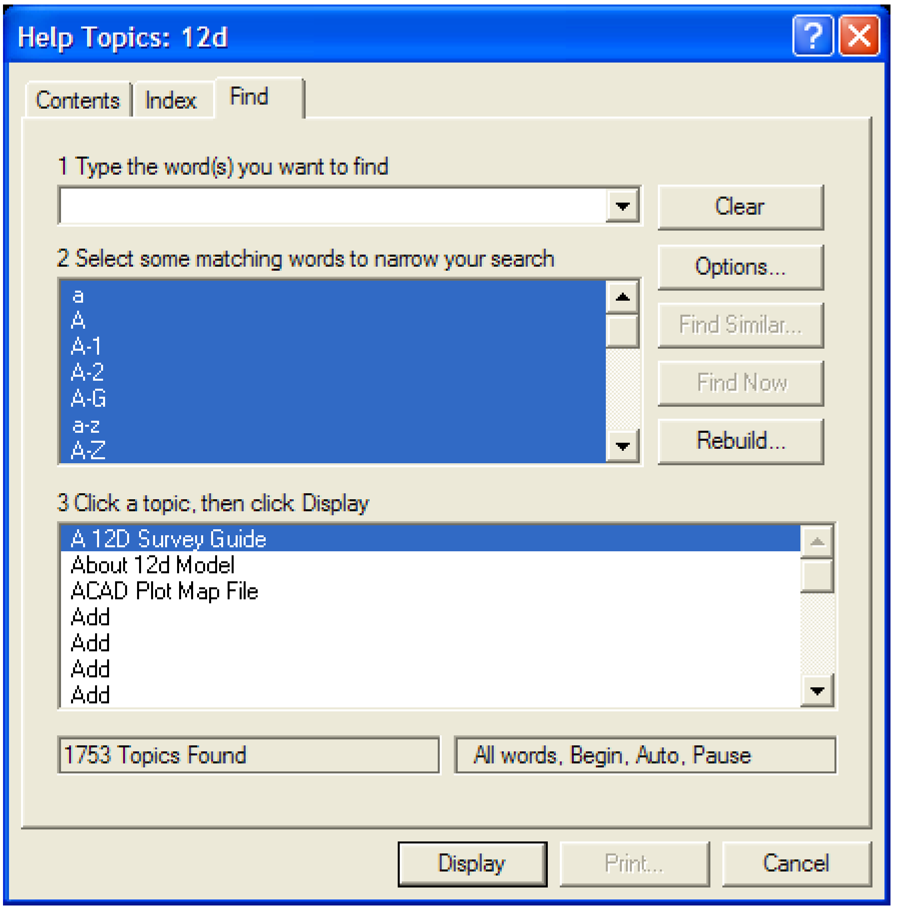
The most powerful searching method for the *Help* system is *Find*.

Simply click on the *Find* tab to search for words or phrases that may be contained in a Help topic.

If *Find* is being invoked for the first time, the ***Find Setup Wizard*** runs to create an index of every word in the Help.



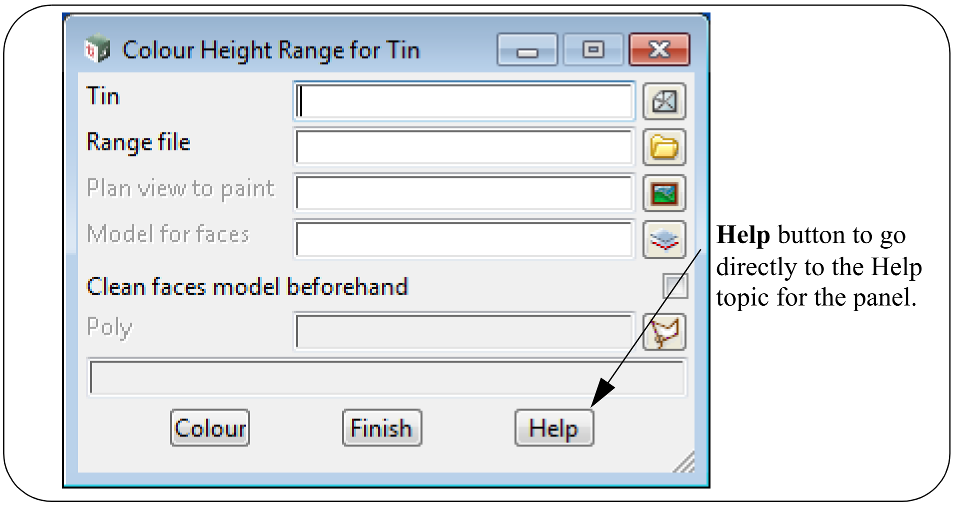
From then on, selecting the *Find* tab goes straight to the *Find* screen.



Continue to Panel Help Button or return to 6 12d Model Help.

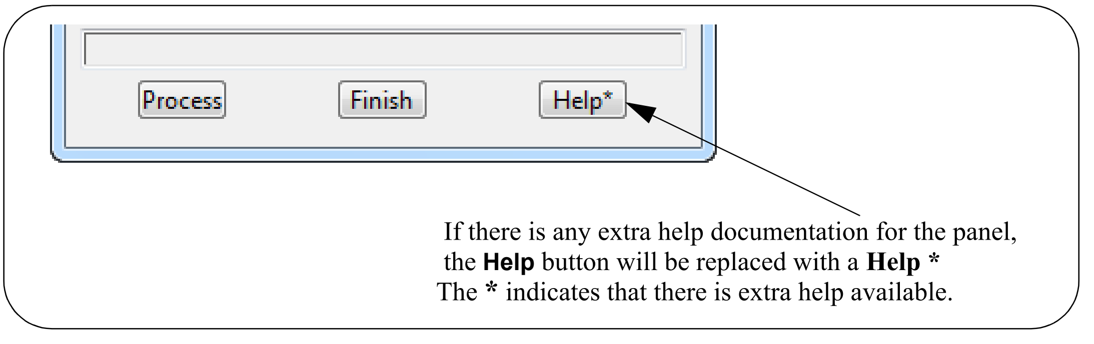
Panel Help Button

Every panel has a **Help** button which when selected goes to the *topic* describing that panel.



The default ***12d Model*** **Help** is all in one *Winhlp* file but a method for displaying additional help information exists so 12d Solutions, 12d Distributors and Users can supply additional (extra) **Help** information.

If there is extra help available for an option, then **Help*** will appear instead of **Help** on the panel button.



Information on how the extra help is set up is given in the section Extra Help.

Continue to F1 Key or return to 6 12d Model Help.

F1 Key

Another method of invoking **Help** is by using the **F1** key as follows:

> when a **menu** or **panel** is on the screen and has focus (the menu or panel title area will be highlighted), or the cursor is over an item on a **toolbar**, pressing **F1** will bring up the *help* for that menu, panel or toolbar item.

Warning - some of the items on the *Strings* menu automatically start up a string select and change the focus from the panel to a View. This means that pressing F1 will bring up the Help for the View and not the Help for the panel.

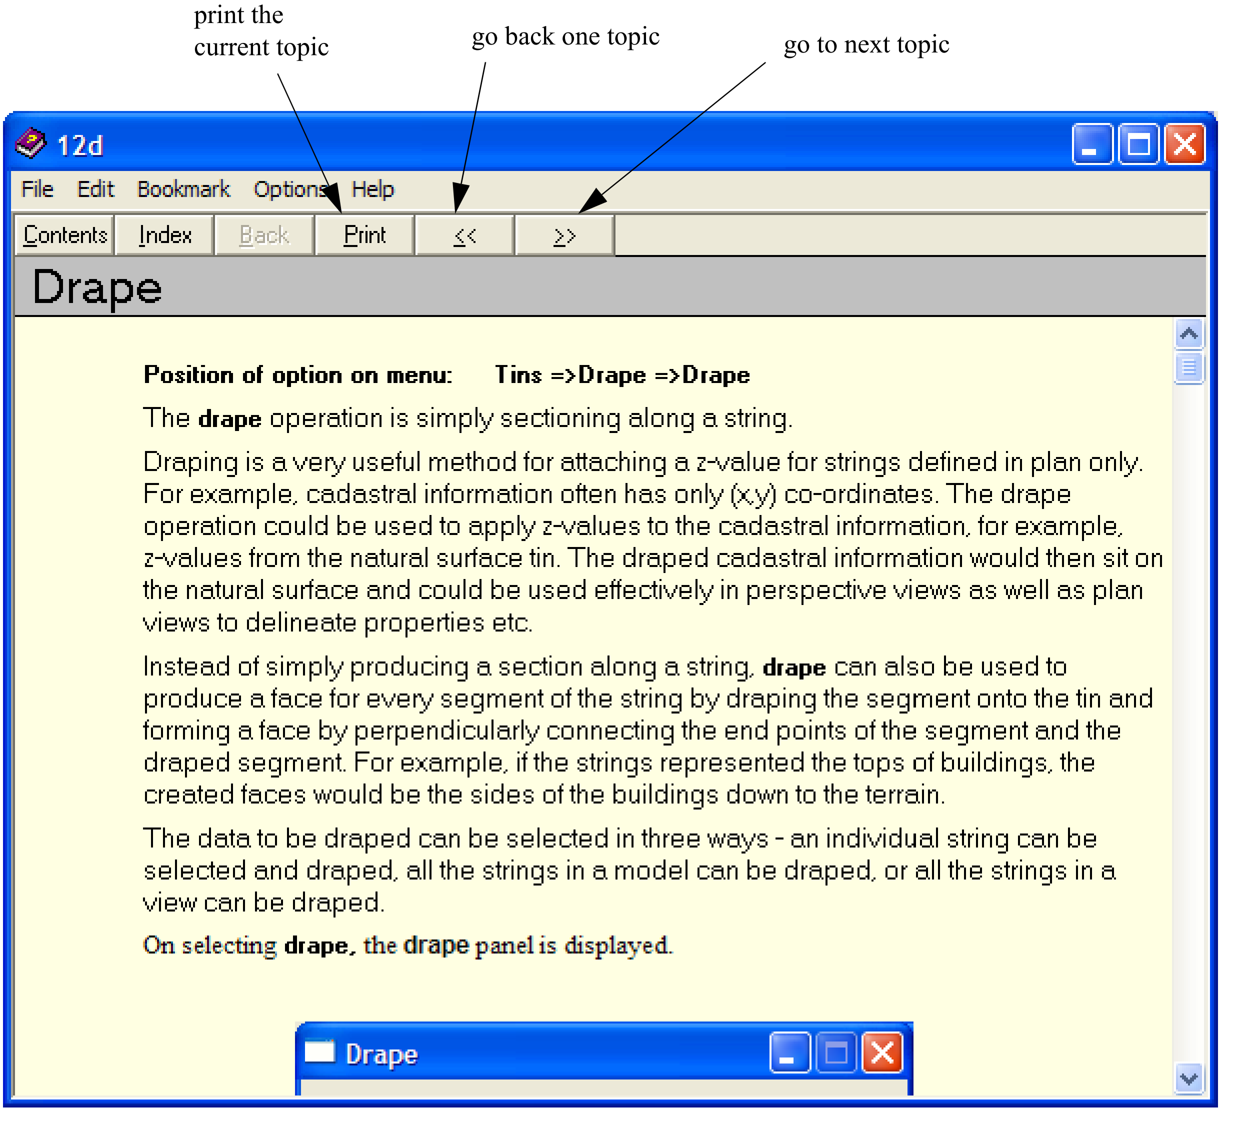
To get **Help** for such a panel, click on the panel to bring the focus back to the panel before pressing F1. The top of the panel will highlight showing that it has focus.

Continue to Navigating in Help or return to 6 12d Model Help.

Navigating in Help

Once at a *topic* in the Help, the **<<** and **>>** buttons at the top of the Help topic will go to the previous and next Help topics respectively.

Individual Help topics can be printed by clicking ***Print*** at the top of the Help page.



Because it is difficult to print large sections of Microsoft's Help system, a PDF file of the entire ***12d Model Reference*** Manual has been created and can be used to print out large sections of the manual.

The ***12d Model Reference*** Manual PDF file is on the ***12d Model*** *11 Installation DVD* in the folder ***Documentation\Reference Manual***.

Continue to Extra Help or return to 6 12d Model Help.

Extra Help

The default context sensitive ***12d Model*** **Help** is all in one help file supplied by *12d Solutions* but a method for displaying additional help information exists so 12d Solutions, 12d Distributors and Users can supply additional (extra) **Help** information. This extra information can also be supplied by ***12d Model*** PLs (macros) written by 12d Solutions or Users.

How to Set Up Extra Help

Any extra help for an inbuilt panel (that is, one not created by a macro) is placed in a folder with the same name as the dump name for the panel without the ending after the "." (to get the dump name, see ***Dumping a Panel, Creating a Screen Layout File or Default File*** in *12d Help* or the ***12d Model*** *Reference manual).*

For macros, created by Users or 12d Solutions, there can only be the same Help button for any panels created by the macro and the extra help for the macro is placed in a folder with the same name as the macro without the ending "4do" after the "." **and** with any blanks or non alphanumeric characters replaced by a underscore ("_"). For example, the extra help files for the macro called "testing help (3) system.4do" go in a folder called testing_help__3__system. Note there is an underscore for the blanks and the "(" and ")" in the macro name.

The extra help files for an inbuilt panel or macro can have *any name* and can be a pdf, wmv, avi. txt etc.

For example, for the panel ***Project Tree*** brought up by selecting **Project =>Tree,** the extra documentation would be in a folder called ***Project_Tree.***

The folder of extra help for a panel, is then placed in any one of the three places:

(a) in the *Help* folder in the ***12d Model*** installation area: For example, for version 11

c:\Program Files\12d\12d Model\11.00\Help

c:\Program Files (x86)\12d\12d Model\11.00\Help

(b) in a folder called *Help* inside the *Set_ups* folder in the ***12d Model*** installation area. For example

c:\Program Files\12d\12d Model\11.00\Set_ups\Help

c:\Program Files (x86)\12d\12d Model\11.00\Set_ups\Help

or

(c) in a folder called *Help* inside the *User* folder in the 12d User area. For example

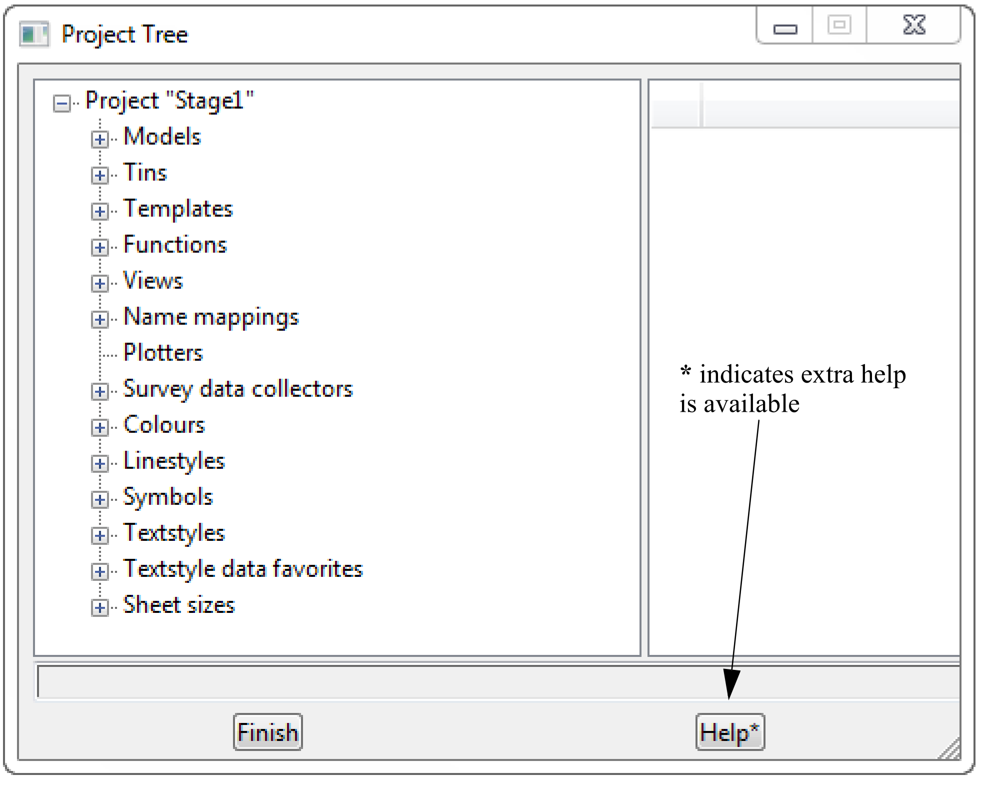
c:\12d\11.00\User\Help

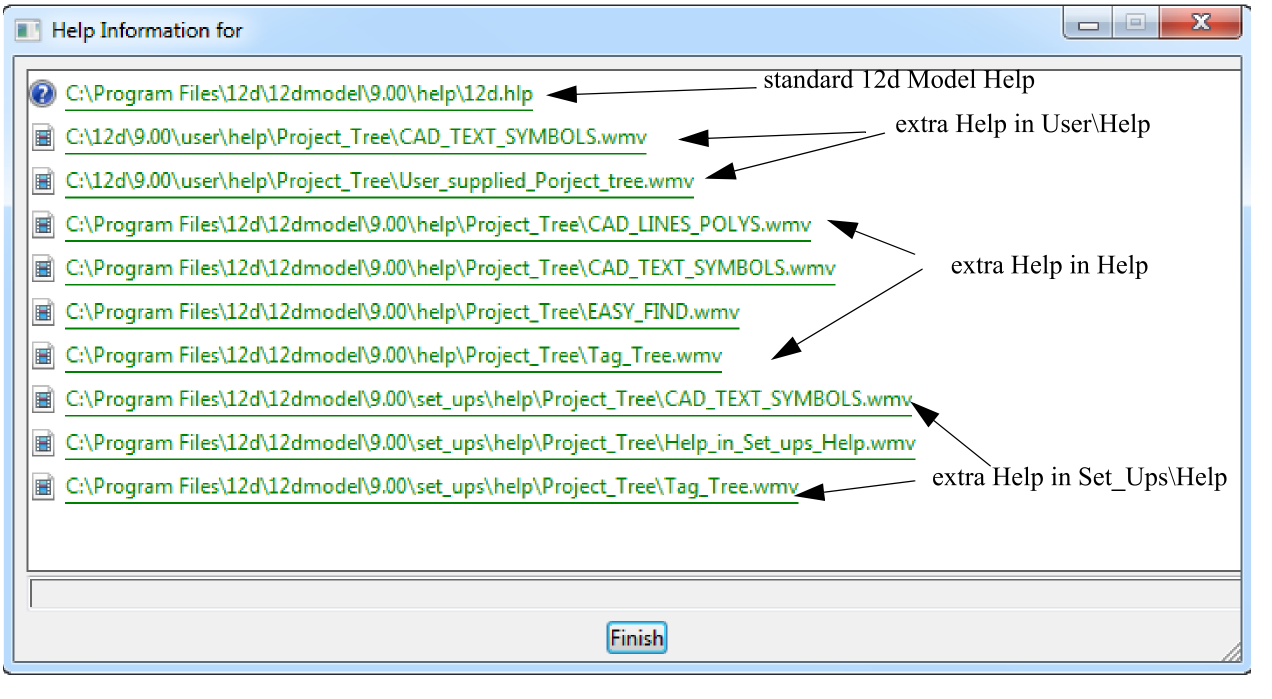
For an inbuilt panel an macro, each of these areas is searched and if any extra help is found, it is listed with the full path to each extra help file.

If there is any extra help for a inbuilt panel or macro, the **Help** button on the panel will be replaced with a **Help *** button. The * indicates that there is extra help available.

When you click on the **Help** * button, you will get a list of all the extra help files for that inbuilt panel or macro with the full pathname to the extra help. Clicking on the file name will bring up that extra help.

For example,



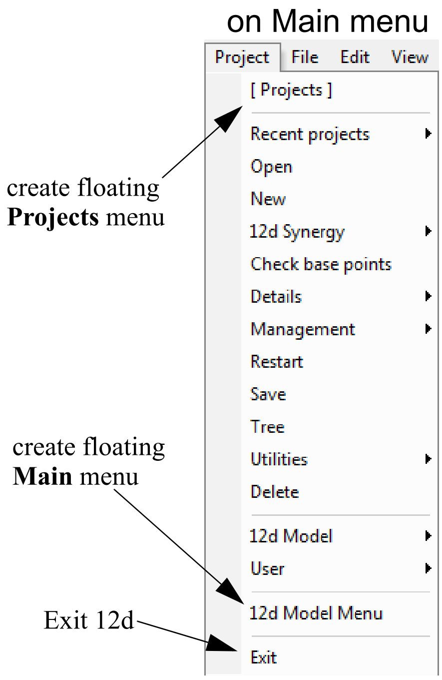


Users Own Extra Help Files

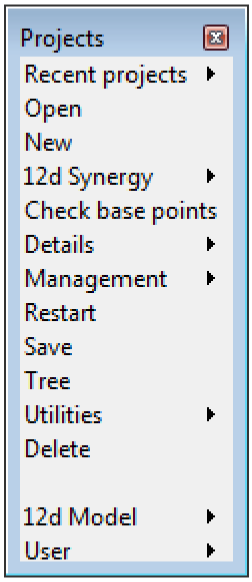
Note that users can also have their own extra help files and the files are simply placed in the correctly named folder under **User\Help**.

7 Project

The **Projects** walk-right menu is:



floating **Projects** menu



lists recent projects
open an existing project
create a new project
only available for 12d Synergy users
number of points for base point count
project description, details and diary
edit project setup/management files
exit and restart in same project
save the working project to disk
project data and set up files in tree form
project utilities
delete a project from disk

information on ***12d Model***
Projects User menu

For the options, see:

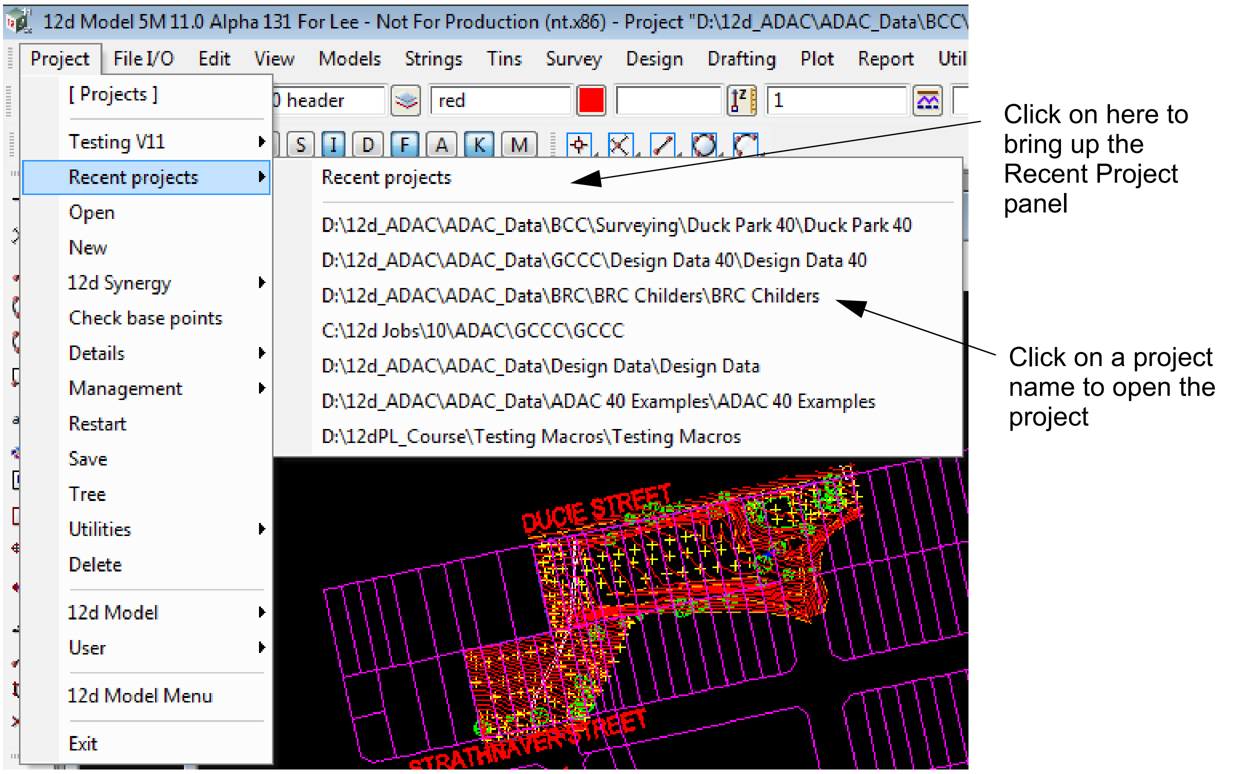
Model	7.12 12d Model
Model Menu	7.13 12d Model Menu (only on the **Main Menu**)
Exit	7.14 Exit

7.1 Recent Projects

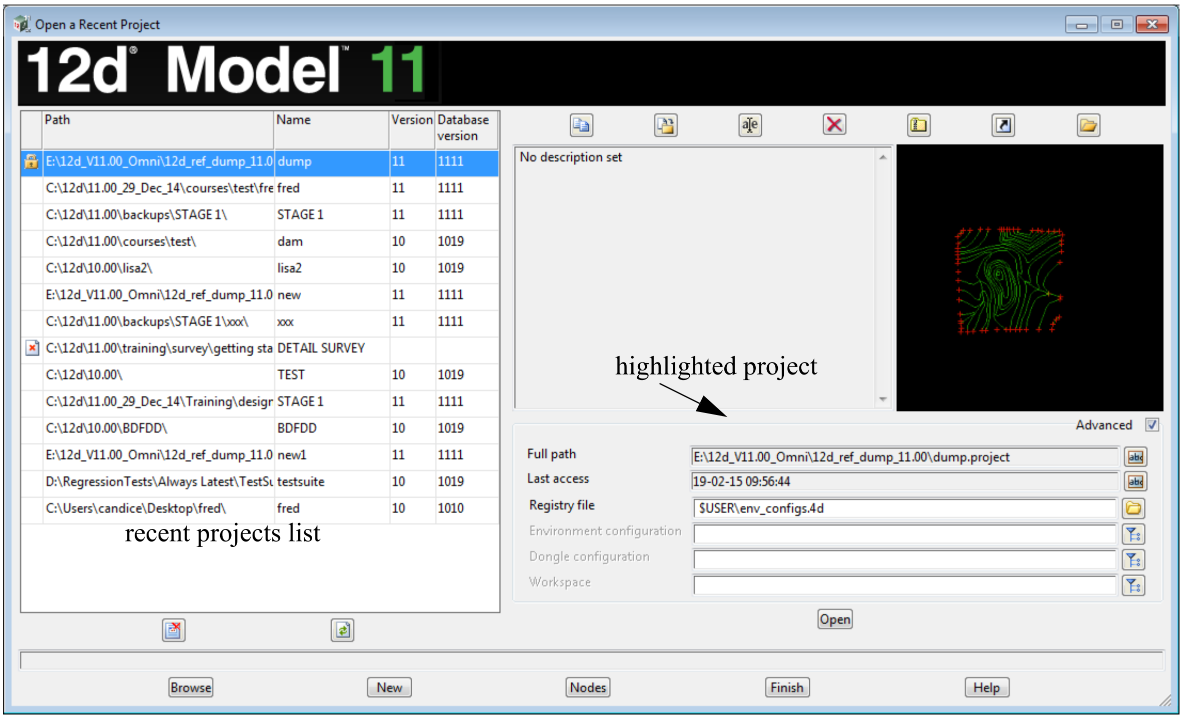
Position of option on menu: **Project =>Recent projects**

Walking right on the ***Project =>Recent projects*** lists the projects recently accessed by ***12d Model***.



Clicking on a project in the list will open the project.

Clicking on the ***Recent Projects*** heading on the ***Main Menu*** or on the **Recent projects** item when the **Projects** menu is pinned up, brings up the **Open a Recent Project** panel which shows the recent project in the front panel (see 5.1 Front Panel - Open a Recent Project).



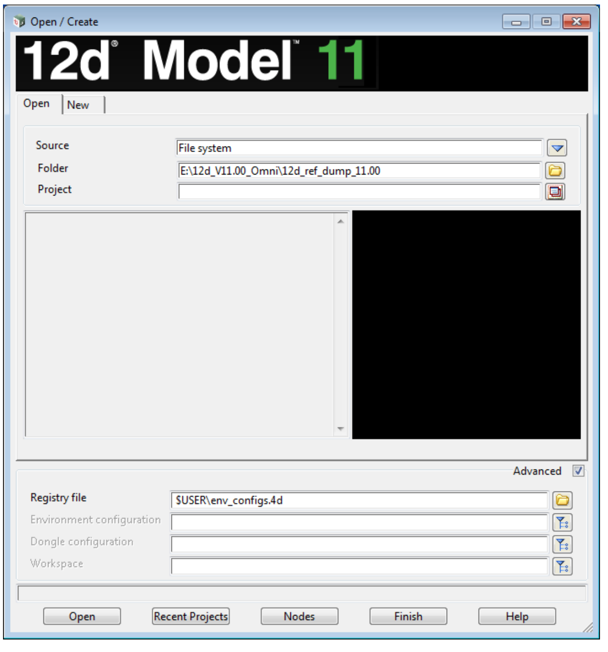
Go to the next section 7.2 Open/Create Project or return to 7 Project.

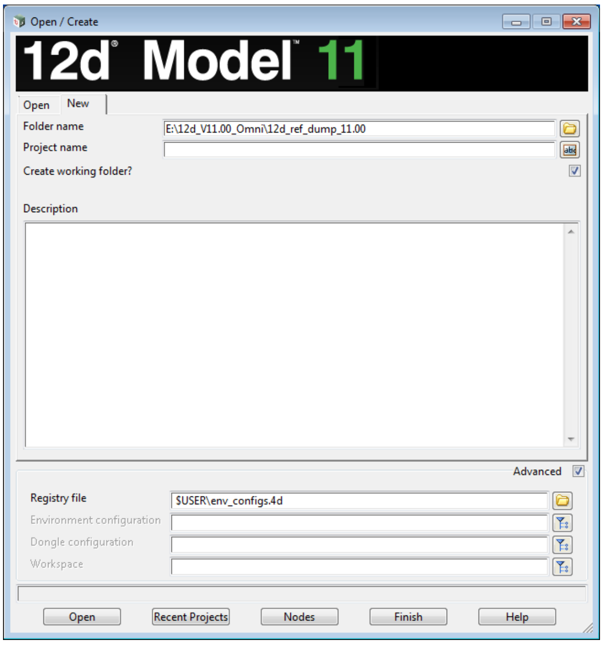
7.2 Open/Create Project

Position of option on menu: **Project =>Open**

Position of option on menu: **Project =>New**

Both **Open** and **New** bring up the **Open/Create** panel with the **Open** or **New** showing.





(a) The **Open** option is used to change the working folder and the working project to an another existing project.

With ***Advanced*** ticked, it is also possible to set or modify one or more of the *Environment configuration*, *Dongle* or *Workspace* set ups for the projects. For more information on Environment configuration settings, go to 7.6.4 Env Configuration or a quick discussion in the section 7.2.1 Project Open/Create Panel with Advanced Ticked.

The **Open/Create** panel with the **Open** tab showing is described in the section 5.2 Browse Button and Open Tab.

(b) **New** creates a new ***12d Model*** project.

A working folder (directory) of the same as the project can also be created with the actual project created inside the folder.

The **Open/Create** panel with the **New** tab showing is described in the section 5.3 New Button and New Tab.

7.2.1 Project Open/Create Panel with Advanced Ticked

To tailor ***12d Model,*** there are a large number of environment variables in a file called ***env.4d***.

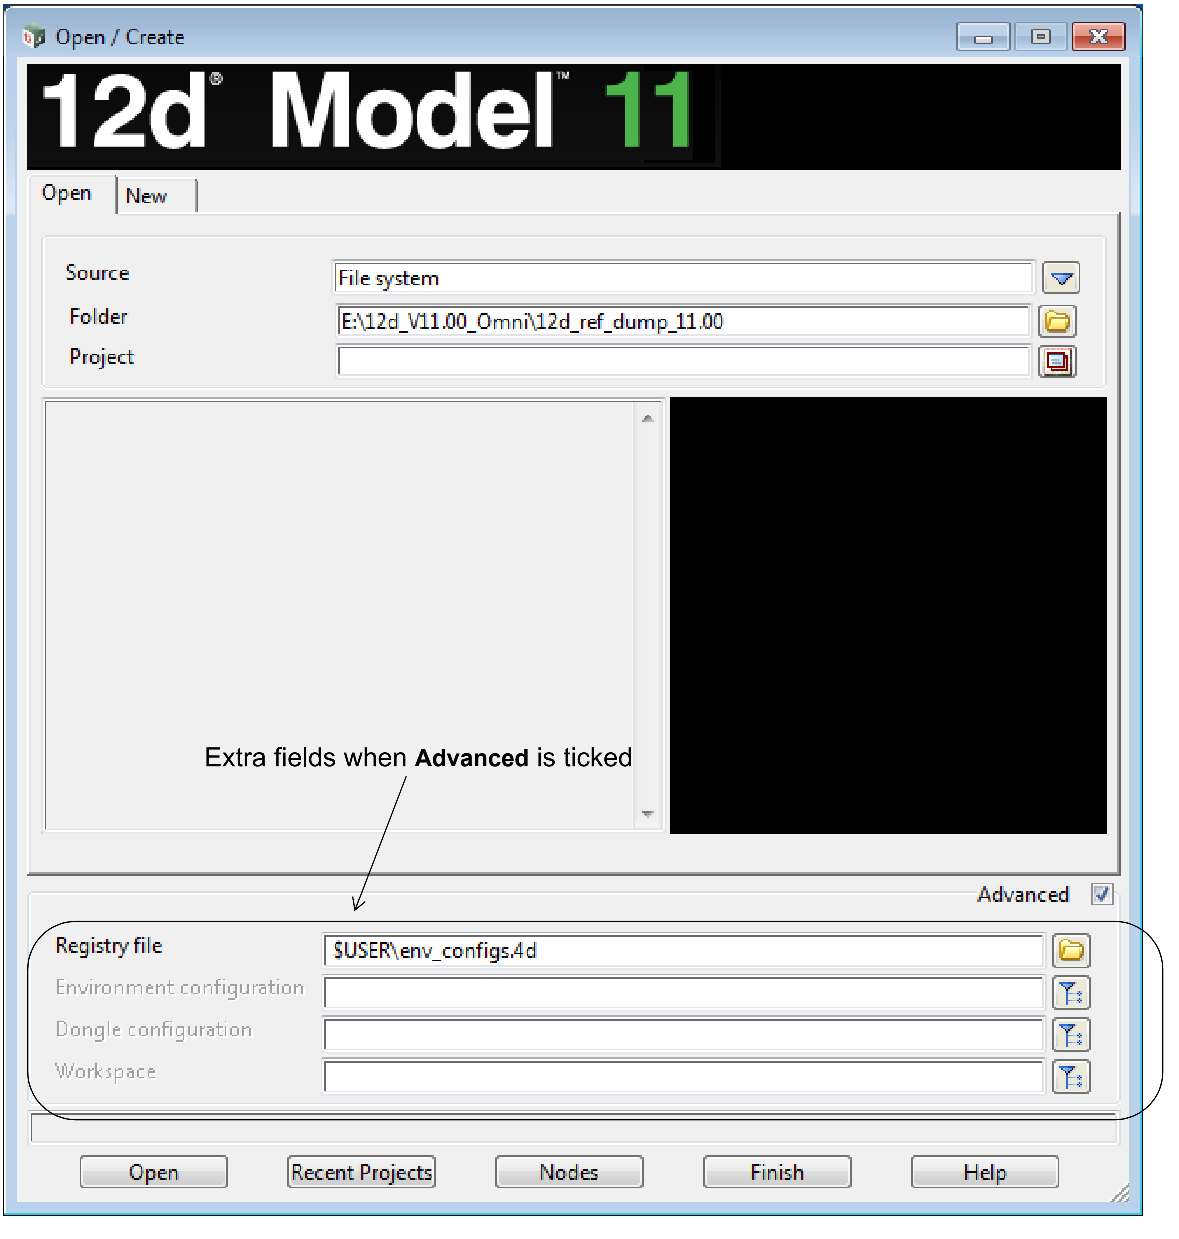
For most users, one ***env.4d*** file provides enough customisation for their site but for users with customers requiring very different set ups, a more flexible system is required.

For example, one project may be for a Main Roads Department which requires its own mapping files, linestyle files, ppf files etc, and another project is for a Local Authority who has totally different standards and requirements.

For this more complex situation, different ***env.4d*** files and environment variable overrides can be defined for each project and the **Advanced** tick box gives access to the advanced tailoring for a project.

For more information on the advanced tailoring, go to 7.6.4 Env Configuration.

With **Advanced** ticked, the **Open/Create and Open a Recent Project** panels display a section for extra configuration options



The extra fields and buttons in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Registry file	registry box		env_configs.4dfolder browse

the registry file used to define the Environments, Dongles and Workspaces definitions.

Environment configuration

if non blank, the given Environment configuration set up is used for this project.

The choices for the Environment configuration pop-up come from the registry file. For more information on defining Registry files, go to 7.6.4 Env Configuration *and for more information on the Environmental configuration section in particular, go to* Creating/Editing an Environments Set Up.

Dongle configuration

if non blank, the given Dongle set up is to be used for this project.

The choices for the Dongles pop-up come from the Registry file. For more information on defining Registry files, go to 7.6.4 Env Configuration *and for more information on the Dongles section in particular, go to* Creating/Editing a Dongles Set Up.

Workspace

if non blank, the given Workspace set up is used and if it includes a workspace file, then that file is used when the project is opened. However once the project is opened, the workspace file is saved locally and any changes saved with the project.

The choices for the Workspace pop-up come from the Registry file. For more information on defining Registry files, go to 7.6.4 Env Configuration *and for more information on the Workspaces section in particular, go to* Creating/Editing a Workspaces Set Up.

Go to the next section 7.2.2 Open or return to 7.2 Open/Create Project.

7.2.2 Open

Position of option on menu: **Project =>Open**

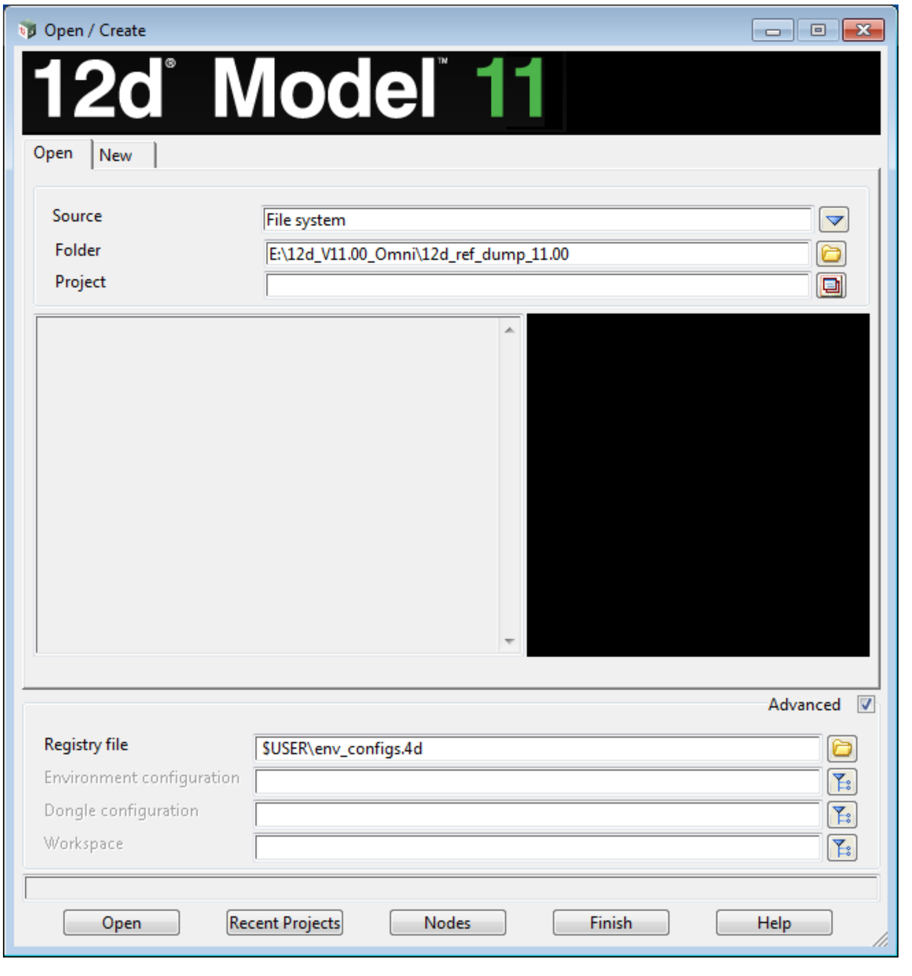
Position of option on menu: **Project =>Utilities =>Projects**

For the **Project =>Utilities =>Project** option, go to the section 7.10.2 Projects

The **Open** option is used to change the working folder and the working project to an another existing project.

With ***Advanced*** ticked, it is also possible to set or modify one or more of the *Environment configuration*, *Dongle* or *Workspace* set ups for the projects. For more information on Environment configuration settings, go to 7.6.4 Env Configuration or a quick discussion in the previous section 7.2.1 Project Open/Create Panel with Advanced Ticked.

Open option brings up the **Open/Create** panel with the **Open** tab showing, and this is described in the section 5.2 Browse Button and Open Tab.



Go to the next section 7.2.3 New or return to 7.2 Open/Create Project.

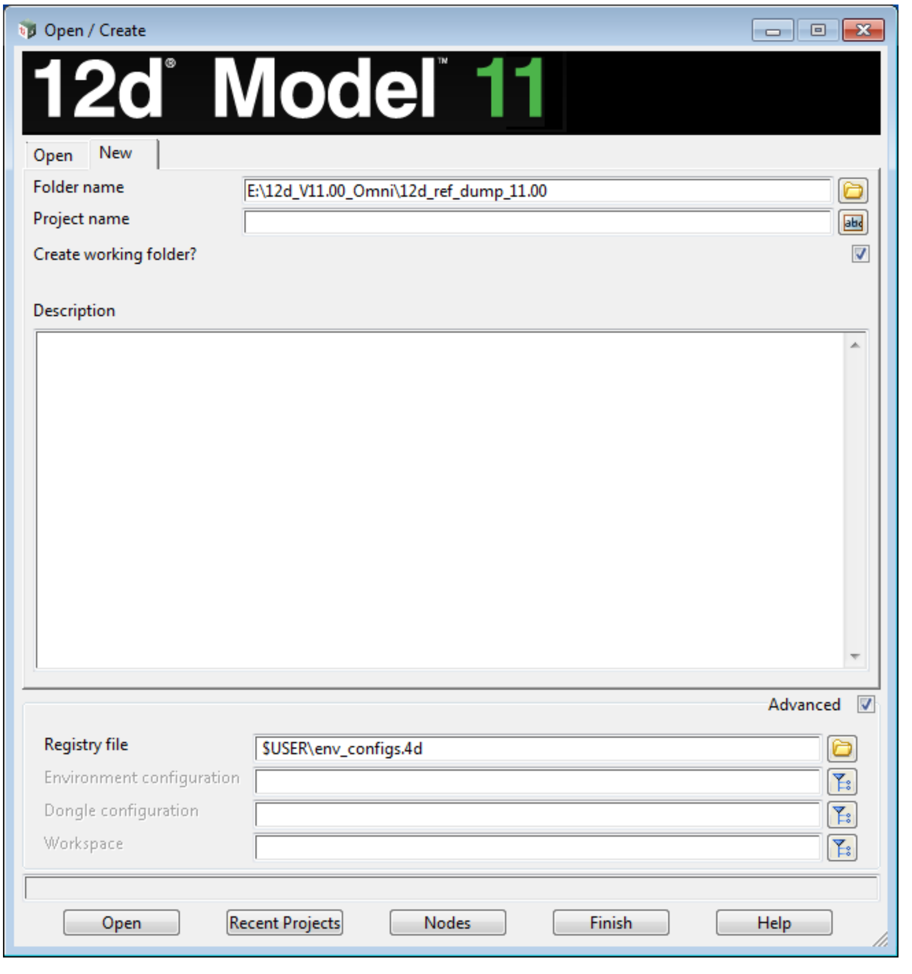
7.2.3 New

Position of option on menu: **Project =>New**

New creates a new ***12d Model*** project.

A working folder (directory) of the same as the project can also be created with the actual project created inside the folder.

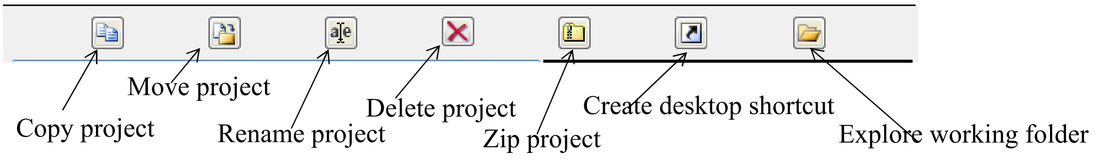
New option brings up the **Open/Create** panel with the **New** tab showing, and this is described in the section 5.3 New Button and New Tab.



Go to the next section 7.2.4 Options Active When Recent Project Highlighted or return to 7.2 Open/Create Project.

7.2.4 Options Active When Recent Project Highlighted

When a project is highlighted in the list of **recent projects** in the **Open a Recent Project** panel, icons for options are activated on the right hand side of the **Project Selection** panel.



Copy Project	see 7.2.5 Copy Project - Icon
Move Project	see 7.2.6 Move Project - Icon
Rename Project	see 7.10.7 Rename
Delete Project	see 7.2.7 Delete Project - Icon
Zip Project	see 7.2.8 Zip Project - Icon
Create Desktop Shortcut	create a shortcut on the desktop that starts ***12d Model*** and opens the project - see 5.6 Project Shortcuts
Explore	open Windows Explorer and show the contents of the working folder
Refresh	refresh the *recent projects list*

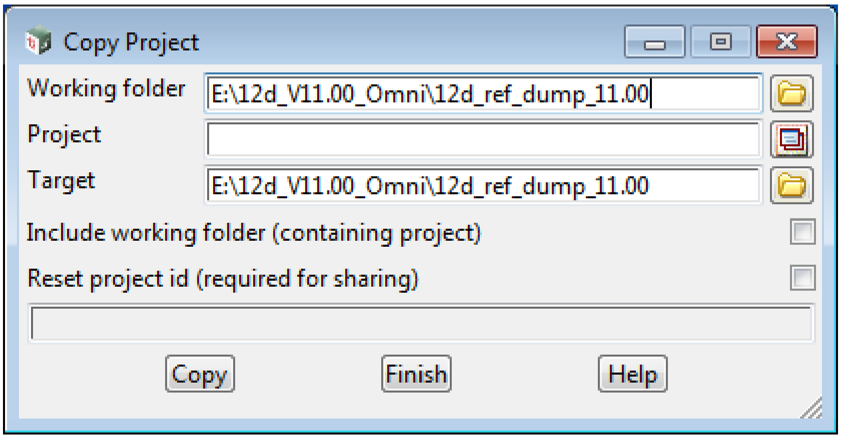
7.2.5 Copy Project - Icon

Position of option on menu: **Project Selection =>Copy Project icon**

Position of option on menu: **Project =>Open=> Copy Project icon**

This panel copies a project to a new location. If you are attempting to copy the project you are currently in, ***12d Model*** will prompt you to save and restart.

Selecting  brings up the **Copy Project** panel:



The fields and buttons used in this panels have the following functions.

Field Description Type Defaults Pop-Up

Working folder file

the folder containing the project

Project

the name of the project to copy

Target file

where the project should copied to

Include working folder (containing project) tick box

if ticked, the folder containing the project (and all sub folders) will also be copied

Reset project id (required for sharing) tick box

if you are intending to share the copied project, you must reset the ID - otherwise sharing will not be allowed from the copied project

Copy button

copies the project

Go to the next section 7.2.6 Move Project - Icon or return to 7.2 Open/Create Project.

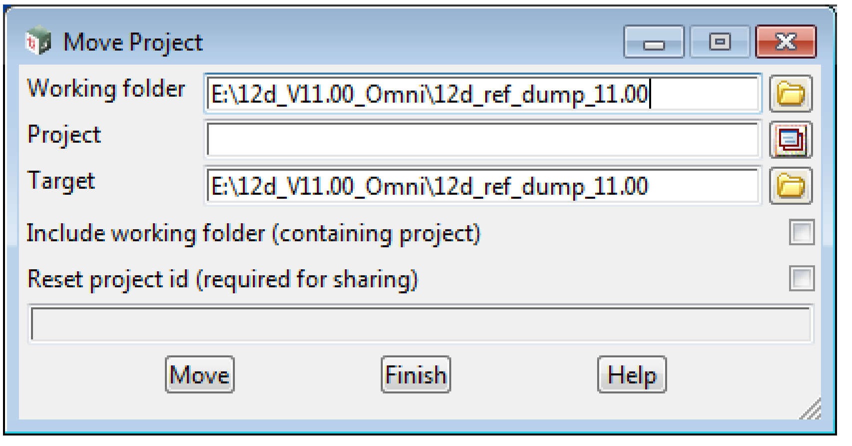
7.2.6 Move Project - Icon

Position of option on menu: **Project Selection=> Move Project icon**

Position of option on menu: **Project =>Open=> Move Project icon**

This panel moves a project to a new location. If you are attempting to move the project you are currently in, ***12d Model*** will prompt you to save and restart.

Selecting brings up the **Move Project** panel:



The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Working folder	file		

the folder containing the project

Project

the name of the project to move

Target file

where the project should moved to

Include working folder (containing project) tick box

if ticked, the folder containing the project (and all sub folders) will also be moved

Reset project id (required for sharing) tick box

if you are intending to share the moved project, you must reset the id - otherwise sharing will not be allowed from the moved project.

Move button

moves the project

Go to the next section 7.2.7 Delete Project - Icon or return to 7.2 Open/Create Project.

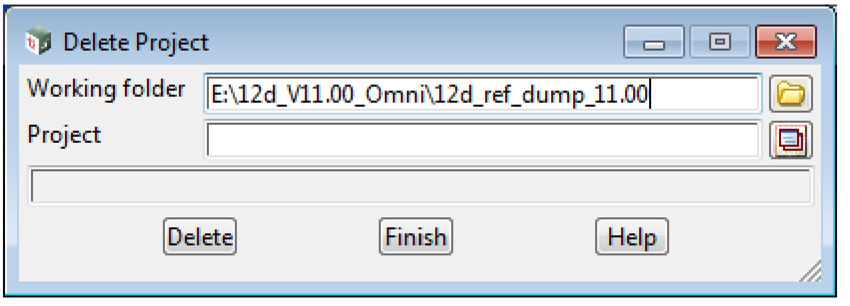
7.2.7 Delete Project - Icon

Position of option on menu: **Project Selection=> Delete Project icon**

Position of option on menu: **Project =>Open=> Delete Project icon**

This will delete a project. This cannot be the current open project.

Selecting  brings up the **Delete Project** panel:



The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Working folder	file		

the folder containing the project to be deleted

Project

the name of the project to delete

Delete button

delete the project

Go to the next section 7.2.8 Zip Project - Icon or return to 7.2 Open/Create Project.

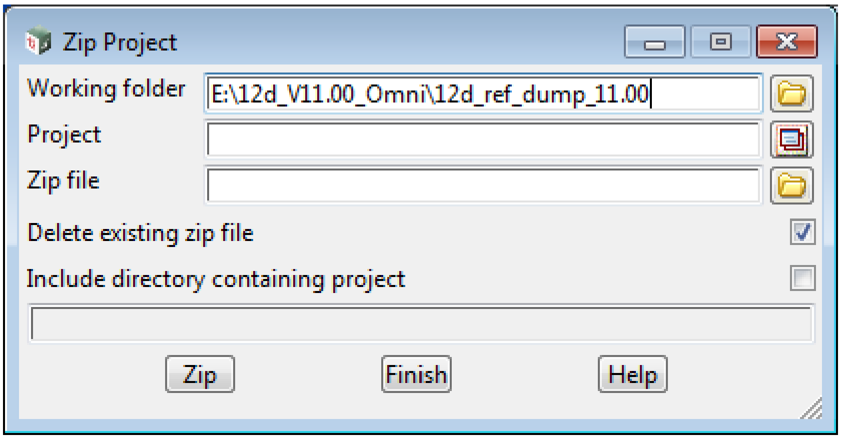
7.2.8 Zip Project - Icon

Position of option on menu: **Project Selection=> Zip Project icon**

Position of option on menu: **Project =>Open=> Zip Project icon**

This panel will zip a project. If you attempt to zip the current project, ***12d Model*** will prompt you to save and restart.

Selecting  brings up the **Zip Project** panel:



The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Working folder	file box		

the folder where the project resides

Project	project box		

the name of the project you wish to zip

Zip file	file box		

the file to zip into

Delete existing zip file	tick box		

if ticked on, any existing zip file will be deleted

Include directory containing project tick box

if ticked on, the directory containing the project (the working directory) will also be zipped, along with all sub folders

Zip	button		

zips the project

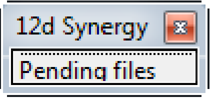
Return to 7.2 Open/Create Project.

7.3 12d Synergy

Position of option on menu: **Project =>12d Synergy**

This section of documentation is a work in progress and will be updated in subsequent releases.

On selecting the **12d Synergy** option,



Go to the next section 7.4 Check Base Points or return to 7 Project.

7.4 Check Base Points

Position of option on menu: **Project =>Check base points**

All ***12d Model*** versions have a Base module that is authorised for a set number of Base Points. For example, the 50K Base allows up to 50,000 base points, the 5M version allows up to 5,000,000 base points and the 250M version allows up to 250,000,000 base points.

The **Check base points** option displays the number of base points used in the current project and the total number of base points authorised for the version of ***12d Model*** being used to open the project.

The items included in the Base Point count are:

1. each vertex in a string counts as a base point except

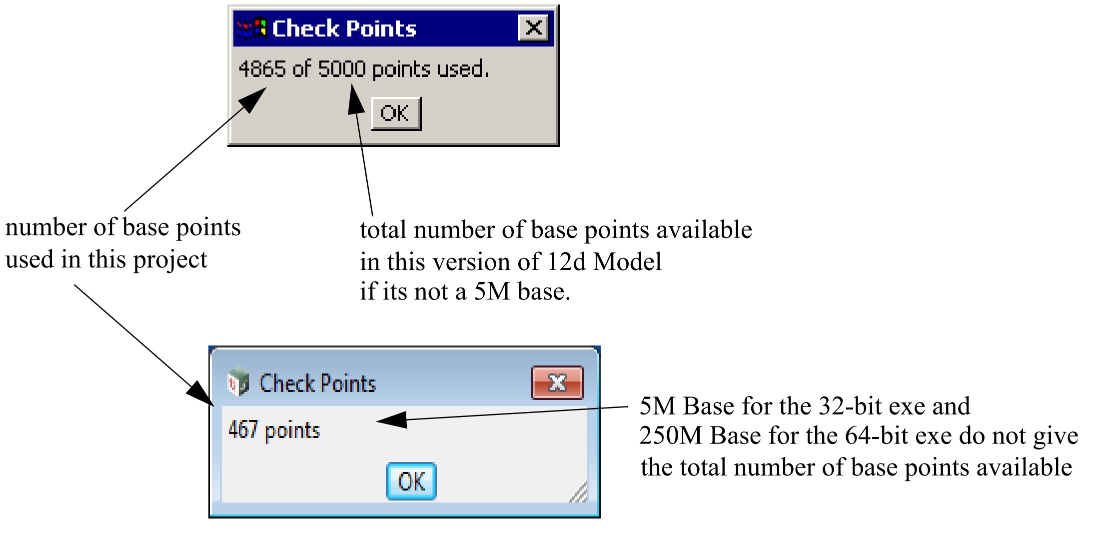
   (a) for a project, the vertices of strings created when plotting to a model inside the project do not count as base points for that project

   (b) for a project, contours generated by ***2d Model*** and written to models inside the project do not count for that project.

2. points in a tin count as base points
3. for an alignment, the number of base points is the number of HIP's plus the number of VIP's
4. items in models and tins shared into a project are included in the base point count.

Important Note:
If any non-counted base point data is written out as 12da and read into a project then the data read in from the 12da ***will*** be included in the base point count in the project that the data is read into.

Selecting **Check base points** displays the **Check Base Points** panel.



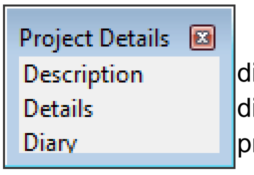
Go to the next section 7.5 Details or return to 7 Project.

7.5 Details

Position of option on menu: **Project =>Details**

A project description and project details can be defined.

The **Project details** walk-right menu contains various project items.



display/modify the project description
display/modify the project details
project diary

For the option *Description*, go to 7.5.1 Description
Details 7.5.2 Edit Details
Diary 7.5.3 Diary

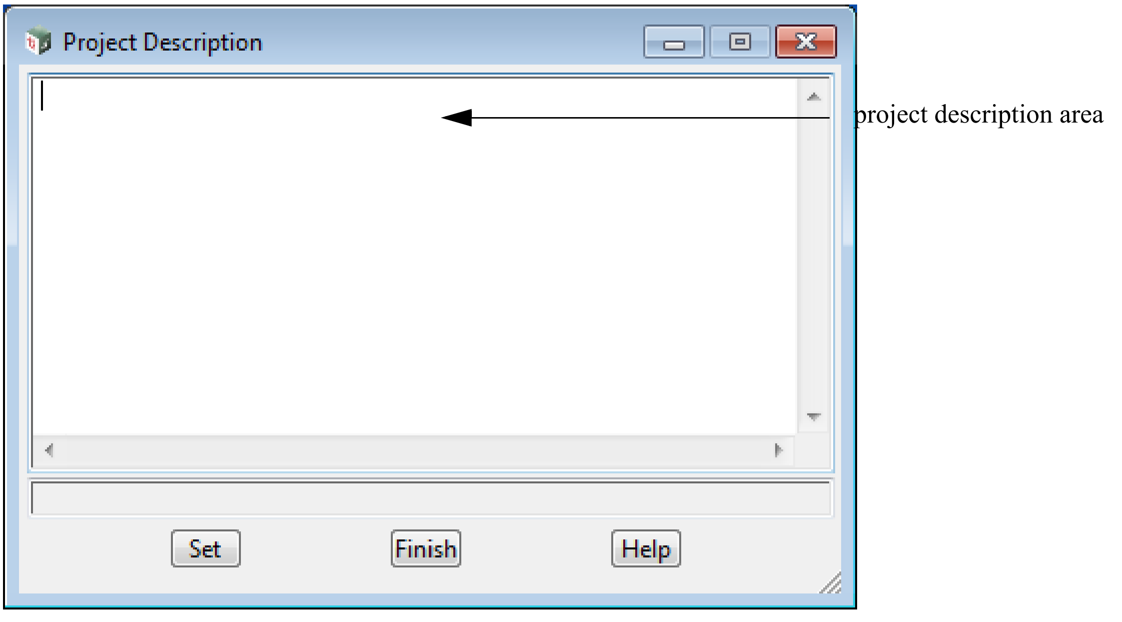
The options in the menu will now be described.

7.5.1 Description

Position of option on menu: **Project =>Details =>Description**

The **description** option is used to create and edit the project description.

Selecting **Description** brings up the **Project Description** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Project description area	input		

the description for the project to be rebuilt. The description can be more than one line long.

Set	button		

set the project description.to be the text in the **project description area**.

Note: This panel is a resizable panel.

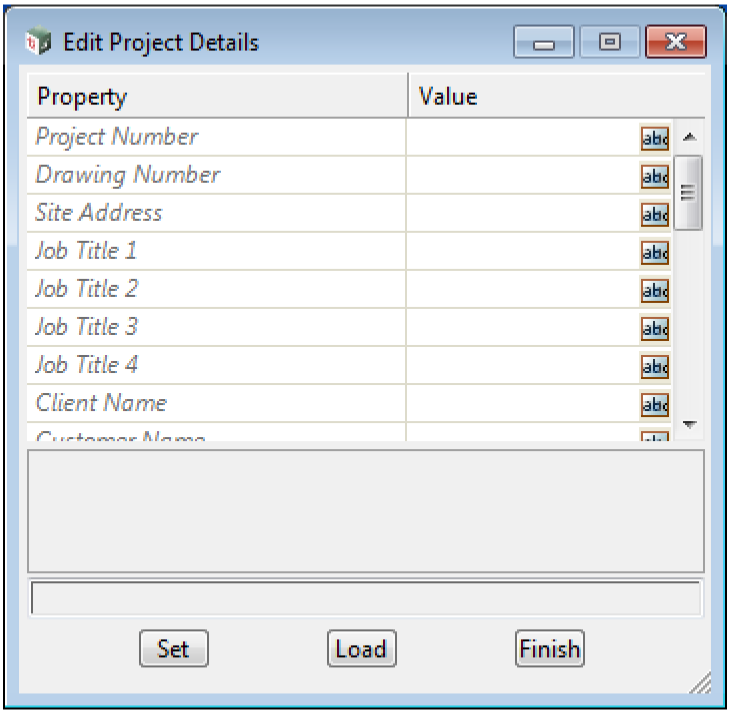
Go to the next section 7.5.2 Edit Details or return to 7.5 Details.

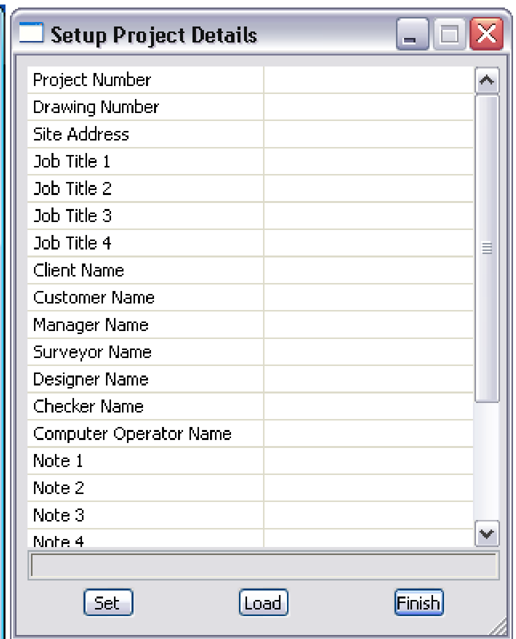
7.5.2 Edit Details

Position of option on menu: **Project =>Details =>Details**

The **Details** option is used to enter project details.

Selecting **Details** opens the **Edit Project Details** panel.





Panel displayed when new project started

What information is to be entered into the **Enter Project Details** panel is defined in the option

Project =>Management =>Details editor - *go to* 7.6.2 Details Editor

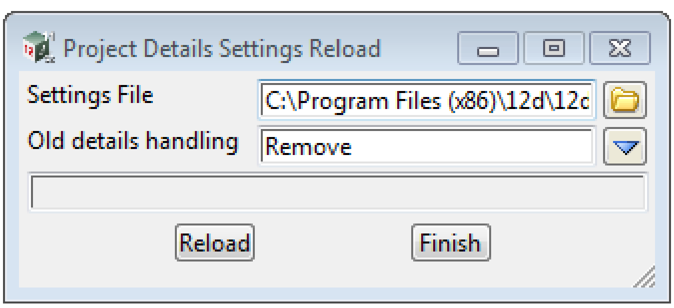
The fields and buttons used in the **Enter Project Details** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Set	button		

set the project details to the values show in the panel. The values are stored as project attributes.

Field Description	Type	Defaults	Pop-Up
Load	button		

brings up the **Projects Details Setting Reload** *panel that is used to load a new definition of project detail attributes.*



A file defining a new set of project attributes of project details can be loaded. How existing project details are handled depends on the value of **Old details handling**

Old details handling

Remove *- all existing project detail attributes are removed and totally replaced by the new set*

Keep (no update) *- any existing project detail are kept but their values* **are not** *updated by the default setting if the same attribute exists in the Settings file.*

Keep (with update) *- any existing project detail are kept and their values* **are updated** *by the default setting if the same attribute exists in the Settings file.*

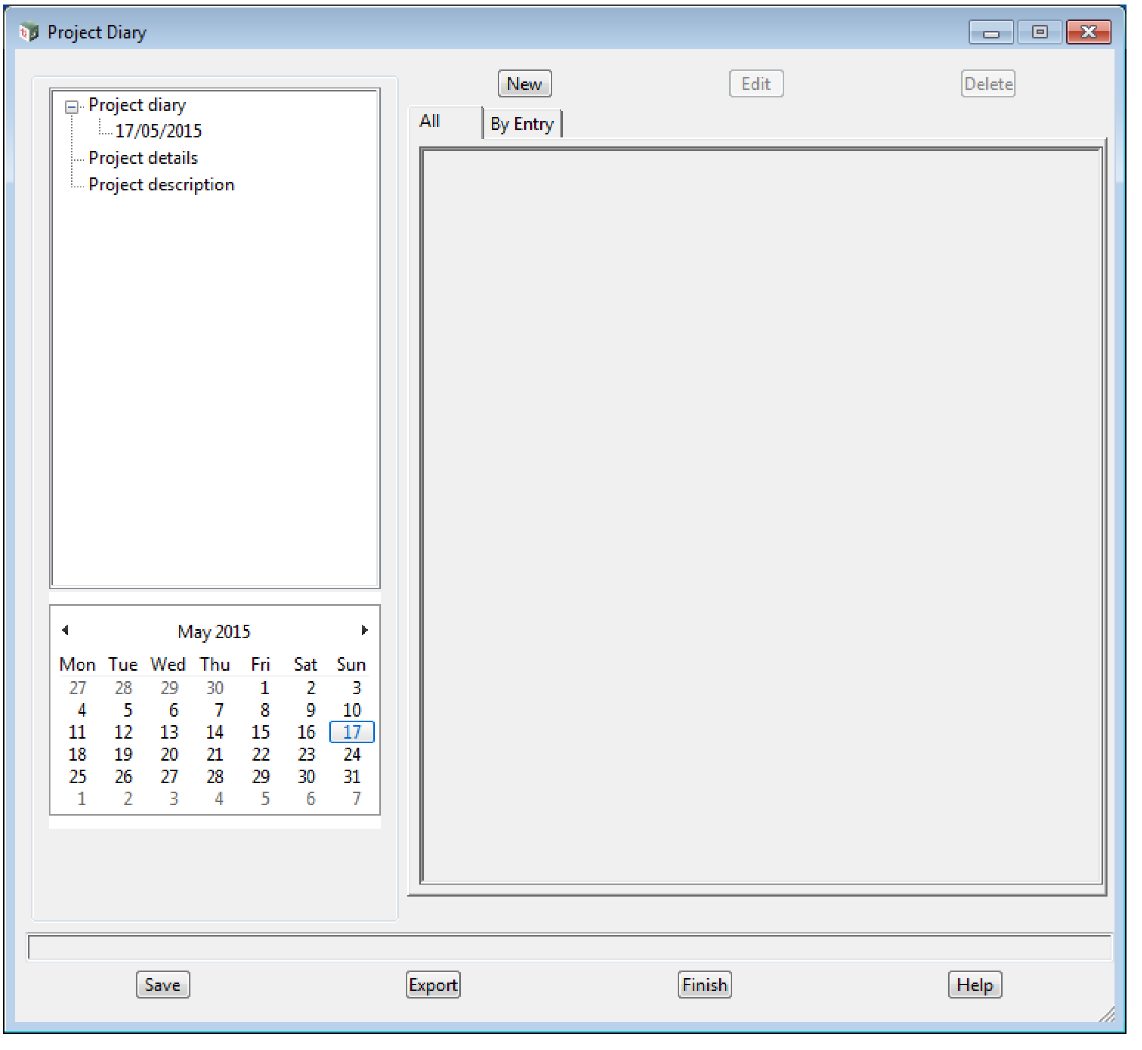
Go to the next section 7.5.3 Diary or return to 7.5 Details.

7.5.3 Diary

Position of option on menu: **Project =>Details =>Diary**

The **Project diary** allows information to be entered for each day. It can also be used to edit project details and the project description.

Selecting **Diary** brings up the **Project Diary** panel.



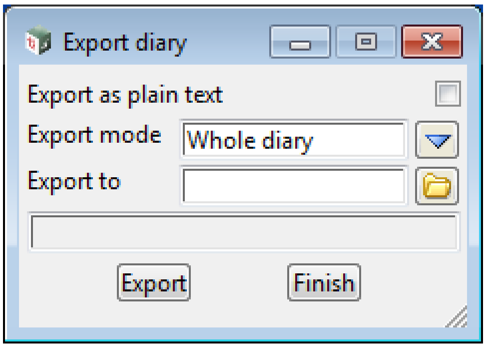
The **Project diary** panel has a grid with nodes for the **Project diary, Project Details** and **Project description**.

Clicking on the **+** on **Project diary** will expand the tree to show all the dates with diary notes as well as a position for entry at today's date. Clicking in the calendar at the bottom of the panel will allow notes to be added for earlier days that do not already have notes. Notes can not be added for future dates.

Clicking on **Project details** will display in read-only format the ***Project details*** information for the project with their current values. To modify any of the values, click on the **Edit** button and the **Edit Project Details** panel is displayed. The information can then be modified/saved as documented in the section 7.5.2 Edit Details.

Clicking on **Project description** display the current description in the right hand side of the panel. The description is simply text and can be modified directly in the panel. Click on the **Write** button to save the modified description.

Clicking on **Export** display the **Export Diary** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Export as plain text	tick box	not ticked	

if ticked, exports the diary as plain text without formatting
if not ticked, exports the diary in RTF, with all formatting retained

Export mode	choice box	Whole diary	Whole diary, Selected month, Selected day

which data should be exported - the whole diary, the selected month or the selected day

Export to	file		

the file to export the diary to

Export

writes the current export diary settings out to the file given in the **Export to** *field.*

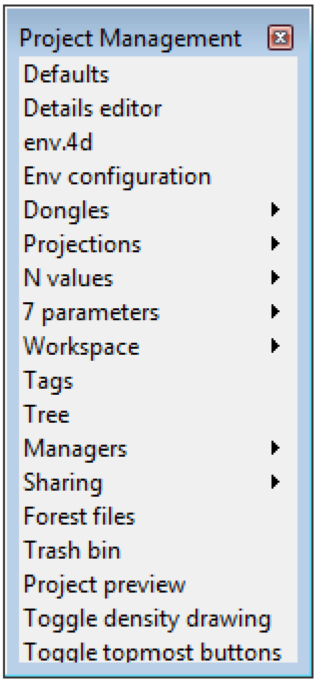
Return to 7.5 Details.

7.6 Management

Position of menu: **Project =>Management**

Options to set up the project

The **Project management** walk-right menu contains various project items.



set default values for the project
edit the details definition file
edit the env.4d file
set up environments with different user, user library folders, dongles
find network dongles, edit dongles.4d and certify CodeMeters
define/use projections
define/use N value parameters
define/use 7 value parameters
define/use workspace setup
create tag tree
edit items on the project tree
managers for project, tin, models etc
set share settings for this session
create/edit forest files
look at what models and tins are in the Trash Bin
set up user defined preview rather than automatic one
toggle density drawing - only for 250M
toggle on buttons to use instead of a keyboard when on tablets

For the option:

Defaults, go to	7.6.1 Defaults
Details editor	7.6.2 Details Editor
env.4d	7.6.3 env.4d
Env configuration	7.6.4 Env Configuration
Dongles	7.6.5 Dongles
Projections	7.6.6 Projections
N Values	7.6.7 N values
7 Parameters	7.6.8 7 Parameters
Workspace	7.6.9 Project Workspace
Tags	7.6.10 Tags
Tree	7.6.11 Tree
Managers	7.6.12 Managers
Sharing	7.6.13.2 Project Sharing
Forest files	7.6.14 Forest File
Trash bin	7.6.15 Trash Bin
Project preview	7.6.16 Project Preview
Toggle density drawing	7.6.17 Toggle Density Drawing
Toggle topmost buttons	7.6.18 Toggle Topmost Buttons

The options in the menu will now be described.

7.6.1 Defaults

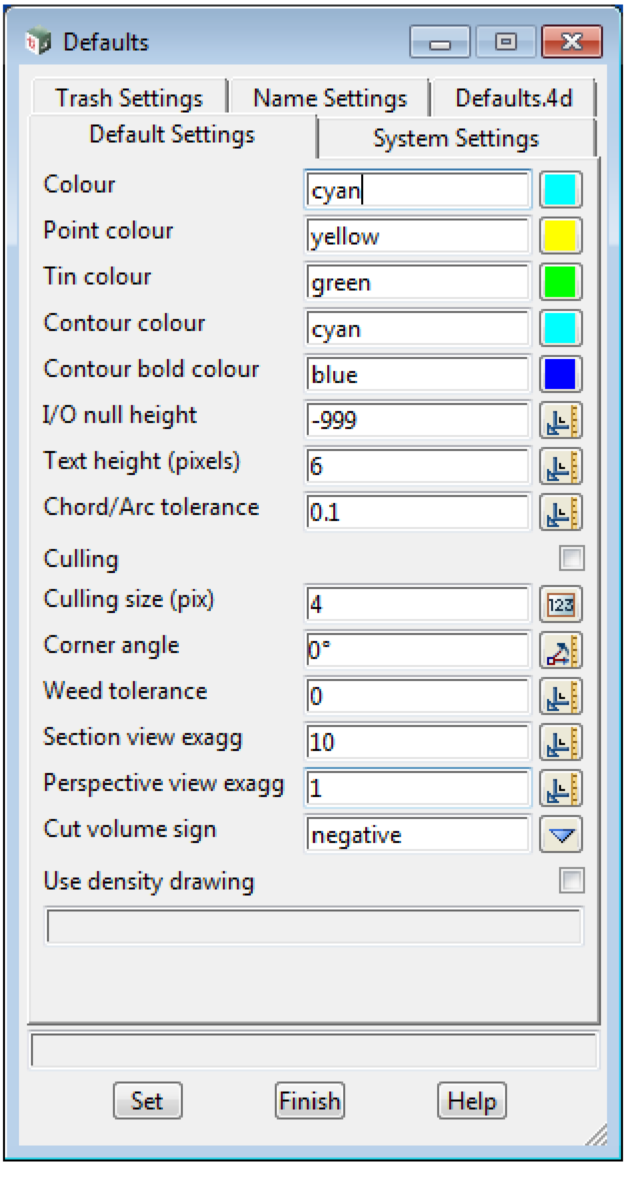
Position of option on menu: **Project =>Management =>Defaults**

The **Defaults** option allows the user to view and modify many of the default values used in the current 12d Model project.

NOTE - The values in the default option panels are initially set for a new project by the values in the **defaults.4d** file. For more information on the defaults.4d file, go to the section 39.2.7.3 Defaults File (defaults.4d) in the Appendix 39 Setting Up & Configuring 12d

Any changes made in the **Defaults** panel are used in the current session for the project when the **Set** button is pressed. The values are only *saved* for the project if a **Project =>Save** is done after the **Set**.

On selecting the **Default Settings** tab, the **Default Settings** are displayed.

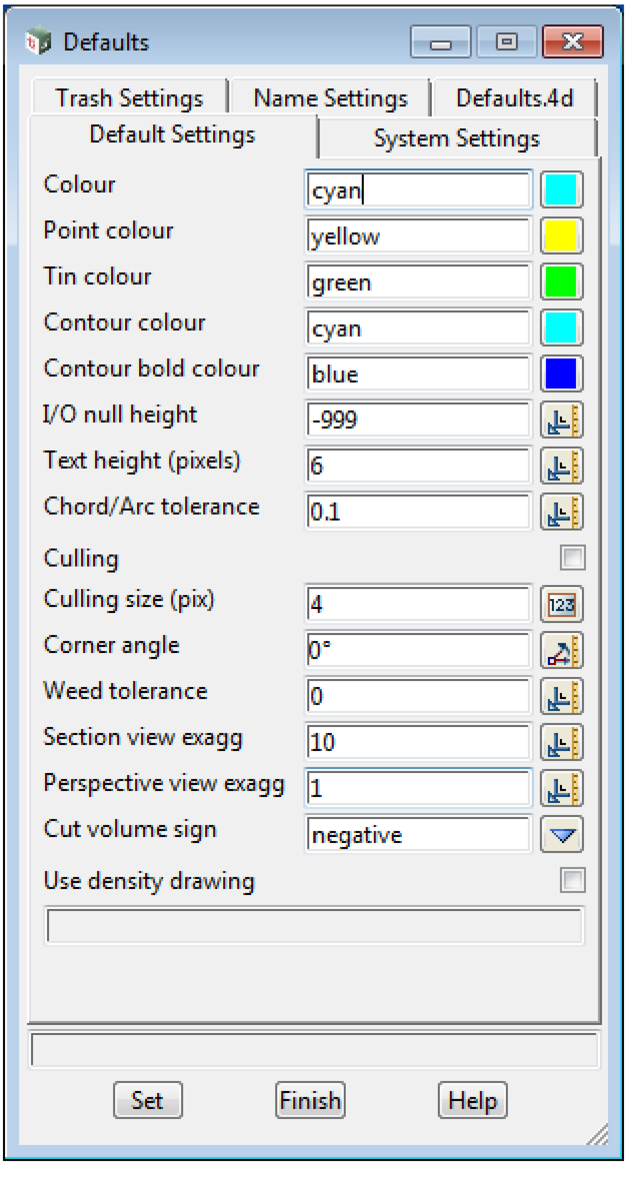


The **Defaults** panel consists of tabs for the groups of settings *Defaults*, *System*, *Trash* and *Name*.

Default Settings tab
System Settings tab
Trash Settings tab

Names Settings tab

Default Settings tab



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Colour	colour box	default colour	available colours

the name of the current default colour used for line strings.

Point colour	colour box	def point colour	available colours

the current default colour used for point strings.

Tin colour	colour box	def tin colour	available colours

the default tin colour used in the triangulate model and view panels.

Contour colour	colour box	default cont colour	available colours

the default contour colour used in the contour panel.

Cont bold colour colour box default cont index colour available colours

the default contour bold colour is used in the contour panel.

I/O null height input -999.0

this field contains the value of the value recognised as a null height when reading in and writing out data.

Text height (pixels) input 8

the default text height used in the sewer option and other panels.

Chord/Arc tolerance input 0.1

the maximum value of a chord to arc distance. If this distance is exceeded when approximating curves by chords, extra points are inserted into the curve so that the chords all have chord/arc distances less than this value. A value of zero disables the chord/arc test.

Culling tick box

the **culling** *setting for any new perspective or plan views.*

Culling size (pix) input 5

the **culling size** *for any new perspective or plan views.*

Corner angle input 15

when applying templates or calculating interfaces along a string, extra sections may be required at string vertices with no horizontal curve on them. If the **corner angle** *is non-zero, extra sections are added in at multiples of the* **corner angle** *value for the plan angle at the vertex.*

Weed tolerance input 0

if two points on a string (with the same bearing) are closer that this distance then the second point is left out. This applies to the extra points added in at chainage points in interfacing and corner angles.

Section view exagg input 10

the **vertical exaggeration** *used for any new section views.*

Perspective view exagg input 1

the **vertical exaggeration** *of any new perspective.*

Cut volume sign choice box negative negative, positive

the sign (positive or negative) used for cut volumes and areas. The sign for fill is the opposite.

Use density drawing tick box

If **Use density drawing** *is ticked, the data density for a model is calculated and if it is too high, a red rectangle is drawn around the model instead of the individual vertices of the strings in the model.*
If the data density of the model is low enough not to replace the entire model by a red rectangle, a data density is calculated for each string in the model and if the data density is too high, the string is replaced by a red rectangle.

Note*: This setting is only applicable to the 250M version of* ***12d* *Model.***

The default for a new project is given by the environment variable USE_DENSITY_CHECKS_4D.

Load button

read the default values from the current default.4d file for the project. The values are not used for the project until the ***Set*** *button is pressed. The values are not saved for the project until a* **Project =>Save** *is done after the* ***Set****.*

Set button

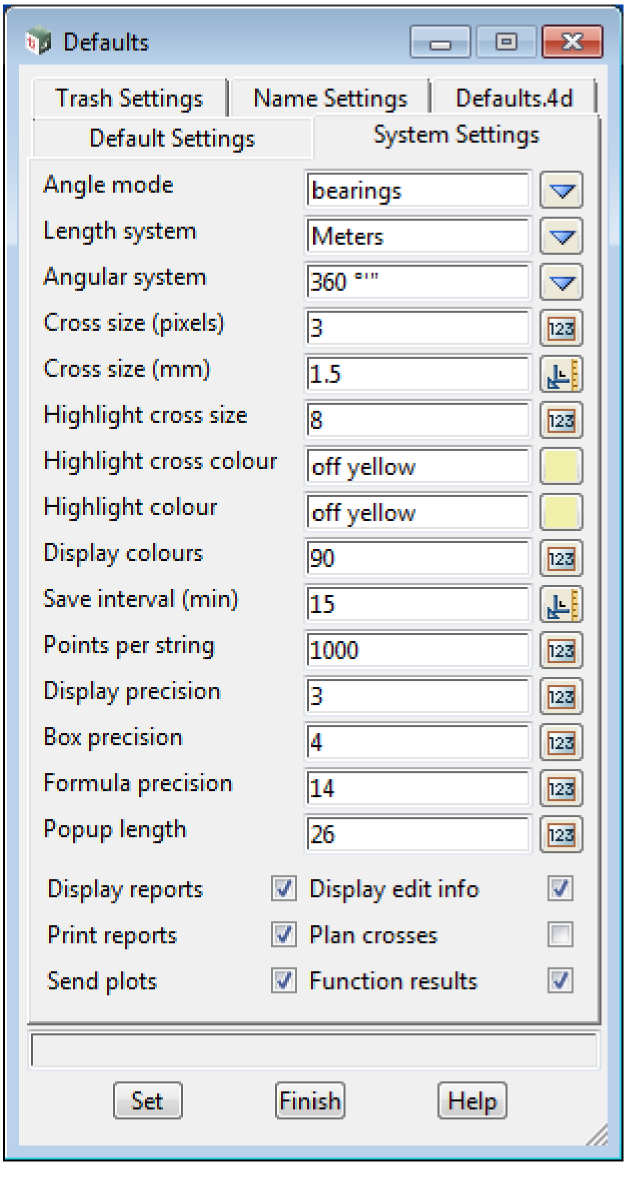
when set is selected, the defaults are set to the values given in the corresponding fields of this panel. These are not saved unless a **Project =>Save** *is done after the* ***Set****.*

Write button

write the values in the panel to the defaults.4d file.
The values are not used for the project until the ***Set*** *button is pressed. The values are not saved for the project itself until a* **Project =>Save** *is done after the* ***Set****. For more information on the* **Write** *button, go to the section* 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d.

System Settings tab

On selecting the **System Settings** tab, the **System Settings** are displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Angle mode	choice box	bearings	cartesian, bearings

specifies whether bearings or cartesian angles are used in reporting the instantaneous direction of the selected string in the **information** *menu.*

Cross size (pixels) input/output 2

the size in pixels that crosses (for points etc.) are drawn on the screen.

Cross size (mm) input/output 2.5

the size in millimetres that crosses (for points etc.) are drawn on any plots.

Highlight cross size input/output 8

the size in pixels of the cross used for highlighting objects in views.

Highlight cross colour colour box yellow available colours

the colour of the cross used for highlighting objects in views.

Highlight colour colour box white available colours

the colour used to display objects in views when they are highlighted.

Display colours input/output 0

the number of colours from the colours.4d file that are displayed in a **Select Colour** *pop-up.*
If ***0****, all colours are displayed.*
The order that the colours are selected is given by the Pop-up number in the colours.4d file. See 4.22.3 Editing Colours.4d.

Save interval (min) input/output 5

the number of minutes that elapse after a save before the **save project reminder** *panel comes up. If 0, the panel never comes up.*

Display precision input/output 3

the number of decimal places used for values displayed in the information menus.

Box precision input/output 4

the number of decimal places used for values displayed in boxes and panels.

Popup length input/output 28

this is no longer used - the maximum number of items in a pop-up before breaking the pop-up into walk-rights.

Display reports tick box tick

if ***ticked****, as soon as a report is produced, it will be displayed in the editor defined by the environment variable, EDITOR_4D.*

Display edit info tick box tick

if ***ticked****, the edit info panel is automatically displayed whenever a string is created or edited.*

Print reports tick box tick

if ***ticked****, as soon as a report is produced, it will be passed to the script/program defined by the environment variable, PRINTER_4D.*

Send plots tick box tick

if ***ticked****, as soon as a plot is produced, it will be passed to the script/program defined by the environment variable, PLOTTER_4D.*

Plan crosses tick box

This option is experimental *- at the moment things will look messy when editing in a section view with plan crosses turned on.*
if ***ticked****, when the cursor is in a plan or perspective view, it is projected onto any section views as well.*

Function results tick box tick

if ***ticked****, function results such as volumes will be displayed on the screen every time a recalc is done.*
if ***not ticked****, no function results as displayed on a function recalc.*

Load button

read the default values from the current default.4d file for the project. The values are not used for the project until the ***Set*** *button is pressed. The values are not saved for the project until a* ***Project =>Save*** *is* *done after the **Set**.*

Set button

when set is selected, the defaults are set to the values given in the corresponding fields of this panel. These are not saved unless a **Project =>Save** *is done after the **Set**.*

Write button

write the values in the panel to the defaults.4d file.
*The values are not used for the project until the **Set** button is pressed. The values are not saved for the project itself until a* **Project =>Save** *is done after the **Set**. For more information on the* **Write** *button, go to the section* 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d

Trash Settings tab

On selecting the **Trash Settings** tab, the **Trash Settings** are displayed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Trash mode	choice box	trash string	keep string, trash string, delete string

In many string options, new strings are created from existing strings. What happens to the original strings may be determined by the **trash mode***.*
If set to ***keep string****, the original strings will not be touched*
trash string*, the original strings will be moved to the trash model*
delete string*, the original strings will be deleted.*

Trash model	model box	Trash Model	available models

the model that trashed strings are put into. This model needs to be cleaned or deleted to permanently remove the strings.

Load button

read the default values from the current default.4d file for the project. The values are not used for the project until the ***Set*** *button is pressed. The values are not saved for the project until a* ***Project =>Save*** *is done after the* ***Set****.*

Set button

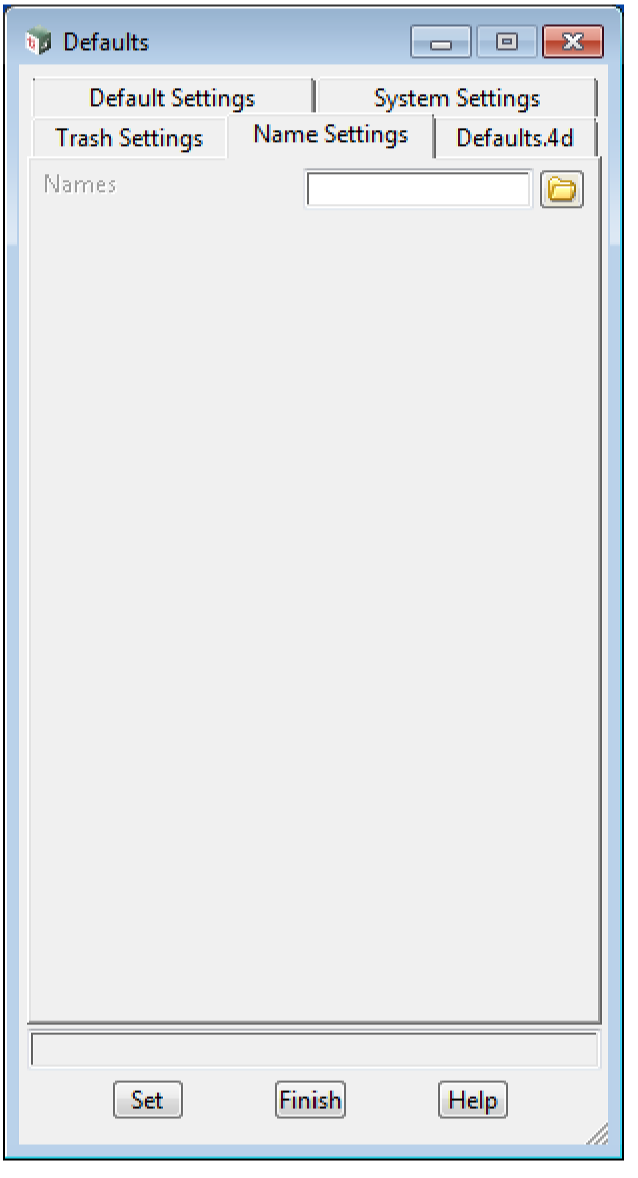
when set is selected, the defaults are set to the values given in the corresponding fields of this panel. These are not saved unless a **Project =>Save** *is done after the* ***Set****.*

Write button

write the values in the panel to the defaults.4d file.
The values are not used for the project until the ***Set*** *button is pressed. The values are not saved for the project itself until a* **Project =>Save** *is done after the* ***Set****. For more information on the* **Write** *button, go to the section* 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d

Names Settings tab

On selecting the **Name Settings** tab, the **Name Settings** are displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Names	input		*.mapfile, *.mf files

name of the Map File used as the default name mapping file.

Load button

*read the default values from the current **default.4d** file for the project. The values are not used for the project until the **Set** button is pressed. The values are not saved for the project until a **Project =>Save** is done after the **Set**.*

Set button

when set is selected, the defaults are set to the values given in the corresponding fields of this panel. These are not saved unless a **Project =>Save** *is done after the **Set**.*

Write button

write the values in the panel to the defaults.4d file.
*The values are not used for the project until the **Set** button is pressed. The values are not saved for the project itself until a* **Project =>Save** *is done after the **Set**. For more information on the* **Write** *button, go*

to the section 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d.

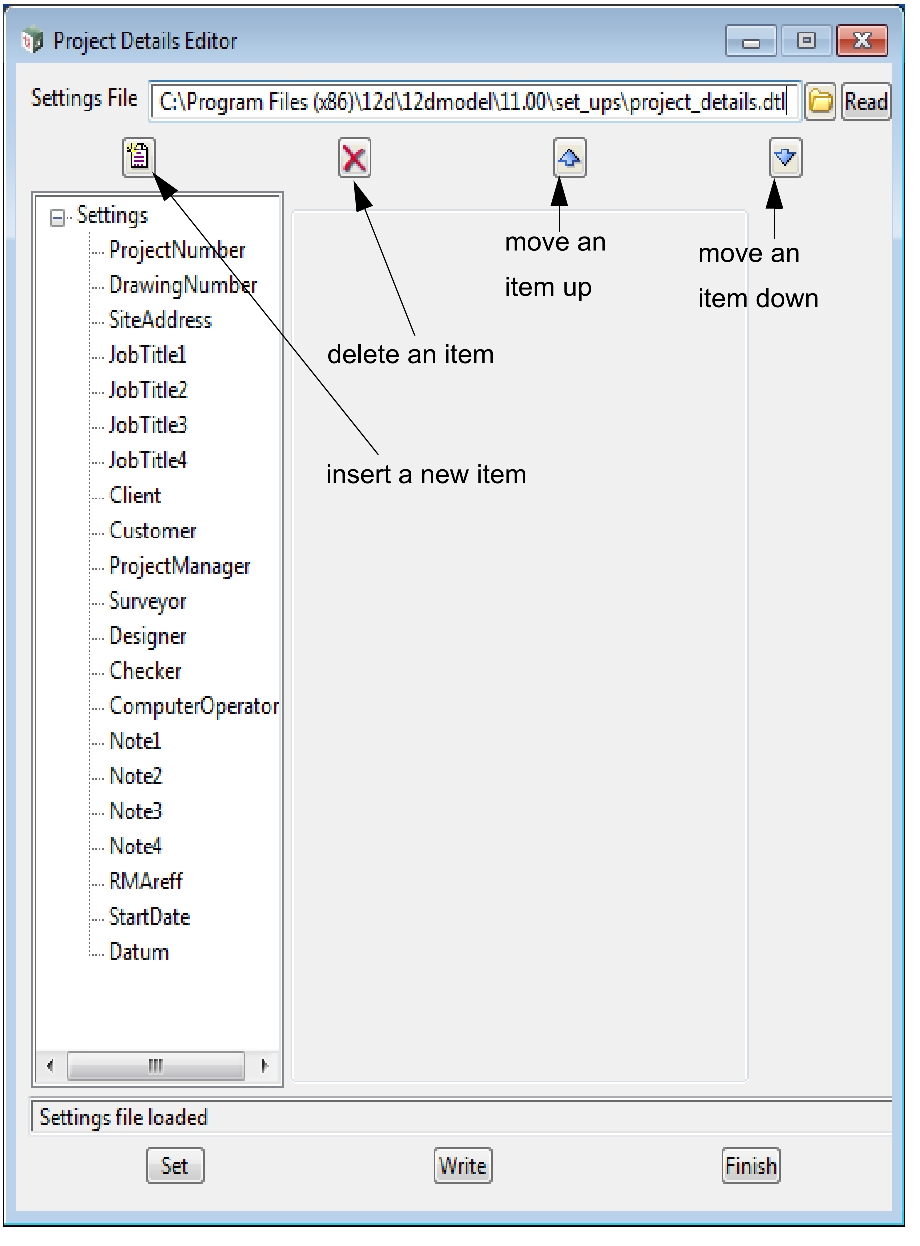
Go to the next section 7.6.2 Details Editor or return to 7.6 Management.

7.6.2 Details Editor

Position of option on menu: **Project =>Details =>Management =>Details editor**

The **Details Editor s** option creates the files used to define the project attributes displayed in the **Project Details** panel.

On selecting the **Details Editor** option, the **Project Details Editor** panel is displayed.



The items defined in the **Project Details Editor** panel can be of type Text (e.g. fred), Integer (e.g. 11) or Real (e.g. 23.15).

The fields and buttons used in the **Enter Project Details** panel have the following functions.

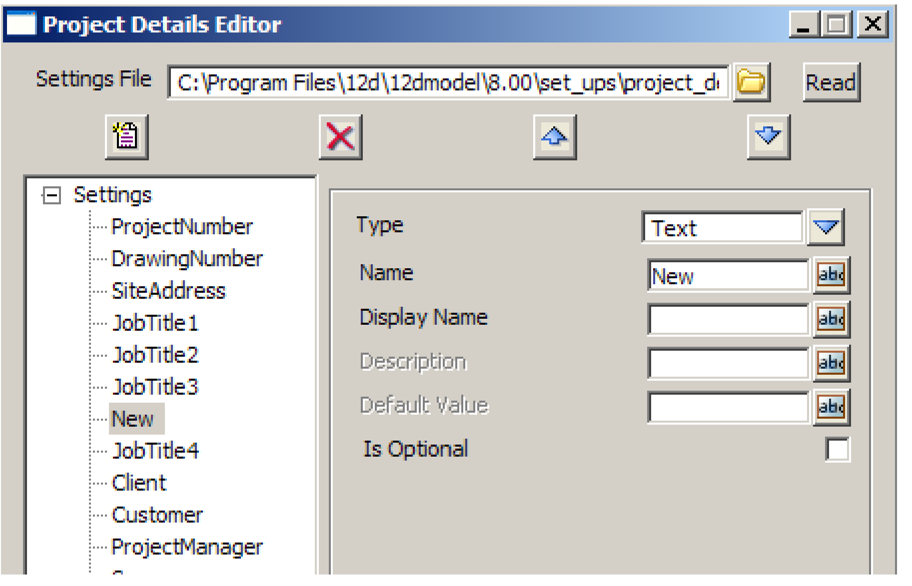
Field Description	Type	Defaults	Pop-Up
Set	button		

the values in the panel are set as the project details setup

Write	button		

writes out a project details file.

When inserting a new ***detail***, the following is displayed



Field Description	Type	Defaults	Pop-Up
Type	choice box		TextText, Integer, Real

the detail can be text, an integer or a real value

Name input

name of the project attribute used to store the detail

Display name input

name to appear in the **Enter Project Details** *panel*

Description input

description that appears when the **Display name** *is clicked in the* **Enter Project Details** *panel*

Default value input

default value for the detail

Precision integer box

only for Type Real - number of decimal places

Is optional tick box tick

*if **ticked**, then the detail does not have to be filled in.*
*If **not ticked,** it is compulsory to fill in the detail in the* **Enter Project Details** *panel before leaving the panel.*

Go to the next section 7.6.3 env.4d or return to 7.6 Management.

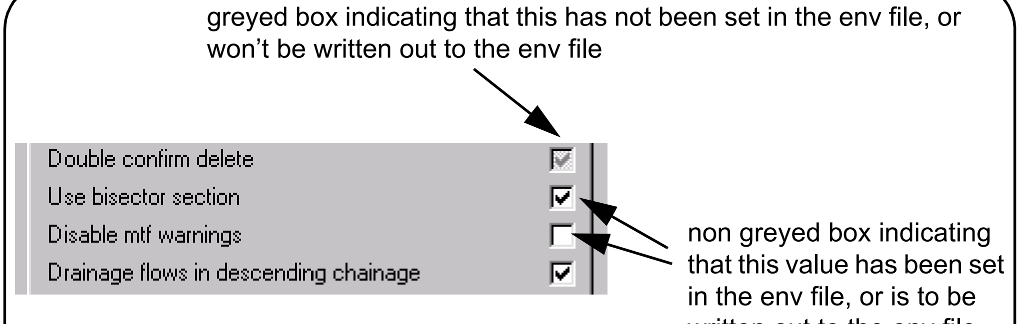
7.6.3 env.4d

Position of option on menu: **Project =>Management =>env.4d**

The **env.4d** option is used to create/update the *env.4d* file of environmental variables.

When the option is selected, it reads in the *current* env.4d file and displays in the panel, the values for any environment variables *in the file*. Hence the panel shows the values for the environment variables *in the file*, not those that are not in the file and have default values set by ***12d Model***.

Hence the tick boxes in the *Edit Environment Variables* panel have three states rather than the standard two states. There is the standard tick or nothing to denote the value of the variable is set from the env file (or is going to be written out to the env file) or a greyed out tick or greyed out blank box to indicate that the value has *not* been set by the environment variable. Clicking on the tick box will toggle between the three states - on, off and no value.

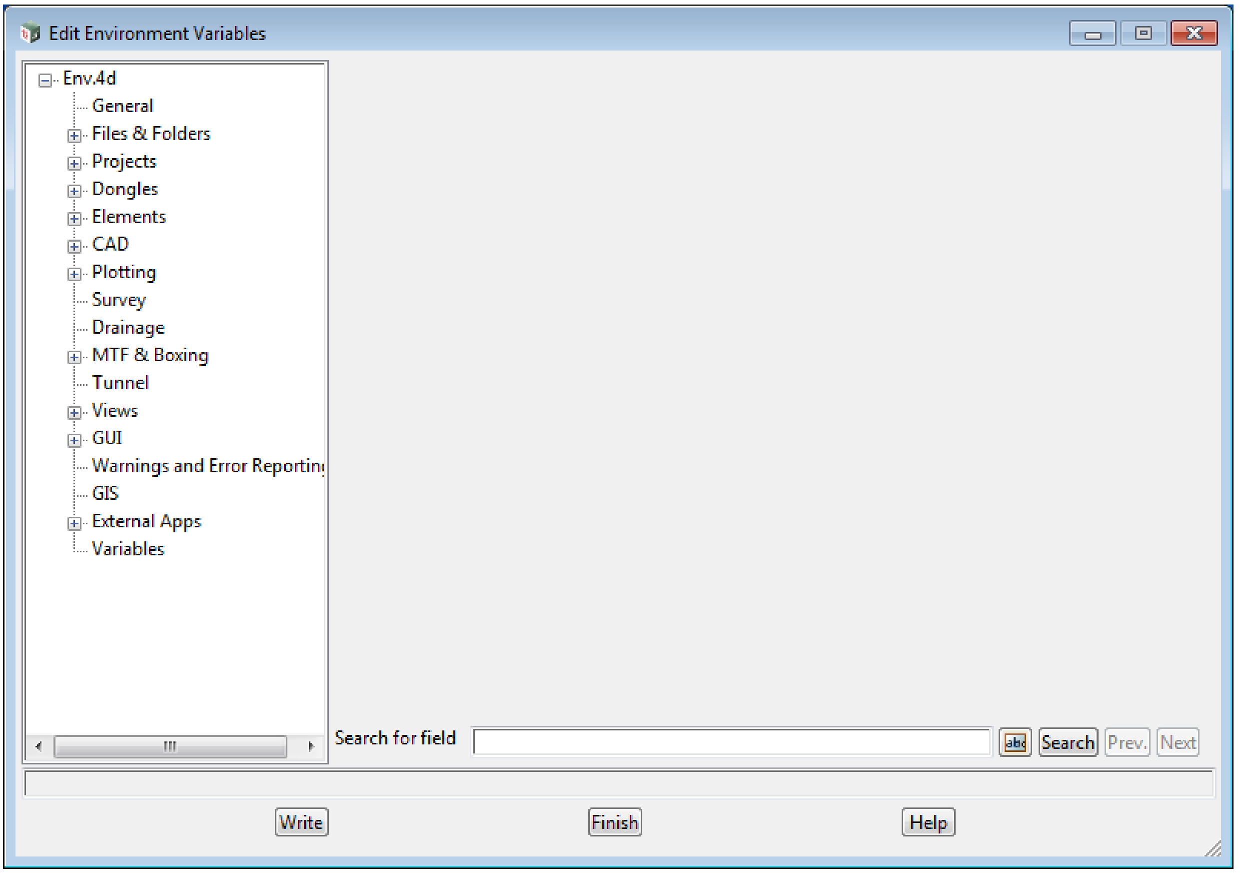


Three State Tick Box

After any modifications are made, the parameters are written out to an env.4d file.

Note that the *env.4d* file is only used when a project is loaded so the parameters written to an *env.4d* file can only take affect for the current project if a project *restart* is done.

Selecting **env.4d** displays the **Edit Environmental Variables** panel.



This panel has a tree on the left hand side and clicking on the **+** will expand the node and **-** will collapse the node.

The fields and buttons at the bottom of the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Search for field	typed input		

text to search for on the env.4d panel (not the env variable name).

Search *button - search for the text in the* **Search for field**. *The search starts from where your cursor is in the panel fields.*

Prev. *button - search for the previous occurrence of the text in the* **Search for field**.

Next *button - search for the next occurrence of the text in the* **Search for field**.

Write	button		

write the values in the panel to a file. For more information on the **Write** *button, go to the section* 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d

Note - the *env.4d* file is only used when a project is loaded so the parameters written to the env.4d file will only take affect for the current project if a project *restart* is done.

For information on the variables, see

General	General

Variables	Variables

The environment variables are described in more detail in the section 39.4 Environment Variables of the Appendix 39 Setting Up & Configuring 12d.

Field Description Type Defaults Pop-Up

General

Show full path name tick box

if ticked, when 12d Model fires up the actual file names defined by any environment variables are written to the output window. This is useful for debugging.

Env variable and full documentation: see SHOW_PATHS_4D

Show Vista full path name tick box

if ticked, then for Microsoft Vista, when 12d Model fires up, the actual file names defined by any environment variables are written to the output window. This is useful for debugging due to the fact that Vista may put file sin strange places.

Env variable and full documentation: see SHOW_VISTA_VIRTUAL_STORE_PATHS_4D

Enable undo tick box

if ticked, allow Undos.

Env variable and full documentation: see UNDO_4D

Plan table settings tick box

if ticked, allow the drawing of z-values, vertices, etc. on the plan view to be set by individual models rather than for all models on the view.

Env variable and full documentation: see PLAN_TABLE_SETTINGS_4D

Use names.4d comment field tick box

if ticked,

Environment variable USE_NAMES_COMMENT_4D

Check for updates on startup tick box

if ticked, the 12d web site is checked on startup for any newer updates to 12d Model.

If not ticked, the 12d web site is not checked.

Environment variable CHECK_FOR_UPDATES_4D

Show time taken for options tick box

if ticked, the time taken for an option to run is written to the output window.

If not ticked, the information is not written to the output window.

Environment variable SHOW_OPTION_EXECUTION_TIME_4D

Text editor file box

if non-blank, the script or program that is fired up when a report is created. It usually points to an editor.

Env variable and full documentation: see EDITOR_4D

Typed units mode choice box

Controls the typed input units for feet - international and/or US.

Environment variable TYPED_UNITS_MODE_4D

System names Choice box Long, Short, Short then long

for file name compatibility with DOS 8.3 format, the default names for all set up files can be restricted to just short names (8.3), long names, or short and then long.

Environment variable SYSTEM_NAMES_4D

Web search typed input www.google.com

Web address that is used in 12d option ***Help =>12d on the Web =>Search the web***

Env variable and full documentation: see WEB_SEARCH_4D

Processor affinity typed input

Environment variable PROCESSOR_AFFINITY_4D

Sort colour box by popup number tick box

In ticked the colours in the Select Colour popup are sorted by the Pop-up number.

Env variable and full documentation: see SORT_COLOURS_BY_POPUP_NUM_4D

Files & Folders

Files & Folders > Folders

Use "\Documents and Settings\All Users" for env.4d, users user_lib folders tick box

Env variable and full documentation: see USE_ALL_USERS_PROFILE_4D

Setups folder folder box default set_ups

if non blank, the full path name of the folder to use for the 12D Solutions supplied setup files.

Env variable and full documentation: see SET_UPS_4D

Library folder folder box default library

if non blank, the full path name of the folder to use for the 12D Solutions supplied library files.

Env variable and full documentation: see LIB_4D

User folder folder box default user

if non blank, the full path name of the folder to use for the User supplied setup files.

See User and Customer_User.

Env variable and full documentation: see USER_4D

User library folderfolder box default user_lib

if non blank, the full path name of the folder to use for the User supplied library files.

See 39.3.2 User Library.

Env variable and full documentation: see USER_LIB_4D

Customer user folder folder box no default

if non blank, the full path name of the folder to use for the Customer User supplied setup files.

See User and Customer_User.

Env variable and full documentation: see CUSTOMER_USER_4D

Customer library folder folder box no default

if non blank, the full path name of the folder to use for the Customer supplied library files.

See 39.3.3 Customer Library.

Env variable and full documentation: see CUSTOMER_LIB_4D

Log folder folder box default *working folder*

if non blank, the full path name of the folder to use for the **12d Model** *log files.*

Env variable and full documentation: see LOG_DIR_4D

Help folder folder box default *help*

If non blank, the full path name of the folder containing the **12d Model** *help files.*

Env variable and full documentation: see HELP_4D

Files & Folders > Files

Fonts file file box default fonts.4d

if non blank, the full path name of the file to use for defining text fonts.

Env variable and full documentation: see FONTS_4D

Function keys file file box default userkeys.4d

if non blank, the full path name of the file to use for function keys definitions.

Env variable and full documentation: see FUNCTION_KEYS_4D

Linestyles file file box default linestyl.4d

if non blank, the full path name of the file to use for defining linestyles.

Env variable and full documentation: see LINESTYLES_4D

Name mappings file file box default names.4d

if non blank, the full path name of the file to use for defining names file for the mapping of string names.

Env variable and full documentation: see NAME_MAPPINGS_4D

Textstyles file file box default textstyl.4d

if non blank, the full path name of the file to use for defining the text styles and fonts they use.

Env variable and full documentation: see TEXTSTYLES_4D

Textstyles favourite file file box default textstyle_names.4d

if non blank, the full path name of the file to use for defining the textstyles favourites.

Env variable and full documentation: see TEXTSTYLE_MAPPINGS_4D

Colours.4d file box default colours.4d

If non blank, the full path name of the file to use as the **12d Model** *colour file.*

Env variable and full documentation: see COLOURS_4D

Defaults.4d file box default defaults.4d

If non blank, the full path name of the file to use as the **12d Model** *defaults file.*

Env variable and full documentation: see DEFAULTS_4D

Digitizers.4d file box default digitizers.4d

If non blank, the full path name of the file to use as the **12d Model** *digitizers file.*

Environment variable DIGITIZERS_4D

Symbols.4d file box default symbols.4d

If non blank, the full path name of the file to use as the **12d Model** *symbols file.*

Env variable and full documentation: see SYMBOLS_4D

Patterns.4d file box default patterns.4d

If non blank, the full path name of the file to use as the **12d Model** *patterns file.*

Env variable and full documentation: see PATTERNS_4D

astyles.4d file box default astyles.4d

If non blank, the full path name of the file to use for defining super alignment symbology.

Environment variable SUPER_ALIGNMENT_STYLE_4D

On duplicate toolbar choice box Do nothing, Take First, Take last

This environment variable manages what to do if toolbars with the same name are read from a toolbars.4d file.

Do nothing - accept all toolbars of the same name
Take first - accept only the first instance of the toolbar
Take last - accept only the last instance of the toolbar

Env variable and full documentation: see TOOLBAR_DUPLICATE_MODE_4D

On duplicate linestyle / symbol Do nothing, Take First, Take last

This environment variable manages what to do if symbols or linestyles with the same name are read from the symbols.4d or linstyle.4d file

Do nothing *- accept all instances of symbols / linestyles of the same name*
Take first *- accept only the first instance of the symbol / linestyle*
Take last *- accept only the last instance of the symbol / linestyle*

Env variable and full documentation: see LINESTYLE_DUPLICATE_MODE_4D

Files & Folders > File input

Use anonymous functions for file inputs tick box

if ticked, when a file is read with a File input option, a function is automatically created and named. This function must exist to allow the data to be added to a view after it is read in, to be able to delete all the data read in at a later time, and to re-run the function to reread the data file and replace the data read in last time.

Env variable and full documentation: see ALLOW_ANONYMOUS_FUNCTIONS_4D

Add file input data to a view choice box

if anonymous function are set, the data created by the File input option can be added to a view. The choices are:

Do nothing *- don't add the data read in to any view*

Add to current view *- add the data read in to the current view (the current view is the view that highlighted)*

Add to new view *- automatically create a new view and add the data read in to that view*

Add to named view *- add the data read in to the view given by FILE_READ_ADD_TO_VIEW_NAME_4D (see* **Add file input data to view name).**

Env variable and full documentation: see FILE_READ_ADD_TO_VIEW_4D

Add file input data to view name text box

name of the view to use if FILE_READ_ADD_TO_VIEW_4D is set to ***Add to named view****. (see* **Add file input data to a view** *and* **Use anonymous functions for file inputs**).

If the view does not exist then it is created.

Env variable and full documentation: see FILE_READ_ADD_TO_VIEW_NAME_4D

Genio wildcard typed input *.mos

sets the ending of the files selected for the pop-up list for the **File** *field in the* **Read Genio Data** *panel.*

Env variable and full documentation: see GENIO_WILDCARD_4D

Files & Folders > File backups

Use backups.4d folder tick box default tick

if tick, backup files are placed in the folder backups.4d. in the project working folder (that is, in the folder containing the .project folder).

Env variable and full documentation: see USE_BACKUPS_4D_FOLDER_4D

Files & Folders > Usage Logs

Usage log folder folder box

if non blank, log files of the form

<log file folder>\(<dongle> <user> <computer> <time stamp> <process ID>.log)

will be created in the given folder.

Env variable and full documentation: see USAGE_LOG_4D

Usage logs folder folder box

if non blank, log files of the form

<log file folder>\<dongle>\<user>\<computer>\(<time stamp> <process ID>.log)

will be created in the given folder.

Env variable and full documentation: see USAGE_LOGS_4D

Projects

Projects > General

Short project names tick box

if ticked, use short extension names (3 characters after the .) for all internal files such as models, tins, projects.

Env variable and full documentation: see PROJECT_NAMES_4D

Setups file file box default setups.4d

if non blank, the full path name of the file to use for setting up the initial screen layout for new projects.

Env variable and full documentation: see SETUPS_FILE_4D

Recent projects positive integer box default 20

if non blank, the maximum number of accessed projects displayed in the Project list when ***12d Model*** *first starts up.*

Env variable and full documentation: see RECENT_PROJECTS_4D

Projects > Macros

Macro input mode tick box

controls whether or not the value passed down in the variable to receive the answer for any macro prompt, is actually placed into the console panel as the default answer so that it can be accepted by just typing <enter> into the console panel.

If ticked, put the passed down values into the console panel.

Env variable and full documentation: see MACRO_INPUT_MODE_4D

macros.4d (run on new project file box default macros.4d

if non blank, the full path name of the file of macros that is run when ***12d Model*** *creates a* ***new*** *project.*

Env variable and full documentation: see RUN_MACROS_FILE_4D

project_macros.4d (run on every project file box default project_macros.4d

If non blank, the full path name of the file of macros that is run when ***12d Model*** *opens an existing project.*

Env variable and full documentation: see RUN_PROJECT_MACROS_FILE_4D

Projects > Details

Show project details on new project tick box

If ticked, the Edit Project Details *panel is displayed when a new project is created.*

Env variable and full documentation: see SHOW_PROJECT_DETAILS_4D

Validate project details on startup tick box default tick

If ticked, the Project Details are validated when a project is opened and the user can not continue until all the details validate. See 7.5.2 Edit Details.

Env variable and full documentation: see ALWAYS_VALIDATE_PROJECT_DETAILS_4D

New project details file file box default

If non blank, the full path name of the file of project details file to use for new projects.

Env variable and full documentation: see PROJECT_DETAILS_4D

Projects > Reports

Amount of report header choice box no header, minimal header, full header

controls the amount of header information in reports.

Env variable and full documentation: see REPORT_HEADER_4D

Printer script file box

if not blank, points to a script or program which is fired up whenever a report is generated.

Env variable and full documentation: see PRINTER_4D

Projects > Sharing

Auto sync tins tick box default off

if ticked, the server projects for any shared tins added to this project are checked to see if they have been modified (checked every SHARE_CHECK_INTERVAL seconds). If any tins have been modified, they are re-copied to this project.

Env variable and full documentation: see AUTO_TIN_SYNC_4D

Auto sync models tick box default off

if ticked, the server projects for any shared models added to this project are checked to see if they have been modified (checked every SHARE_CHECK_INTERVAL seconds). If any models have been modified, they are re-copied to this project.

Env variable and full documentation: see AUTO_MODEL_SYNC_4D

Interval to check for updates positive integer default 0

if non zero, the number of seconds between checks to see if any of the shared tins or models added to the project have been modified.

Env variable and full documentation: see SHARE_CHECK_INTERVAL_4D

Share locking folder folder box default *inside project*

if non blank, the full path name of the folder used to keep lock files for shares.

Env variable and full documentation: see SHARE_LOCKS_FOLDER_4D

Colour for shared elements in list boxes colour box default blue

if non blank, the colour to use for showing shared tins/models in a list of tins/models. That is, the tins/models that have been added to the project as shared tins/models are shown in this colour. Setting the colour to black will disable this feature.

Env variable and full documentation: see SHARED_ELEMENT_COLOUR_4D

Colour for sharing elements in list boxes colour boxdefault 255,165,0

if non blank, the colour to use for showing tins/models that are allowed to be shared in a list of tins/models. That is, those tins/models in the project that the user has allowed others to share are shown in this colour. Setting the colour to black will disable this feature.

Env variable and full documentation: see SHARING_ELEMENT_COLOUR_4D

Sharing map file file box default none

if not blank, the full path name of the map file to be applied to shared models.

Env variable and full documentation: see SHARE_MAP_FILE_4D

Sharing cache folder file box default none

if not blank, the full path name of the folder to use for caching models and tins.

Env variable and full documentation: see SHARING_CACHE_4D

Projects > Trash bin

Use trash bin tick box default tick

if ticked, any deleted models or tins, or cleaned models, are placed in the Trash bin.

Env variable and full documentation: see USE_TRASH_BIN_4D

Days before auto purge positive integer default 0 (don't purge)

the number of days before the Trash Bin is automatically purged of tins and models.
*If 0, the Trash Bin is **not** purged.*

Env variable and full documentation: see PURGE_TRASH_DAYS_4D

Maximum trash bin size (Mb) positive integer default 0 (don't limit)

maximum number of Mb that the trash file can be.
*If 0, the Trash Bin is **not** limited in size.*

Env variable and full documentation: see MAXIMUM_TRASH_SIZE_4D

On overflowing trash bin Choice box Auto manage, auto empty default Auto manage

the action to take when the trash bin exceeds the maximum trash bin size.

*If **Auto manage,** the oldest files in the trash bin are deleted until the new item can fit in the trash bin.*
*if **Auto empty,** files in the trash bin are deleted.*
Note - if a large model or tin is deleted and it is bigger than the maximum trash bin size, the user is alerted and asked to decide if they want the element to go in the trash bin anyway, or if they want to permanently delete it.

Env variable and full documentation: see OVERFLOWING_TRASH_MODE_4D

Projects > Workspace

New project workspace file file box default

if non blank, the full path name of the workspace file for new projects.

Env variable and full documentation: see WORKSPACE_FILE_4D

Always show new toolbars tick box default

if ticked, when a project starts up, all the toolbars are checked to see if they are listed in the workspace (visible or invisible) and if the toolbar does not exist, then the toolbar will be displayed. This is to allow any new toolbars added to toolbars.4d to be automatically displayed so that the user knows that it exists.

Env variable and full documentation: see NEW_TOOLBARS_VISIBLE_4D

Dongles

Dongles > General

Time dongle access positive integer

time between searches for a dongle

Env variable and full documentation: see DEBUG_DONGLE_ACCESS_4D

Nodes file file box default nodes.4d *if not blank, the full path name of the* **12d Model** *authorization file.*

Env variable and full documentation: see AUTHORIZATION_4D

Dongles file file box default dongles.4d

if not blank, the full path name of the **12d Model** *dongles file.*

Env variable and full documentation: see DONGLES_4D

Dongles > Wibu (depreciated)

these environment variables for Wibu dongles have been replaced by the dongles.4d file. The dongles.4d file has the information about what Local and Network Wibu dongles and CodeMeter Containers to search for. See 7.6.5.3 Dongles.4d Editor.

Use Wibu dongle tick box

if ***ticked****, search for 12d Wibu dongles*
If ***not ticked****, don't search for Wibu dongles*

Env variable and full documentation: see WIBU_4D

Local choice box local, no local

if ***local****, then a stand alone Wibu dongle is looked for on the computer hat the user is on.*
If ***no local****, then no stand alone Wibu dongle is looked for on the computer*

Env variable and full documentation: see WIBU_DONGLE_4D

Network choice box no network, network first, network last

if ***no network****, then no Wibu network dongle is looked for.*
If ***network first****, then a Wibu network dongle is looked for before a single user local dongle.*
If ***network last****, then a Wibu network dongle is looked for after looking for a single user local dongle.*

Env variable and full documentation: see WIBU_DONGLE_4D

Login retries positive integer

number of retries to find a Wibu dongle
Env variable and full documentation: see WIBU_DONGLE_4D

Login wait positive integer

time in seconds to wait between Wibu dongle retries
Env variable and full documentation: see WIBU_DONGLE_4D

Disable dongle tick box

if ***ticked****, don't search for a Wibu dongle*
if ***not ticked****, search for a Wibu dongle*

Env variable and full documentation: see WIBU_DONGLE_4D

Debug dongle tick box

if ***ticked****,*
if ***not ticked****,*

Env variable and full documentation: see WIBU_DONGLE_4D

Wibu IP/Name addresses

if ***non blank****, a list of IP addresses and/or computer names to search for a 12d Wibu network dongle. The items in the list are separated by commas*
If ***blank****, search the entire network for a 12d Wibu network dongle*

Env variable and full documentation: see WIBU_IPADDR

Elements

Elements > Rasters

Use image server tick box

If ticked

Environment variable USE_IMAGE_SERVER_4D

Use ECW server tick box

If ticked

Environment variable USE_ECW_SERVER_4D

Elements > Strings

Use new string creates tick box

If ticked then the String Creates are for super strings.
If not ticked, the String Creates are the non-super string creates.

Environment variable NEW_STRING_CREATES_4D

Super strings ? tick box default tick

if ticked, super strings are allowed.
If not ticked super strings are not allowed.

Environment variable SUPER_STRINGS_4D

Only use super string tick box default no tick

if ticked, only super strings are created by all options.

Environment variable USE_SUPER_STRINGS_4D

Always user Super Strings advanced mode tick box default no tick

if ticked, the super string editor always comes up in the Advanced mode with all options available.

Environment variable SUPER_ADVANCED_MODE_4D

Use speed tables tick box default tick

if ticked, speed tables are enabled.
If not ticked, speed tables are not allowed.

Environment variable SPEED_TABLES_4D

Alignment VG Corridor fixup tick box default tick

if ticked, alignment corridor calculations introduced in V8 are used.
If not ticked, the V7 alignment corridor calculations are used.

Env variable and full documentation: see ALIGNMENT_CORRIDOR_FIXUP_4D

Use bisector section tick box default no tick

at a HIP with no curve on it, either two sections can be applied at the HIP point or just a single bisector section applied to the bisector of the change of angle through the HIP.

If ticked, the bisector section is used.
If not ticked, two sections will be created at the HIP.

Env variable and full documentation: see BISECTORS_4D

Weed Tolerance positive real

Used in Alignment and Super strings so that when arcs have been chord-to-arc'd, the resulting points are weeded so that no point is closer than the weed tolerance. Is is also used in Apply Template and Apply MTF so that no cross sections are closer than the weed tolerance.

Env variable and full documentation: see WEED_TOLERANCE_4D

Polyline draw choice box don't use speed ups
intermediate speed ups
faster speed ups

Different methods that speed up drawing of polylines.

Env variable and full documentation: see POLYPOLYLINES_4D

Elements > Tins

Tin viewport clip tick box shipped env.4d has this ticked

If ticked then some experimental techniques for speeding up the drawing of tins, fast contours is used.

Env variable and full documentation: see TIN_VIEWPORT_CLIP_4D

Pre*postfix for model for tin text box *default is* ***"tin "***

This environment variable is used to customize the default model for the tin in the panels for creating triangulations. Text can be defined for prepending and/or appending to the tin name to create a default model name from the tin name.

The text for prefixing and postfixing is given in a special form: ***pre-text*post-text***

If pretext only, just give the text. If post text is required, precede it by a ".".*

If the environment variable is not set, the default "tin " is used.

Env variable and full documentation: see MODEL_FOR_TIN_PREFIX_4D

Allow exact calculations for super tins tick box

Options using tins are split into two categories:

(1) options that require sections through tins
(2) options that require the triangles of the tin

if ticked, this allows super tins to be used in options where triangles are required for calculations.
if not ticked, this prevents super tins to be used in options where triangles are required for calculations.

Note: ticking this option requires super tins to be updated when a tin within the super tin changes, so there is a time, storage, and memory cost. It was found that some projects only ever required options that used sections (not triangles), so for these type of projects, there is an efficiency gain by turning off this option.

Env variable and full documentation: see ALLOW_SUPER_TINS_EXACT_CALCS_4D

Elements > Selects

Autopan on selects tick box default tick

if ticked, if you have accepted but not accepted a string and are zoomed in on the strings and type **ch value** *where the position at that chainage is off the view, the view will autopan so that the new selection point (at chainage* value*) is on the view. This applies for all typed selects.*

Env variable and full documentation: see AUTO_PAN_SELECT_4D

Auto hide panel on selects tick box default not tick

if ticked, when the string select icon is picked on a panel, the panel minimises until a string is selected *and accepted.*

Env variable and full documentation: see AUTO_HIDE_PANEL_SELECTS_4D

Pick only on selects tick box

if ticked,

Env variable and full documentation: see PICK_ONLY_ON_SELECTS_4D

Display all strings at snap tick box

if ticked,

Env variable and full documentation: see USE_DISPLAY_MANY_SNAP_4D

Show prettier information tick box

if ticked,

Env variable and full documentation: see USE_NEW_SELECT_4D

CAD

Fast accept tick box

*If ticked, the **Fast Accept** snap (**A** snap) is turned on by default for new projects.*

If Fast Accept (A snap) is on, when an item is picked and there is one item in the selection list, then the item is automatically accepted without clicking MB.

Env variable and full documentation: see FAST_ACCEPT_4D

Fast construction snap tick box

*If ticked, the **Fast Construction** snap (**K** snap) is turned on by default for new projects.*

Env variable and full documentation: see FAST_CONSTRUCTION_SNAPS_4D

Never snap to self tick box default tick

If ticked, the software tries to stop snapping to itself during editing.

Env variable and full documentation: see NEVER_SNAP_ITSELF_4D

Construction snaps model

If non blank, the model to use for objects created during construction snaps.

Env variable and full documentation: see CONSTRUCTION_SNAP_MODEL_4D

Plan height max real value box ‘ default 0

set the default value to use in Plan Settings panels that have a **Height max (w)** *field.*

Env variable and full documentation: see HEIGHT_MAX_DEFAULT_4D

Default CAD Modify mode choice box ‘ Multi pick

Env variable and full documentation: see CAD_START_IN_MULTI_PICK_4D

Plotting

Plotting > General

Plan plot scale 1: real box default blank

if non blank, the default plot scale to be used on any new plan views.

Note that the scale is used in the plan view for displaying text, linestyles and symbols defined in paper *units.*

Env variable and full documentation: see DEFAULT_PLAN_PLOT_SCALE_4D

Show title variables choice box as blank
as $variable
no substitution

this is used for debugging the title block file. Default is ***as blank****.*

If ***as blank****, any $variable not used is left as blank.*
If ***as $variable****,* any *$variable* not used is shown as $variable.
If ***no substitution****,* all *$variable* are plotted with no substitution.

Env variable and full documentation: see SHOW_TITLE_VARIABLES_4D

Symbol file for long and x-sections file box default *plotsymb.4d*

if non blank, the full path name of the plot symbols file.

Env variable and full documentation: see PLOT_SYMBOLS_4D

Plotter script file box

If non blank, points to a script or program which is fired up whenever a plot is generated.

Env variable and full documentation: see PLOTTER_4D

User plotters file box default *plotters.4d*

if non blank, the full path name of the file containing the definitions of plotters.

Env variable and full documentation: see PLOTTERS_4D

Plotter mapping file file box default *pmf.4d*

if non blank, the full path name of the file used as the default plotter mapping file.

Env variable and full documentation: see PLOTTER_MAPPING_4D

Sheets file file box default *sheets.4d*

if non blank, the full path name of the file defining the plot sheet sizes.

Env variable and full documentation: see SHEET_SIZES_4D

DGN plot seed file file box

if non blank, the full path name of the file to use as a seed file for Microstation plots.

Env variable and full documentation: see DGN_PLOT_SEED_FILE_4D

DWT plot template file file box

if non blank, the full path name of the file to use as a template file for AutoCAD plots.

Env variable and full documentation: see DWG_PLOT_SEED_FILE_4D

Acad plot unit choice box English, Metric

Env variable and full documentation: see DWG_PLOT_UNIT_4D

Use title blocks in 12a format tick box default tick

if ticked, the title block file is in 12da format.
If not ticked, the title block is in the pre V7 title block .tf format

Env variable and full documentation: see V7_TITLE_BLOCKS_4D

Use hardware arcs tick box default tick

if ticked, use computer hardware to draw arcs (rather than software).
If not ticked, draw arcs in software

Env variable and full documentation: see WRITE_ALL_PLOT_PARAMETERS_4D is preceded by HARDWARE_ARCS_4D

Write all plot parameters tick box default tick

Only used in old Plot options using (text) ppf files which have been superseded by binary ppf files. The panels have a Plot parameters write *field to write out an text ppf for the plot.*

If ticked, when writing out an (text) ppf files, write out all plot parameters.
If not ticked, only write out those plot parameters that have been used in the ppf file.

Env variable and full documentation: see WRITE_ALL_PLOT_PARAMETERS_4D

Show old plotting options tick box default tick

*If ticked, then a menu **Plot =>Old plotting** is included which has all the old text ppf options.*

Env variable and full documentation: see ALLOW_OLD_PLOTTING_4D

Offset chainages to output window tick box default not tick

If ticked,

Environment variable SPECIAL_OFFSET_CHAINAGES_4D

Plotting > Parameter files > Binary

Binary drainage plan parameter file file box default *none*

if non blank, the full path name of the file used as the default binary plot parameter file (.drainplanppf) for the plan annotation produced by the panel **Drainage Plan Plot PPF Editor**.

Env variable and full documentation: see NEW_DRAINAGE_PLAN_PPF_4D

Binary Melbourne Water parameter file file box default *none*

if non blank, the full path name of the file used as the default binary plot parameter file (.melbppf) for the long section plot produced by the panel **Sewer Plot Melbourne Water PPF Editor**.

Env variable and full documentation: see NEW_DRAINAGE_MELB_PPF_4D

Binary drainage parameter file file box default *none*

if non blank, the full path name of the file used as the default binary plot parameter file (.drainppf) for the long section plot produced by the panel **Drainage Plot PPF Editor**.

Env variable and full documentation: see NEW_DRAINAGE_PPF_4D

Binary pipeline parameter file file box default *none*

if non blank, the full path name of the file used as the default binary plot parameter file (.pipelineppf) for the long section plot produced by the panel **Pipeline Plot PPF Editor**.

Env variable and full documentation: see NEW_PIPELINE_PPF_4D

Binary plot frame parameter file file box default *none*

if non blank, the full path name of the file used as the default binary plot parameter file (.plotframeppf) for the long section plot produced by the panel **Section Long Plot PPF Editor**.

Env variable and full documentation: see NEW_PLOT_FRAME_PPF_4D

Binary long section parameter file file box default *none*

if non blank, the full path name of the file used as the default binary plot parameter file (.lplotppf) for the plan plot produced by the panel **Plot Frame PPF Editor**.

Env variable and full documentation: see NEW_LONG_SECTION_PPF_4D

Binary x-section parameter file file box default *none* *if non blank, the full path name of the file* used as the default binary plot parameter file (.xplotppf) for the cross section plot produced by the panel **Section X Plot PPF Editor**.

Env variable and full documentation: see NEW_X_SECTION_PPF_4D

Plotting > Parameter files > Ascii

X-section parameter file file box default *none*

Note - the text ppfs have been superseded by the binary ppfs.

if non blank, the full path name of the file used as the default text plot parameter file (.ppf) for the cross section plot produced by the panel **Cross Section Plot**.

Env variable and full documentation: see X_SECTION_PPF_4D

Long-section parameter file file box default *none*

Note - the text ppf's have been superseded by the binary ppfs.

if non blank, the full path name of the file used as the default text plot parameter file (.ppf) for the long section plot produced by the panel **Long Section Plot**.

Env variable and full documentation: see LONG_SECTION_PPF_4D

Drainage parameter file file box default *none*

Note - the text ppf's have been superseded by the binary ppfs.

if non blank, the full path name of the file used as the default text plot parameter file (.ppf) for the drainage long section plot produced by the panel **New Plot Drainage Network**.

Env variable and full documentation: see DRAINAGE_PPF_4D

Melbourne Water parameter file file box default *none*

Note - the text ppf's have been superseded by the binary ppfs.

if non blank, the full path name of the file used as the default text plot parameter file (.ppf) for the Melbourne Water long section plot produced by the panel **Melbourne Water Sewer Plot**.

Env variable and full documentation: see SEWER_PPF_4D

Plotting > Printing

Enable Windows printers tick box default tick

If ticked, use Windows printers

Env variable and full documentation: see WINDOWS_PRINTERS_4D

Update document properties before printing tick box

If ticked,

Environment variable WINDOWS_PRINTER_SET_DOCUMENT_PROPERTIES_4D

Windows 2000/XP print dialog tick box

If ticked, PrintD1gEX.
If not ticked, PrintD1g

Env variable and full documentation: see WINDOWS_PRINT_MODE_4D

Use exclusive access to printer tick box

If ticked, force direct printing to the printer (the user may need Printer admin access).

Env variable and full documentation: see WINDOWS_PRINT_MODE_4D

Use intermediate print file tick box

If ticked, print to a file first and then submit the file to the printer.

Env variable and full documentation: see WINDOWS_PRINT_MODE_4D

Raster resolutions dots/inch real value box *default 150.0*

number of dots per inch to use for plotting rasters

Env variable and full documentation: see DEFAULT_RASTER_DPI_4D

Maximum time for PDF995 (seconds) positive integer

the number of seconds to wait for PDF995 to finish producing the current PDF file.

Env variable and full documentation: see PDF995_TIME_LIMIT_4D

Windows printer resolution dots/mm choice box Windows 95/98/Me
Windows 2000/XP

For Windows 95, 98 and ME, the printer resolution can only be 0.04 mm when covering an A0 sheet.

Under Windows NT, 2000 and XP, no such restriction exists and the full resolution of 0.01 mm can be used so the environment variable HIMETRIC_4D allows access to the higher resolution for Windows NT, 2000 and XP.

Env variable and full documentation: see HIMETRIC_4D

Survey

Ignore extra words in .fld files tick box

If ticked, trailing tabs are not considered words in a field file. Mainly for Leica when writing a format file which can't suppress trailing tabs when writing a 12d Field file.

Env variable and full documentation: see FLD_IGNORE_XTRA_WORDS_4D

Allow named point attributes tick box

If ticked,

Environment variable ALLOW_NAMED_POINT_ATTRIBUTES_4D

Display commands in SDR Editor as per V8 tick box

If ticked,

Environment variable SDR_DISPLAY_V8_FORMAT_4D

Data collectors file file box default *survey.4d*

if non blank, the full path name of the file of definitions of available data collectors.

Env variable and full documentation: see DATA_COLLECTORS_4D

Data collector choice box data collectors in *survey.4d*

the data collector that is used if no data collector has been set for a project, and the default data collector that is used in the Survey Data Setup panel.

Env variable and full documentation: see DATA_COLLECTOR_4D

Station prefix text box

the Station prefix to user if no Station prefix has been set for a project, and the default Station prefix that is used in the Survey Data Setup panel.

Env variable and full documentation: see STATION_PREFIX_4D

DMS entry, treat 0.123 as 12 minutes 03 seconds tick box *if ticked, the special case of 0.mms is interpreted as mm minutes and s seconds. That is, 0.123 is interpreted as 12 minutes and 3 seconds.*

If not ticked, the special case of 0.mms is interpreted as mm minutes and 10 x s seconds. That is, 0.123 is interpreted as 12 minutes and 30 seconds.

Env variable and full documentation: see INTERPRET_DMS_INPUT_OLD_4D

Drainage

Drainage flow direction same as string direction tick box

if ticked, the drainage flow direction is the same as the string direction.
If not ticked, the drainage flow direction is in the opposite direction to the string direction.

Env variable and full documentation: see DRAINAGE_FLOW_DIR_4D

Show old grading edit options tick box

if ticked, the grading options used before V8 are still in the Drainage editor.

Environment variable DRAINAGE_EDIT_GRADE_4D

Show full hydraulic report details tick box *default not ticked*

the rational hydraulic report contains hydrology data.

If ticked, the hydrology calculations for each catchment set (1 to 3) are written to the hydraulic report.

Env variable and full documentation: see FULL_HYDRAULIC_REPORT_4D

Label 150 and PVC pipes tick box default ticked

if ticked, the 150 PVC pipes are labelled on the drainage long section.
If not ticked, the 150 PVC pipes are not labelled on the drainage long section.

Env variable and full documentation: see LABEL_PVC_150_PIPES_4D

Drainage.4d file box default *drainage.4d*

if not blank, the full path name of the file to use as the filed of ***12d Model*** *drainage definitions.*

Env variable and full documentation: see DRAINAGE_4D

MTF & Boxing

MTF & Boxing > MTF General

Disable MTF warnings tick box

if ticked, write mtf warnings to the background window.
If not ticked, display the mtf warnings in the text editor.

Env variable and full documentation: see DISABLE_MTF_WARNINGS_4D

MTF extra start/end tick box

if ticked, Extra start/end is turned on by default in the MTF Editor.

Env variable and full documentation: see EXTRA_START_END_MTF_4D

MTF extra start/end value measure box

the default extra start/end value for a new MTF. After a MTF is created, the value can be changed within the MTF, and saved with the MTF.

Env variable and full documentation: see MTF_EXTRA_START_END_VAL_4D

Default name for design layer

the default name for the design layer in a new MTF. After a MTF is created, the value can be changed within the MTF, and saved with the MTF.

Env variable and full documentation: see MTF_DESIGN_LAYER_NAME_4D

Name to access hinge as link

the default name used to refer to the Hinge string as a link in a new MTF. After a MTF is created, the value can be changed within the MTF, and saved with the MTF.

Env variable and full documentation: see MTF_CONSTRUCTION_HINGE_NAME_4D

Snippet temp file, use snippet name tick box

if ticked, the temporary file created after the preprocessing occurs for the snippet is given the same name as the snippet, with the file extension ***.tmp_mtf***

If not ticked, the MTF name is used. Note: If there is more than one snippet, this file will be overwritten.

Env variable and full documentation: see MTF_SNIPPET_TEMP_FILE_USE_SNIPPET_NAME_4D

For more information on snippets, see 21.5 Defining and Using Snippets.

Don't delete snippet temp file tick box

if ticked, the temporary files created after the preprocessing occurs for the snippet are left on the hard drive.

If not ticked, the temporary files are deleted.

NOTE: If the snippet is compiled, the temporary files are always deleted.

Env variable and full documentation: see MTF_SNIPPET_TEMP_FILE_USE_SNIPPET_NAME_KEEP_4D

For more information on snippets, see 21.5 Defining and Using Snippets.

Snippet temp file custom extension *text*

if not blank, the standard ***.tmp_mtf*** *file extension will be replaced with this value.*

If blank, the standard ***.tmp_mtf*** *file extension will be used.*

Env variable and full documentation: see MTF_SNIPPET_TEMP_FILE_EXTENSION_4D

For more information on snippets, see 21.5 Defining and Using Snippets.

MTF Seed files, include MTF files tick box

*if ticked, existing MTF files are included (in addition to files of type **.MTF_Seed**) in the choices of files which can be used as a MTF Seed file.*

*if not ticked, only files of type **.MTF_Seed** are included in the choices of files which can be used as a MTF Seed file.*

Env variable and full documentation: see MTF_SEED_INCLUDE_MTFS_4D

MTF & Boxing > MTF Editor General

Remember panel location/size tick box ticked

if ticked, when a MTF panel is placed on the screen and closed with Finish, its final position and size are recorded and used when the panel is opened again.

Env variable and full documentation: see REMEMBER_MTF_PANEL_SIZE_4D

Default MTF editor zoom buffer (%) *real box* *default 5*

the value is a percentage increase on the distance required to fit the arrows.

if Autopan is on for the **Left/Right MTF Modifiers** *panel, when a command is clicked in the panel and the region to pan is not displayed on the view, then the extent displayed is the required amount increased by the real_value percentage.*

Env variable and full documentation: see NEW_MTF_EDITOR_ZOOM_BUFFER_4D

Default MTF editor autopan on *tick box* *default tick*

*if ticked, the default for Autopan is **on** for the MTF* **Left/Right MTF Modifiers** *panel.*
*if not ticked, the default for Autopan is **off** for the MTF* **Left/Right MTF Modifiers** *panel.*

Env variable and full documentation: see NEW_MTF_EDITOR_AUTOPAN_DEFAULT_4D

Named part text size (pixels) measure box

the size of the text to use when the name of the named part is highlighted.

Env variable and full documentation: see MTF_NAMED_PART_HIGHLIGHT_TEXT_SIZE_4D

Pasted modifier colour colour box

when you cut/paste the modifiers, the background colour of the pasted rows will remain that colour until you edit them, i.e. this option lets you know the pasted rows until you edit them.

Env variable and full documentation: see NEW_MTF_EDITOR_PASTED_MODIFIER_COLOUR_4D

MTF & Boxing > MTF Hinge Colours

Hinge offset colour colour box

the colour of the text in the Type column for the Hinge Offset commands in the **Hinge Modifiers** *panel.*

Env variable and full documentation: see HINGE_OFFSET_ZONE_COLOUR_4D

Hinge height colour colour box

the colour of the text in the Type column for the Hinge Height commands in the **Hinge Modifiers** *panel.*

Env variable and full documentation: see HINGE_HEIGHT_ZONE_COLOUR_4D

Hinge position colour colour box

the colour of the text in the Type column for the Hinge Position commands in the **Hinge Modifiers** *panel.*

Env variable and full documentation: see HINGE_POSITION_ZONE_COLOUR_4D

MTF & Boxing > MTF Fixed/Snippet/Decision Colours

Fixed colour *colour box* *default blue*

the colour of the text in the Type column for the Fixed commands in the **Left/Right MTF Modifiers** *panel.*

Env variable and full documentation: see FIXED_ZONE_COLOUR_4D

Fixed width colour *colour box* *default light blue*

*the colour of the text in the Type column for the Fixed commands involving width, in the Modifiers section of the **Left/Right MTF Modifiers** panel.*

Env variable and full documentation: see FIXED_WIDTH_ZONE_COLOUR_4D

Fixed height colour *colour box* *default dark blue*

*the colour of the text in the Type column for the Fixed commands involving height, in the Modifiers section of the **Left/Right MTF Modifiers** panel.*

Env variable and full documentation: see FIXED_HEIGHT_ZONE_COLOUR_4D

Fixed xfall colour *colour box* *default dark blue*

*the colour of the text in the Type column for the Fixed commands involving xfall, in the Modifiers section of the **Left/Right MTF Modifiers** panel.*

Env variable and full documentation: see FIXED_XFALL_ZONE_COLOUR_4D

Fixed decision colour colour box

the colour of the text in the Type column for the Fixed Decision commands in the **Left/Right MTF Modifiers** *panel.*

Env variable and full documentation: see FIXED_DECISION_ZONE_COLOUR_4D

Snippet colour *colour box* *default RGB(155, 140, 150*

*the colour of the text in the Type column for the Snippet command in the Modifiers section of the **Left/Right MTF Modifiers** panel.*

Env variable and full documentation: see SNIPPET_ZONE_COLOUR_4D

Decision colour colour box *default purple*

*the colour of the text in the Type column for the Decision commands in the Modifiers section of the **Left/Right MTF Modifiers** panel.*

Env variable and full documentation: see DECISION_ZONE_COLOUR_4D

Non zone specific colour colour box

the colour of the text in the Type column for the commands that aren't in the Fixed, Cut, Fill or Final sections of the modifiers in the **Left/Right MTF Modifiers** *panel, e.g. Interval commands.*

Env variable and full documentation: see NOP_ZONE_COLOUR_4D

MTF & Boxing > MTF Cut/Fill Colours

Cut colour *colour box* *default red*

*the colour of the text in the Type column for the Cut commands (other than those involving width, height or slope) in the Modifiers section of the **Left/Right MTF Modifiers** panel.*

Env variable and full documentation: see CUT_ZONE_COLOUR_4D

Cut width colour *colour box* *default light red*

the colour of the text in the Type column for the Cut commands involving width, in the Modifiers section of the ***Left/Right MTF Modifiers*** *panel.*

Env variable and full documentation: see CUT_WIDTH_ZONE_COLOUR_4D

Cut height colour *colour box* *default dark red*

the colour of the text in the Type column for the Cut commands involving height, in the Modifiers section of the ***Left/Right MTF Modifiers*** *panel.*

Env variable and full documentation: see CUT_HEIGHT_ZONE_COLOUR_4D

Cut slope colour *colour box* *default dark red*

the colour of the text in the Type column for the Cut commands involving slope, in the Modifiers section of the ***Left/Right MTF Modifiers*** *panel.*

Env variable and full documentation: see CUT_SLOPE_ZONE_COLOUR_4D

Fill colour *colour box* *default green*

the colour of the text in the Type column for the Fill commands (other than those involving width, height or slope) in the Modifiers section of the ***Left/Right MTF Modifiers*** *panel.*

Env variable and full documentation: see FILL_ZONE_COLOUR_4D

Fill width colour *colour box* *default light green*

the colour of the text in the Type column for the Fill commands involving width, in the Modifiers section of the ***Left/Right MTF Modifiers*** *panel.*

Env variable and full documentation: see FILL_WIDTH_ZONE_COLOUR_4D

Fill height colour *colour box* *default dark green*

the colour of the text in the Type column for the Fill commands involving height, in the Modifiers section of the ***Left/Right MTF Modifiers*** *panel.*

Env variable and full documentation: see FILL_HEIGHT_ZONE_COLOUR_4D

Fill slope colour *colour box* *default dark green*

the colour of the text in the Type column for the Fill commands involving slope, in the Modifiers section of the ***Left/Right MTF Modifiers*** *panel.*

Env variable and full documentation: see FILL_SLOPE_ZONE_COLOUR_4D

MTF & Boxing > MTF Final Colours

Final colour *colour box* *default light brown RGB(147, 87, 28)*

the colour of the text in the Type column for the Final commands (other than those involving width or slope) in the Modifiers section of the ***Left/Right MTF Modifiers*** *panel.*

Env variable and full documentation: see FINAL_ZONE_COLOUR_4D

Final width colour *colour box* *default dark brown*

the colour of the text in the Type column for the Final commands involving width, in the Modifiers section of the ***Left/Right MTF Modifiers*** *panel.*

Env variable and full documentation: see FINAL_WIDTH_ZONE_COLOUR_4D

Final cut colour *colour box* *default light brown*

the colour of the text in the Type column for the Final command for Final Cut slope, in the Modifiers *section of the **Left/Right MTF Modifiers** panel.*

Env variable and full documentation: see FINAL_CUT_SLOPE_ZONE_COLOUR_4D

Final fill colour *colour box* *default light brown*

*the colour of the text in the Type column for the Final command for Final Fill slope, in the Modifiers section of the **Left/Right MTF Modifiers** panel.*

Env variable and full documentation: see FINAL_FILL_SLOPE_ZONE_COLOUR_4D

Final no cut colour *colour box* *default light brown*

*the colour of the text in the Type column for the Final command for No Cut slope, in the Modifiers section of the **Left/Right MTF Modifiers** panel.*

Env variable and full documentation: see FINAL_NO_CUT_SLOPE_ZONE_COLOUR_4D

Final no fill colour *colour box* *default light brown*

*the colour of the text in the Type column for the Final command for No Fill slope, in the Modifiers section of the **Left/Right MTF Modifiers** panel.*

Env variable and full documentation: see FINAL_NO_FILL_SLOPE_ZONE_COLOUR_4D

Final no cut/fill colour *colour box* *default light brown*

*the colour of the text in the Type column for the Final commands for No cut/fill, in the Modifiers section of the **Left/Right MTF Modifiers** panel.*

Env variable and full documentation: see FINAL_NO_CUT_FILL_SLOPE_ZONE_COLOUR_4D

MTF & Boxing > Boxing Editor

Boxing wall offset *measure box* *default 0.000001*

when boxing automatically creates a vertical wall, this is the offset distance between the top and bottom of the vertical wall.

Env variable and full documentation: see BOXING_WALL_OFFSET_4D

Rules colour *colour box* *default blue*

the colour of the text in the Type column in the Boxing Rules panel for all Boxing command other than Comment, Decision, Goto and Label.

Env variable and full documentation: see BOXING_RULES_COLOUR_4D

Comment colour *colour box* *default yellow*

background colour for the Comment boxing command grid row in the Boxing Rules panel. The text in the grid row is black.

Env variable and full documentation: see BOXING_COMMENT_COLOUR_4D

Decision/goto colour *colour box* *default mauve*

the colour of the text in the Type column for the Decision and Goto commands in the Boxing Rules panel.

Env variable and full documentation: see BOXING_DECISION_GOTO_COLOUR_4D

Label colour *colour box* *default light red*

the colour of the text in the Type column for the Label command in the Boxing Rules panel.

Env variable and full documentation: see BOXING_LABEL_COLOUR_4D

Region colour colour box

the colour of the text in the row for the Region command in the Boxing Rules panel.

Env variable and full documentation: see BOXING_REGION_COLOUR_4D

Views

Views > General

Prompt on close tick box

if ticked, when a view is closed/deleted, a prompt will ask for a confirmation of deleting/closing.

Env variable and full documentation: see PROMPT_ON_VIEW_CLOSE_4D

Use density drawing tick box

if ticked, for a new project, the default for Use density drawing *in the* **Defaults** *panel is* ***tick***.

If not ticked, for a new project, the default for Use density drawing *in the* **Defaults** *panel is* ***no tick***.

For more information on ***density drawing****, see* Use density drawing tick box.

Note*: This setting is only applicable to the 250M version of* ***12d Model.***

Env variable and full documentation: see USE_DENSITY_CHECKS_4D

Default pan mode tick box default *tick*

if ticked, standard pan is used for pan/pans on view.
If not ticked, pane delta is used for pan/pans on view.

Env variable and full documentation: see PAN_MODE_4D

Zoom origin dynamic tick box default not tick

controls the origin of the dynamic zoom.

If ticked, then the point selected in the view to indicate which view to dynamically zoom (and to be the zoom-in, zoom-out definition point) becomes the point to dynamically zoom about.

Whilst the dynamic zoom is running, another point can be selected to become the new zoom origin.

Env variable and full documentation: see ZOOM_ORIGIN_DYNAMIC_4D

Zoom pan dynamic tick box default not tick

if ticked, ***dynamic pan*** *is the default for the pan options.*

Env variable and full documentation: see ZOOM_PAN_DYNAMIC_4D

Icons on views tick box default *tick*

if ticked then icons instead of text are used for menu items on the views.
If not ticked, text is used for menu items on the views.

Env variable and full documentation: see VIEW_BITMAP_BUTTONS_4D

Show view buttons tick box default *tick*

if ticked then menu items (view buttons) are displayed on the views (as icons or text).
If not ticked, menu items (view buttons) on not displayed on the views.

Note*: displaying view buttons as icons or text is controlled by* ***Icons on views.***

Env variable and full documentation: see VIEW_BUTTONS_4D

Data tool tips tick box default *tick*

if ticked then data tips can be displayed when the cursor moves over vertices in a plan view. The ***D*** *snap is then operational and toggles the data tips on and off in a 12d session.*

If not ticked, data tips will not be displayed and ***D*** *snap has no effect.*

Env variable and full documentation: see DATA_TIPS_4D

Default view colour colour box default *black*

the default background colour for views. After a view is created, its background colour can then be modified and the new colour is saved for that view.

Env variable and full documentation: see DEFAULT_VIEW_COLOUR_4D

Preview view name text box default *blank*

if non blank, the name of the view whose image is dumped on exiting the project. The image is used as the project preview.
If blank then the last active view is used.

Env variable and full documentation: see PREVIEW_VIEW_4D

Views > OpenGL

View backing store choice box off, on

if ***on****, a backing store is used.*
if ***off****, a backing store is not used.*

For Window Vista/Windows 7, the default is on. Otherwise the default is 0.

Env variable and full documentation: see OPENGL_VIEW_BACKING_STORE_4D

Use offset tick box default tick

if ticked, the coordinates are localised for OpenGL calls. This is to work around problems with some graphics cards that can't handle large coordinates.

Env variable and full documentation: see OPENGL_OFFSET_4D

Cache tins tick box *default not ticked*

if ticked, tins are cached in the graphics card memory for potential speed ups. More memory in the graphics card allows more caching and usually more performance gains.

Env variable and full documentation: see OPENGL_CACHE_TINS_4D

Cache textures and rasters tick box *default ticked*

if ticked, rasters and textures are cached in the graphics card memory for potential speed ups. More memory in the graphics card allows more caching and usually more performance gains.

Env variable and full documentation: see OPENGL_CACHE_4D

Use mipmaps for rasters tick box *default tick*

if ticked, the graphics card down samples for rasters when the image is further away.

Env variable and full documentation: see OPENGL_MIPMAP_4D

Use mipmaps for billboards tick box

if ticked, the graphics card down samples for billboards when the image is further away.

Env variable and full documentation: see OPENGL_MIPMAP_BILLBOARDS_4D

Use mipmaps for plan images tick box default ticked

if ticked, the graphics card down samples plan images when draped onto a tin.

Env variable and full documentation: see OPENGL_MIPMAP_PLAN_IMAGES_4D

Use mipmaps for projector images tick box default ticked *if ticked, the graphics card down samples projector images (a projector is for the "hidden" perspective image data object of a super string).*

Env variable and full documentation: see OPENGL_MIPMAP_PROJECTOR_IMAGES_4D

GUI

GUI > General

Width of edit fields (number of characters) text box *default 10*

if non blank, the number of characters to make the width of an Edit Box on a panel.

Env variable and full documentation: see EDIT_BOX_WIDTH_IN_CHARACTERS_4D

Show help buttons tick box

if ticked, Help buttons are added to panels.

Env variable and full documentation: see HELP_BUTTONS_4D

Use lists for popups tick box

if ticked, the popup lists are scrolling lists.
If not ticked, the popups turn into walk-right menus when too long.

Env variable and full documentation: see LIST_POPUPS_4D

Use trees for linestyles and symbols tick box default tick

if ticked, the linestyle and symbol pop-up lists are in scrolling boxes so they don't run over the bottom of the screen. The list of linestyles/symbols is displayed in a tree structure with the Groups as the nodes of the tree.
If not ticked, the linestyle and symbols lists are one long list with each Group being an item on the list. The list may get too long to fit on the screen.

Env variable and full documentation: see USE_NEW_LINESTYLE_LIST_BOX_4D

Warp cursor hide tick box default *not tick*

controls whether the cursor is hidden before moving - only needed on some computers.

If ticked, don't hide the cursor before moving it.
If not ticked, hides the cursor before moving it.

Env variable and full documentation: see WARP_CURSOR_HIDE_4D

Multi-line text edits tick box default not ticked

if ticked, a Text Edit Box is used instead of the Input Box and more than one line of text can be typed.
Env variable and full documentation: see MULTI_LINE_TEXT_4D

Colour widgets with errors tick box default ticked

*if ticked, when a panel field fails to validate, the panel field is filled with the colour given in the **Colour for failed widgets**.*
Env variable and full documentation: see USE_VALIDATION_COLOURS_4D

Colour for failed widgets colour box

if not blank, the colour to fill the panel field with when there is a validation error for the field. The value is either a colour name, a colour number or RGB(x,y,z).

*This is only used if **Colour widgets with errors** is ticked (or at least not ticked since the default is ticked).*
If blank, the default colour is RGB(255,72,72),

Env variable and full documentation: see VALIDATION_FAIL_COLOUR_4D

Xtra menu file file box default *xtramenu.4d*

if non blank, the full path name of the 12d Solutions supplied file of definitions for some extra menus.

Env variable and full documentation: see EXTRA_OPTIONS_4D

User options file file box default *usermenu.4d*

if non blank, the full path name of the user supplied file of definitions for user defined menus.

Env variable and full documentation: see USER_OPTIONS_4D

Toolbars file file box default *toolbars.4d*

if non blank, the full path name of the toolbar definitions and names.

Env variable and full documentation: see TOOLBARS_4D

Delete walkrights distance positive integer default *32*

the distance in pixels that is used to collapse the cascade of walk-right menus when the cursor moves that distance past the end of the last walk-right menu.

Env variable and full documentation: see AUTO_DELETE_WALKRIGHTS_4D

Drag reset distance positive integer default *50*

the distance in pixels to move the cursor to reset the picking rejection list for a directional pick. If blank then the value 50 is used.

Env variable and full documentation: see AUTO_RESET_SELECT_DRAG_TOLERANCE_4D

Reset distance positive integer default *5*

the distance in pixels to move the cursor to reset the picking rejection list for a non-directional pick. If blank then the value 5 is used.

Env variable and full documentation: see AUTO_RESET_TOLERANCE_4D

Default table width positive integer default *5*

if non blank, gives the number of characters displayed in tables such as decisionals and mtf editor.

Env variable and full documentation: see DEFAULT_TABLE_WIDTH_4D

Linestyle/symbol box width number box

if non blank, the pixel width of the linestyle and symbol scrolling pop-ups.
If blank, the default is 256.
Env variable and full documentation: see LINESTYLE_BOX_WIDTH_4D

Linestyle/symbol box height number box

if non blank, the pixel height of the linestyle and symbol scrolling pop-ups.
If blank, the default is 512.
Env variable and full documentation: see LINESTYLE_BOX_HEIGHT_4D

GUI > OnScreen keyboard

On screen keyboard mode choice box *No keyboard*
Dockable keyboard
Full screen keyboard

Default No keyboard

if ***No keyboard,*** *then no onscreen keyboard comes up when you double click in a panel field.*

if ***Dockable keyboard****, when you double click in a panel field that takes typed input, then a dockable onscreen keyboard come up for the user to type the data for the panel field into.*

*if **Full screen keyboard**, when you double click in a panel field that takes typed input, then a full screen onscreen keyboard come up for the user to type the data for the panel field into.*

Env variable and full documentation: see ONSCREEN_KEYBOARD_4D

On screen keyboard layout choice box *Full keyboard*
Numeric keyboard

Default Full keyboard

*if **Full keyboard,** then when there is an onscreen keyboard, it comes up with a full keyboard.*

*if **Numeric keyboard**, then when there is an onscreen keyboard, it comes up with just a numeric keyboard.*

Env variable and full documentation: see ONSCREEN_KEYBOARD_LAYOUT_4D

On screen keyboard font size number box

if non blank, the pixel size of the font for the onscreen keyboard.

If blank, it defaults to the normal system font size.

Env variable and full documentation: see ONSCREEN_KEYBOARD_FONT_SIZE_4D

GUI > Special characters

Large diameter symbol *integer (base 10)* default *216*

The integer (base 10) value of the character to use as the large diameter symbol.

Env variable and full documentation: see DIAMETER_LARGE_CHARACTER_4D

Cubed symbol *integer (base 10)* default *179*

The integer (base 10) value of the character to use as the cubed symbol.

Env variable and full documentation: see CUBED_CHARACTER_4D

Small diameter symbol *integer (base 10)* default *248*

The integer (base 10) value of the character to use as the small diameter symbol.

Env variable and full documentation: see DIAMETER_SMALL_CHARACTER_4D

Middle dot *integer (base 10)* default *183*

The integer (base 10) value of the character to use as the middle dot symbol.

Env variable and full documentation: see MIDDLE_DOT_CHARACTER_4D

Squared symbol *integer (base 10)* default *178*

The integer (base 10) value of the character to use as the squared symbol.

Env variable and full documentation: see SQUARE_CHARACTER_4D

Degrees character *integer (base 10)* default *176*

The integer (base 10) value of the character to use as the degrees character.

Env variable and full documentation: see DEGREES_CHARACTER_4D

GUI > Chain Editor

Prompt for on deleting a chain command *tick box*

if ticked,

Env variable and full documentation: see ASK_ON_CHAIN_COMMAND_DELETE_4D

GUI > Split drafting message

Split long drafting messages *tick box*

if ticked, for CAD Dimensions, Leaders and Tables, long messages being written to the screen message area are broken up into two shorter lines with the first one being displayed. Both the shorter lines have a (m)ore on them to get to the other line.

Env variable and full documentation: see DRAFTING_SPLIT_MESSAGE_4D

Warnings and Error Reporting

Double confirm delete tick box default not tick

if ticked, the user is asked twice to confirm for deletes and cleans.
If not ticked, the user is asked once to confirm for deletes and cleans.

Env variable and full documentation: see DOUBLE_CONFIRM_DELETE_4D

Crash log level choice box

MiniDumpNormal
MiniDumpWithDataSegs
MiniDumpWithFullMemory
MiniDumpWithHandleData
MiniDumpFilterMemory
MiniDumpScanMemory
MiniDumpWithUnloadedModules
MiniDumpWithIndirectlyReferencedMemory
MiniDumpFiltureModulePaths

MiniDumpWithPrivateReadWriteMemory
MiniDumpWithoutOptionalData

Controls the amount of information written out if ***12d Model*** *crashes.*

Environment variable MINI_DUMP_LEVEL_4D

GIS

ArcSDE DLL Path file box

the full path name to the ArcSDE DLL. This is only required when using the ArcSDE Server.

Env variable and full documentation: see GIS_ARCSDE_PATH_4D

Oracle DLL Path file box

the full path name to the Oracle DLL. This is only required when using the Oracle Server.

Env variable and full documentation: see GIS_ORACLE_PATH_4D

External Apps

External Apps > ADAC

Adac version text

the ADAC Schema version, e.g. 4.1.0

Env variable and full documentation: see ADAC_VERSION_4D

External Apps > AutoCAD

Autocad template folder folder box

if non blank, the full path name of the folder holding Autocad template files.

Env variable and full documentation: see ACAD_SEEDFILES_4D

Acad.pat file box

If non blank, the full path name of the AutoCAD patterns file.

Env variable and full documentation: see AUTOCAD_PATTERNS_4D

Trimesh output mode choice box Do not write, Faces, Polyface mesh

Env variable and full documentation: see TRIMESH_TO_DWG_MODE_4D

External Apps > CivilCAD

CivilCAD folder folder box

if non blank, the full path name of the folder holding CivilCAD files.

Env variable and full documentation: see CIVILCAD_PATH_4D

External Apps > Microstation

Microstation seed folder folder box

if non blank, the full path name of the folder of Microstation seed files.

Env variable and full documentation: see MS_SEEDFILES_4D

External Apps > TP Stakeout

TP Stakeout folder folder box

if non blank, the full path name of the folder of TP Stakeout files.

Env variable and full documentation: see TP_STAKEOUT_PATH_4D

External Apps > VPath

Vpath Windows folder folder box

if non blank, the full path name of the folder for the Queensland Main Road Windows program Vpath - for vehicle turning paths.

Env variable and full documentation: see WINDOWS_VEHICLE_PATH_4D

External Apps > Winter

Winter data folder folder box

if non blank, the full path name of the *Folder containing the Winter data of N-values for Australia.*

Env variable and full documentation: see WINTER_DATA_4D

Winter faster interpolations tick box *default tick*

if ticked, re-reading the Winter data is avoided and this speeds up the calculation for the Winter interpolations.

Env variable and full documentation: see WINTER_USE_NEW_METHOD_4D

Variables

the Variables grid allows for the entry of 12d environment variables that have not been especially included in the Edit Environment Variables *panel.*

Variable **Value**

*The variable tab consists of a table for specifying environment variable names (**Variable**) and setting their values (**Value**).*

This is mainly used for setting environment variables that are not already in the **Edit Environment Variables** *panel.*

Go to the next section 7.6.4 Env Configuration or return to 7.6 Management.

7.6.4 Env Configuration

Position of menu: **Project =>Management =>Env configuration**

The default ***12d Model*** system uses the 12d Solutions supplied ***set_ups*** and ***library*** folders in ***Program files\12d\12d Model\11.0*** and the user supplied folders ***user*** and ***user_lib*** in *c:\12d\11.00*.

There are ***12d Model*** environment variables in ***env.4d*** that can modify the location of each of these folders and most set up files, dongle to be used and the workspace file for new projects.

For most users this provides enough customisation however for users requiring totally different ***user*** and ***user_lib*** folders for different clients will find the above system too restricting.

For example, one project may be for a Main Roads Department which requires its own mapping files, linestyle files, ppf files etc. Another project is for a Local Authority who has totally different requirements.

Environment Configurations can

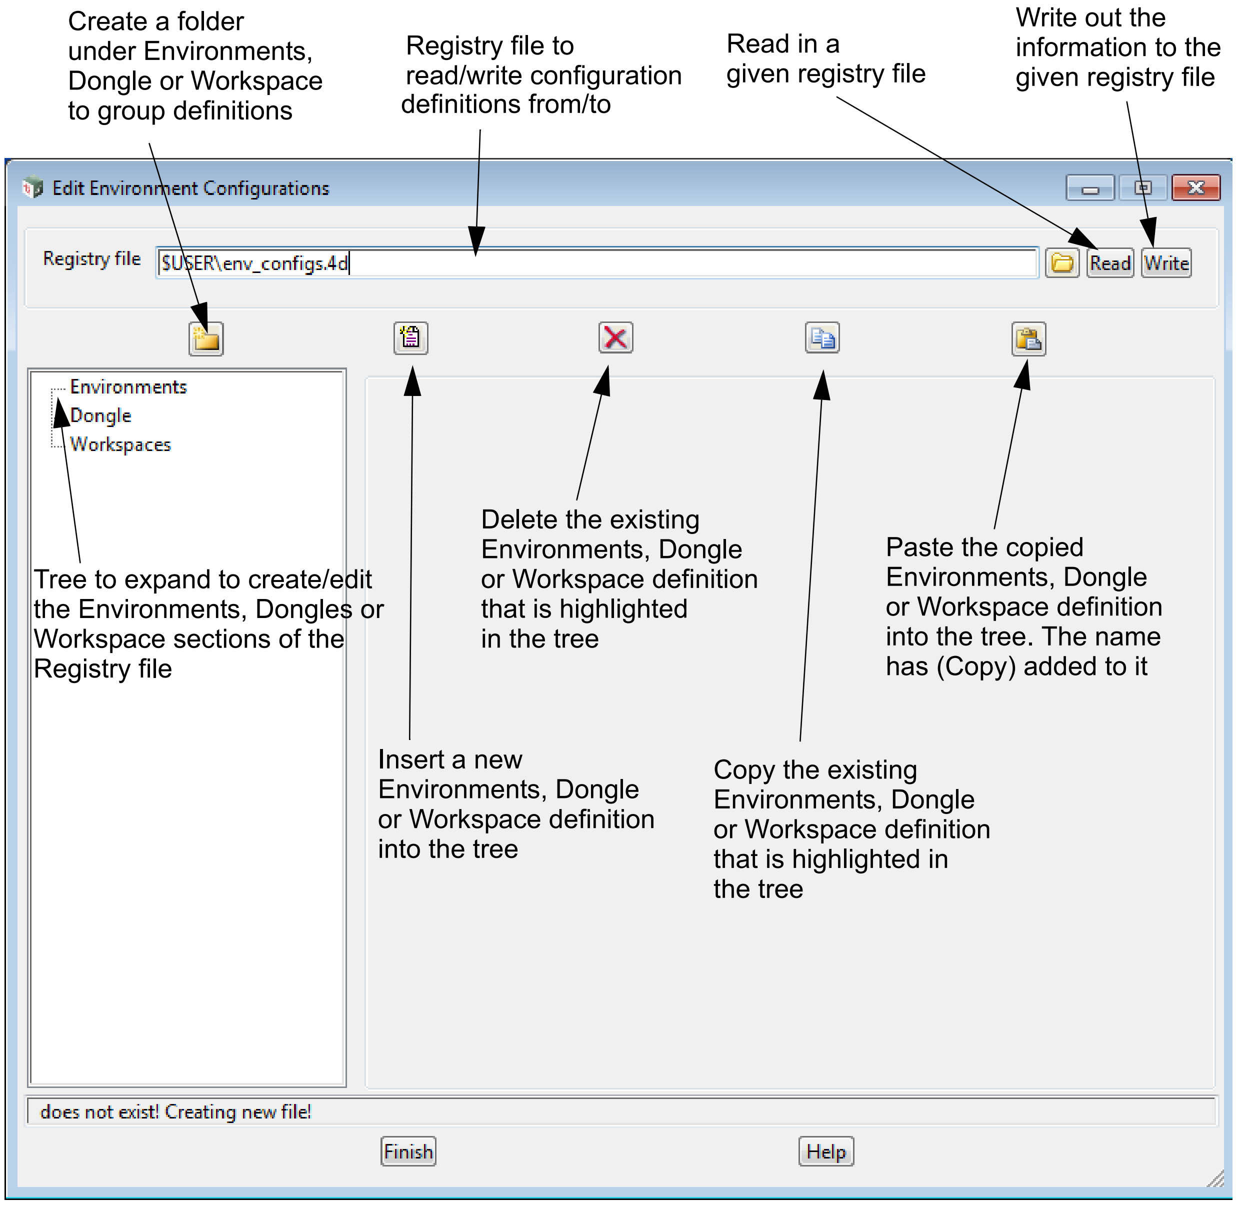
(a) define the environment variable file ***env.4d*** to be used. Hence if different ***env.4d*** files have been set up for different clients, the environment configuration file quickly sets up that binding for a project.

(b) define environment variables that over writes the values set up in the ***env.4d*** file being used for the project. Often a whole new env file is not required but just the replacement of some of the environment variables. For example, just override the location of the folders *user* and *user_lib* from those in the ***env.4d*** file being used.

(c) define the computer with the network dongle to be used with the project. If used, this will override any settings in the env.4d file and values in Environments.

(d) define the workspace file to be used for new projects. If used, this will override any settings in the env.4d file or values in *Environments*.

Selecting **Env configuration** displays the **Edit Environment Configuration** panel which defines the different Environment configurations, Dongle and Workspace settings.



Buttons at Bottom grid

Write button

write out a Registry file

Read button

read in the registry file given in the Registry file field.

Each of the sections Environments, Dongles and Workspaces will now be described in greater detail.

For the section *Registry file*, go to Creating/Editing a Registry File
Environments Creating/Editing an Environments Set Up
Dongles Creating/Editing a Dongles Set Up
Workspaces Creating/Editing a Workspaces Set Up

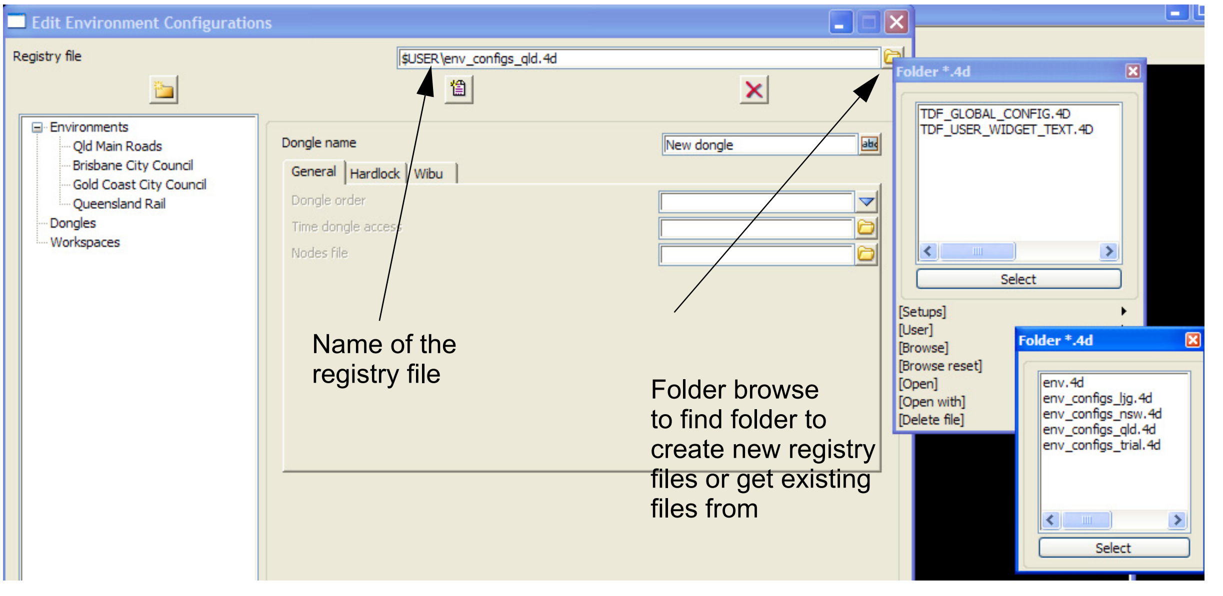
How To Use the Edit Environment Configurations Panel

Creating/Editing a Registry File

When the **Edit Environment Configurations** panel is opened, if no ***env_configs.4d*** file exists in the ***User*** folder for that project, a new blank ***env_configs.4d*** file is automatically created.

To create a ***Registry file*** of a different name, navigate to the folder to write the registry file to, type the registry file name into the ***Registry file box*** and hit <enter>. All the created information will be written away to this file when the **Write** icon is clicked on the **Edit Environment Configurations** panel.

The edit and modify a ***new Registry file***, type in the path name or use the navigator on the ***Registry file box*** and select the required registry file. Clicking on the **Read** icon reads in the information from the selected registry file.



Each of the sections Environments, Dongles and Workspaces will now be described in greater detail.

For the section *Environments*, go to [Creating/Editing an Environments Set Up]

Dongles [Creating/Editing a Dongles Set Up]

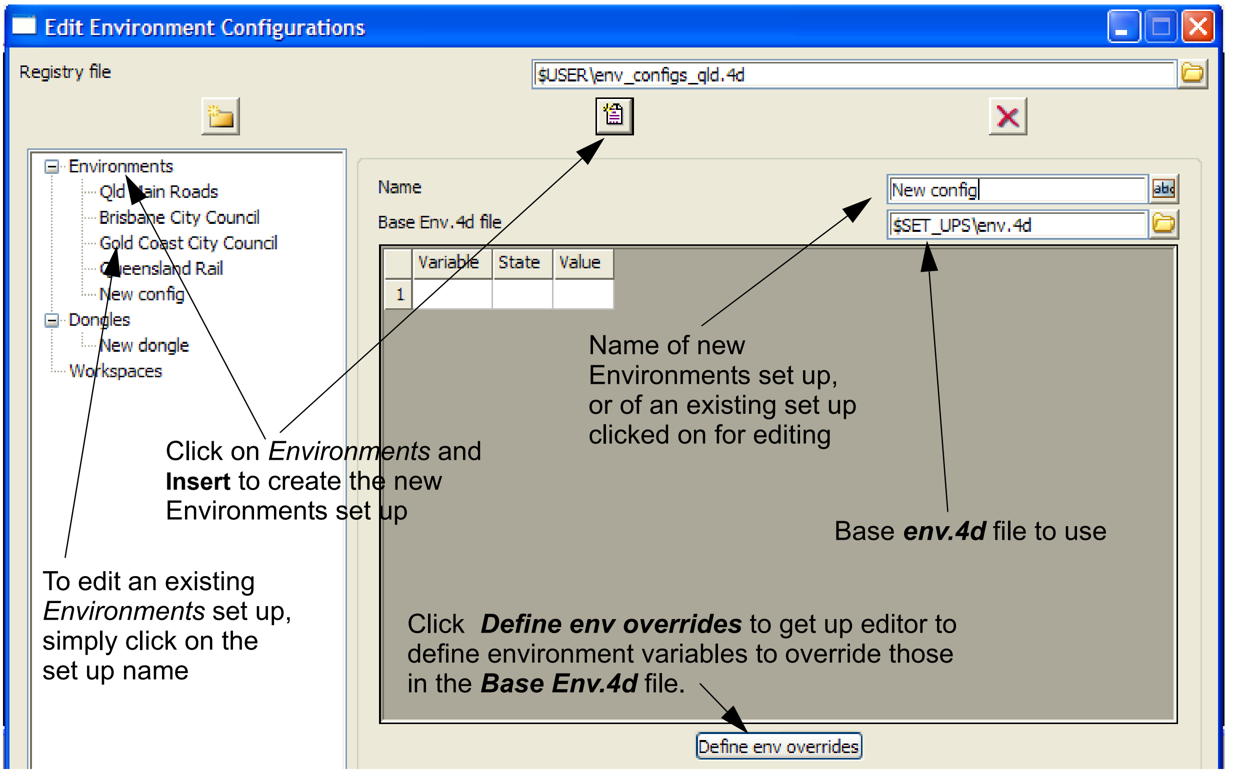
Workspaces [Creating/Editing a Workspaces Set Up]

Creating/Editing an Environments Set Up

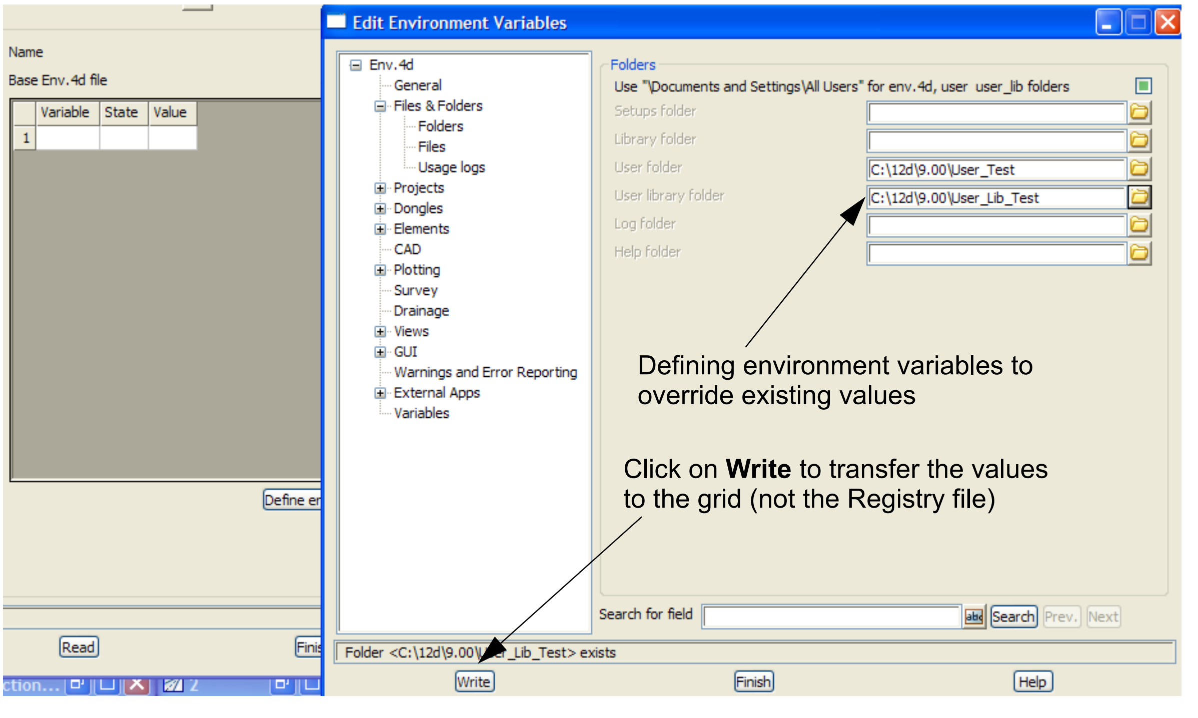
To create a new **Environments** set up, click on the *Environments* node and then on the **Insert** button.

To edit an existing **Environments** set up, simply click on the ***name*** of the set ups to be edited in the *Environments* section

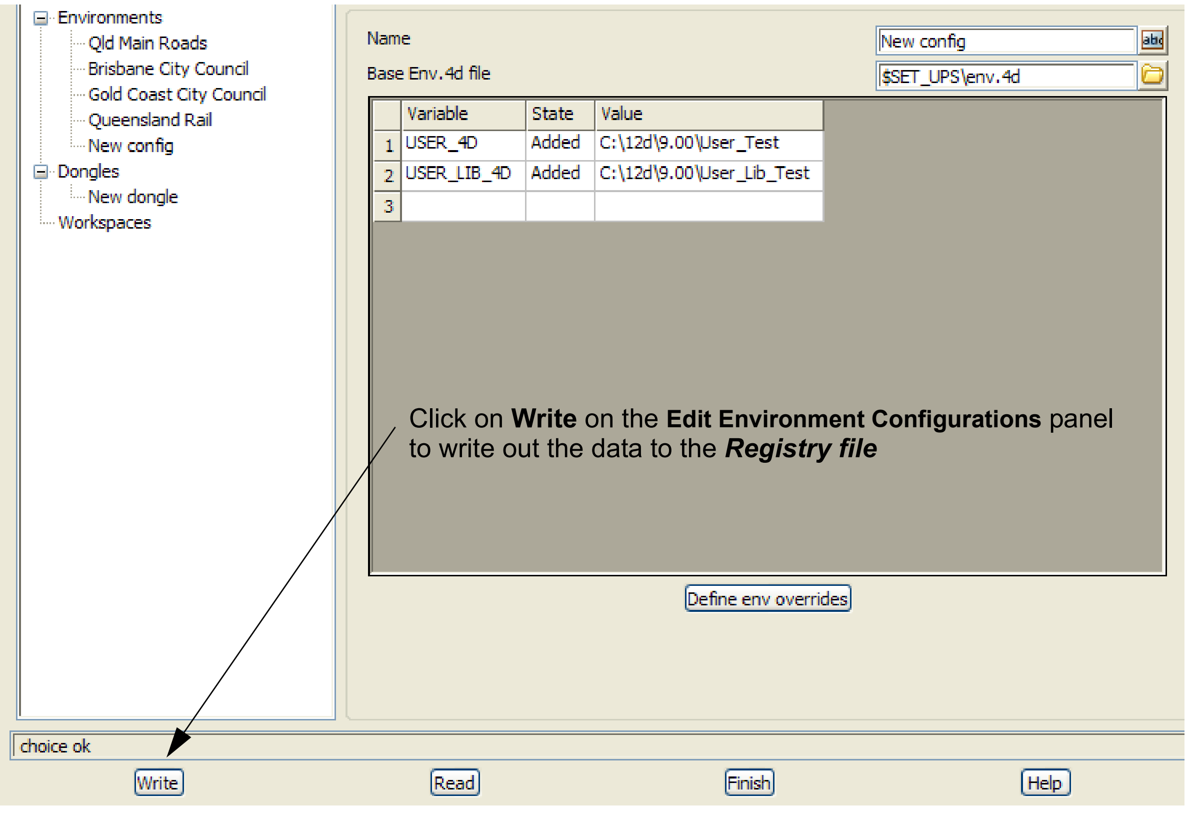
If the ***Base Env.4d file*** field is ***blank***, then the default ***env.4d*** file is used for the project.
If the ***Base Env.4d file*** field is not blank, then it gives the (path) name of the file to use as the ***env.4d*** file.



Any environment variable can be overridden by typing is name and value into the grid, or by bringing up an environment variable editor by clicking on **Define env overrides** button and fill in the required values in the **Edit Environment Variables** panel that is brought up.



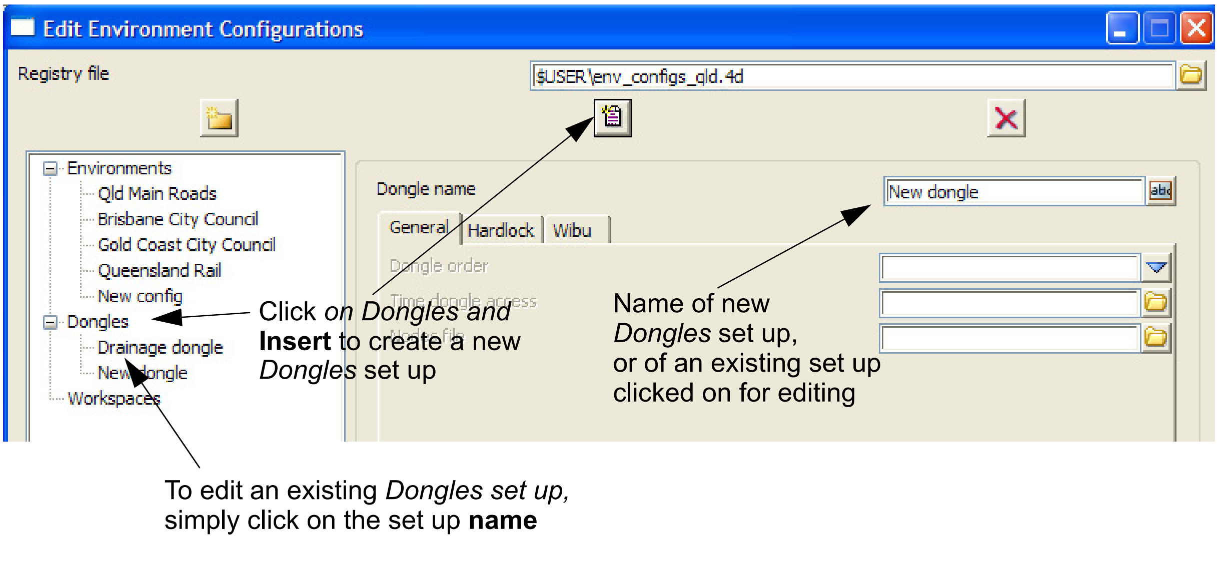
Clicking on **Write** in the **Edit Environment Configuration** panel writes out all the data for the sections *Environments*, *Dongles* and *Workspaces*, to the registry file.



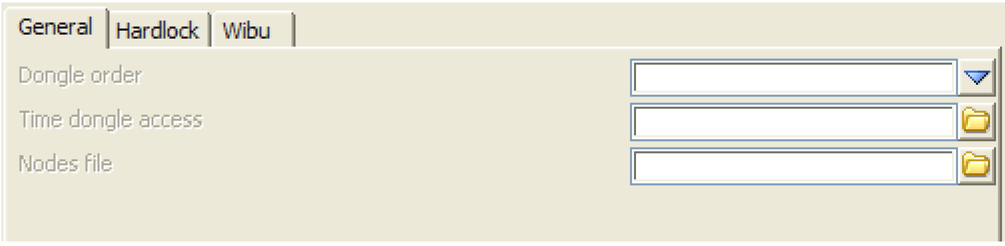
Creating/Editing a Dongles Set Up

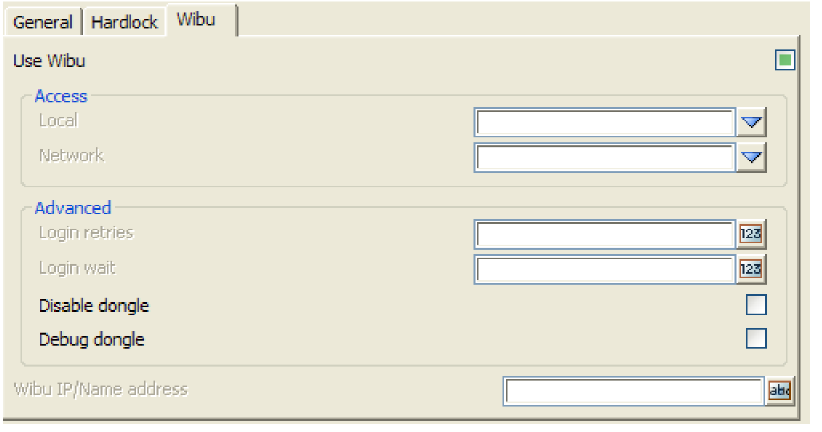
To create a new **Dongle** set up, click on the *Dongles* node and then on the **Insert** button.

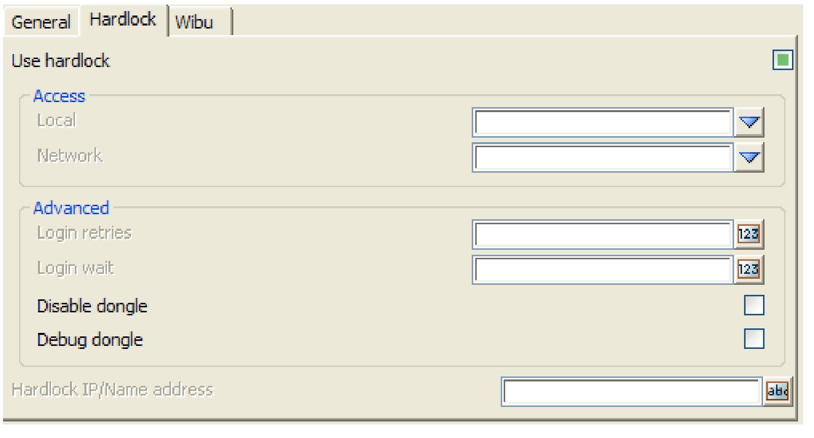
To edit an existing **Dongle** set up, simply click on the name of the **Dongle** set up to be edited.



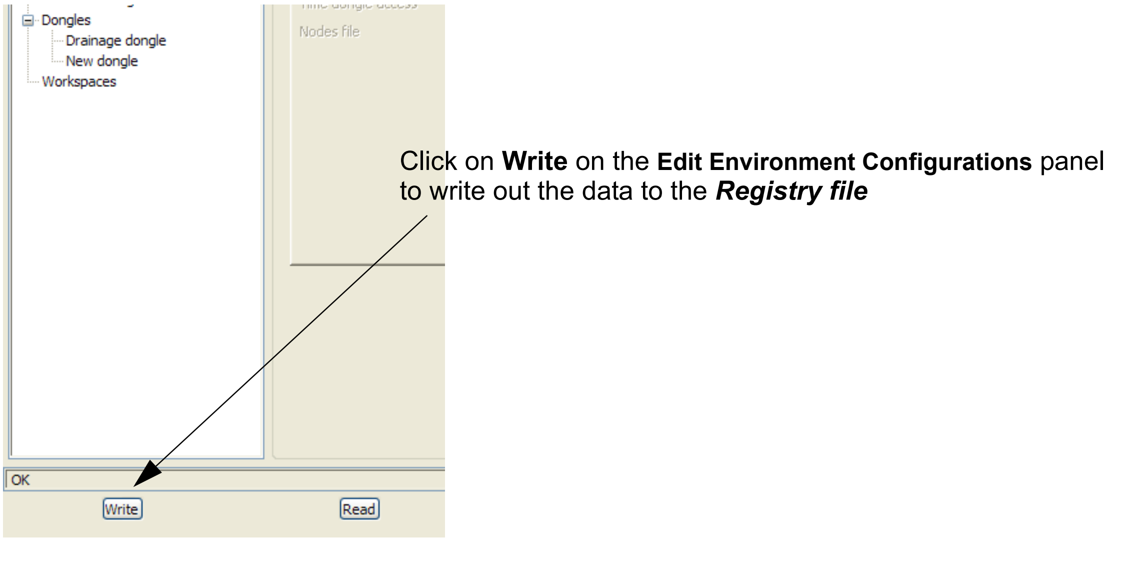
Any environment variable values defined in the *General*, *Hardlock* and *Wibu* tabs will override those in the environment file.







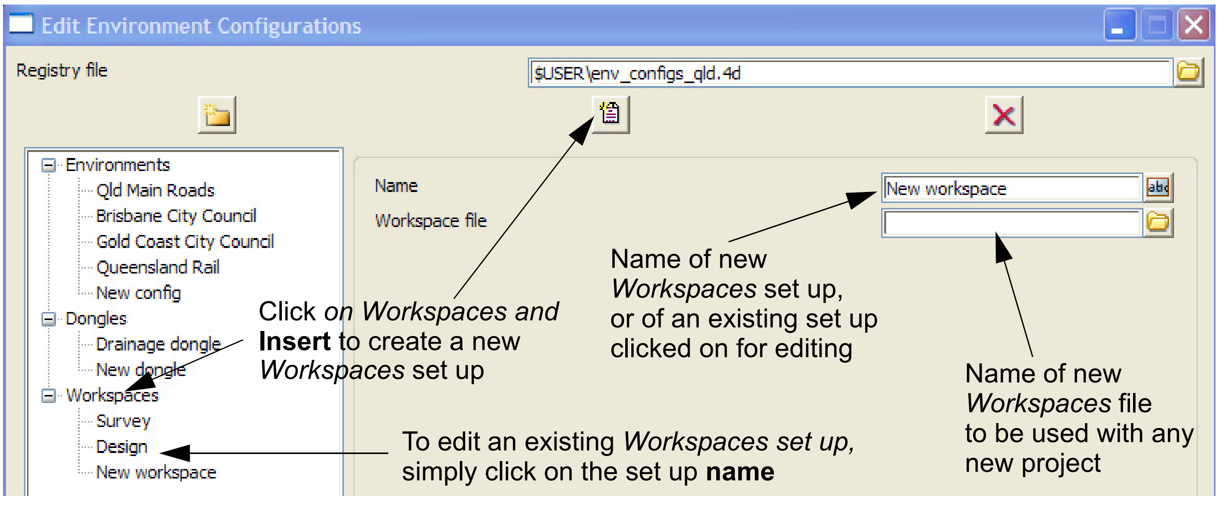
Clicking on **Write** in the **Edit Environment Configuration** panel writes out all the data for the sections *Environments*, *Dongles* and *Workspaces*, to the registry file.



Creating/Editing a Workspaces Set Up

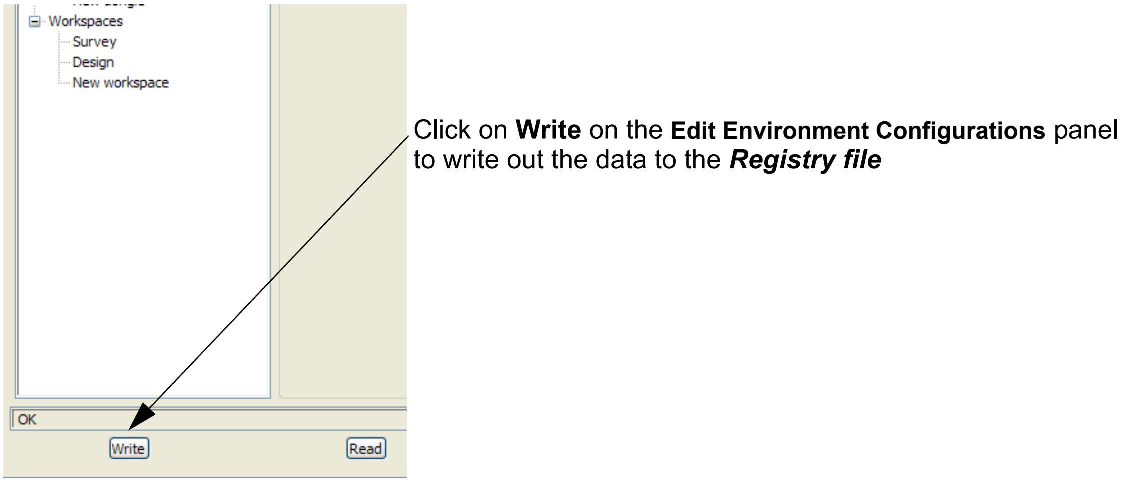
To create a new **Workspaces** set up, click on the *Workspaces* node and then on the **Insert** button.

To edit an existing **Workspaces** set up, simply click on the name of the **workspaces** set up to be edited.



The full path name of the Workspaces file to be used when creating new projects is recorded in the **Workspace file** panel field.

Clicking on **Write** in the **Edit Environment Configuration** panel writes out all the data for the sections *Environments*, *Dongles* and *Workspaces*, to the registry file.

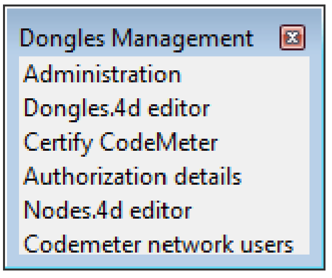


Go to the next section 7.6.6 Projections or return to 7.6 Management.

7.6.5 Dongles

Position of menu: **Project =>Management =>Dongles**

The **Dongles** walk-right menu contains options to discover all the dongles on your subnet, edit the dongles.4d file, certify CodeMeters and show authorization information.



run the dongle administration options
edit the dongles.4d file
certify CodeMeter containers
show Authorization details
edit the nodes.4d file
report on hte users of CodeMeter network dongles

See

- 7.6.5.2 Dongles Administration
- 7.6.5.3 Dongles.4d Editor
- 7.6.5.4 Certify CodeMeter
- 7.6.5.5 Authorization Details
- 7.6.5.6 Nodes.4d Editor
- 7.6.5.7 CodeMeter Network User

Also for information on the **Authorization Error** panel that comes up if there is an error authorising ***12d Model***, see 7.6.5.5.1 Authorization Error.

For more information about what is needed for authorizing ***12d Model***, see 7.6.5.1 12d Dongles, Dongles.4d, Nodes.4d, and Authorizing

7.6.5.1 12d Dongles, Dongles.4d, Nodes.4d, and Authorizing

To control the licensing of ***12d Model*** and specify what modules are used for each ***12d Model*** license, ***12d Model*** uses a combination of a **physical hardware lock** and a **nodes.4d file**.

The **physical hardware lock** is a **Wibu dongle** or a **CodeMeter Container**.

A **Wibu dongle** is either a Wibu USB Standalone (local) dongle (green colour), or a Wibu USB Network dongle (blue colour) that controls a given number of licenses. Each Wibu dongle has a unique ***12d Model*** dongle number. *See* 7.6.5.1.1 Wibu Dongles

A **CodeMeter Container** comes in a variety of physical shapes (USB, SD card etc) but unlike the Wibu dongle, the CodeMeter Container can contain one or more *virtual* ***12d Model*** dongle number. Each virtual ***12d Model*** dongle number is either a Standalone number or a Network number, and in Network case, it also have a given number of licenses. See 7.6.5.1.2 Wibu CodeMeter Containers.

Hence the ***12d Model* dongle number** (from a physical Wibu dongle or within a CodeMeter Container) is either

a Standalone (Local) number

or

a Network number with a given number of licenses

For brevity, the ***12d Model* dongle number** is also referred to as the **12d dongle number** or just the **12d dongle**. But remember that the **12d dongle** may not be a physical item - it may be just one of many 12d dongles stored in a CodeMeter Container.

So the term **12d dongle** will be used to mean:

(a) a physical Wibu dongle (either stand alone or network). This has a label with the 12d dongle number written on it.

(b) a virtual 12d dongle inside a CodeMeter Container. The 12d dongle numbers are obtained by running a CodeMeter Administration tool.

The **dongles.4d** file lists the computers to search for Wibu dongles and CodeMeter Containers to find 12d dongle numbers. It also defines the order to search for both computers and dongle types. See 7.6.5.3 Dongles.4d Editor.

The **nodes.4d** file is supplied by your ***12d Model*** Reseller and contains a list of ***12d Model*** dongle numbers that are valid for you, and for each ***12d Model*** dongle number in the list, the valid modules for that ***12d Model*** dongle number. The nodes.4d file is an XML file and there is an option to examine, modify and report on it. See 7.6.5.3 Dongles.4d Editor.

When ***12d Model*** tries to create a new project, or open an existing project, ***12d Model*** uses

1. the dongles.4d file to obtain a usable ***12d Model*** dongle number from the specified Wibu dongles or CodeMeter Containers

and if a ***12d Model*** dongle number is found,

2. a matching valid entry in the nodes.4d file for that ***12d Model*** dongle number.

If a match is found then the ***12d Model*** project is opened.

Otherwise an **Authorization Error** panel is displayed.

See

7.6.5.1.1 Wibu Dongles
7.6.5.1.2 Wibu CodeMeter Containers

7.6.5.1.1 Wibu Dongles

A **Wibu dongle** can be either a Wibu USB Standalone (local) dongle (a translucent green colour), or a Wibu USB Network dongle (a solid colour) that controls a given number of licenses. Each Wibu dongle has a unique ***12d Model*** dongle number.

The ***12d Model*** dongle numbers for Wibu Standalone (Local) dongles start with 572d.
The ***12d Model*** dongle numbers for Wibu Network dongles start with e151.

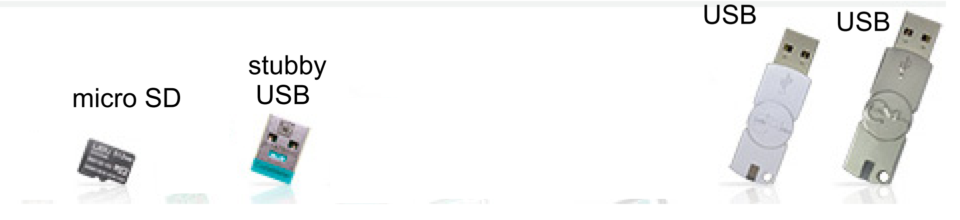
.

Continue to the next section [7.6.5.1.2 Wibu CodeMeter Containers]() or return to [7.6.5.1 12d Dongles, Dongles.4d, Nodes.4d, and Authorizing]() or [7.6.5 Dongles]().

7.6.5.1.2 Wibu CodeMeter Containers

In V11 a new type of physical hardware lock from Wibu, referred to as a **Wibu CodeMeter Container**, has been introduced. We will refer to the *Wibu CodeMeter Container* as a **CodeMeter Container** or a **CodeMeter**.

The **CodeMeters** are similar to the earlier Wibu standalone and network dongles except that they come in a wider variety of hardware shapes that will be more suitable for portable and tablet computers.



Unlike the Wibu dongle, the CodeMeter Container can contain one or more *virtual* ***12d Model*** dongle numbers.

Each virtual ***12d Model*** number may be either a Standalone number or a Network number, and in the Network case, it will also have a given number of licenses.

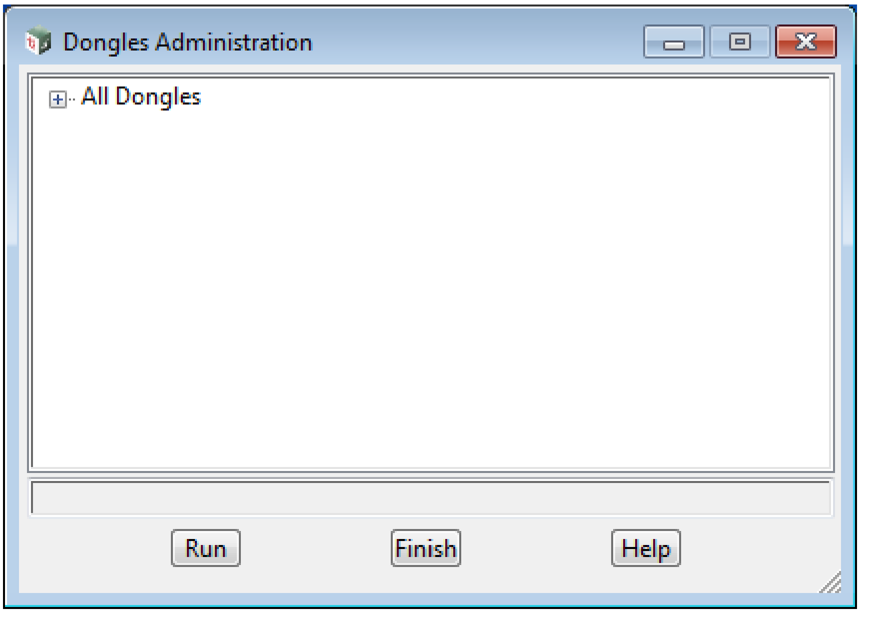
The ***12d Model*** Local (Standalone) dongle numbers in a CodeMeter Container start with 5c2d.
The ***12d Model*** Network dongle numbers in a CodeMeter Container start with ec51.

Return to [7.6.5.1 12d Dongles, Dongles.4d, Nodes.4d, and Authorizing]() or [7.6.5 Dongles]().

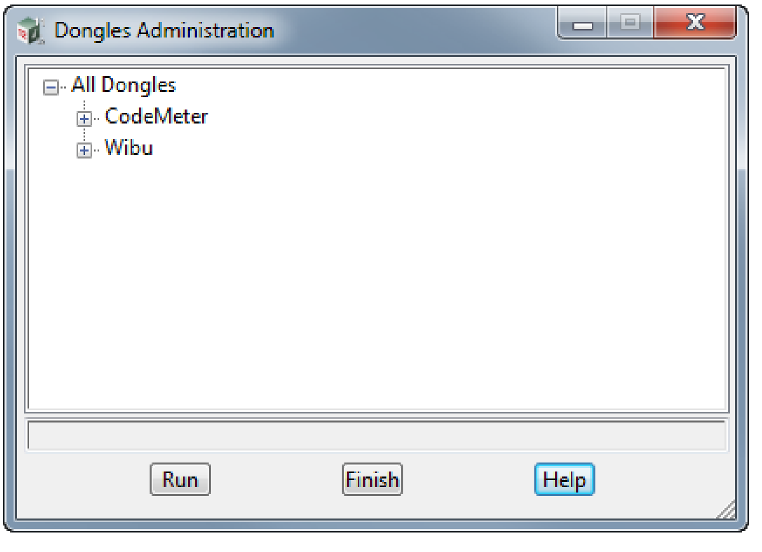
7.6.5.2 Dongles Administration

Position of option on menu: **Project =>Management =>Dongles =>Administration**
Position of option on menu: **Help =>Dongles**

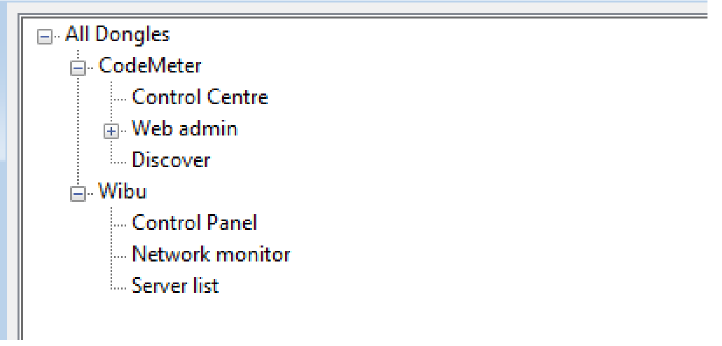
Selecting **Administration** brings up the **Dongles Administration** panel which displays information on ***CodeMeter Containers*** and ***Wibu Dongles*** as nodes in a tree structure.



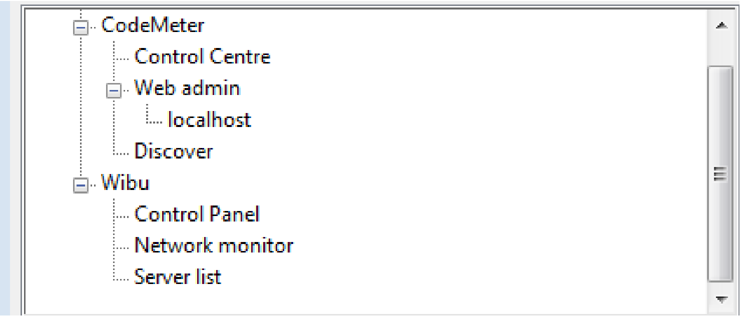
Clicking on the **+** in front of **All Dongles** will list the ***physical dongles*** that could be on your computer. That is, **CodeMeter Containers** and **Wibu Dongles**.



The **CodeMeter** and **Wibu** nodes can also be expanded by clicking on their **+**.



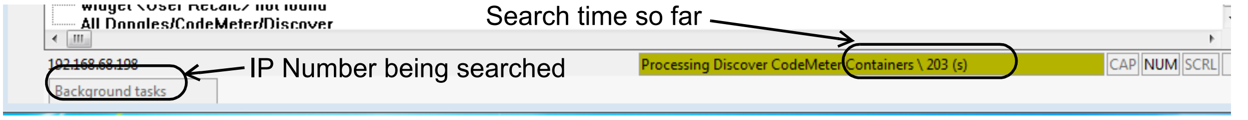
Clicking **+** on **CodeMeter >Web admin** will show the computer you are on as **localhost**.



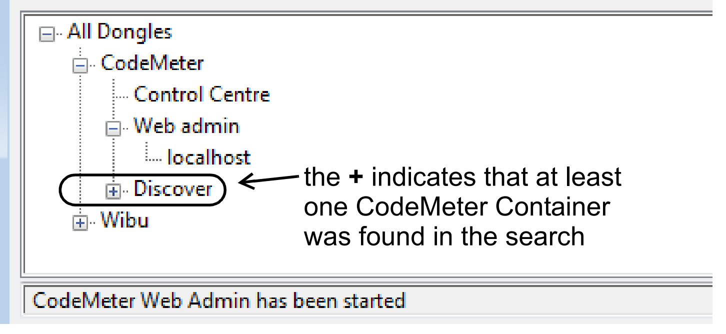
1. Clicking on **CodeMeter >Web admin >localhost** will run the CodeMeter Administration program and display information about the computer you are on in **Home** tab of the **CodeMeter WebAdmin** panel.

2. Clicking on **CodeMeter >Discover** will search the 255 sub nets looking for any *CodeMeter* Containers on each subnet.

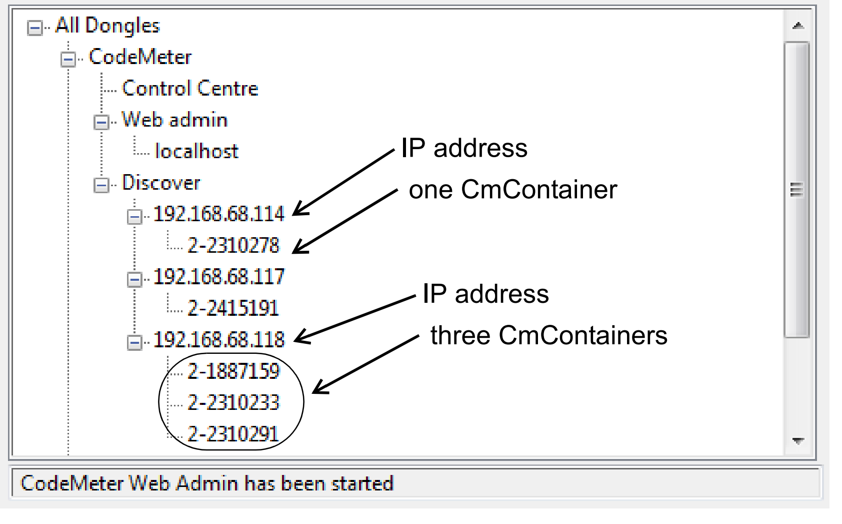
   The **Discovery** may take up to five minutes and you can see the progress of the **Discovery** as it lists the IP addresses being searched in the left had corner of the screen message area, and the right hand side displays how many seconds the **Discovery** has been running.



When **Discovery** has finished searching the 255 sub nets, the IP address of any computer with a CodeMeter Container on it is listed under the **Discover** node. So a **+** will appear in front of **Discover** if at least *one* CodeMeter Container has been found.



Expanding **Discover** will display the IP Addresses with *CodeMeter* Containers (called **CmContainers**) on them. And expanding an IP Address will list all the CmContainers attached to that IP.



Double clicking on a **CmContainer** will bring up the **CodeMeter WebAdmin** panel with the **Content >Licenses** tab on display.

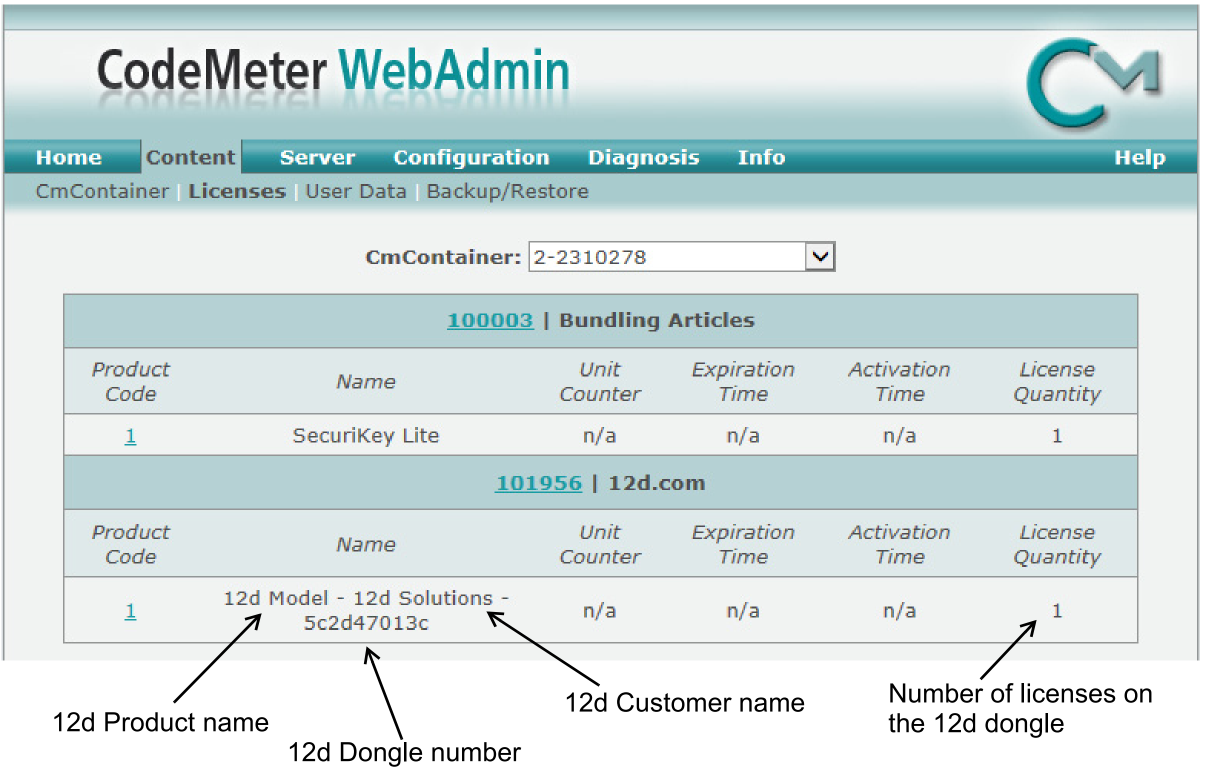
The **Content >Licenses** tab will show the **Products** it contains and for each **12d Product**, it will show the

(a) 12d Product name

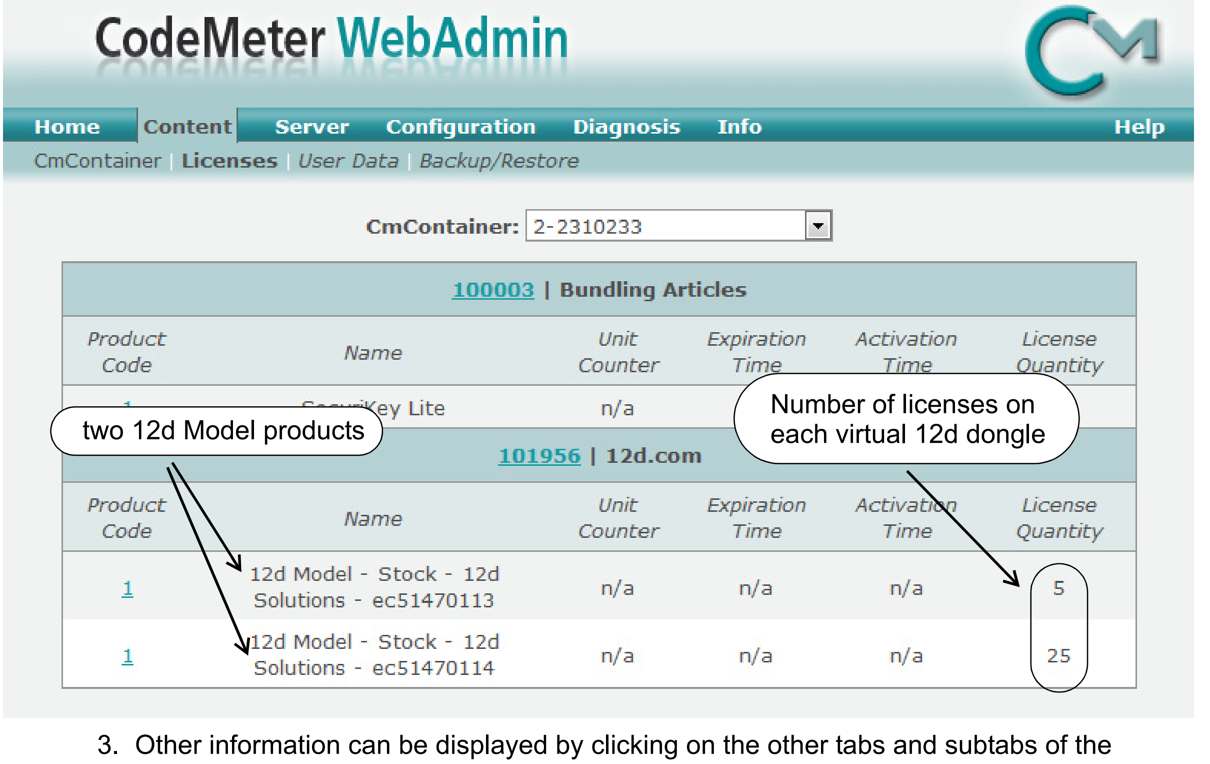
(b) 12d Customer name

(c) ***12d Model*** dongle number (a virtual dongle inside the physical CodeMeter Container)

(d) **number of licenses** for that ***12d Model*** **dongle**.



Note that there may be more than one virtual **12d Dongle** inside the one physical CodeMeter Container, as well as products from other software vendors. For example,



3. Other information can be displayed by clicking on the other tabs and subtabs of the **CodeMeter WebAdmin** panel.

Continue to the next section 7.6.5.3 Dongles.4d Editor or return to 7.6.5 Dongles.

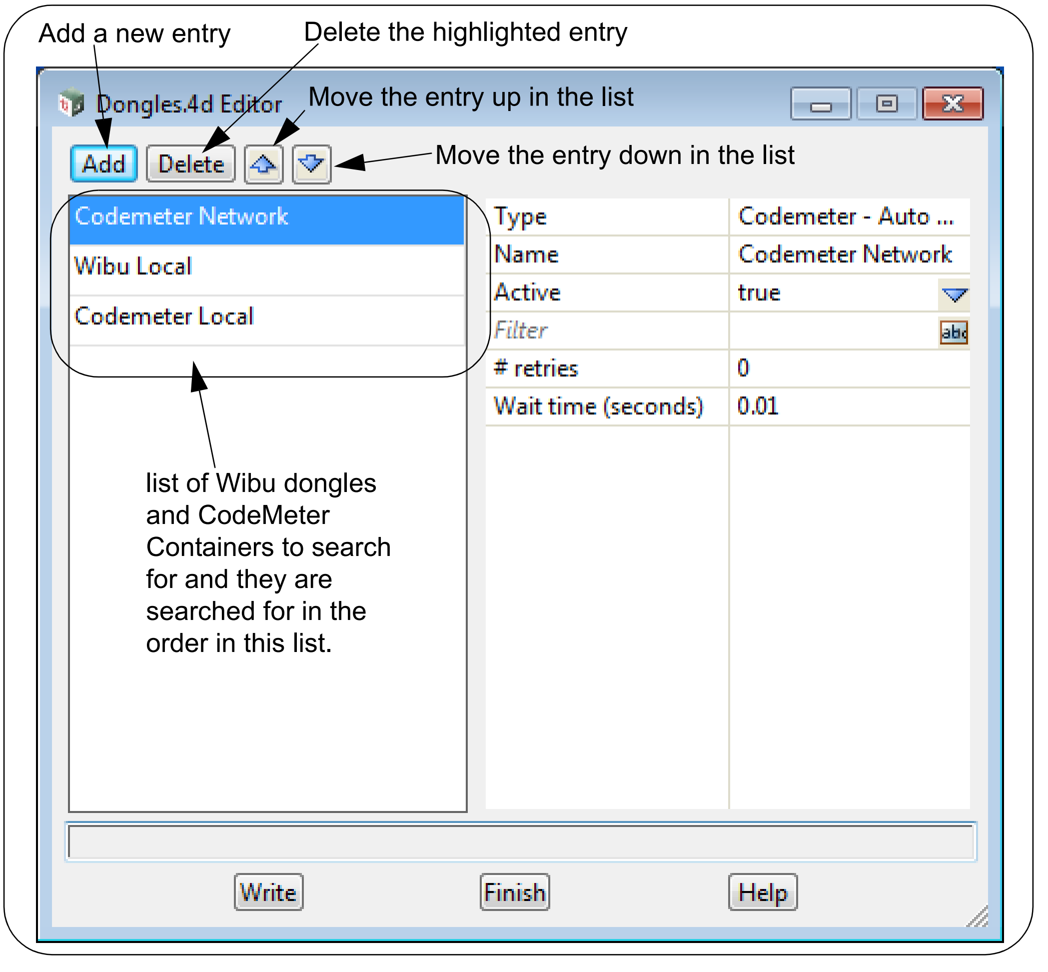
7.6.5.3 Dongles.4d Editor

Position of option on menu: **Project =>Management =>Dongles => Dongles.4d editor**

The **dongles.4d** file lists the computers to search for Wibu dongles (7.6.5.1.1 Wibu Dongles) and CodeMeter Containers (7.6.5.1.2 Wibu CodeMeter Containers) to find 12d dongle numbers. It also defines the order to search for both computers and dongle types.

The **Dongles Editor** option is for editing the ***dongles.4d*** file.

Selecting **Dongles.4d editor** brings up the **Dongles.4d Editor** panel.

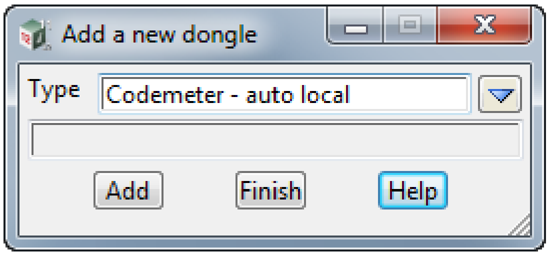


The **Dongles.4d Editor** panel displays the list of Wibu dongles (local and/or network) and CodeMeter containers (local and/or network) to search for to find 12d dongles to potentially use when opening a project. The order of searching is the order that the items occur in this list.

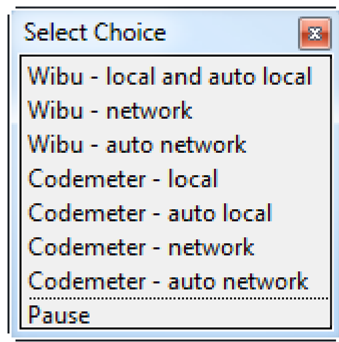
The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Add	button		

*this brings up the **Add a New Dongle** panel*



Type choice box ,



Wibu - local and auto local*: search the local computer for a Wibu Standalone dongle. If there is more than one Standalone Wibu dongle on the computer then the first one found is used. So there should only be one Standalone Wibu dongle on the computer.*

	Type	Wibu - Local and Auto Local
user defined name →	Name	Wibu Auto Local
use entry if Active is true →	Active	true
number of times to retry →	# retries	0
time to wait between retries →	Wait time (seconds)	0.01

Wibu - network*: a server name (computer name) is given as part of the information for this Type. The computer on the network with this name is searched for a Wibu Network dongle. There should only be one Wibu network dongle on the given computer*

	Type	Wibu - Network
user defined name →	Name	New dongle
use entry if Active is true →	Active	true
name of the computer →	Server name	
number of times to retry →	# retries	0
time to wait between retries →	Wait time (seconds)	0.01

Wibu - auto network*: search all computers on the network for Wibu Network dongles. Note there should only be one Wibu network dongle on the one computer*

	Type	Wibu - Auto Network
user defined name →	Name	New dongle
use entry if Active is true →	Active	true
not currently used →	Filter	
number of times to retry →	# retries	0
time to wait between retries →	Wait time (seconds)	0.01

CodeMeter - local: *a Dongle UNC is given as part of the information for this Type. The local computer is searched for a CodeMeter Container of the given Dongle UNC.*

.

	Type	Codemeter - Local
user defined name	Name	New dongle
use entry if Active is true	Active	true
CodeMeter dongle UNC	Dongle UNC	
number of times to retry	# retries	0
time to wait between retries	Wait time (seconds)	0.01

CodeMeter - auto local: *search the local computer for all CodeMeter Containers that have 12d Standalone dongles in them.*

	Type	Codemeter - Auto Local
user defined name	Name	New dongle
use entry if Active is true	Active	true
not currently used	Filter	
number of times to retry	# retries	0
time to wait between retries	Wait time (seconds)	0.01

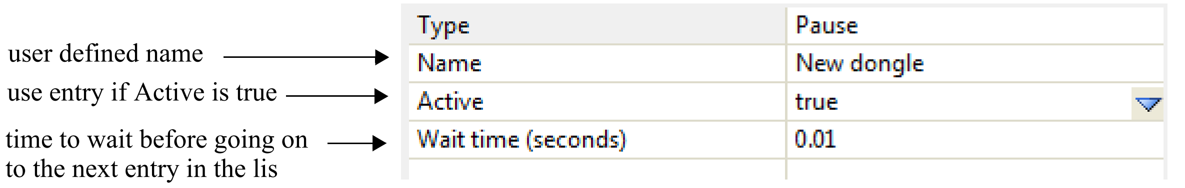
CodeMeter - network: *a computer name is given as part of the information for this Type. The computer on the network with this name is searched for CodeMeter Containers with 12d network dongle numbers in them.*

	Type	Codemeter - Network
user defined name	Name	New dongle
use entry if Active is true	Active	true
name of the computer	Server name	
number of times to retry	# retries	0
time to wait between retries	Wait time (seconds)	0.01

CodeMeter - auto network: *search all computers on the network for CodeMeter Containers that have 12d network dongles in them.*

	Type	Codemeter - Auto Network
user defined name	Name	Codemeter Auto Network
use entry if Active is true	Active	true
not currently used	Filter	
number of times to retry	# retries	0
time to wait between retries	Wait time (seconds)	0.01

Pause: *wait for a given amount of time before going on to the next entry in the list*



Delete button

delete the highlighted entry.

Up Arrow button

move the highlighted entry up in the list.

Down Arrow button

move the highlighted entry down in the list.

Write button

write out the dongles.4d file. For more information on the **Write** *button, go to the section* 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d.

For information on the **dongles.4d** file installed with ***12d Model***, see 7.6.5.3.1 Dongles.4d Shipped with 12d Model.

Important Note

If the *dongles.4d* file being used by ***12d Model*** has no entries relating to network dongles, then any existing deprecated WIBU_DONGLE_4D and WIBU_IPADDR environment variables for WIBU network dongles are still used.

Continue to the next section 7.6.5.4 Certify CodeMeter or return to 7.6.5 Dongles.

7.6.5.3.1 Dongles.4d Shipped with 12d Model

When ***12d Model*** is installed, a **dongles.4d** file is included in **set_ups.**

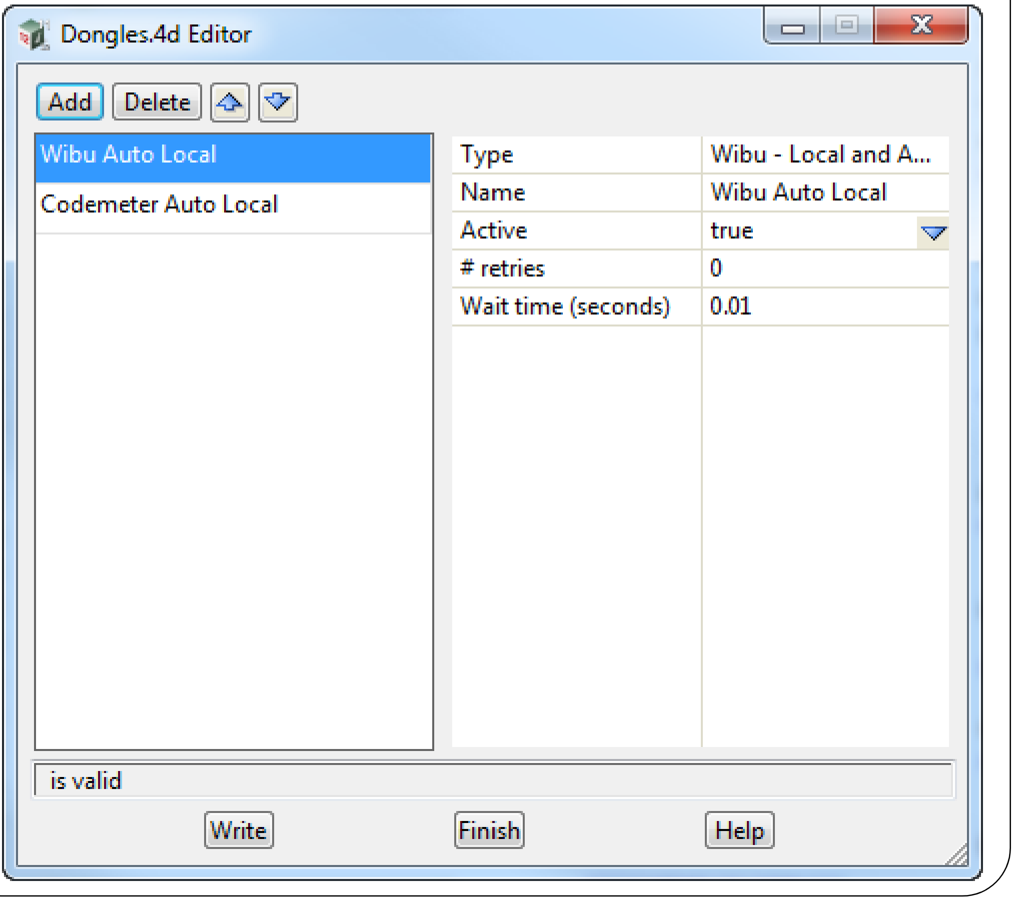
This shipped dongles.4d file only contains entries to as ***12d Model*** to look for any local Wibu dongles and any local Codemeter Containers.

Important Note for Network Dongle Users

There are no entries for network dongles in the shipped dongles.4d file.

So if you are using Wibu network dongles or Codemeter Containers with network 12d dongles in them, then you need to have **your own** dongles.4d file that includes entries for network dongles. Your dongles.4d file is searched for as a Set Up file, or by using the environment variable DONGLES_4D.

Installed dongles.4d File



Return to 7.6.5.3 Dongles.4d Editor or 7.6.5 Dongles.

7.6.5.4 Certify CodeMeter

Position of option on menu: **Project =>Management =>Dongles => Certify CodeMeter**

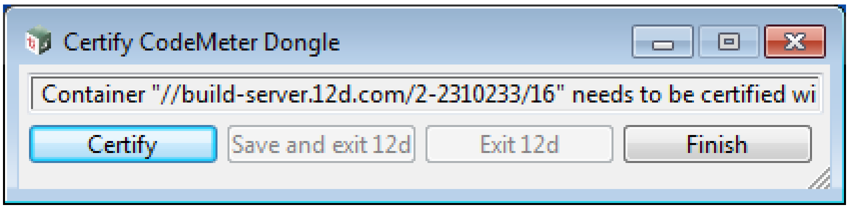
The Wibu **CodeMeter** Container (also called CodeMeter Container or CodeMeter dongle or just CodeMeter) use the Certified Time capability of the dongle and the dongle must communicate over the Internet with a certified Wibu Time Server every two months to check that there is no problem with the ***CodeMeter Container*** that your ***12d Model*** license is coming from.

For Certification to occur, a computer able to access the dongle must also have access to the Internet to run the Certification.

One month before the end of the two month period, ***12d Model*** will bring up the **Certify CodeMeter Dongle** panel which gives the number of days, minutes and seconds remaining until Certification is required.

The **Certify CodeMeter Dongle** panel can also be brought up by the option

Project =>Management =>Dongles =>Certify Codemeter



Clicking on the button **Certify** will attempt to certify the CodeMeter.

Important Note

There is an environment variable AUTO_CERTIFY_DONGLE_4D and if it is set on then when the warning period is active for the CodeMeter Container (dongle) being used by ***12d Model***, ***12d Model*** will automatically attempt to certify the dongle and if successful, no intervention by the user is required. See AUTO_CERTIFY_DONGLE_4D.

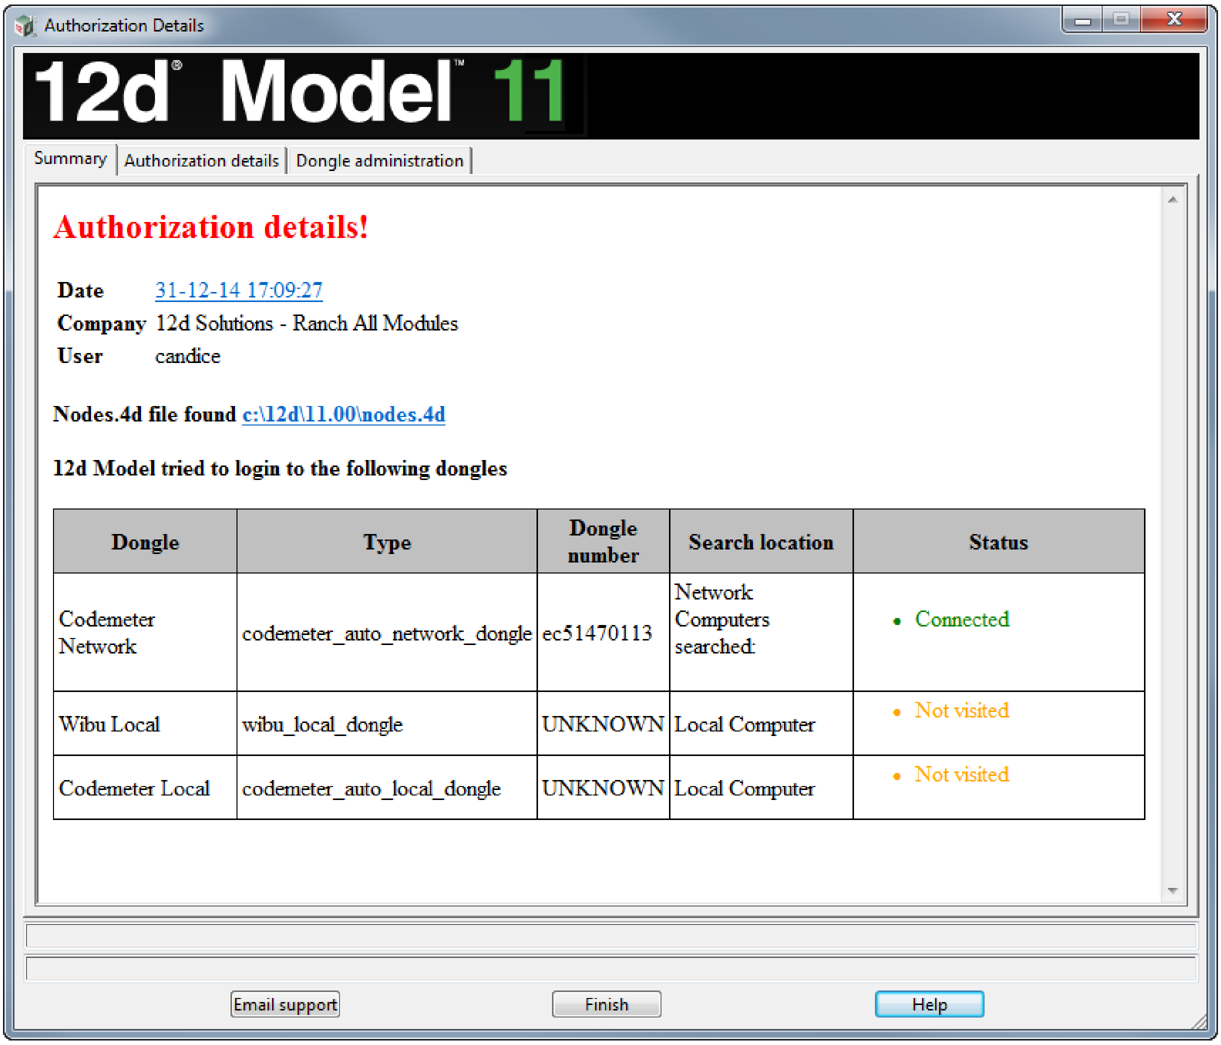
Continue to the next section 7.6.5.5 Authorization Details or return to 7.6.5 Dongles.

7.6.5.5 Authorization Details

Position of option on menu: **Project =>Management =>Dongles => Authorization details**

The **Authorization Details** option shows similar information to the **Authorization Error** panel except in this case there is a match between a found ***12d Model*** dongle and an entry in the nodes.4d file.

Selecting **Authorization details** brings up the **Authorization Details** panel.



The fields and buttons used in this panel have the following functions.

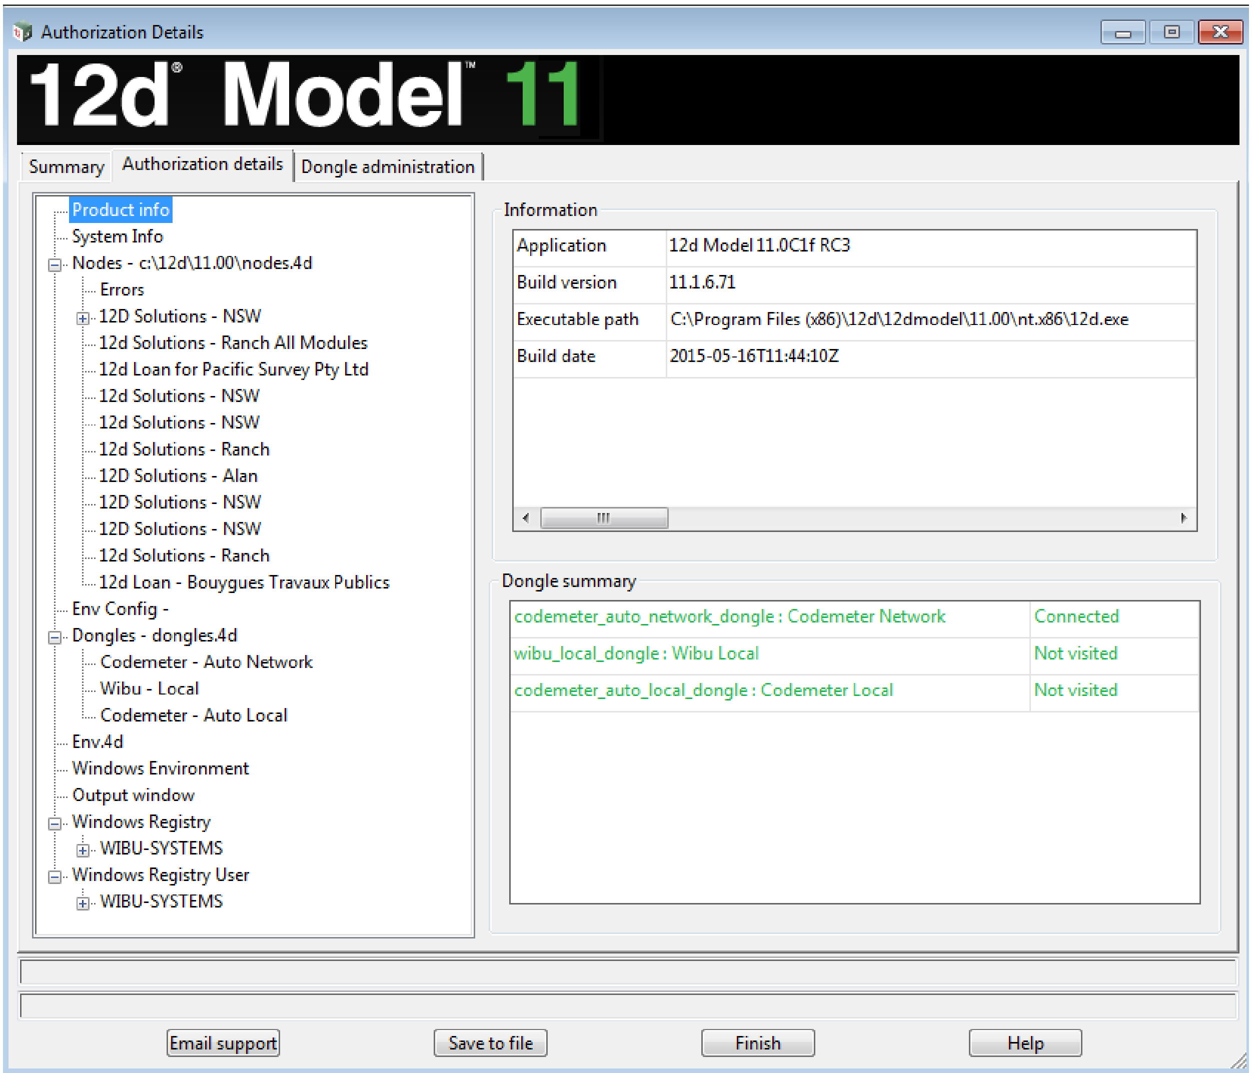
Field Description Type Defaults Pop-Up

Summary tab

*this summarises information from the **Authorization details** tab.*

It shows the 12d Model dongle being used.

Authorization details tab



shows details about the

version of 12d Model

nodes.4d file used

dongles.4d file used

env.4d file used

Buttons at Bottom

Email support button

creates an email with an attachment of a zipped up copy of all the information on the ***Authorization details*** *tab.*

If there is an error in the authorising of 1***12d Model*** , ***12d Model*** will not open a project but instead bring up a similar panel called the **Authorization Error** panel. See 7.6.5.5.1 Authorization Error.

Continue to the next section 7.6.5.6 Nodes.4d Editor or return to 7.6.5 Dongles.

7.6.5.5.1 Authorization Error

This panel only appears if ***12d Model*** will not authorise for the selected project.

Before any selected ***12d Model*** project will open, a valid authorization is required.

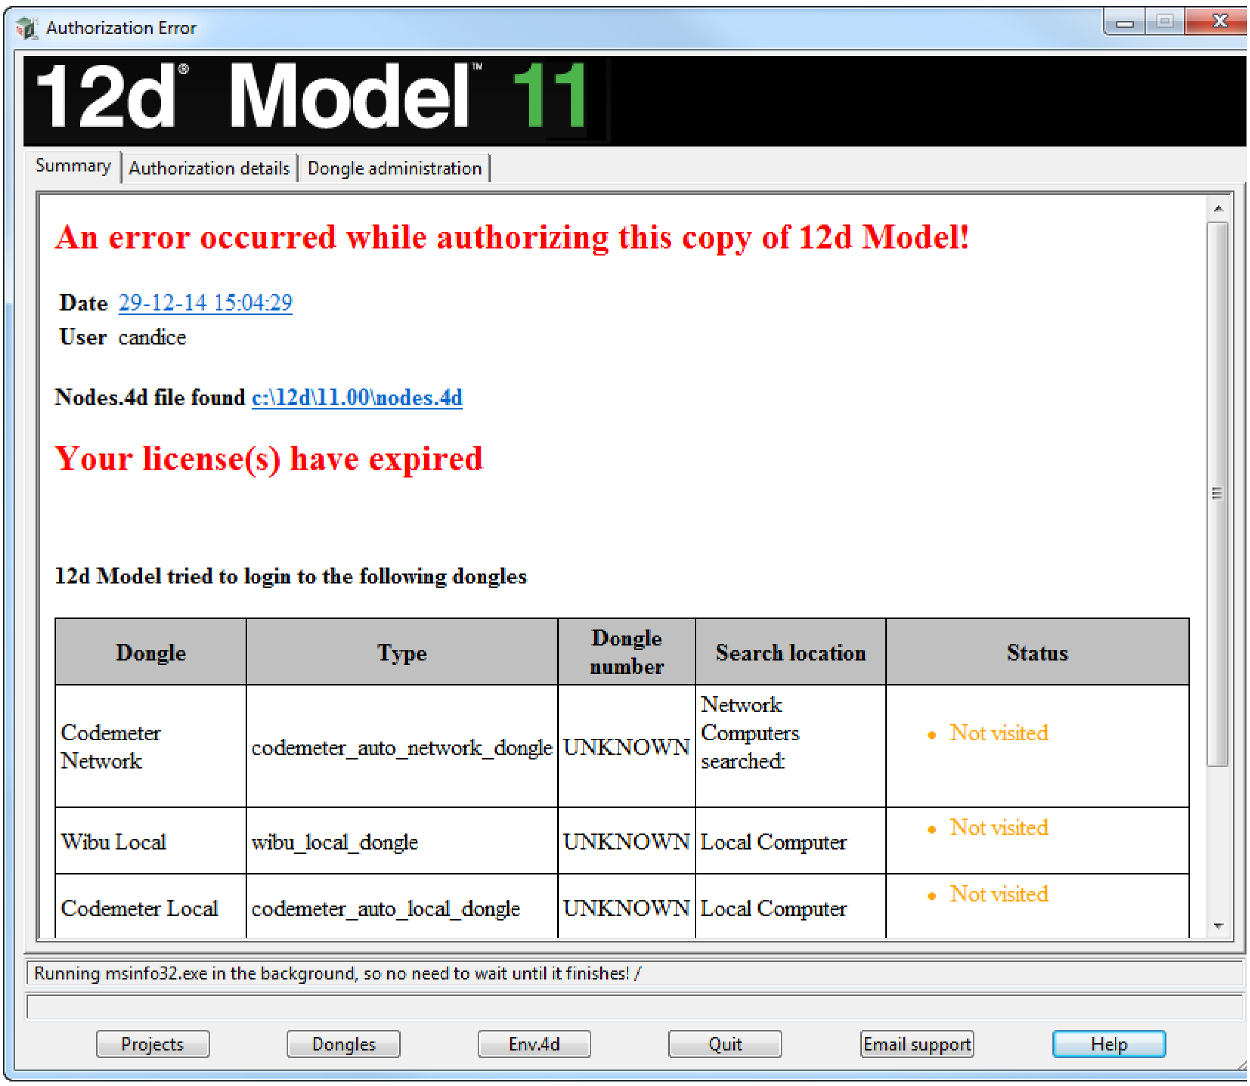
A valid authorization consists of:

1. a ***12d Model*** dongle number from a Wibu dongle or a CodeMeter Container
2. a valid entry in a nodes.4d to match the ***12d Model*** dongle number

If either of the above is missing, then instead of the project being opened, an **Authorization Error** panel is displayed with information to help find the error.

For more information on what is needing for authorising ***12d Model***, see 7.6.5.1 12d Dongles, Dongles.4d, Nodes.4d, and Authorizing.

The **Authorization Error** panel contains information to help find out why there is an authorization error.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Summary tab

*this summarises information from the **Authorization details** tab.*

Authorization details tab

shows details about the

version of 12d Model
nodes.4d file used
dongles.4d file used
env.4d file used
Windows Environment
What is in the Output Window
Windows Registry
Windows Registry User

Dongle administration tab

same as running the ***Project =>Management =>Dongles =>Administration*** *option. See* 7.6.5.2 Dongles Administration.

Buttons at Bottom

Projects button

opens the **12d Model** *front screen so a* **12d Model** *project can be selected or created.*

Dongles.4d button

opens the ***Dongles.4d Editor*** *panel so that the dongles.4d file can be edited. See* 7.6.5.3 Dongles.4d Editor.

Env.4d button

opens the ***Env.4d Editor*** *panel so that the env.4d file can be edited. See* 7.6.3 env.4d.

Email support button

creates an email with an attachment of a zipped up copy of all the information on the ***Authorization details*** *tab. This will provide useful information for someone trying to determine why the project is not authorising.*

Return to 7.6.5.5 Authorization Details or 7.6.5 Dongles.

7.6.5.6 Nodes.4d Editor

Position of option on menu: **Project =>Management =>Dongles => Nodes.4d editor**

The ***nodes.4d*** is an XML format and so can not be easily edited, or even viewed, in its native XML format.

There is a program shipped by ***12d Solutions*** that is used to install the nodes.4d file that can:

(a) Install a ***nodes.4d*** file

but also load an existing XML nodes.4d and

(b) merge in another nodes file

(c) look at all the entries in the file and display information on each entry (start & end dates, modules authorised etc)

(d) move entries up and down

(e) delete entries

(f) create an html report on the entries

(g) create a new ***nodes*** file from selected entries

This program is accessible from inside ***12d Model*** by

(a) the **Nodes** button on the Front screen (the one before you select a project)

(b) the option ***Projects =>Management =>Dongles =>Nodes.4d editor***

and also from outside ***12d Model***

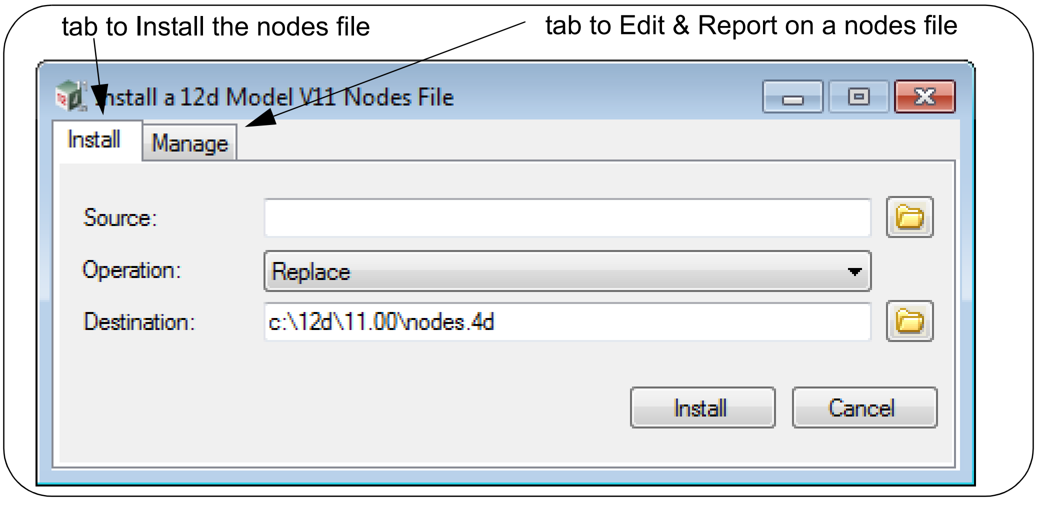
(c) the program is called 12dNodesUtility.exe and is installed as a 32-bit program in

Program Files (x86) \12d\Nodes\11.0

The **Nodes.4d Editor** option is for editing the ***Nodes.4d*** file.

Note that program is actually external to ***12d Model*** and when it is run, it is running independently of ***12d Model***.

Selecting **Nodes.4d editor** brings up the external program and its panel **Installing a *12d Model* 11 Nodes File**:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Install **tab**

this tab is for installing the nodes.4d file.

Source file box file browser

the full path name of the nodes file to install.

Operation choice box Replace Replace, Append, Prepend

*if **Replace**, the Destination file is replaced by the Source file.*

*If **Append**, the Source file is added to the end of the Destination file.*

*If **Prepend**, the Source file is added to the beginning of the Destination file.*

Destination file box file browser

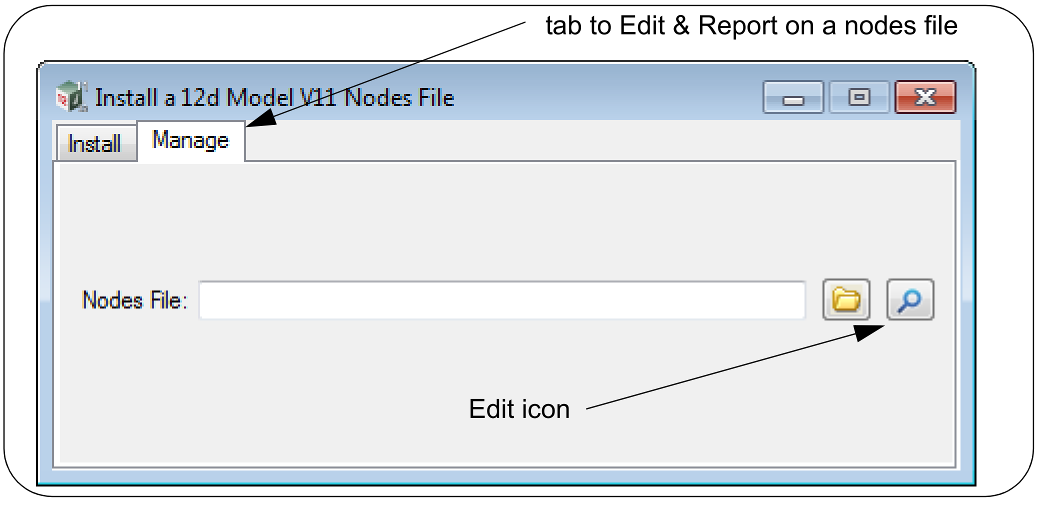
*the full path name of where to install the **nodes.4d** file.*

Install button

install the nodes.4d file.

Manage **tab**

this tab is for editing and reporting a nodes.4d file.



Nodes file file box file browser

the full path name of the nodes file to edit/modify/report.

After the nodes.4d file has been fill in, click on the Edit icon (Looking glass icon) to bring up the **Node Contents** *panel.*

The panel shows all the Client Entries in the nodes.4d file in a tree structure with all the dongle records for a particular Client Entry displayed when the + is clicked on in front of the Client Entry.

***Note:** The Client Entry contains all the dongles records that were produced for a Client at the one time. These dongle records can only stay inside that one Client Entry, even though there may be other Client Entries of the same name.*

Dongle Records can be moved up or down within a Client Entry but can't be moved to a different Client Entry.

A Client Entry can be moved up and down in the Tree.

Highlighted Client Entries can be deleted and all the Dongle Records for the Client Entry will also be deleted.

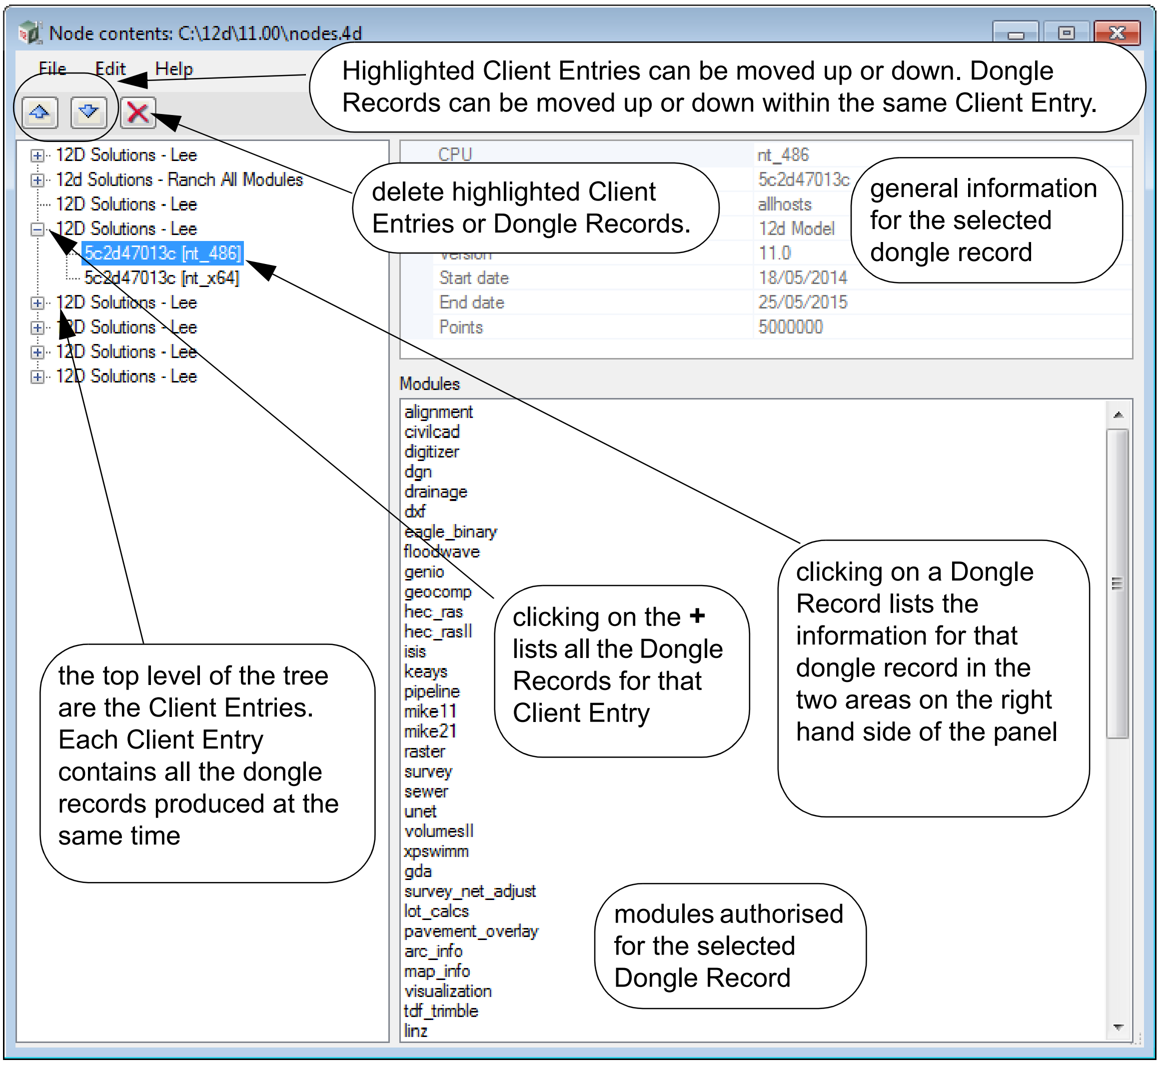
Highlighted Dongle Records can be deleted.

***File** has options to produce a HTML report and write out to a new nodes file sa subset of the Client*

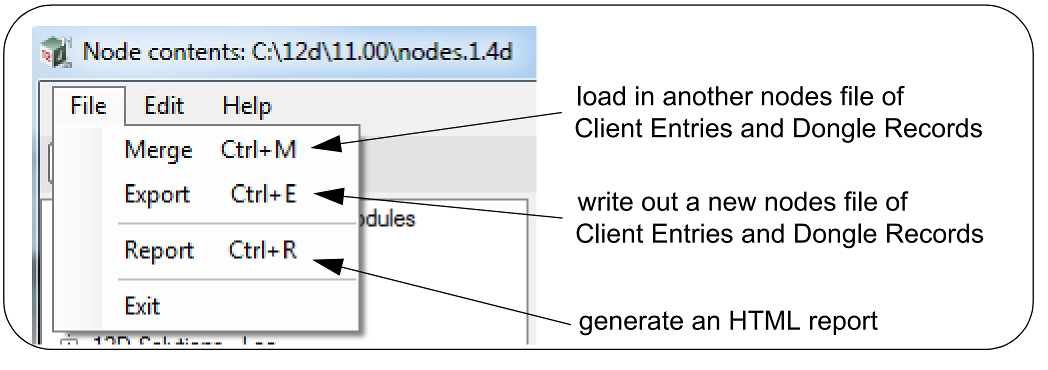
Entries and Dongle Records.

*Clicking on **X** removes the* **Node Contents** *panel*

.

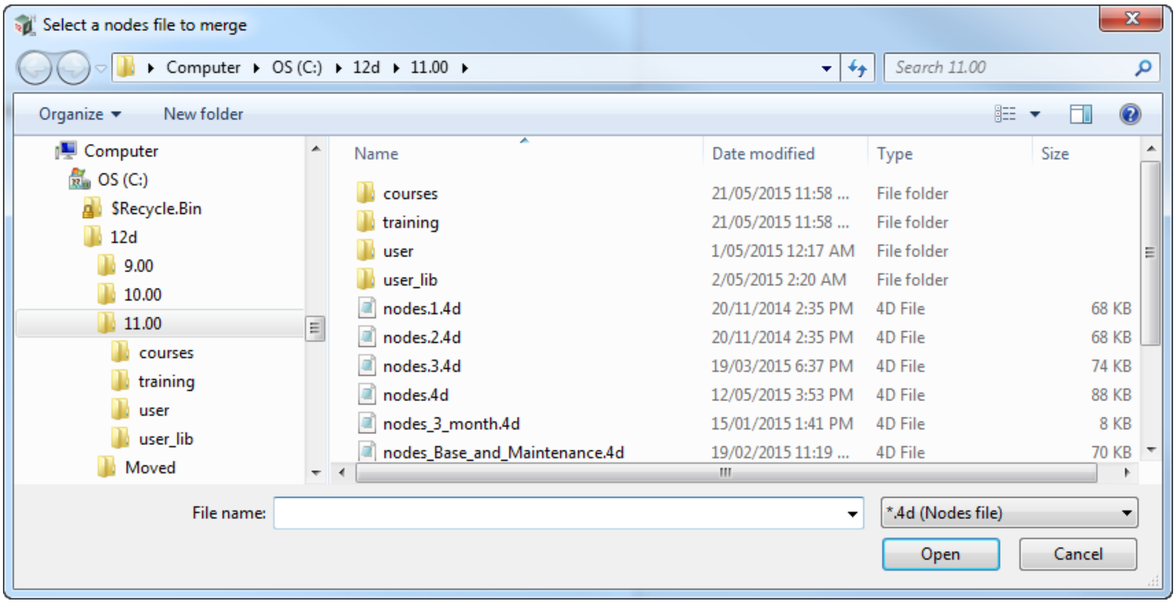


Clicking on **File** brings up the



1. Merge menu item

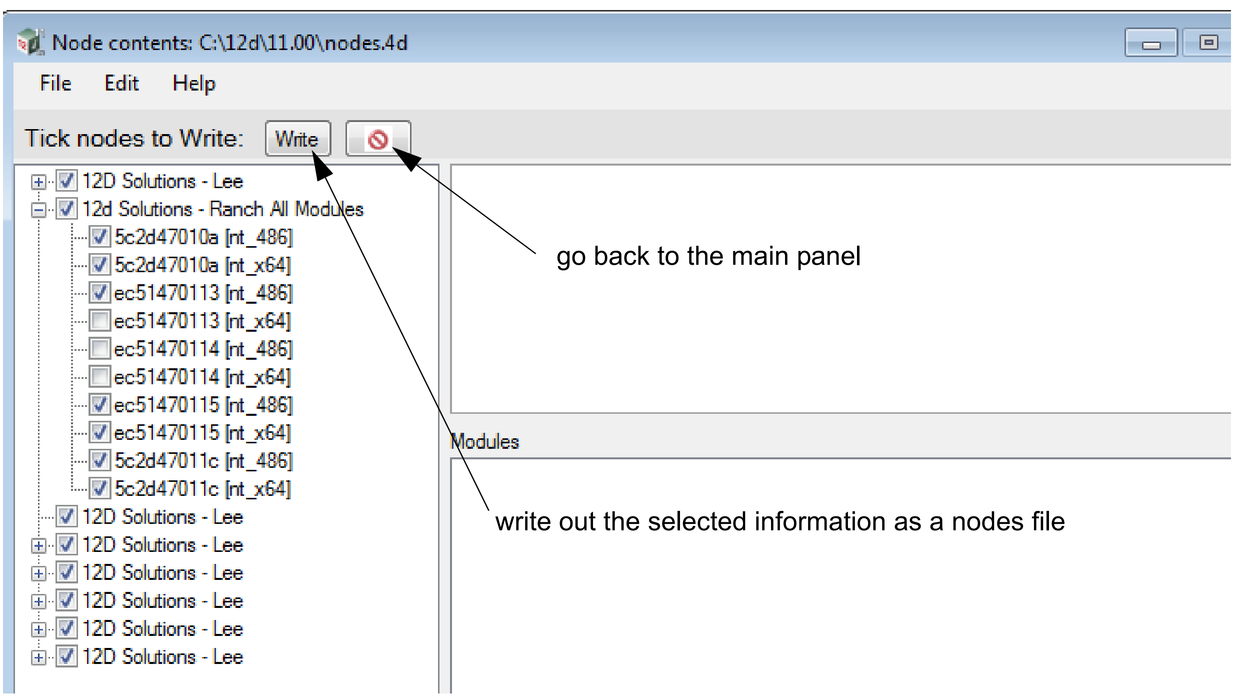
*clicking on **Merge** brings up the Microsoft browser to obtain the another nodes.4d read in.*



The new ***Client Entries*** *and* ***Dongle Records*** *are added to the bottom of the list of existing* ***Client Entries*** *ready for editing.*

2. Export menu item

clicking on ***Export*** *brings a Tree showing all the Client Entries and Dongle Records but with a tick box to indicate if the information is to be written out or not, to the new nodes file.*



Write button

clicking on ***Write*** *brings up the Microsoft* **Save As** *browser to obtain the name of the file to write the selected information out to as a node.4d file.*

Stop button

clicking on ***Stop*** *takes you back to the* **Node Contents** *panel*

3. Report menu item

*clicking on **Report** brings up the Microsoft* **Save As** *browser to obtain the name of the file to write the HTML report to.*

*The report will list all the **Client Entries.** And for each **Client Entry**, the **Dongle Record**s in it showing the modules authorised for that Dongle Record in blue.*

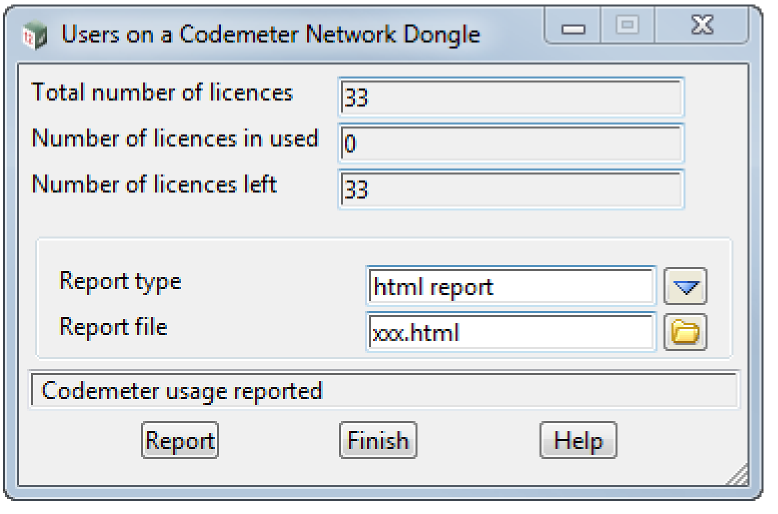
Continue to the next section 7.6.5.7 CodeMeter Network User or return to 7.6.5 Dongles.

7.6.5.7 CodeMeter Network User

Position of option on menu: **Project =>Management =>Dongles => CodeMeter network users**

This option shows the number of ***12d Model*** licenses on the CodeMeter network dongles and how many are used/unused. A report can also be produced showing details for each individual network dongle.

Selecting **CodeMeter network users** brings up s panel **Users on a CodeMeter Network Dongle**:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Total number of licenses	output only		

the total number of 12d Model licenses on the CodeMeter network dongles. This number is updated when **Report** *button is pressed.*

Number of licenses in use output only

the number of 12d Model licenses currently being used.

Number of licenses left output only

the number of 12d Model licenses left to be used.

Report type choice box html report, original xml, <customize>

output format for the report. An XML file will be produced and then if required, converted to the selected report.

For information on setting up custom reports from the generated XML file using xslts, see 4.30 Setting Up XML Reports.

Report file file box

*if **not blank**, an XML file will be created and a report of this name, and of the type given by* **Report type** *will be generated from the XML file.*

*If **blank**, no report is created but the number of licenses information is still written to the appropriate panel fields.*

Report button

check how many licenses are on CodeMEter network dongles and write the values to the panel fields. If Report file is not blank then a report is also produced.

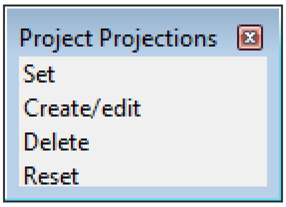
Return to 7.6.5 Dongles.

7.6.6 Projections

Position of option on menu: **Project =>Management =>Projections**

User defined Projections can be defined using the Create/edit option. A user defined projection can then be set for the project (the project projection). Values from the project projection (e.g. scale factor) are used in various options.

The **Project projections** walk-right menu contains various projection items.



set the default projection for the project
create/edit project definitions
delete a project definition
reset the projection set for the project

For the option *Set*, go to the section	7.6.6.1 Set Projection.
Create/edit	7.6.6.2 Create/Edit Projection.
Delete	7.6.6.4 Delete Projection.
Reset	7.6.6.5 Reset Projection.

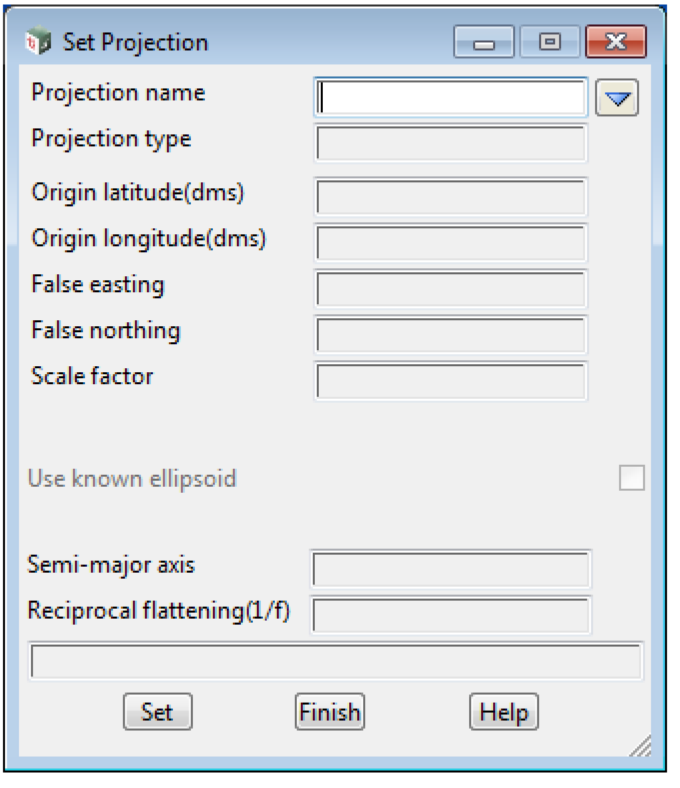
7.6.6.1 Set Projection

Position of option on menu: **Project =>Management =>Projections =>Set**

The **Set** option sets the *Project Projection* to be the one selected from the list defined projections.

To define a new projection, see 7.6.6.2 Create/Edit Projection.

On selecting the **Set** option, the **Set Projection** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Projection name	choice box		all defined projections

name of the projection to be set as the Project projection.

Depending on the projection type, the relevant projection parameters are displayed in the rest of the fields in the panel.

The rest of the fields are for reporting information about the selected projection.
The fields will change depending on the type of the selected Projection.

To define a new projection, see 7.6.6.2 Create/Edit Projection.

Set	button

after selecting this button, the projection for the project is set to that given in the **Project name** *field. The project projection is used in a number of options in* ***12d Model***.

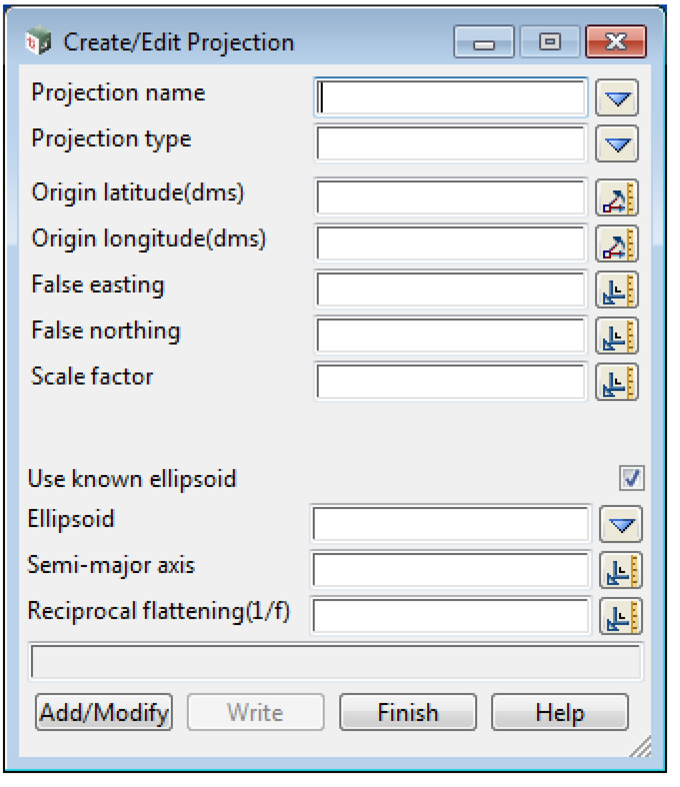
Go to the next section 7.6.6.2 Create/Edit Projection or return to 7.6.6 Projections.

7.6.6.2 Create/Edit Projection

Position of option on menu: **Project =>Management =>Projections =>Create/Edit**

This option defines a new projection, or edits an existing projection in the current list of available projections.

On selecting the **Create/edit** option, the **Create/edit Projection** panel is displayed.



For more information about terminology used in this sections, see the Appendix 38 Geodetics Summary.

Field Description	Type	Defaults	Pop-Up
Projection name	typed input an choice box		all defined projections

name of the projection to be set as the Project projection.

Field Description	Type	Defaults	Pop-Up
Projection Type	choice box		Transverse Mercator, UTM RSO, General

the type of projection to be set as the Project projection.

Depending on the projection type, the relevant projection parameters can be entered.

*For **Transverse Mercator** the fields are:*

Origin latitude (dms); Origin longitude (dms), False Easting, False Northing, Scale factor.

*For **UTM** the fields are:*

Zone number, North/South Hemisphere.

*For **RSO** the fields are:*

Origin latitude (dms); Origin longitude (dms), REctified Skew Azimuth (dms), False Easting, False Northing, Scale factor.

*For **General** the field is Projection Parameter which requires a special line of text defining the projection. For more information on defining a **general** projection, see* 7.6.6.3 Defining a General Cartographic Projection

Use known ellipsoid tick box tick

*if **ticked**, the ellipsoid for the projection has been defined previously and the parameters for the particular ellipsoid can be used. The values of defined ellipsoids are displayed when a selection is made from the ellipsoid pop-up box (e.g. GRS80).*

*if **not ticked** then the ellipsoid parameters can be defined by entering the ellipsoid parameters.*

Add/Modify button

after selecting this button, the user defined projection is added to the current list or the existing projection definition is modified. using the entered values. A number of new projections can be added by simply entering the relevant data and selecting the add/modify button.

Write button

*after selecting this button, the user defined projections defined by the add/modify process are written to a **carto.4d** file which can be written to various locations. This means that the new defined projections can be used for other **12d Model** projects. For more information on the* **Write** *button, go to the section* 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d.

Go to the next section 7.6.6.3 Defining a General Cartographic Projection or return to 7.6.6 Projections.

7.6.6.3 Defining a General Cartographic Projection

A general *cartographic projection* is defined by giving a series of parameters starting with the mandatory +proj parameter giving the projection type. For example,

+proj=*projection_type* e.g. +proj=tmerc or +proj=utm

To specify the Earths's elliptical figure used in the projection, two parameters are required.

The first required value is the major semi-axis of the ellipse or equatorial radius,

major semi-axis of the ellipse	+a= *value*

and the second parameter can be any one of the following standard forms:

minor semi-axis of the ellipse	+b= *value*
flattening	+f= *value*
reciprocal flattening (i.e. 1/f)	+rf= *value*
eccentricity)	+e= *value*
eccentricity squared)	+es= *value*

For example, the Australian National Spheroid (ANS) is defined by:

+a=6378160
+rf= 298.25

GRS80 is defined by:

+a=6378137
+rf= 298.257222101

WGS84 is defined by:

+a=6378137
+rf= 298.257223663

A further three parameters are common to most projections:
the central meridian +lon_0=*value*, and the cartesian offsets for the respective x and y axis, +x_0=*value*, +y_0=*value* (often referred to as false easting and northing).

central meridian	+lon_0= *value*	*units in decimal degrees*
x offset- false easting	+x_0=*value*	
y offset - false northing	+y_0=*value*	

A fourth parameter, +lat_0=*value*, is used to designate a central parallel and associated y axis origin for a projection.

Unless a value is specified for the parameters lon_0, lat_0, x_0 and y_0, they are assumed to be zero.

Other parameters will depend on the particular projection used.

See:

7.6.6.3.1 Transverse Mercator Projection +proj=tmerc

7.6.6.3.2 Universal Transverse Mercator Projection +proj=utm

7.6.6.3.3 Australian Map Grid (AMG84)

7.6.6.3.4 Map Grid of Australia (MGA94)

7.6.6.3.5 Lambert Conformal Conic Projection +proj=lcc

Go to the next section 7.6.6.3.1 Transverse Mercator Projection +proj=tmerc or return to 7.6.6 Projections.

7.6.6.3.1 Transverse Mercator Projection +proj=tmerc

project	+proj=tmerc
scale factor	+k=*value*

e.g. Metro-Perth is:
+proj=tmerc +a=6378160 +rf=298.25 +lon_0=115.833333333 +lat_0=0.0 +x_0=54466.561 +y_0=3690893.265 +k=1.0

Perth Coastal Grid 1984 (PCG84) is:
+proj=tmerc +a=6378160 +rf=298.25 +lon_0=115.833333333 +x_0=40000 +y_0=3800000 +k=1.000006

Go to the next section 7.6.6.3.2 Universal Transverse Mercator Projection +proj=utm or return 7.6.6.3 Defining a General Cartographic Projection or 7.6.6 Projections.

7.6.6.3.2 Universal Transverse Mercator Projection +proj=utm

This is a special from of the Transverse Mercator Projection. The central meridian is constrained to 6 degree intervals starting at 3 degrees. An extra parameter exists called +zone where +zone=1 specifies the region from 180 degree W to 174 degrees W (equivalent to +lon_0=177 degrees W) and proceeds easterly until +zone=60 for the region from 174 degree E to 180 degrees E (i.e. +lon_0=177 degrees E). Hence

+zone=N	N = 1, 2,... 60

which automatically defines the central meridian +lon_0= 6 x N - 183 where N = zone number.

The +south option adds a false northing of 10,000,000 m (used for AMG and MGA co-ordinates) for projection in the Southern Hemisphere.

+south	defines +y_0=10000000

In all cases, for a Universal Transverse Mercator projection, a false easting of 500,000 m is used.

+x_0=500000

Go to the next section 7.6.6.3.3 Australian Map Grid (AMG84) or return 7.6.6.3 Defining a General Cartographic Projection or 7.6.6 Projections.

7.6.6.3.3 Australian Map Grid (AMG84)

The Australian Map Grid is a Universal Transverse Mercator Projection with

(a) coordinates are in metres

(b) zones are 6 degrees wide plus overlapping belts of 80 kilometres at each grid junction

(c) AMG zones are numbered from zone 49 with central meridian 111 degrees E to zone 57 with central meridian 159 degrees E.

(d) the origin of each zone is the intersection of the central meridian with the equator

(e) a central scale factor, k, is defined as 0.9996

(f) a false easting of 500,000 and a false northing of 10,000,000 are used

(g) uses the Australian National Spheroid +a=6378160 +rf=298.25

For example, the definition of AMG zone 50 is:

+proj=utm +south +zone=50 +k=0.9996 + a=6378160 +rf=298.25

Go to the next section 7.6.6.3.4 Map Grid of Australia (MGA94) or return 7.6.6.3 Defining a

General Cartographic Projection or 7.6.6 Projections.

7.6.6.3.4 Map Grid of Australia (MGA94)

The Map Grid of Australia is a Universal Transverse Mercator Projection with

(a) coordinates are in metres

(b) zones are 6 degrees wide plus overlapping belts of 80 kilometres at each grid junction

(c) MGA zones are numbered from zone 49 with central meridian 111 degrees E to zone 57 with central meridian 159 degrees E.

(d) the origin of each zone is the intersection of the central meridian with the equator

(e) a central scale factor, k, is defined as 0.9996

(f) a false easting of 500,000 and a false northing of 10,000,000 are used.

(g) uses GRS80 +a=6378137 +rf=298.257222101

For example, the definition of MGA zone 50 is:

+proj=utm +south +zone=50 +k=0.9996 + a=6378137 +rf=298.257222101

Go to the next section 7.6.6.3.5 Lambert Conformal Conic Projection +proj=lcc or return 7.6.6.3 Defining a General Cartographic Projection or 7.6.6 Projections.

7.6.6.3.5 Lambert Conformal Conic Projection +proj=lcc

This is a special from of the Conic Projection.

There are two standard parallels +lat_1 and +lat_2 and the projection is centred on +lat_0 and +lon_0

For example, a Lambert Conformal Conic Conformal with standard parallels of 15 degrees South and 39 degrees South, centred at centred at 27degrees South 134degrees East, with a false origin at that point is 5,000,000m/5,000,000m and using the Australian National Spheroid (i.e. AGD84) is

+proj=lcc +lat_1=-15 +lat_2=-39 +lon_0=134 +lat_0=-27
+x_0=5000000 +y_0=5000000 +a=6378160 +rf=298.25

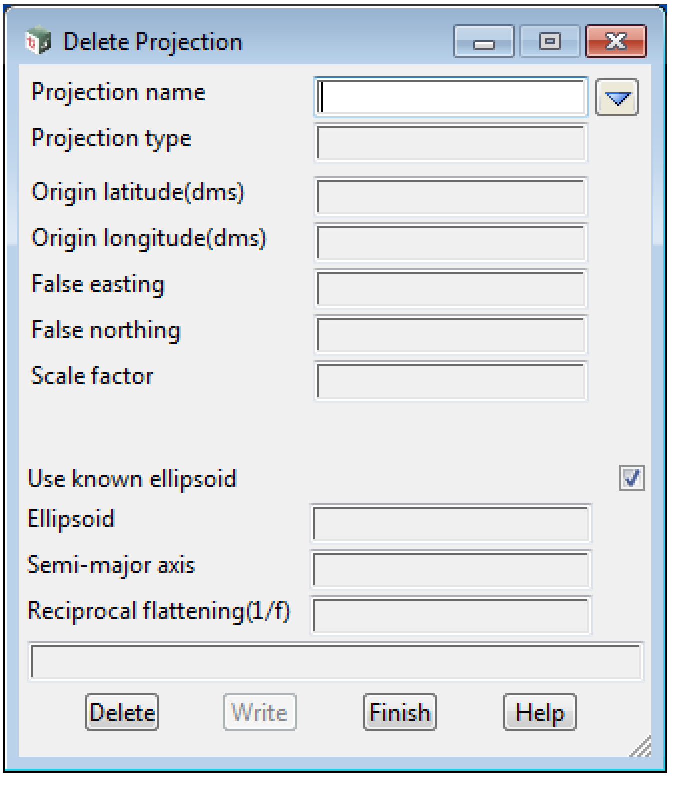
Go to the next section 7.6.6.4 Delete Projection or return 7.6.6.3 Defining a General Cartographic Projection or 7.6.6 Projections.

7.6.6.4 Delete Projection

Position of option on menu: **Project =>Management =>Projections =>Delete**

The **Delete** option deleted a projection from the list of available projections.

On selecting the **Delete Projection** option, the **Delete Projection** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Projection name	input		all defined projections

name of the projection to be deleted from the Project projection list.

The rest of the fields depend upon the projection type and are used to display information about the projection.

Delete	button		

after selecting this button, the selected projection is deleted from the project projection list. This can be done for a number of projections by simply selecting the projection to be deleted and selecting the delete button.

Write	button		

after selecting this button, the list of projections altered by the delete process can be written in various locations. This means that the updated projections list will be used to set current and future projects. For more information on the **Write** *button, go to the section* 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d

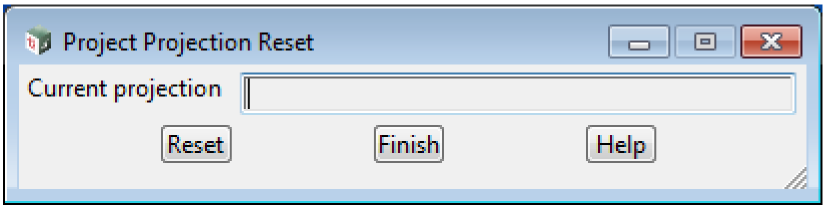
Go to the next section 7.6.6.5 Reset Projection or return 7.6.6.3 Defining a General Cartographic Projection or 7.6.6 Projections.

7.6.6.5 Reset Projection

Position of option on menu: **Project =>Management =>Projections =>Reset**

The **Reset** option is used to remove the projection set for the project.

On selecting the **reset Projection** option, the **Project Projection Reset** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	pop-Up
Current projection	output only		

name of the projection currently set for the project.

Reset	button		

after selecting this button, the projection for the project is set to none. That is, no project has been set for the Project.

Go to the next section 7.6.7 N values or return to 7.6 Management.

7.6.7 N values

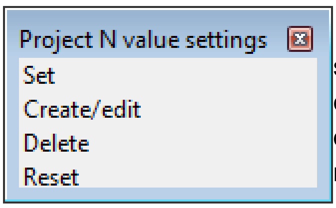
Position of option on menu: **Project =>Management =>N values**

N values are the separation distances between the geoid and the ellipsoid. In GPS surveys, heights are often given in ellipsoid heights whilst most other level datums are based on the geoid. Since most geodetic calculations are based on the ellipsoid, any observations should be reduced onto the ellipsoid. This reduction process takes into the consideration the heights above the ellipsoid. Therefore, it is necessary to convert non ellipsoid heights to ellipsoid values by adding the geoid-ellipsoid separations (n values). There are various methods for determining the N values.

An N value method can be defined using the Create/edit option. Values from the project N value settings are used to determine which method is used to calculate N values. These values are used in various options where the level values are not ellipsoid values and require the N value to be added to get to an ellipsoid height. A user defined N value method can then be set for the project (the project N value setting) which is then the default N Values in any panel.

For more information about terminology used in this section, see the Appendix 38 Geodetics Summary.

The **Project n value** walk-right menu contains various projection items.



set the default N-values for the project
create/edit N-values definitions
delete a N-values definition
reset the N-values set for the project

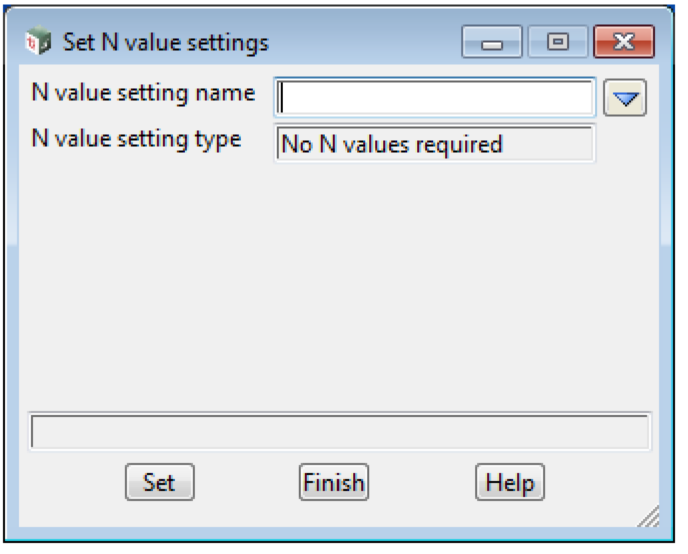
For the option *Set*, go to the section 7.6.7.1 Set N-Values.
Create/edit 7.6.7.2 Create/Edit N-Values.
Delete 7.6.7.3 Delete N-Values.
Reset 7.6.7.4 Reset N-Values.

7.6.7.1 Set N-Values

Position of option on menu: **Project =>Management =>N values =>Set**

The **Set** option sets the Project N Values and these are then used as the default in panels.

On selecting the **Set** option, the **Set N value settings** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
N value setting name	choice box		all defined N value settings

name of the n value setting to be set as the Project N value setting.

N value setting type	input		defined N value types

Depending on the N value interpolation method, the relevant method is displayed.

Set	button		

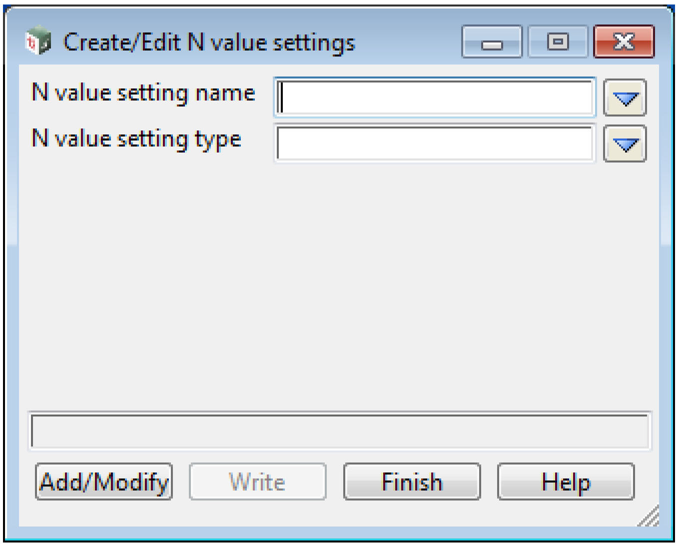
after selecting this button, the current N value setting is set using the displayed values. These values are used as defaults in panels that need N values for calculations

Go to the next section 7.6.7.1 Set N-Values or return to 7.6.7 N values.

7.6.7.2 Create/Edit N-Values

Position of option on menu: **Project =>Management =>N values=>Create/Edit**

On selecting the **Create/edit** option, the **Create/edit N value settings** panel is displayed.

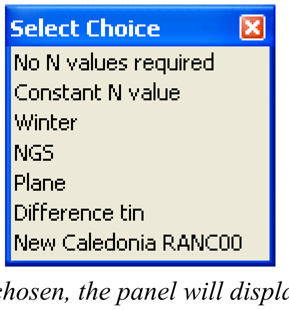


Field Description	Type	Defaults	Pop-Up
N value setting name	choice box		all defined N value settings

name of the n value setting to be set as the Project N value setting.

Field Description	Type	Defaults	Pop-Up
N value setting type	choice box		defined N value types

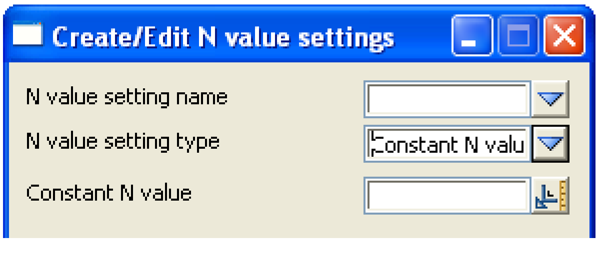
There are various methods for the determination of the N values. These are given in the choice box:



Depending on the setting type chosen, the panel will display the appropriate fields.

No N values required: This applies to data that already has ellipsoid heights and requires no interpolation for N values.

For N value setting type = Constant N value



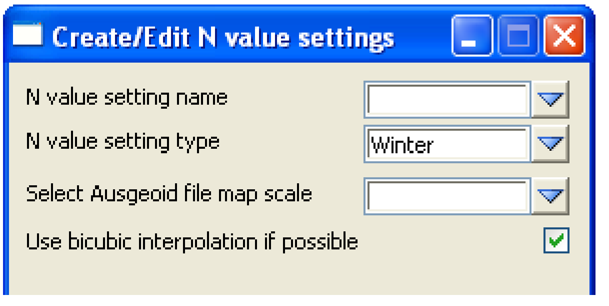
Field Description Type Defaults Pop-Up

Constant N value input box

this N value will be used for the entire n value interpolation process. (i.e. it will not change).

For N value setting type = Winter

This method uses the same method as the Winter interpolation software supplied by Auslig. The data files used should be winter compatible and reside in a folder that is pointed to by the WINTER_DATA_4D parameter in the env.4d file. The data files can be downloaded from the Auslig website.



Field Description	Type	Defaults	Pop-Up
Select Ausgeoid file map scale	choice box		1:100,000
			1:250,000
			1:1,000,000

this value will be dependant on the type of files to be used by winter. ***The files themselves should be in a folder that is pointed to by the WINTER_DATA_4D parameter in the setup area of the env.4d file.***

Use bicubic interpolation if possible tick box ticked

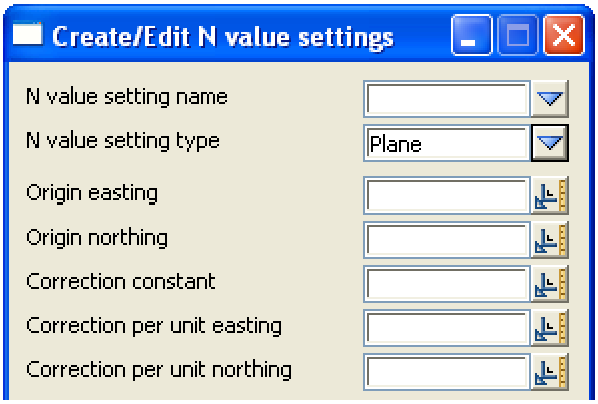
if ticked, the bicubic interpolation method will be used if possible.

For N value setting type = NGS

This method is currently under development.

For N value setting type = Plane

This method allows a plane to be defined allowing N values to be derived from that plane.



Field Description	Type	Defaults	Pop-Up
Origin easting	input box		

the origin easting value.

Origin northing	input box		

the origin easting value.

Corr constant	input box		

the constant z value of the plane.

Corr per unit easting	input box		

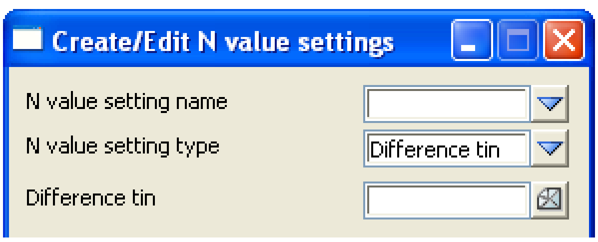
the z value correction per unit easting.

Corr per unit northing	input box		

the z value correction per unit nothing.

For N value setting type = Difference tin

This method allows value to be interpolated from a difference tin. A difference tin is simply a tin of difference values (N values). This tin can be re-triangulated as new points become available, thus introducing more points than a regular grid.



Field Description	Type	Defaults	Pop-Up
Difference tin	tin box		Available tins

the difference tin from which the N values will be interpolated.

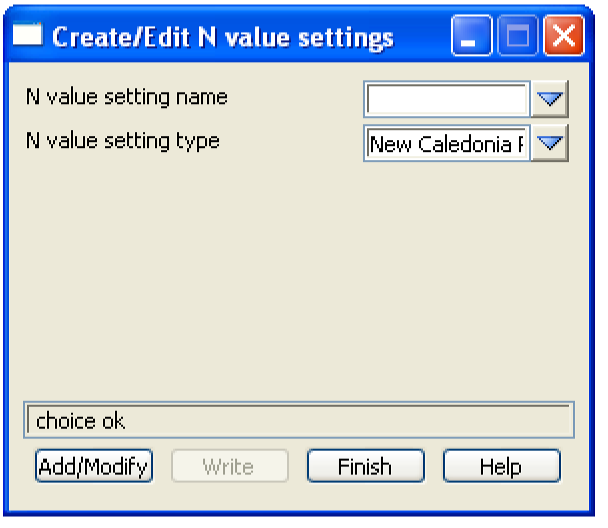
Add/Modify	button		

after selecting this button, the user defined N value settings are added to the current list or the existing N value settings is modified. using the entered values. A number of new settings can be added by simply entering the relevant data and selecting the add/modify button.

Write button

after selecting this button, the user defined N value settings defined by the add/modify process can be written to the file nvalues.4d in various locations. This means that the defined N value settings will be allowed to be set in current and future projects. For more information on the **Write** *button, go to the section* 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d

For N value setting type = New Caledonia RANC00

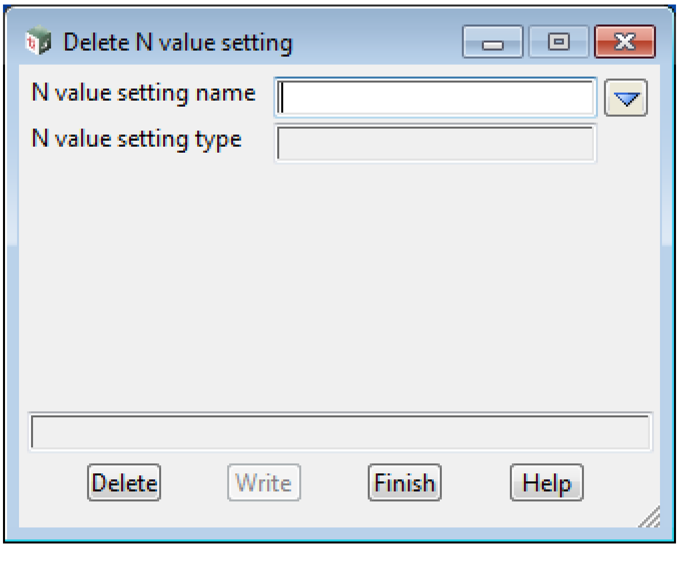


7.6.7.3 Delete N-Values

Position of option on menu: **Project =>Management =>N value =>Delete**

The **Delete** option deleted a projection from the list of available projections.

On selecting the **Delete** option, the **Delete N value setting** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
N value setting name	input		all defined N value settings

name of the setting to be deleted from the N value setting list.
Depending on the setting type, the relevant setting parameters are displayed.

Delete button

after selecting this button, the selected N value setting is deleted from the setting list. This can be done for a number of n value settings by simply selecting the projection to be deleted and selecting the delete button.

Write button

after selecting this button, the list of n value settings altered by the delete process can be written to the nvalues.4d file in various locations. This means that the updated n value settings list will be used to set current and future projects. For more information on the **Write** *button, go to the section* 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d.

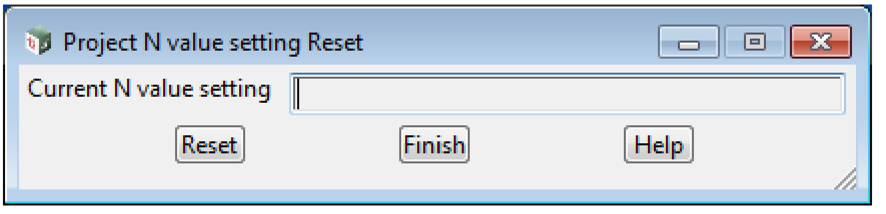
Go to the next section 7.6.7.4 Reset N-Values or return to 7.6.7 N values.

7.6.7.4 Reset N-Values

Position of option on menu: **Project =>Management =>N values =>Reset**

The.**Reset** option is used to remove the projection set for the project.

On selecting the **reset** option, the **Project N value setting reset** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Current N value setting	output only		

name of the n value setting, set for the project.

Reset	button		

after selecting this button, the N value setting for the project is set to none. That is, no N value setting has been set for the Project.

Go to the next section 7.6.8.1 Create/Edit 7 Parameters or return to 7.6.7 N values.

7.6.8 7 Parameters

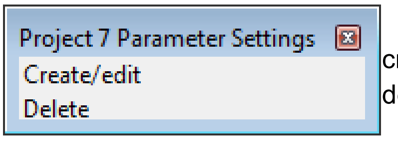
Position of option on menu: **Project =>Management =>7 parameters**

Seven (7) parameter transformations are used to transform data between two ellipsoids. They are also known as 7 parameter similarity transforms, Bursa-Wolf and 7 parameter Helmert transformations.

***Warning*: the definition and hence sign of some terms varies between countries.**

In ***12d Model***, the seven parameter similarity transformations are used in the ***General Transformation*** option **Survey =>Conversions =>General transformations** (see 17.10.6 General Transformations) and the transformation is applied in the Global XYZ system.

The **7 parameters** walk-right menu contains options to create and delete seven parameter transformation setting.



create/edit 7 parameter definitions
delete 7 parameter definitions

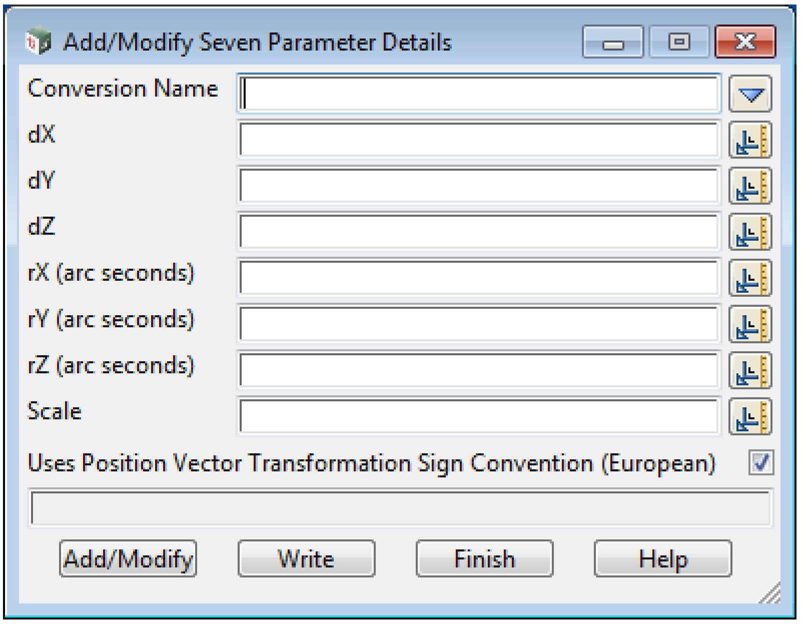
For the option *Create/edit*, go to 7.6.8.1 Create/Edit 7 Parameters
Delete 7.6.8.2 Delete 7 Parameters

The options in the menu will now be described.

7.6.8.1 Create/Edit 7 Parameters

Position of option on menu: **Project =>Management =>7 parameters=>Create/Edit**

On selecting the **Create/edit** option, the **Add/Modify Seven Parameter Details** panel is displayed.



Field Description	Type	Defaults	Pop-Up
Conversion name	choice box		all defined 7 param settings

name of the 7 parameter setting to be created/edited.

DX, DY, DZ input box

the translations for the 7 parameter transformation.

rX (arc seconds), rY (arc seconds, rZ (arc secondsinput box

the rotations, in arc seconds, for the 7 parameter transformation.

Scale input box

the scale for the 7 parameter transformation.

Use Position Vector Transformation sign convention (European) tick box

if ticked, the European Position Vector Transformation convention is used.
If not ticked, PVT sign is not used (mainly not used for USA).

Depending on the sign convention, some of the parameters will have the opposite sign.

Add/Modify button

after selecting this button, either the new 7 parameter set is created or an exiting one modified. To save the setting list, use the **Write** *button.*

Write button

after selecting this button, the user defined 7 parameter settings are written out to the file ***7params.4d*** *in the user selected folder. This means that the 7 parameter settings will be available in the current and future projects. For more information on the* **Write** *button, go to the section* 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d.

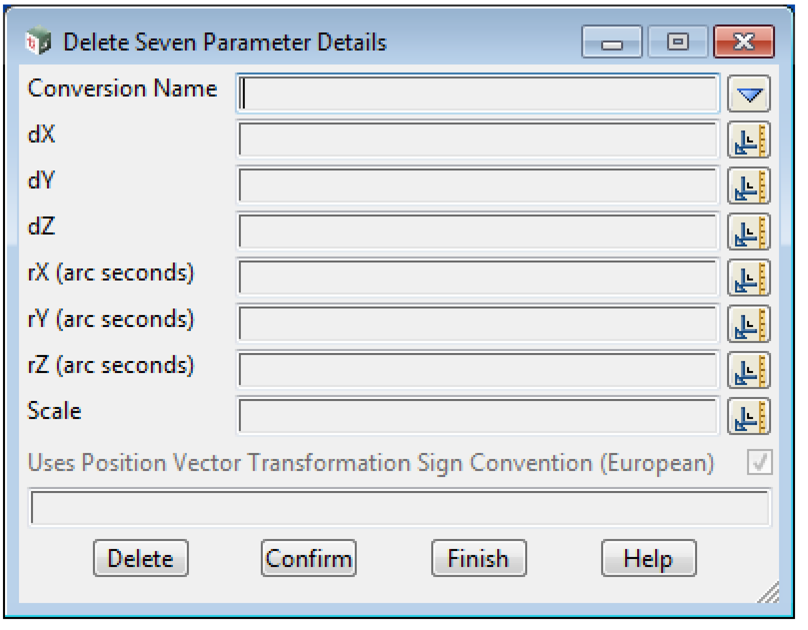
Go to the next section 7.6.8.2 Delete 7 Parameters or return to 7.6.8 7 Parameters.

7.6.8.2 Delete 7 Parameters

Position of option on menu: **Project =>Management =>7 parameters =>Delete**

The **Delete** option deleted a seven parameter set from the list of available seven parameter settings.

On selecting the **Delete** option, the **Delete 7 Parameter Details** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Conversion name	input		all defined 7 param settings

name of the 7 parameters setting to be deleted from the 7 parameter settings list. The relevant setting parameters are displayed.

Delete	button		

after selecting this button, the selected 7 parameter setting is deleted from the setting list. This can be done for a number of 7 parameter sets by simply selecting the name to be deleted and selecting the delete button. To save the modified setting list, use the **Write** *button*

Write	button		

after selecting this button, the user defined 7 parameter settings are written out to the file ***7params.4d*** *in the user selected folder. This means that the 7 parameter settings will be available in the current and future projects. For more information on the* **Write** *button, go to the section* 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d

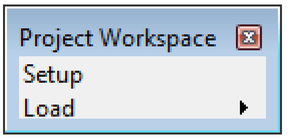
Return to 7.6.8 7 Parameters.

7.6.9 Project Workspace

Position of option on menu: **Project =>Management =>Workspace**

Options to set up the project

The **Project Workspace** walk-right menu contains various projection items.



create/edit workspace files
list and load workspace files

For the option *Setup*, go to 7.6.9.1 Workspace Setup

Load 7.6.9.2 Project Workspace Load

7.6.9.1 Workspace Setup

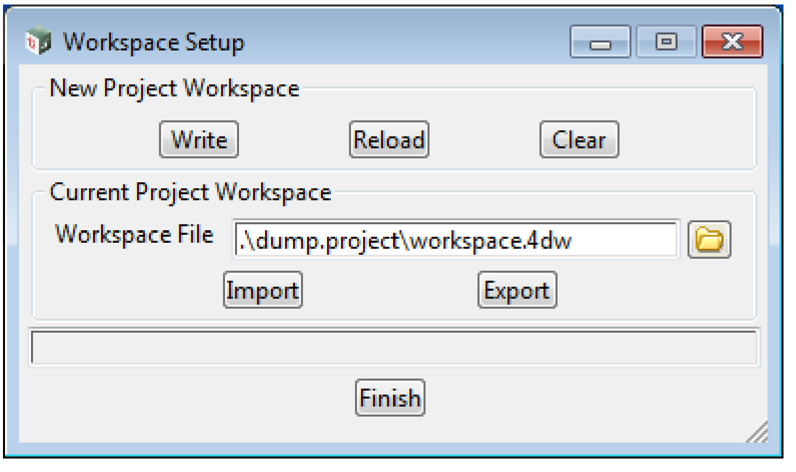
Position of option on menu: **Project =>Management =>Workspace =>Setup**

The workspace file is used to define the position of toolbars and output window for a new projects.

Once inside an existing project, the workspace file is no longer used and the final positions of the toolbars and output window are recorded inside the project so they come up in the same final position as when the project is reopened.

The Workspace Setup option allows the user to define new workspace setup files that can be loaded at any time in an existing project or used as the default workspace file used for all new projects.

On selecting the **Setup** option, the **Workspace Setup** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Write	button		

write out the current toolbar configuration to a .4dw file.

Load	button		

read in the workspace.4dw file in the current project folder.

Clear	button		

remove all the current toolbars and read in the default workspace.4dw file

Workspace file	file box	current workspace file	*.4dw files

name of the workspace file to re imported/exported

Import	button		

read in and use the workspace file given in the **Workspace file** *field.*

Export	button		

write the current toolbar settings out to the workspace file given in the **Workspace file** *field.*

Go to the next section 7.6.9.2 Project Workspace Load or return to 7.6.9 Project Workspace.

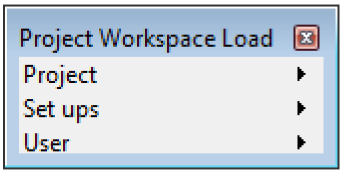
7.6.9.2 Project Workspace Load

Position of option on menu: **Project =>Management =>Workspace >Load**

This option displays and selects a project workspace file to set up the icons etc. on the screen.

The **Project Workspace Load** walk-right menu contains further walk-rights to display the workspace files in the local project, the set ups folder and the user folder.

To load a workspace file, simply click on the name in the walk-right lists.



list and load workspace files in the project
list and load workspace files in the set ups folder
list and load workspace files in the user folder

Return to 7.6.9 Project Workspace.

7.6.10 Tags

For the option *Tag tree* go to	7.6.10.1 Tag Tree
Find new tags	7.6.10.2 Register New Tags

7.6.10.1 Tag Tree

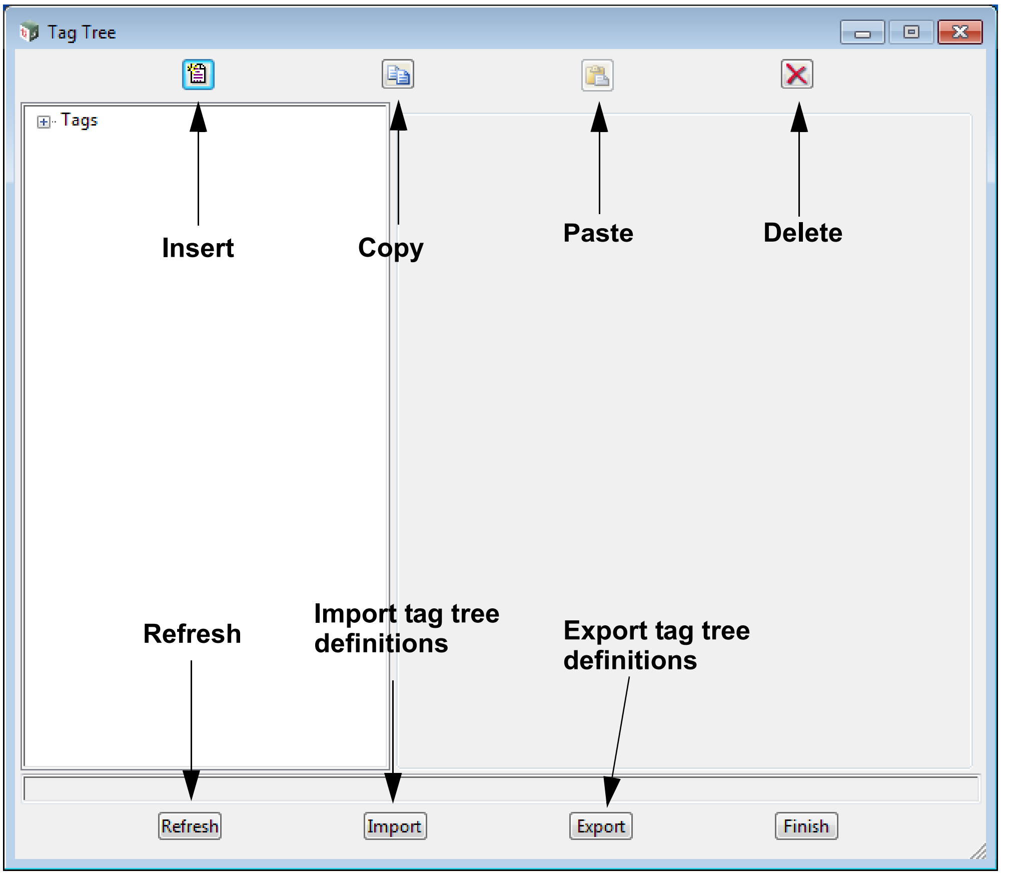
Position of option on menu: **Project =>Management =>Tags =>Tag tree**

The ***12d Model*** objects *models*, *tins* and *strings* can be tagged with an unlimited number of user defined text strings called ***tags.*** For example, a string may be tagged with the two tags, "survey day 1" and "sewer".

Tags names are ***case sensitive*** and must be ***unique***.Tags are used in an increasing number of ***12d Model*** options. For example, on a view, models can be selected for adding/removing by giving a *tag* name.

To further increase their usefulness, tags in a project can also be assigned a ***hierarchy***, or ***tree structure***. However that will be discussed shortly after first describing how to create, apply and removed simple tags (see Defining a Tag Tree (Tag Hierarchy)).

Selecting **Tags** displays the **Tag Tree** panel which is used to defined tags, and also apply and remove tags from objects.



Buttons at Bottom grid

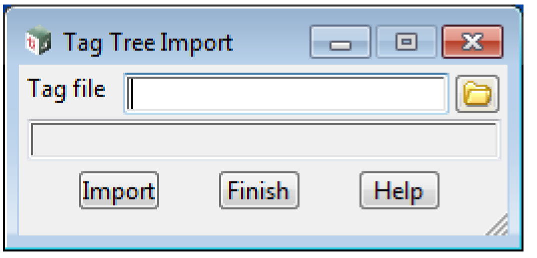
Refresh button

refresh the grid.

Import button

import a tag tree definition file.

Clicking on **Import** *brings up the* **Tag Tree Import** *panel.*



Tag file tags box all .tags files

name of the tag file to read the tag definitions from.

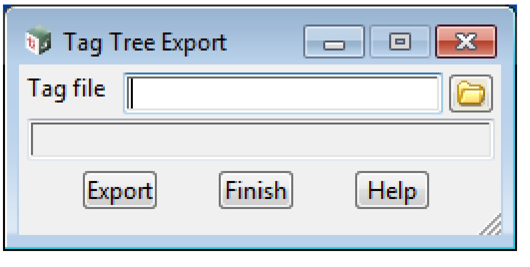
Import button

*read in the tag definitions from the **Tag file** and merge them with the current definitions for the project.*

Export button

export a tag tree definition file.

Clicking on **Export** *brings up the* **Tag Tree Export** *panel.*



Tag file tags box all .tags files

name of the tag file to write the project tag definitions out to.

Export button

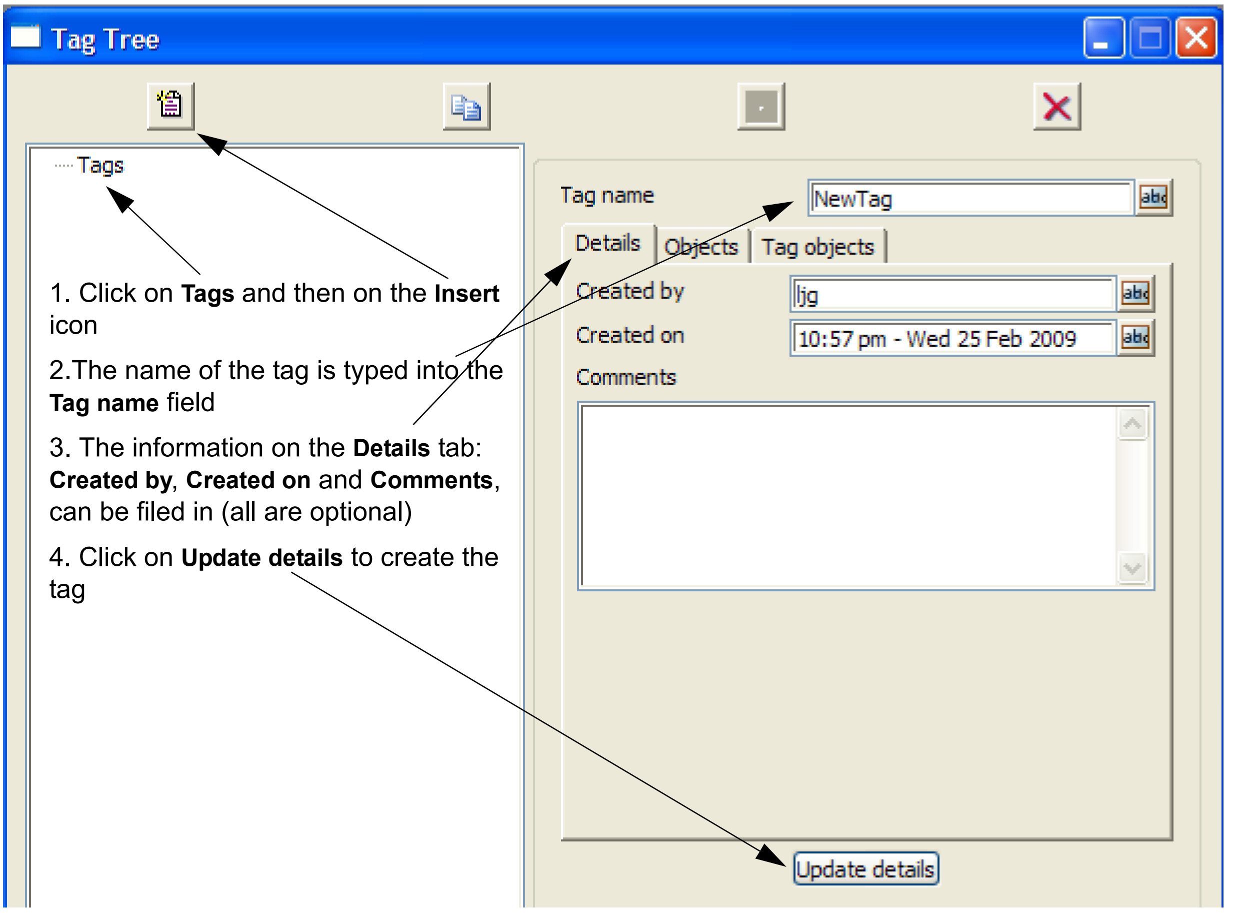
*write out the tag tree definition for this project to the **Tag file**.*

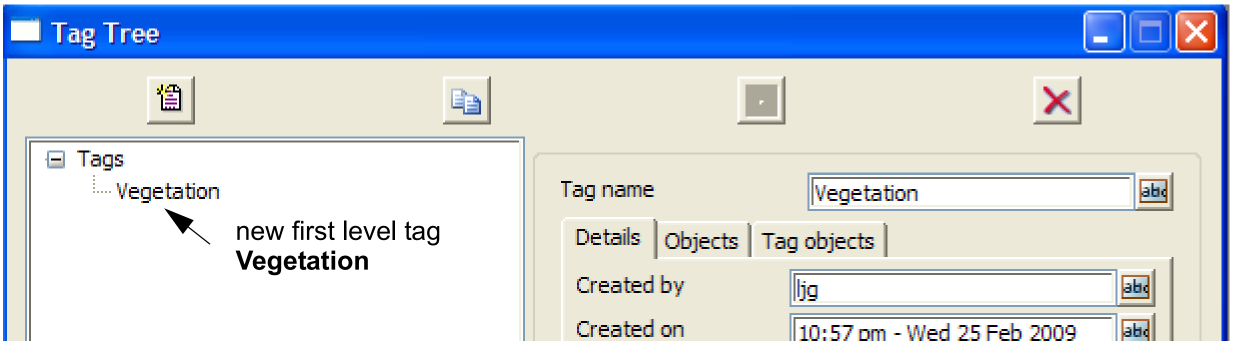
How To Use the Tag Tree Panel

Creating a Tag

To create a ***new first level tag***, click on ***Tags*** and then the **Insert** icon.

The name of the tag is typed into the **Tag name** field, the information on the **Details** tab: **Created by**, **Created on** and **Comments**, can be filled in (all are optional) and then click on **Update details** to create the tag.





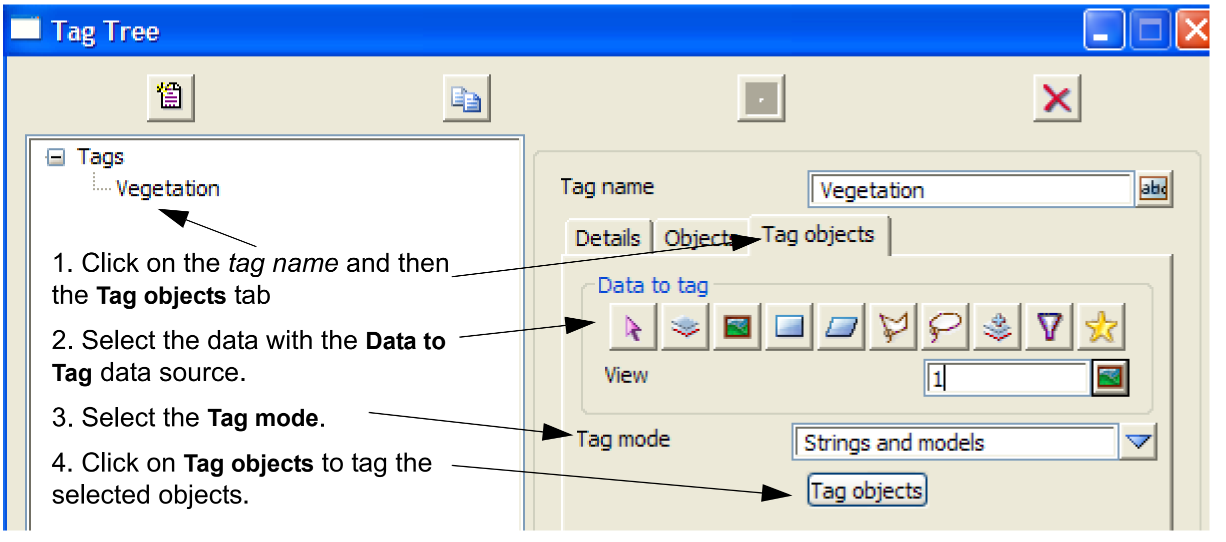
Applying a Tag To Objects

To apply a tag, click on the *tag name* and then the **Tag Objects** tab.

Select the data with the **Data to Tag** data source.

Select the **Tag mode** (choice of *Strings only*, *Models only*, *Strings and models*).

Click on **Tag objects** to tag the selected objects.



Retrieving and Deleting Tagged Objects

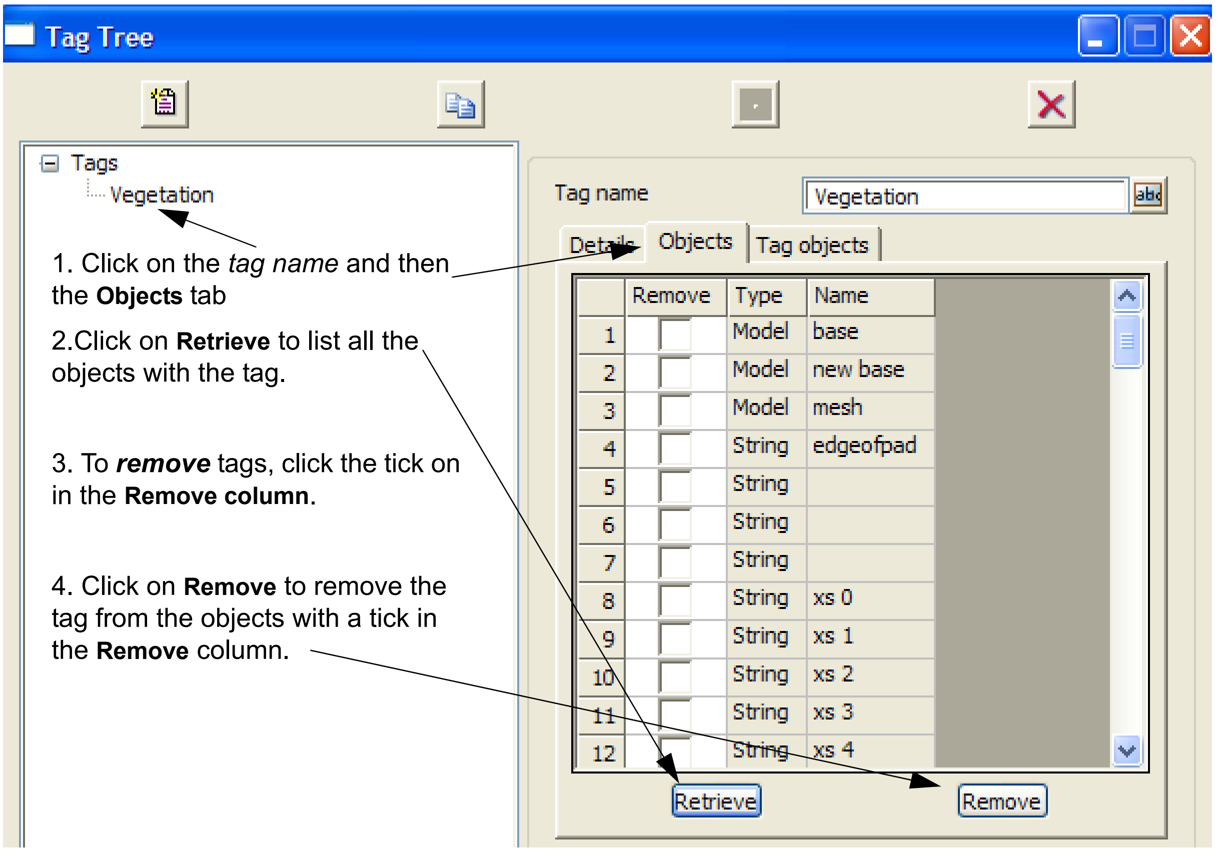
To retrieve a list of data tagged with a certain tag, click on the *tag name* and then the **Objects** tab.

Click on **Retrieve** to list all the objects with the tag.

To remove tags, click the tick on in the **Remove column**.

Click on **Remove** to remove the tag from the ticked objects.

Note - clicking RB on the ***Remove*** at the *top of the column* in the grid brings up a panel with options to set all the ticks on, set all the ticks off or toggle the tick state.



Defining a Tag Tree (Tag Hierarchy)

Tag names are ***case sensitive*** and must be ***unique*** *and* objects can be tagged with **more than one** tag. For example, a string may be tagged with the two tags, "survey day 1" and "sewer"

To further increase their usefulness, tags in a project can also be assigned a ***hierarchy***, or ***tree structure***.

A ***tag tree structure*** can be created for the project by following the rules:

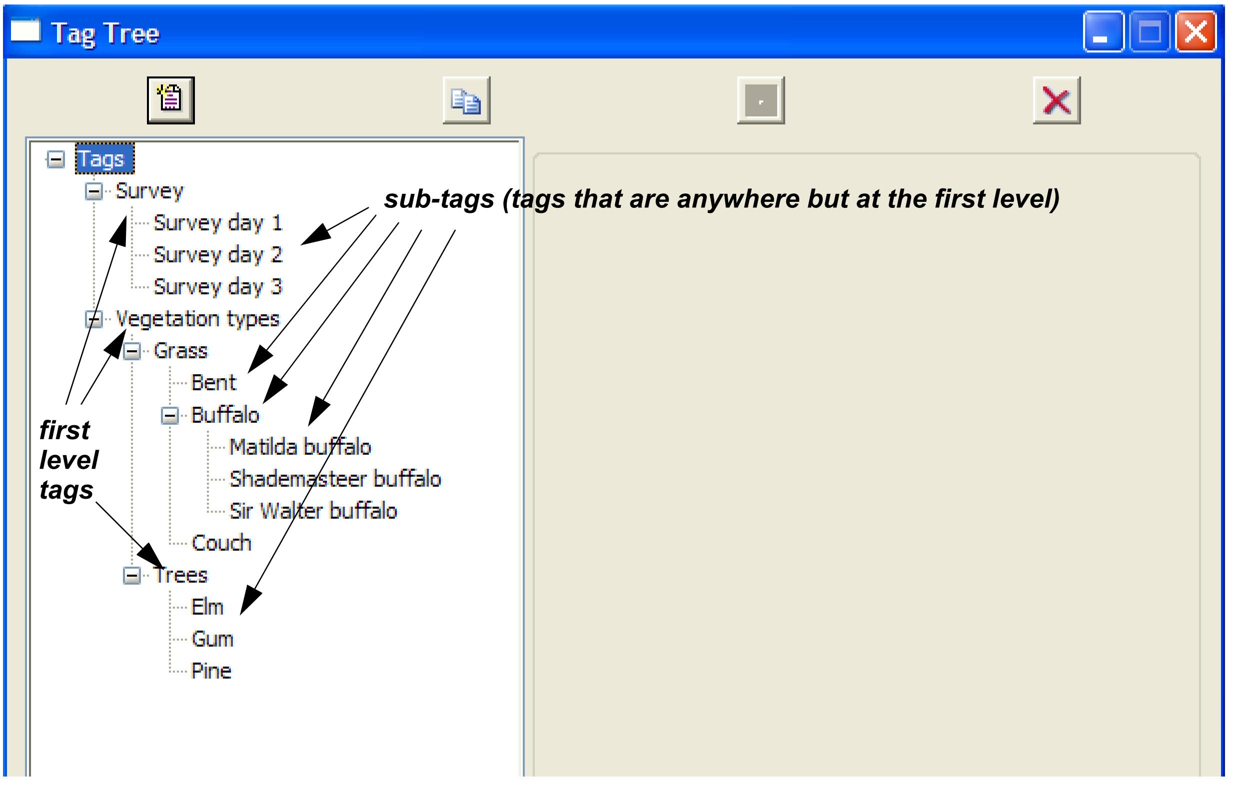
1. Tags can be ***first level tags*** or ***sub-tags***, but not both.
2. ***First level tags*** are tags created at the top level of the tag tree. That is, they are the level directly below the ***Tags*** label in the ***Tag Tree*** panel.
3. ***Sub-tags*** are tags that are created as sub-tags *of a first level tag*, or *sub-tags of other sub-tags*
4. First level tags can not be used as sub-tags and sub-tags can not be a first level tag.
5. ***Tag names*** must be ***unique*** amongst ***all tags - first level tags*** and ***sub-tags***. So you can't have a first level tag with the same name as a sub-tag, and vice-versa.
6. The same subtag name can not appear more than once in any single ***tag-subtag*** sequence.

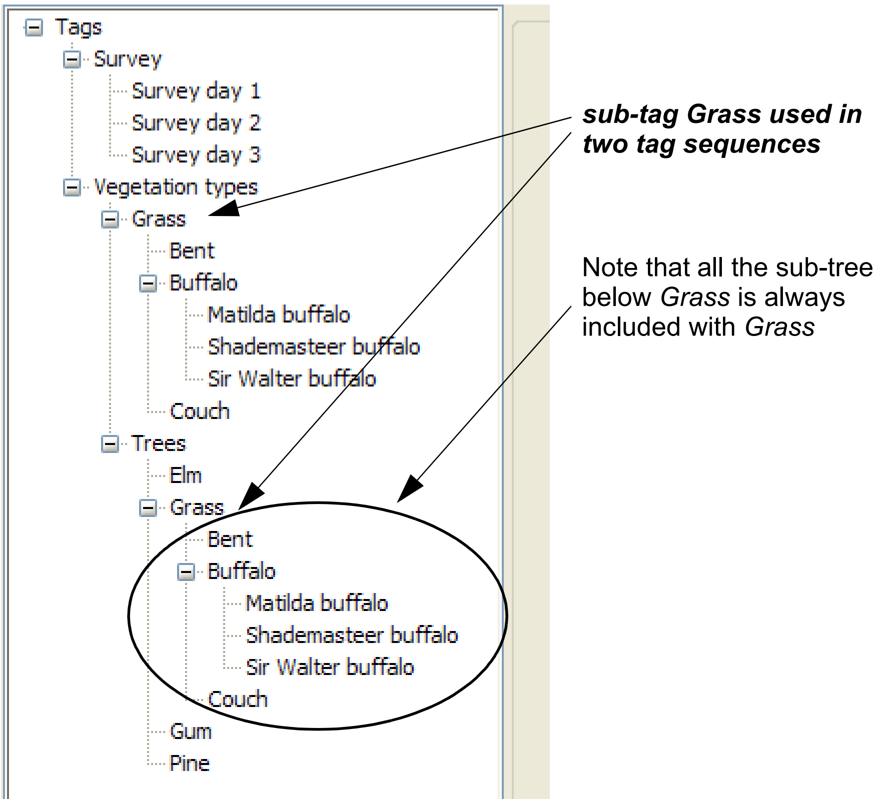
   For example, you can have a tag *Vegetation types* with a subtag of *Grass* and with a sub-subtag of *Bent*. but you can't have a tag *Vegetation types* with a subtag of *Grass,* a sub-subtag of *Bent*, and a sub-sub-subtag of *Grass*.

   That is *Vegetation types > Grass > Bent* is allowed
   but *Vegetation types > Grass >Bent > Grassis **not** allowed*

   Note that because tags are case sensitive

   Vegetation types > Grass >Bent > grass is allowed.
7. A subtag can appear in more than one tag sequence as long as Rule 6 is not violated.





A tag hierarchy can be very useful.

For example, if we have the tags and tag tree as defined in the previous picture, adding the models tagged as *Trees* with the **Add Tagged Models** option will also add the models tagged with *Elm*, Gum, *Pine*, Grass, *Bent, Buffalo, Matilda buffalo*, *Shademasteer buffalo, Sir Walter buffalo* and *Couch* ***even if they are not tagged as Trees.***

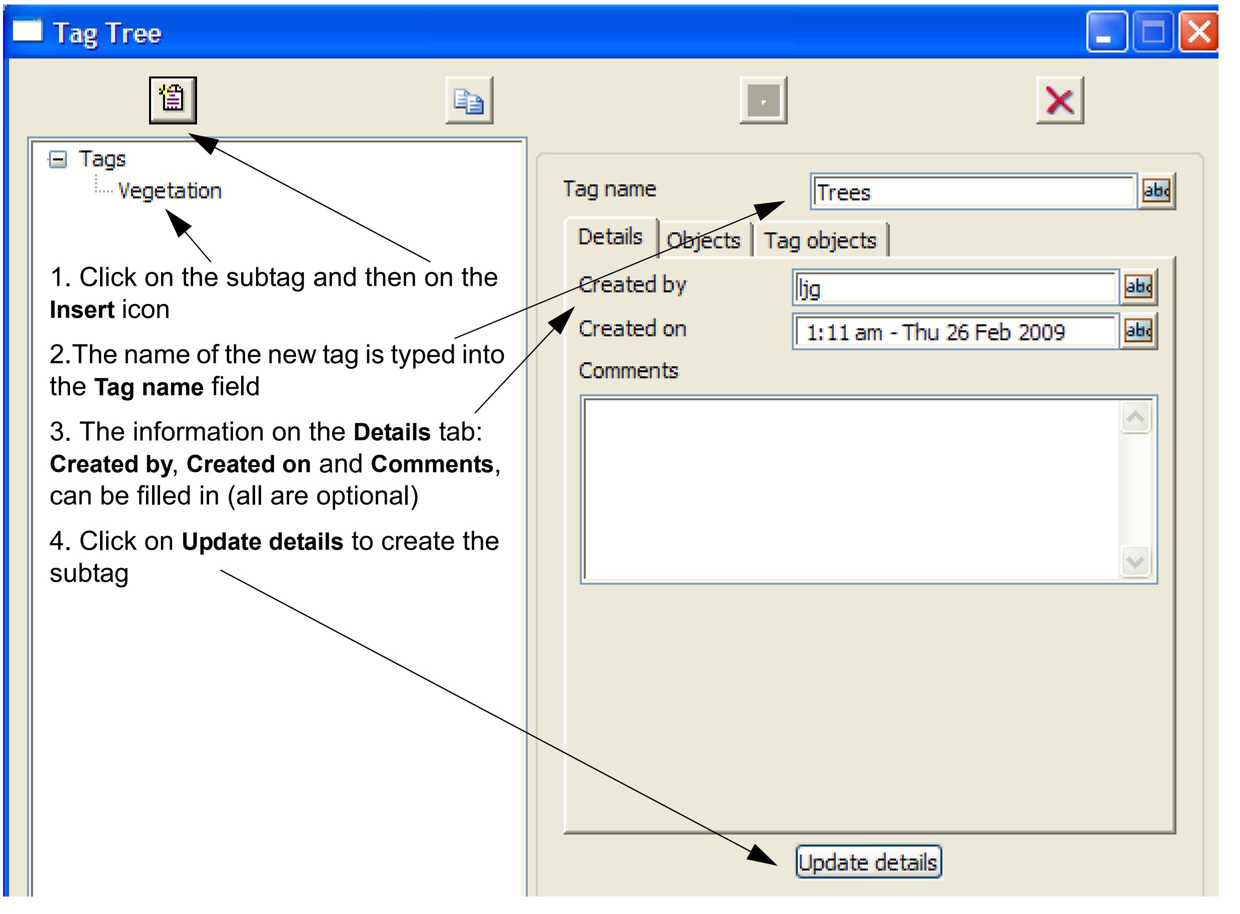
If *Grass* was removed as a subtag of *Trees* then adding *Trees* with the **Add Tagged Models** option will then only add the models tagged with *Trees*, *Elm*, Gum and *Pine.* So no new tagging was needed, just a modification to the tag tree definition.

Creating a Tag Tree Structure

To create a subtag of any tag is very similar to creating a first level tag.

To create a ***new sub tag***, click on the tag to have the subtag, and then click on the **Insert** icon.

The name of the subtag is typed into the **Tag name** field, the information on the **Details** tab: **Created by**, **Created on** and **Comments**, can be filled in (all are optional) and then click on **Update details** to create the subtag.



Tag Tree

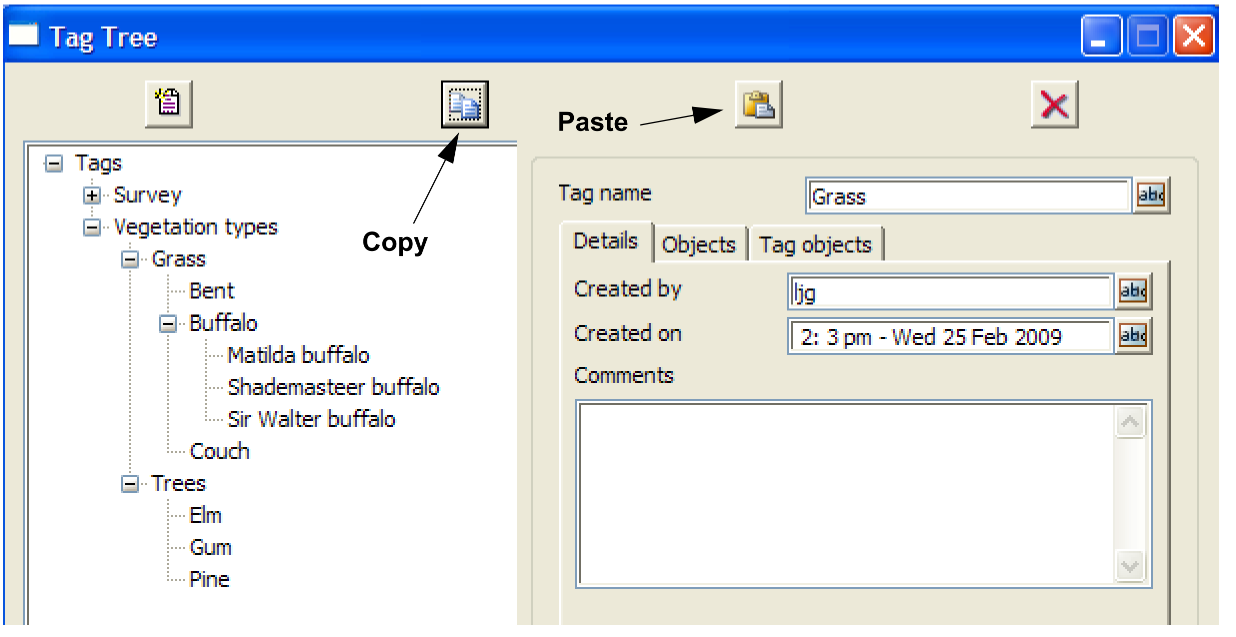
Copy and Paste in a Tag Tree Structure

The **Copy** and **Paste** icons are used to copy subtags around the tag tree structure.

To copy, first click on the subtag you wish to copy (say Grass), and then click on the **Copy** icon.

The **Paste** button will then become active.



Now click on the first level tag or subtag to copy the subtag to (say *Trees*), and then click on the **Paste** icon.

The subtag (and the tree below it) will now be copied as a subtree of the selected tag.

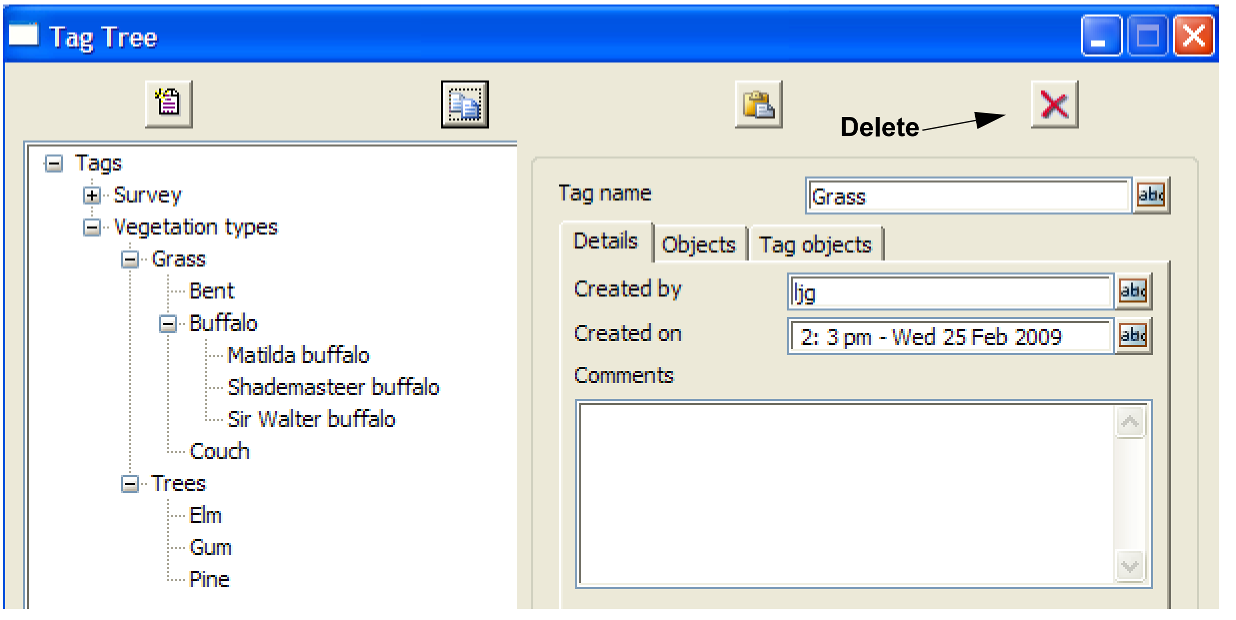
Deleting a Subtag in Tag Tree Structure

A first level tag or subtag can be deleted from anywhere in the tree by simply clicking on the tag to be deleted and then clicking on the **Delete** icon.



Go to the next section 7.6.10.2 Register New Tags or return to 7.6.10 Tags.

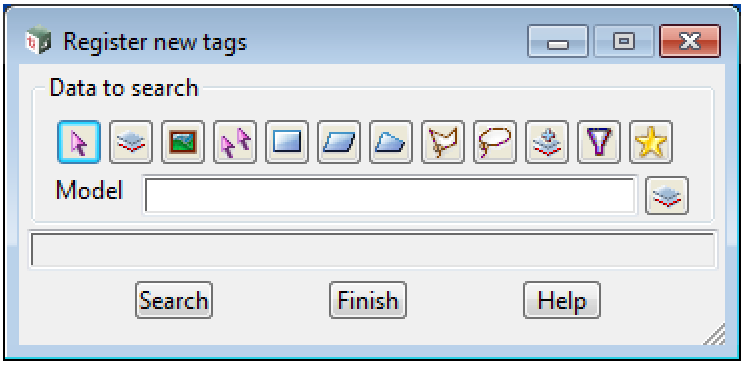
7.6.10.2 Register New Tags

Position of option on menu: **Project =>Management =>Tags => Find new tags**

Register new tags is used to locate any new tags that have been added on models or strings which have not been registered with the project.

Unregistered tags may occur when reading in a 12da that contains models or strings with tags. Until a tag is registered, it can not be used in source boxes or other panels.

Selecting **Find new tags**, brings up the **Register new tags** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data to search	source		

Data to search - for a full description go to 4.19.3 Data Source.

Search	button		

perform the search.

Return to 7.6.10 Tags.

7.6.11 Tree

Position of option on menu: **Project =>Tree**

Position of option on menu: **Project =>Management =>Tree**

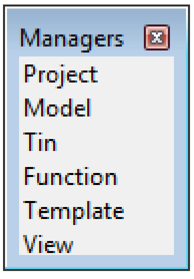
For documentation on this option, go to the section **Project =>Tree** (see 7.9 Tree).

7.6.12 Managers

Position of option on menu: **Project =>Management =>Managers**

The **Managers** display in a tree structure information and settings for all the models, tins, functions and templates both in the project and removed from the project, and for all the views in the project.

The **Managers** walk-right menu contains a manager for the entire project and separate managers for modes, tins, functions templates and views.



display nodes for all models, tins, functions & templates (in & removed from the project), & all views in the project

For the option:

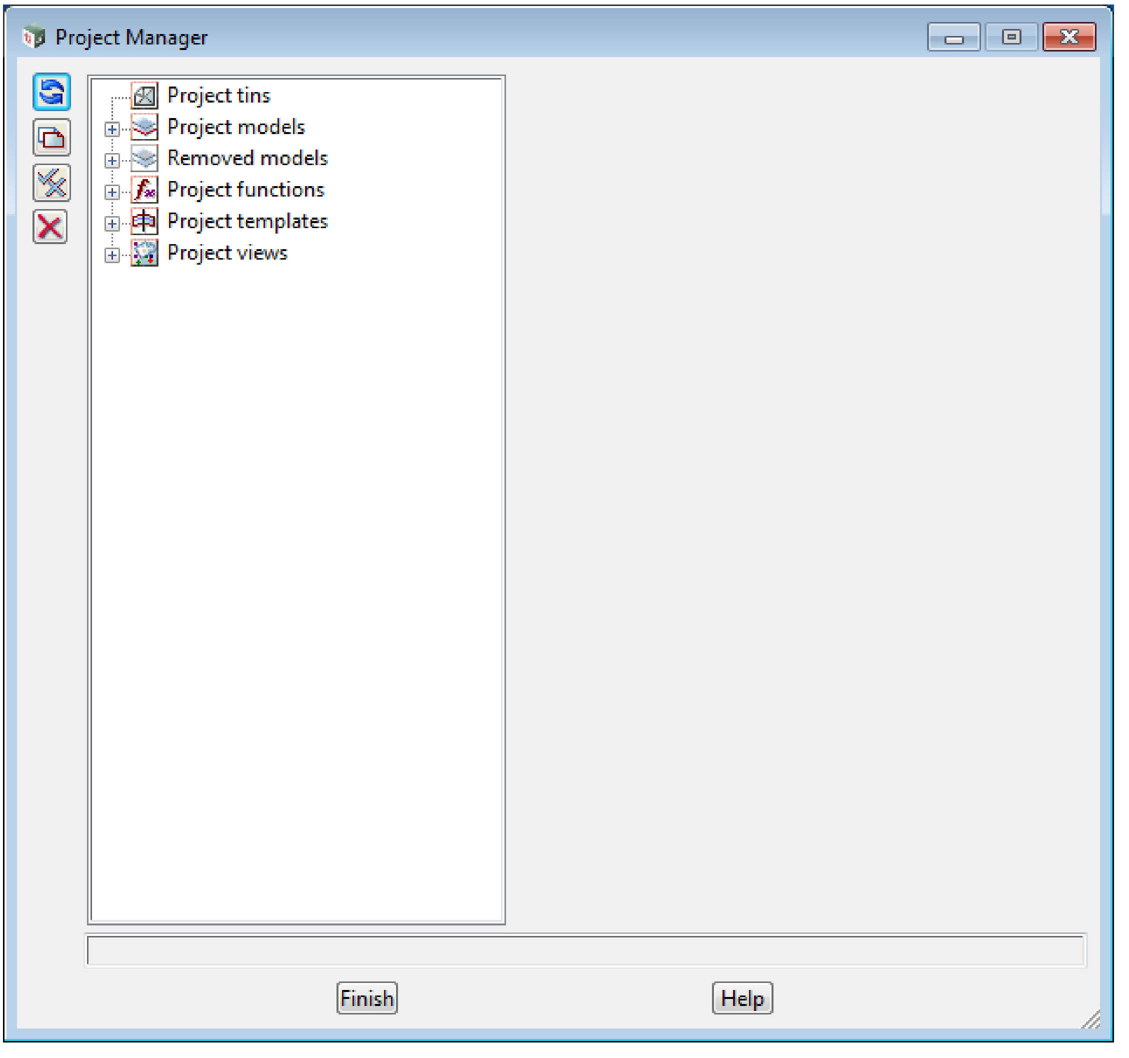
Project, go to 7.6.12.1 Project Manager.
Model 7.6.12.2 Model Manager.
Tin 7.6.12.3 Tin Manager.
Function 7.6.12.4 Function Manager.
Template 7.6.12.5 Template Manager.
View 7.6.12.6 View Manager.

7.6.12.1 Project Manager

Position of option on menu: **Project =>Management =>Managers =>Project**

The **Project Manger** displays in a tree structure nodes for all the models, tins, functions and templates both in the project and removed from the project, and all the views in the project.

Selecting **Project** displays the **Project Manager** panel.



If there are any models/tins/functions/templates in the Project, then there will be a **Project models/tins/functions/templates** node in the tree and that node has sub nodes for all the models/tins/functions/templates in the project. The name of the sub node is the name of the model/tin/function/template.

If there are any models/tins/functions/templates that have been removed from the Project, then there will be a **Removed models/tins/functions/templates/views** node in the tree and that node has sub nodes for all the removed models/tins/functions/templates. The name of the sub node is the name of the removed model/tin/function/template

If there are any views in the Project, then there will be a **Project view** node in the tree with the views as sub nodes. The name of sub node is the name of the view.

The information and setting displayed for these nodes is the same as those in the separate Model/Tin/Function/Template/View Managers and so will be documented in those sections.

See

7.6.12.2 Model Manager

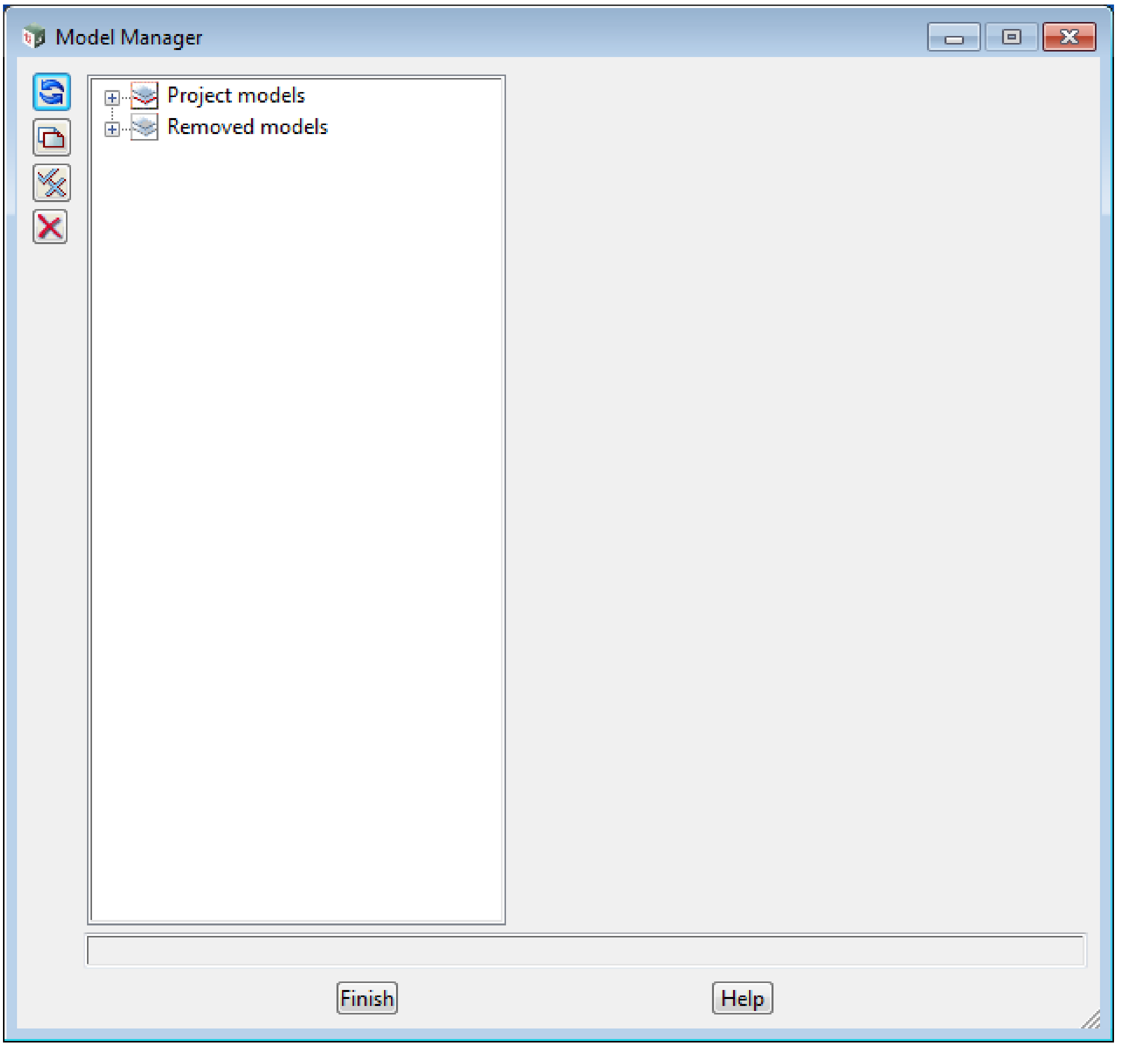
Continue to the next section 7.6.12.2 Model Manager or return to 7.6.12 Managers.

7.6.12.2 Model Manager

Position of option on menu: **Project =>Management =>Managers =>Model**

The **Model Manger** displays in a tree structure all the settings for models in the project, and the names of all the removed models.

Selecting **Model** displays the **Model Manager** panel.



If there are any models in the Project, then there will be a **Project models** node in the tree.

Expanding the **Project models** node lists all the models in the project as sub nodes, and expanding the sub node of a project model displays information and settings for the model on the right hand side of the panel. The name of the sub node is the name of the model.

Many of the settings can then be changed, and the changes take place immediately without having to press any other button.

If there are any models that have been removed from the Project, then there will be a **Removed models** node in the tree.

Expanding the **Removed models** node lists all the models removed from the project as sub nodes but no other information or settings can be displayed for removed models. The name of the sub node is the name of the removed model.

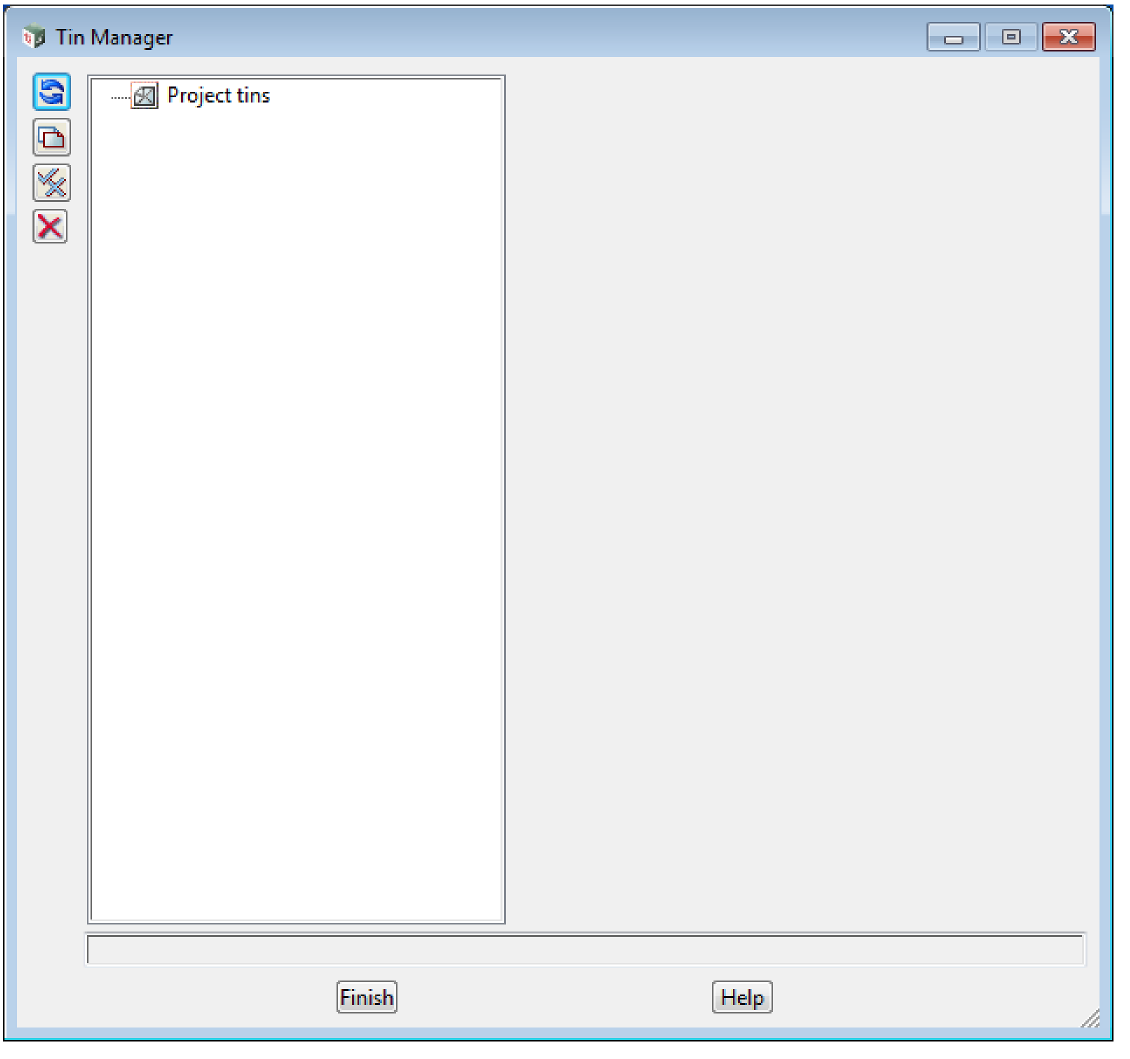
Continue to the next section 7.6.12.3 Tin Manager or return to 7.6.12 Managers.

7.6.12.3 Tin Manager

Position of option on menu: **Project =>Management =>Managers =>Tin**

The **Tin Manger** displays in a tree structure, all the settings for tins in the project, and the names of all the removed tins.

Selecting **Tin** displays the **Tin Manager** panel.



If there are any tins in the Project, then there will be a **Project tins** node in the tree.

Expanding the **Project tins** node lists all the tins in the project as sub nodes, and expanding the sub node of a project tin displays information and settings for the tin on the right hand side of the panel. The name of the sub node is the name of the tin.

Many of the settings can then be changed, and the changes take place immediately without having to press any other button.

If there are any tins that have been removed from the Project, then there will be a **Removed tins** node in the tree.

Expanding the **Removed tins** node lists all the tins removed from the project as sub nodes but no other information or settings can be displayed for removed tins. The name of the sub node is the name of the removed tin.

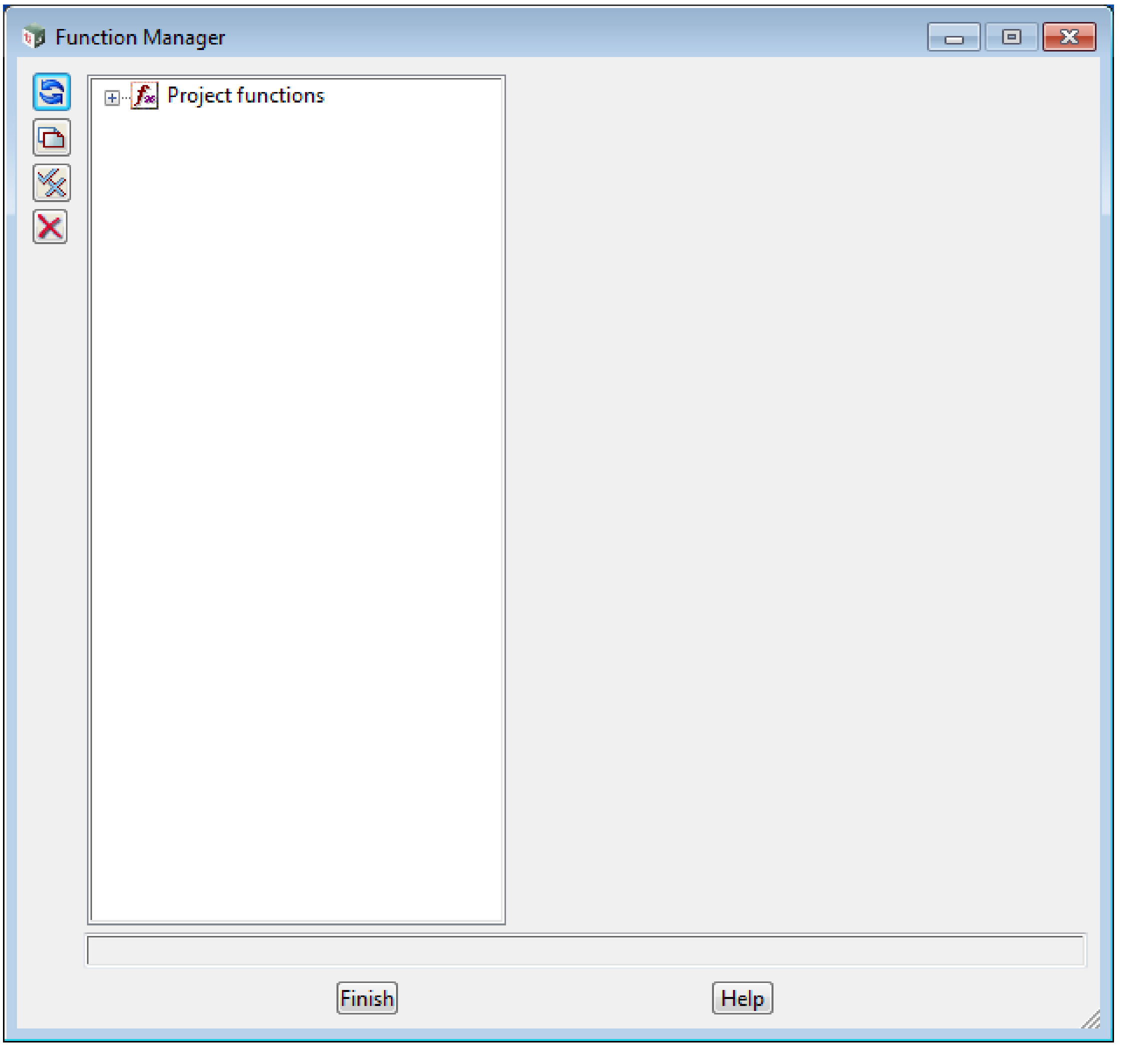
Continue to the next section 7.6.12.4 Function Manager or return to 7.6.12 Managers.

7.6.12.4 Function Manager

Position of option on menu: **Project =>Management =>Managers =>Function**

The **Function Manger** displays in a tree structure, all the settings for functions in the project, and the names of all the removed functions.

Selecting **Function** displays the **Function Manager** panel.



If there are any functions in the Project, then there will be a **Project functions** node in the tree.

Expanding the **Project functions** node lists all the functions in the project as sub nodes, and expanding the sub node of a project function displays information and settings for the function on the right hand side of the panel. The name of the sub node is the name of the function.

Many of the settings can then be changed, and the changes take place immediately without having to press any other button.

If there are any functions that have been removed from the Project, then there will be a **Removed functions** node in the tree.

Expanding the **Removed functions** node lists all the functions removed from the project as sub nodes but no other information or settings can be displayed for removed functions. The name of the sub node is the name of the removed function.

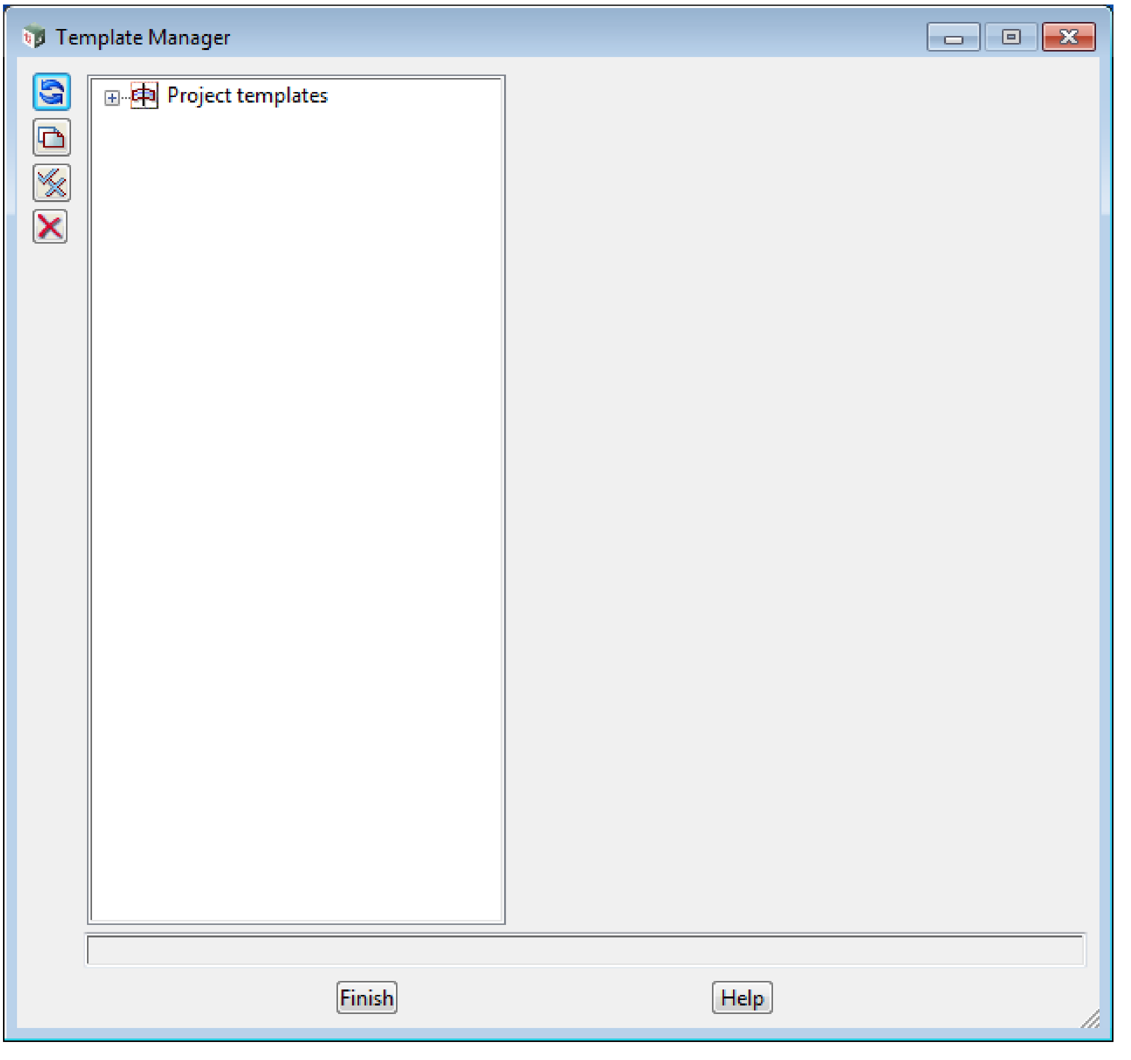
Continue to the next section 7.6.12.5 Template Manager or return to 7.6.12 Managers.

7.6.12.5 Template Manager

Position of option on menu: **Project =>Management =>Managers =>Template**

The **Template Manger** displays in a tree structure, all the settings for templates in the project, and the names of all the removed templates.

Selecting **Template** displays the **Template Manager** panel.



If there are any templates in the Project, then there will be a **Project templates** node in the tree.

Expanding the **Project templates** node lists all the templates in the project as sub nodes, and expanding the sub node of a project template displays information and settings for the template on the right hand side of the panel. The name of the sub node is the name of the template.

Many of the settings can then be changed, and the changes take place immediately without having to press any other button.

If there are any templates that have been removed from the Project, then there will be a **Removed templates** node in the tree.

Expanding the **Removed templates** node lists all the templates removed from the project as sub nodes but no other information or settings can be displayed for removed templates. The name of the sub node is the name of the removed template.

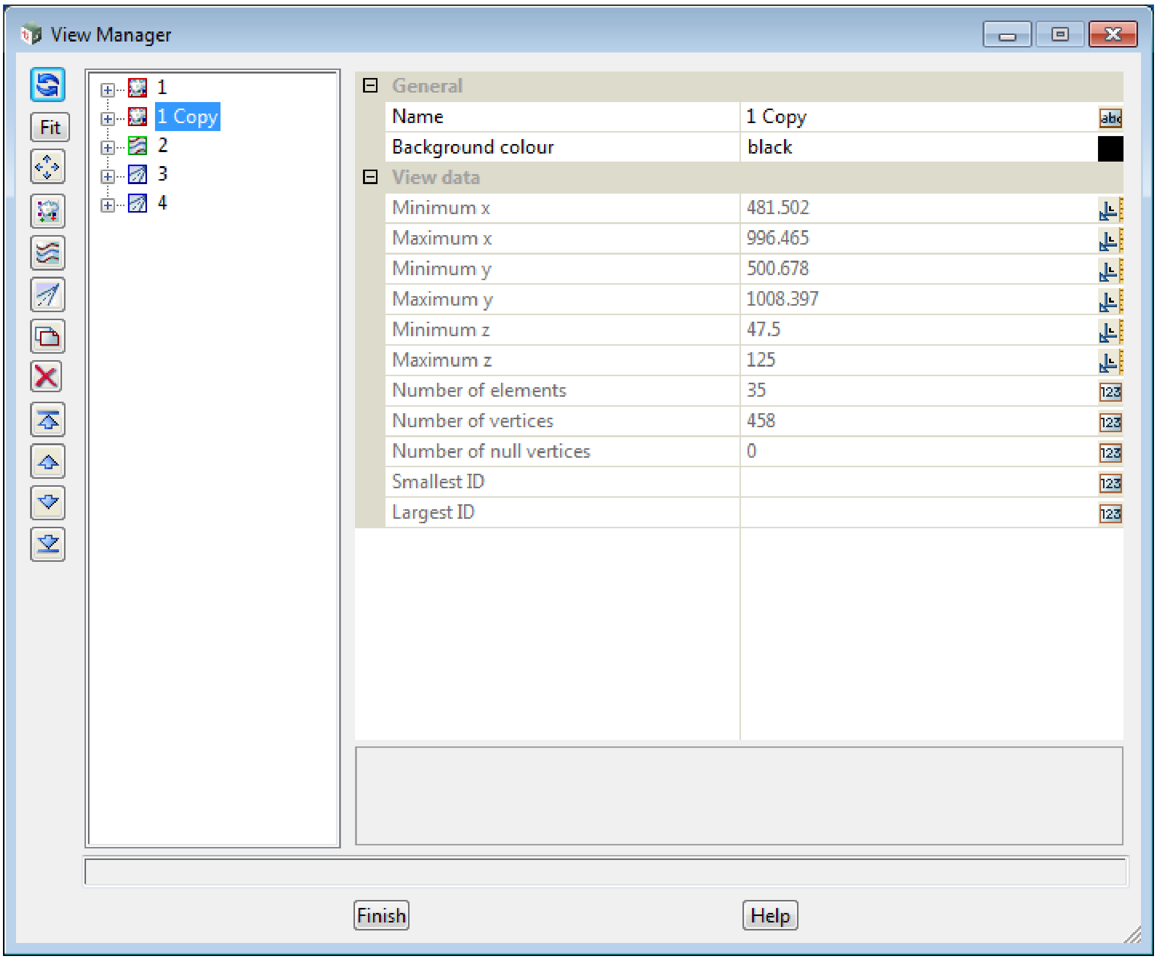
Continue to the next section 7.6.12.6 View Manager or return to 7.6.12 Managers.

7.6.12.6 View Manager

Position of option on menu: **Project =>Management =>Managers =>View**

The **View Manger** displays in a tree structure, all the settings for views in the project.

Selecting **View** displays the **View Manager** panel.



If there are any views in the Project, then there will be a node (**view node**) in the tree with the **name of the view** as the **node name**.

Expanding a **view node** lists information and setting for that view as sub nodes, and displays values for the nodes and sub nodes in the right hand side of the panel.

Once displayed in the right had side, many of the settings can be changed, and the changes will take place immediately without having to press another button.

For each **view node**, the sub nodes, settings and information displayed is the same as for the **View Properties** panels. See 9.4.6 Properties.

Return to 7.6.12 Managers.

7.6.13 Sharing

See

7.6.13.1 Sharing of Models and Tins

7.6.13.1 Sharing of Models and Tins

Models and Tins can be **shared into your project** from other projects. That means that in your project, the models an tins that are shared in from another project are not created in your project, but are copies of the models and tins from the other project.

And when the models and/or tins are modified in the other project, they can be **automatically updated** in your project.

In your own project, you decide which models and tins are available to be shared into other peoples projects. That is, you say which or your models and tins can be **shared out to another project**.

It is possible to have Shares of Shares. That is, you share a model or tin **into your project**, and then that model or tin is **shared out to another project**.

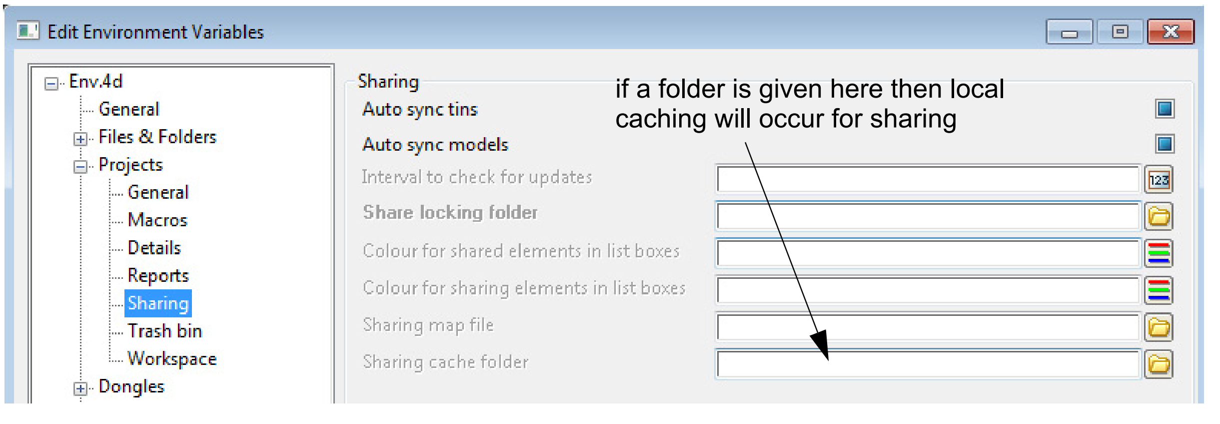
When models and tins are being shared into your project, a copy of the models and tins are copied over into your project. And each time one of the models or tins is modified in the original project, a new copy is made in your project.

However when you exit a project, the next time you start the project the models and tins that are shared into your project may not have changed. Rather than copying the models and tins again, it is possible to have the models and tins saved in a special folder, called a **Sharing Cache Folder**, so they do not have to be copied over again when ever a project is restarted.

There is an environment variable, SHARING_CACHE_4D, which gives the full path name to the local folder to use as the ***Sharing Cache Folder***.

In the ***Edit Environment Variables*** panel, it is the field ***Sharing cache folder*** in

Projects >Sharing.

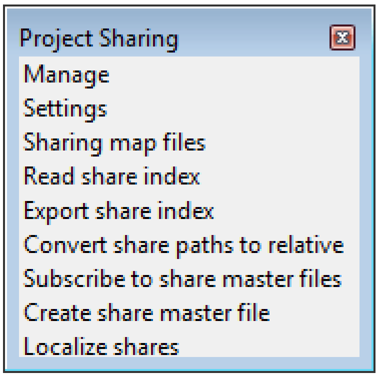


If ***Sharing cache folder*** is left blank then local caching does not occur.

Go to the next section 7.6.13.2 Project Sharing or return to 7.6.13 Sharing.

7.6.13.2 Project Sharing

The **Sharing** walk-right menu is:



For information about sharing, go to 7.6.13.1 Sharing of Models and Tins.

For the options:

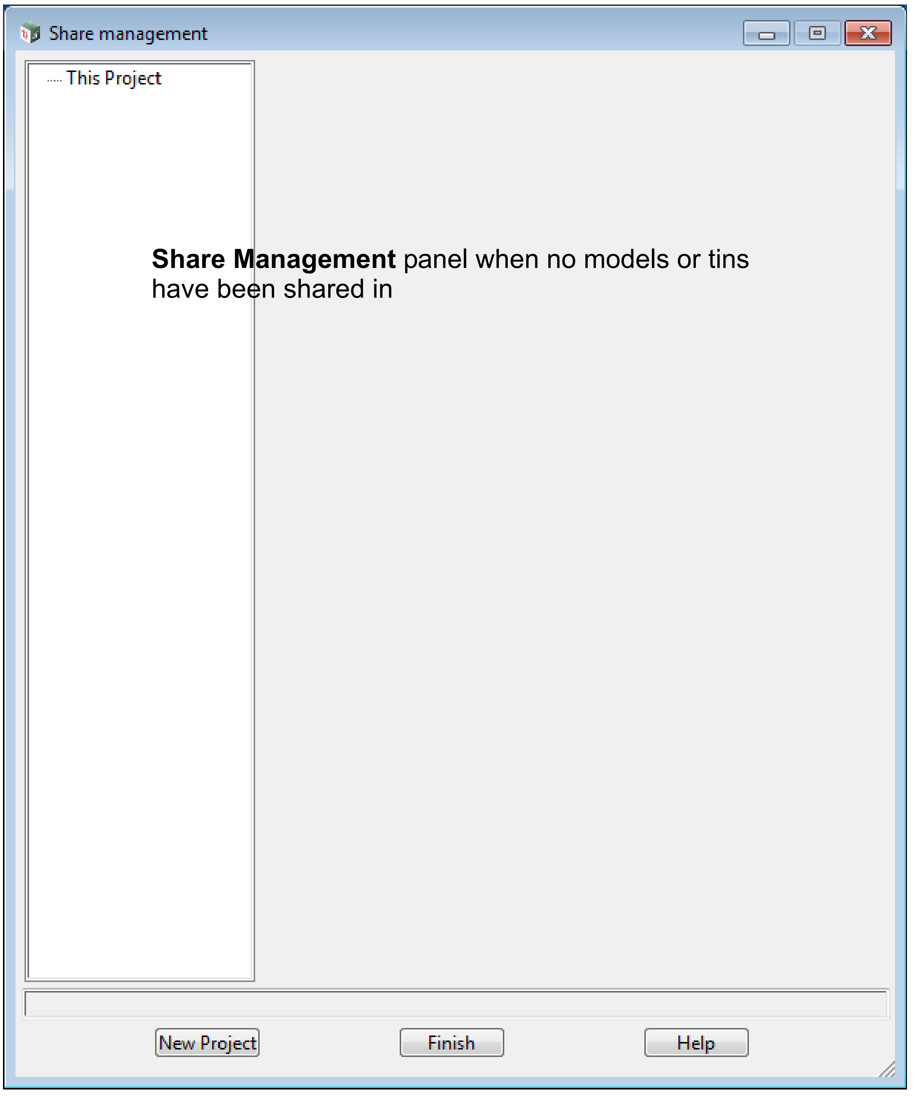
Manage, please go to 7.6.13.3 Share Management
Settings 7.6.13.4 Project Share Settings
Sharing map files 7.6.13.5 Sharing Map Files
Read share index 7.6.13.6 Add Shares By Index File
Export share index 7.6.13.7 Export A Share Index File
Convert share paths to relative 7.6.13.8 Convert Share Paths To Relative
Subscribe to share master files 7.6.13.9 Subscribe to Sharing Master Files
Create share master file 7.6.13.10 Sharing Master File
Localize shares 7.6.13.11 Localize Shares

7.6.13.3 Share Management

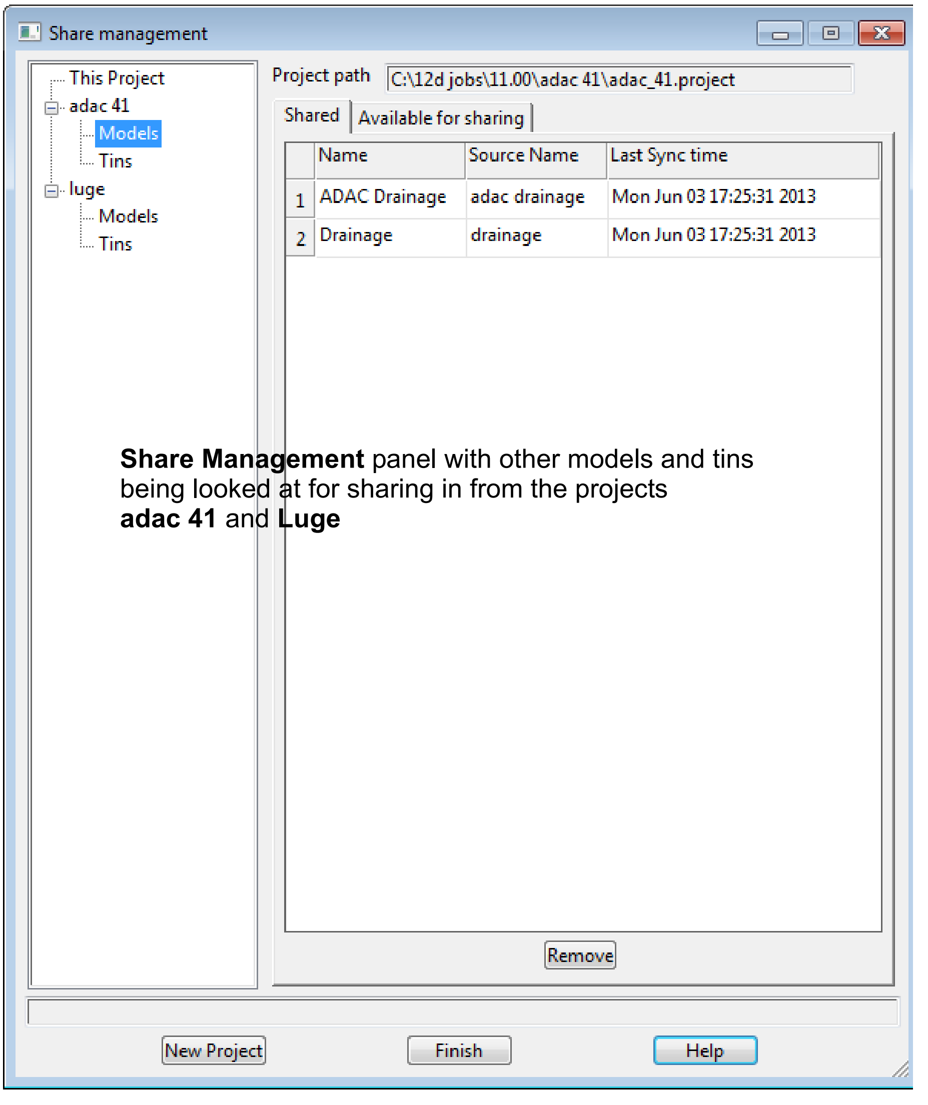
Position of option on menu: **Project =>Management =>Sharing =>Manage**

The **Share Management** tool combines all the **Share**, **Add** and **Remove** options for the sharing of models and tins in and out.

Selecting **Manage** brings up the **Share Management** panel and the panel will list under the **This Project** node, all the models and tins in the project that are available to share out, and as extra as nodes, all the projects that models and tins have been **shared in** from.



Share Management panel when no models or tins have been shared in



Share Management panel with other models and tins being looked at for sharing in from the projects **adac 41** and **Luge**

See

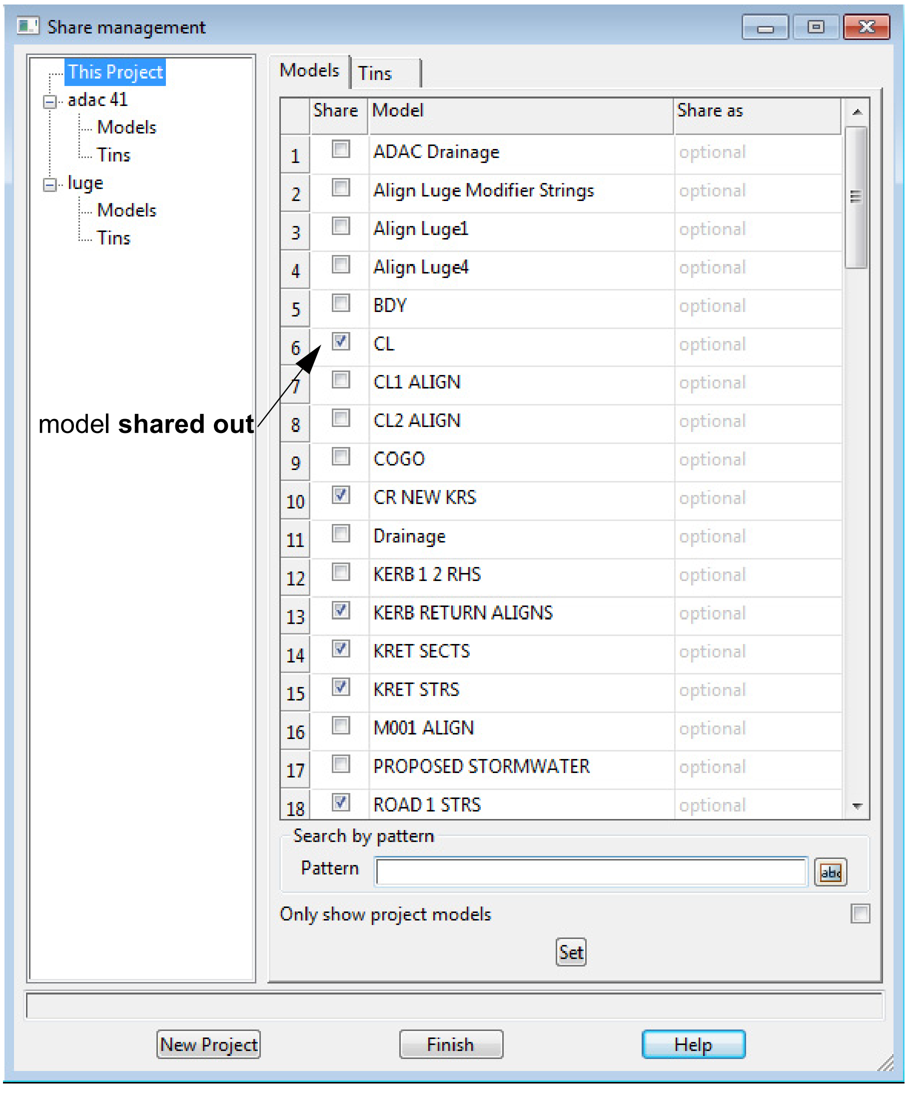
7.6.13.3.1 Making Models or Tins Available for Sharing

7.6.13.3.2 Sharing in Models and Tins

7.6.13.3.1 Making Models or Tins Available for Sharing

Clicking on **This Project** displays all the models in the project on the **Models** tab, and all the tins in the project under the **Tins** tab.

Models or tins that have been made available for sharing, that is are **shared out** so other projects can share in these models and tins from this project, have a tick beside them in the **Set** column.



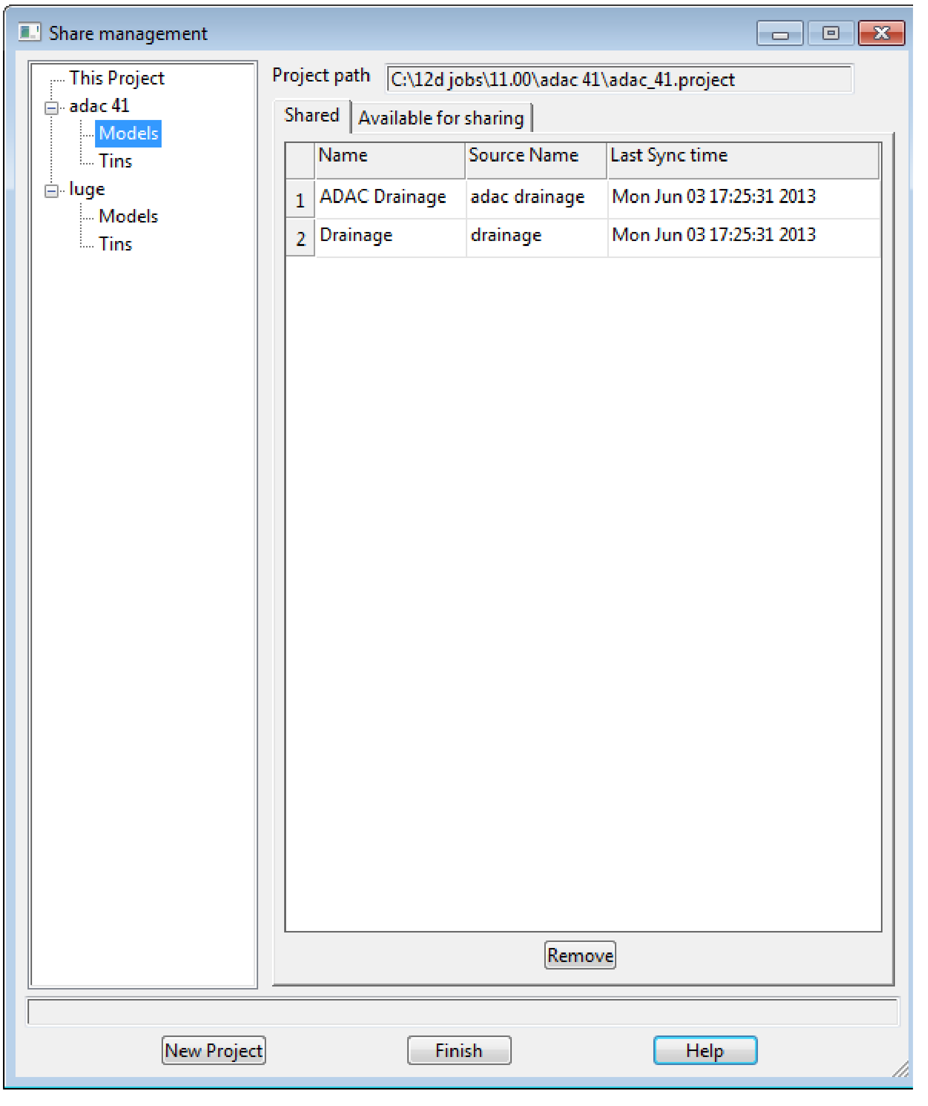
To share models or tins out, simply click the tin on in the **Share Out** column and then click on **Set**.

Similarly if there is no tick in the **Share** column then clicking on **Set** will make the models or tins no longer available to share out.

Go to the next section 7.6.13.3.2 Sharing in Models and Tins or return to 7.6.13.3 Share Management.

7.6.13.3.2 Sharing in Models and Tins

Under each project node, there is a **Models** and **Tins** node.



Models

Clicking on the **Models** node lists all the models that have been shared in on the **Shared** tab, and all the models that are available to be shared in from that project on the **Available for Sharing** tab.

On the **Shared** tab, highlighting a model name and clicking on the **Remove** button will stop the model from being shared in.

On the **Available Sharing** tab, all models available for sharing in are shown and those that have already been shared in are coloured yellow. Models that are not shared in can be shared in by ticking in the **Share ?** column and then clicking the **Add** button.

Tins

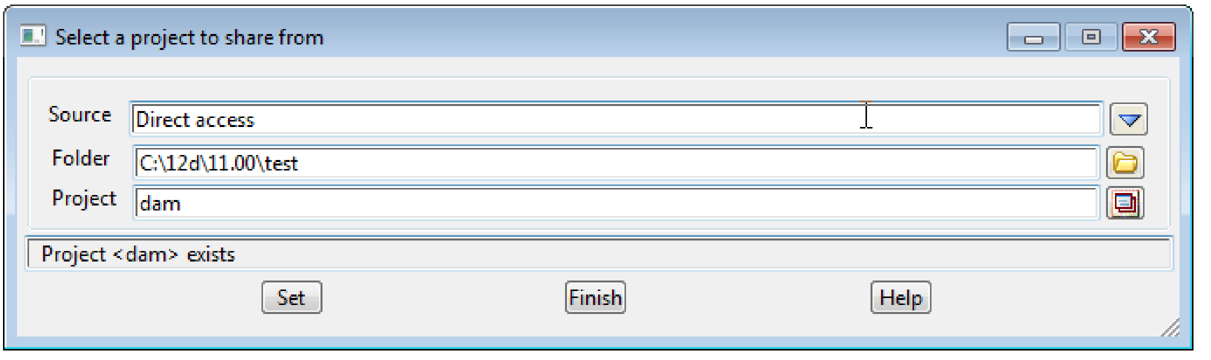
Clicking on the **Tins** node lists all the tins that have been shared in on the **Shared** tab, and all the tins that are available to be shared in from that project on the **Available for Sharing** tab.

On the **Shared** tab, highlighting a tin name and clicking on the **Remove** button will stop the ting from being shared in.

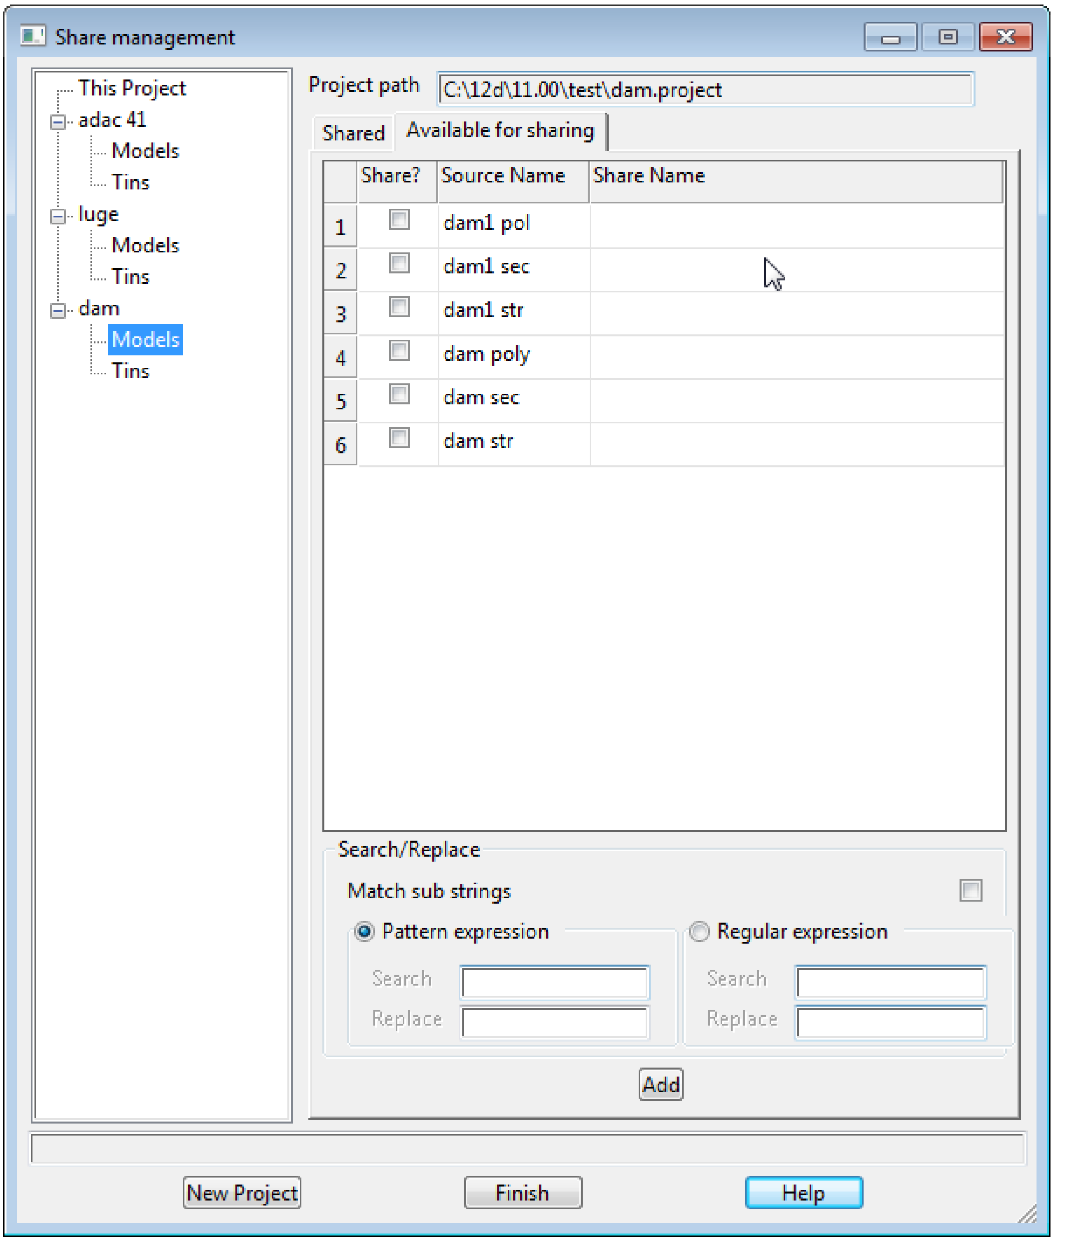
On the **Available Sharing** tab, all tins available for sharing in are shown and those that have already been shared in are coloured yellow. Tins that are not shared in can be shared in by ticking in the **Share ?** column and then clicking the **Add** button.

New Project Button

Clicking on the **New Project** button brings up the **Select a Project to Share From** panel.



Selecting a project and clicking on **Set** adds the given project as a new node in the **Share Management** panel and the **Model** and **Tin** nodes can be used to share in models and tins from that new project.



Go to the next section 7.6.13.4 Project Share Settings or return to 7.6.13.3 Share Management.

7.6.13.4 Project Share Settings

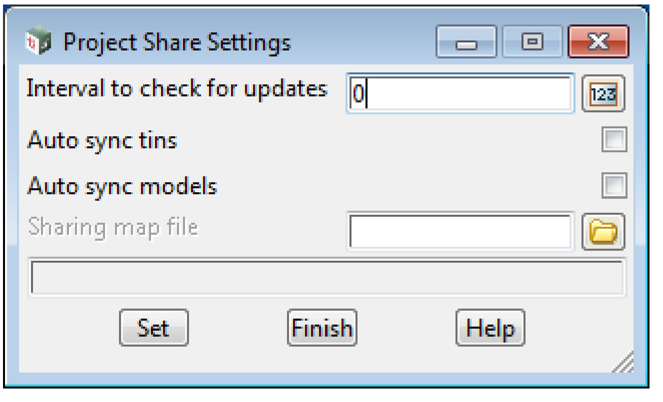
Position of option on menu: **Project =>Management =>Sharing =>Settings**

There are three environment variables that control the auto-synchronizing of any shared models or tins added to this project.

SHARE_CHECK_INTERVAL_4D	number_of_seconds
AUTO_MODEL_SYNC_4D	1 or 0
AUTO_TIN_SYNC_4D	1 or 0

This option will temporarily modify the values for this session. When the project is restarted, the values will revert to those given by the environment variables.

Selecting **Share settings** brings up the **Project Share Settings** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Interval to check for updates input

time in seconds to check if any of the shared models or tins added to the project have been updated in the server projects.

The environment variable controlling this when the project starts up is

SHARE_CHECK_INTERVAL_4D number_of_seconds

The value is only modified for this session. To permanently change the value, please modify the environment variable.

Autosync tins tick box

if ticked, the server projects for any shared tins added to this project are checked to see if they have been modified (checked every SHARE_CHECK_INTERVAL seconds). If any tins have been modified, they are re-copied to this project.

The environment variable controlling this when the project starts up is

AUTO_TIN_SYNC_4D 1 or 0

The value is only modified for this session. To permanently change the value, please modify the environment variable.

Autosync models tick box

if ticked, the server projects for any shared models added to this project are checked to see if they have been modified (checked every SHARE_CHECK_INTERVAL seconds). If any models have been modified, they are re-copied to this project.

The environment variable controlling this when the project starts up is

AUTO_MODEL_SYNC_4D 1 or 0

The value is only modified for this session. To permanently change the value, please modify the environment variable.

Set button

set the values in the panel for this session. The values will revert back to the ones given by the environment variables when the project is restarted.

The values are only modified for this session and will evert back to the ones given by the environment variables when the project is restarted. To permanently change the value, please modify the environment variable.

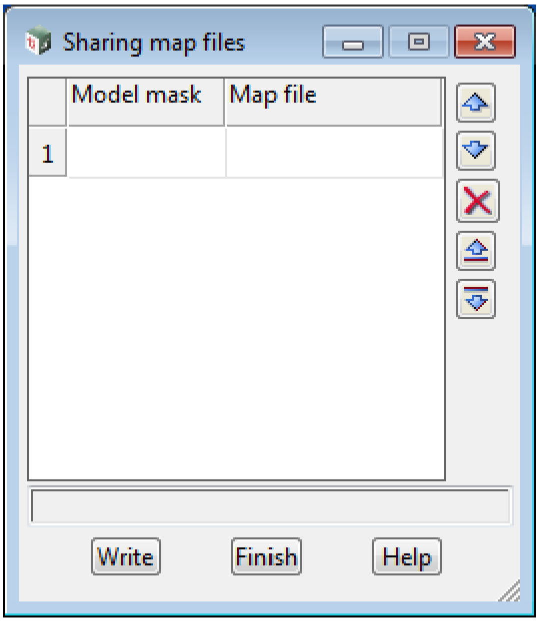
Go to the next section 7.6.13.5 Sharing Map Files or return to 7.6.13 Sharing.

7.6.13.5 Sharing Map Files

Position of option on menu: **Project =>Management =>Sharing =>Sharing map files**

The **Sharing Map Files** option allows different models **shared in** to use different ***Map files***.

Clicking on the option **Sharing map files** brings up the **Sharing Map Files** panel.



Model Mask-Map File grid:

The ***Model Mask Map*** grid in loaded from the file ***sharing_map_files.4d*** which is a ***Set Up*** file that is loaded when the project is opened.

The **Model Mask-Map File** grid consists of rows of text for **Model Mask** and one the same row, and associated **Map File**.

The **Model Mask** is a text string of alphanumeric characters and spaces, and including * for a wild card and **?** as a wild character.

For each **shared in** model, the model name is checked against the **Model Mask** in the first the first row, and if no match is made, is then tested against the next row. This is repeated until a match occurs.

When a match occurs, the **Map File** for the match row is applied to the model and no more tests against **Model Masks** are made.

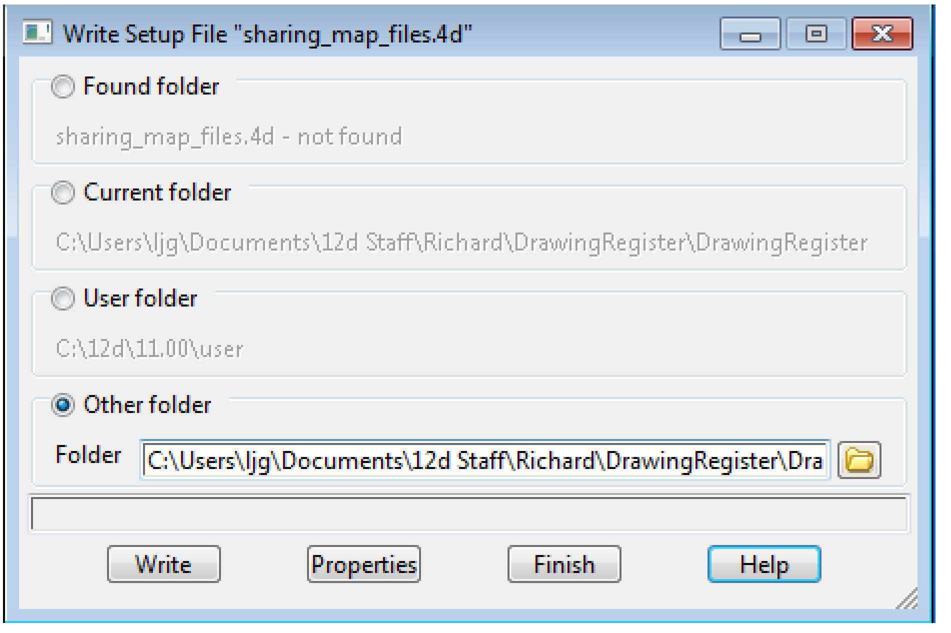
If there is no match but there is a project **Sharing map file** (see the field **Projects >Sharing >Sharing map file** in the **Edit Environment Variables** panel**)**, then the **Sharing map file** is applied to the **shared in** model.

If no match occurs and there is no project **Sharing map file** then the **shared in** model is left alone.

If the data in the ***Model Mask Map*** grid is modified then the modified file is written out with the **Write** button. A project restart is required for the new file to take effect.

Write Button

When the **Write** button is selected, a **Write Setup File** panel comes up to specify where the ***sharing_map_files.4d*** file is to be written out to.



For the choices on the panel, see 39.2.6 Writing Out Setup Files

A project restart is required for the new file to take effect

Note

When applying a **Map File** to a **shared in** model, only the **Basic** tab of the **Map File** is used and it is only used to change the colour of strings in the **shared in** model.

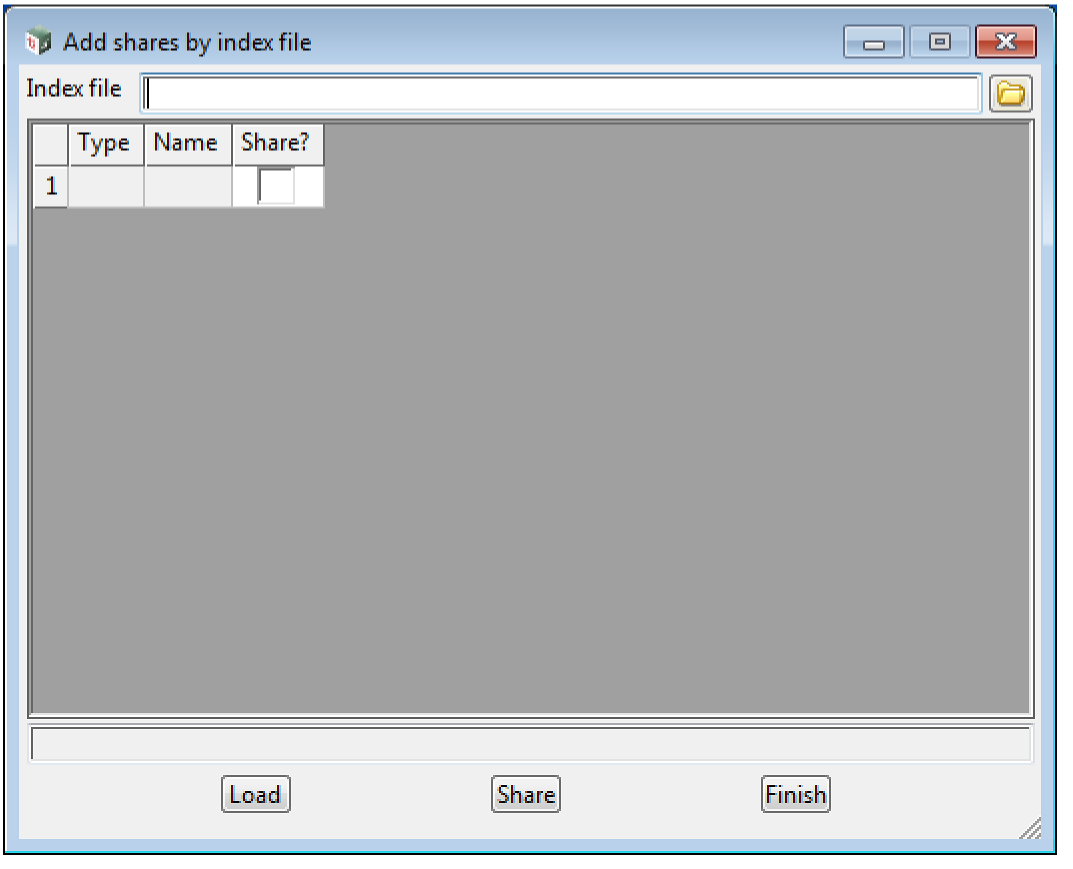
Go to the next section 7.6.13.6 Add Shares By Index File or return to 7.6.13 Sharing.

7.6.13.6 Add Shares By Index File

Position of option on menu: **Project =>Management =>Sharing =>Read share index**

This panel loads shared tin and model details from a share index file, created by 7.6.13.7 Export A Share Index File and allows you to choose which items should be shared into your project.

Selecting **Read share index** brings up the **Add Shares By Index File** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Index file	file		

the sharing index file to read

Type

the type of element (model or tin)

Name

the name of the element

Share?	tick box		

whether or not to share the element in

Load	button		

loads the information from the selected index file

Share	button		

adds the selected shares to the project

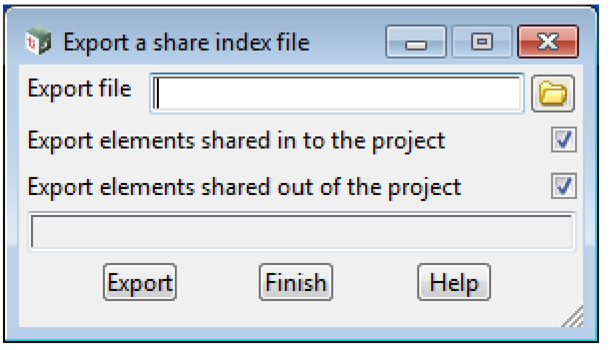
Go to the next section 7.6.13.7 Export A Share Index File or return to 7.6.13 Sharing.

7.6.13.7 Export A Share Index File

Position of option on menu: **Project =>Management =>Sharing =>Export share index**

This panel exports a list of all the shared elements (models and tins) that have been shared into this project. This can then be used to recreate the same sharing setup in another client project.

Selecting **Export share index** brings up the **Export a share index file** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Export file	file		
the file to export details to			
Export	button		
exports the sharing information			

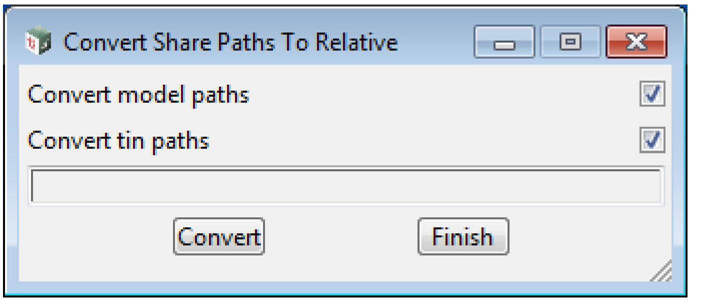
Go to the next section 7.6.13.8 Convert Share Paths To Relative or return to 7.6.13 Sharing.

7.6.13.8 Convert Share Paths To Relative

Position of option on menu: **Project =>Management =>Sharing=>Convert share paths to relative**

This option changes the share paths of models and tins from absolute path names to relative path names. It is mainly used for projects where the share names were recorded as full paths names (e.g. V8 projects).

Selecting **Convert share paths to relative** brings up the **Convert Share Paths to relative** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Convert model paths	tick box		tick

if ticked, the absolute path names of shared models added to this project will be converted to relative paths.

Convert tin paths	tick box		tick

if ticked, the absolute path names of shared tins added to this project will be converted to relative paths.

Convert button

convert absolute paths to relative.

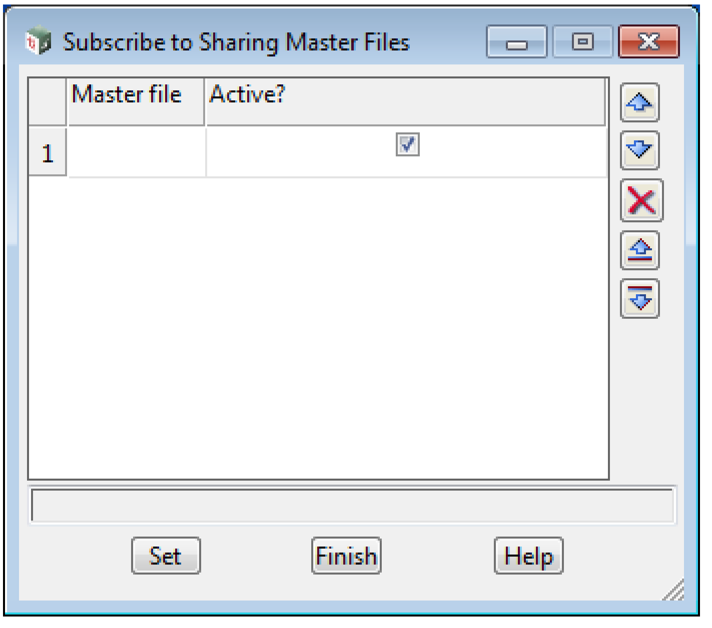
Go to the next section 7.6.13.9 Subscribe to Sharing Master Files or return to 7.6.13 Sharing.

7.6.13.9 Subscribe to Sharing Master Files

Position of option on menu: **Project =>Management =>Sharing =>Subscribe to share master files**

This panel allows you to subscribe to a set of sharing master files. Each master file defines a set of known models and tins, which will be shared into this project.

Selecting **Subscribe to share master files** brings up the **Subscribe to Sharing Master Files** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Set	button		

sets the list of files to which you wish to subscribe

Note that the share check interval must be set, which can be set from the 7.6.13.4 Project Share Settings **panel.**

Go to the next section 7.6.13.10 Sharing Master File or return to 7.6.13 Sharing.

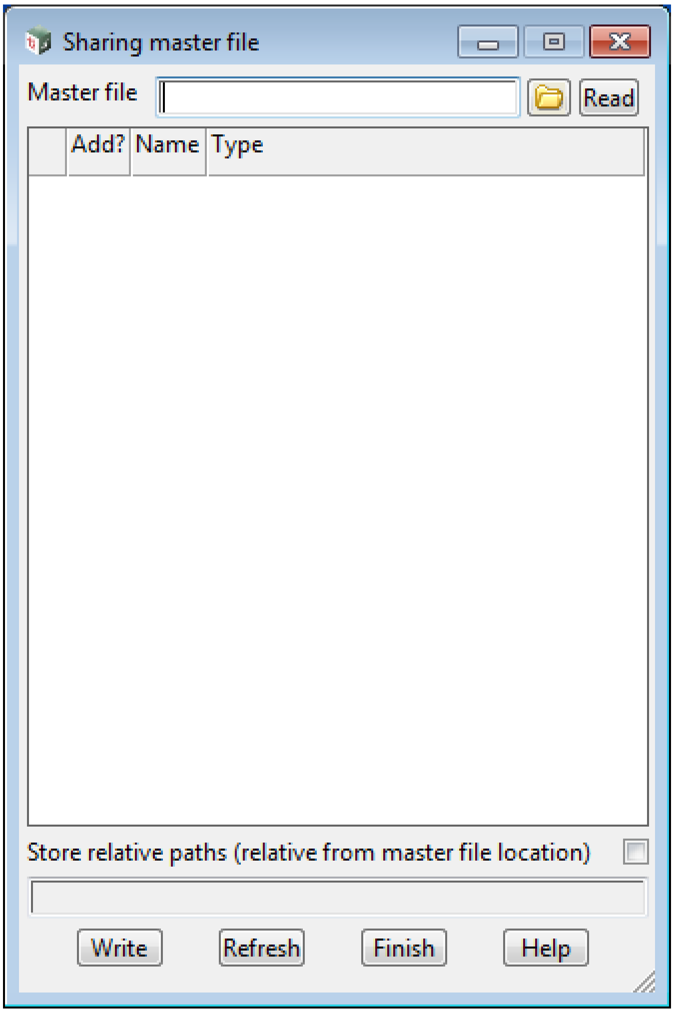
7.6.13.10 Sharing Master File

Position of option on menu: **Project =>Management =>Sharing =>Create share master files**

This panel allows you to define a sharing master file. A sharing master file can be created and subscribed to by a number of clients. This will enforce and define the set of shared models and tins the clients will consume. Updating the sharing master file will likewise update the clients, at a set interval as defined by the client.

This panel will list all models and tins that the user has marked as shareable.

Selecting **Create share master files** brings up the **Sharing master file** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Master file

the file to write to

Add? tick box

whether or not to add the item to the sharing master file

Name

the name of the model or tin

Type

the type of the element (model or tin)

Write button

writes the sharing master file

Refresh button

refreshes the list of shareable models and tins.

Go to the next section 7.6.13.11 Localize Shares or return to 7.6.13 Sharing.

7.6.13.11 Localize Shares

Position of option on menu: **Project =>Management =>Sharing =>Localize shares**

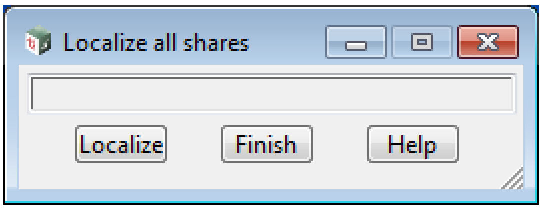
This option copies all the shared models and tins to the local project in a special folder and make them "local shares" so like the original shared models and tins, they still can’t be edited.

This is useful for creating a project that is being sent to another user so that all the shared models and tins are included in the project.

IMPORTANT WARNING

You can’t go back to the original shares so make sure this is only run on a coply of a project and not a working project. If you only wanting copies of your shared models and tins in the project then use the Copy models and tins commands.

Selecting **Subscribe to share master files** brings up the **Subscribe to Sharing Master Files** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Localize	button		

creates "local" shares of all the shared models and tins.

Return to 7.6.13 Sharing.

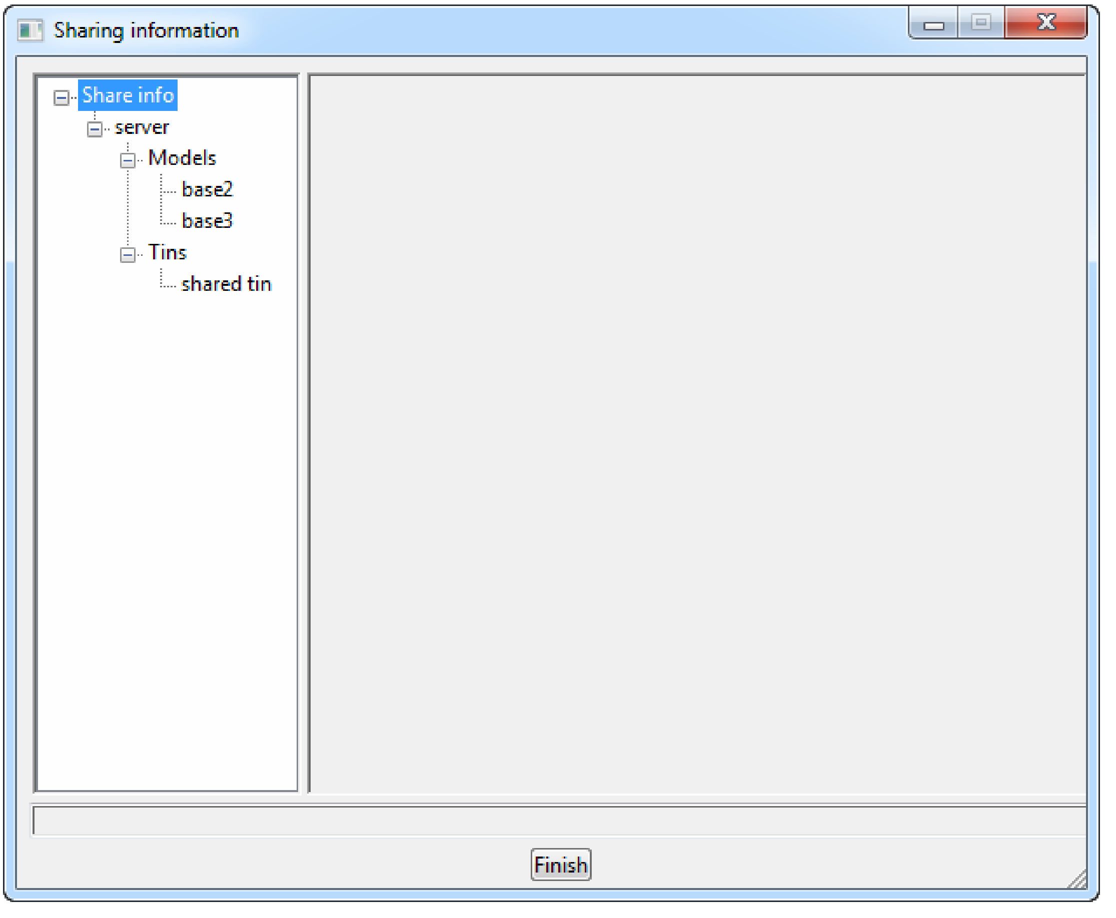
7.6.13.12 Sharing Information

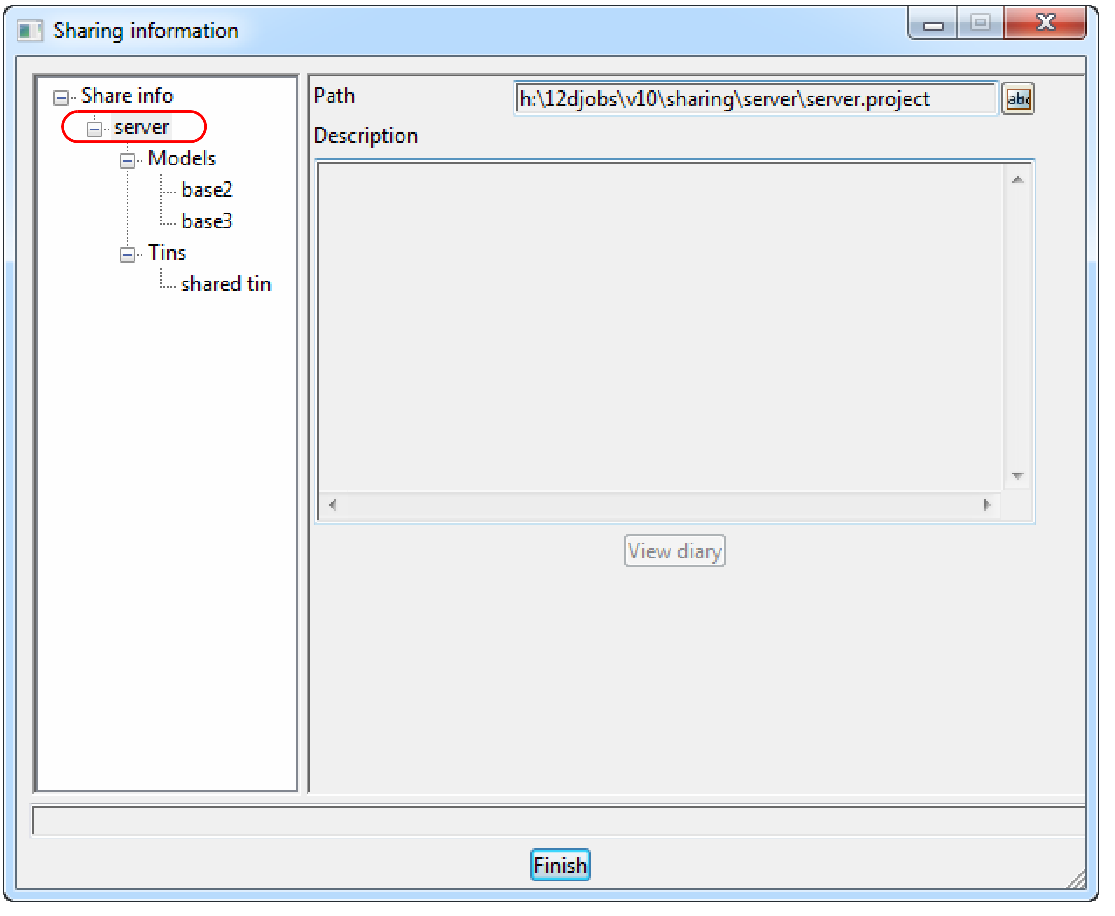
Position of option on menu: **Project =>Management =>Sharing =>Share info**

THIS OPTION HAS BEEN REMOVED FOR V11 AND REPLACED BY7.6.13.3 Share Management**.**

This panel shows information about all models and tins shared into your current project.

Selecting **Share info** brings up the **Sharing information** panel.





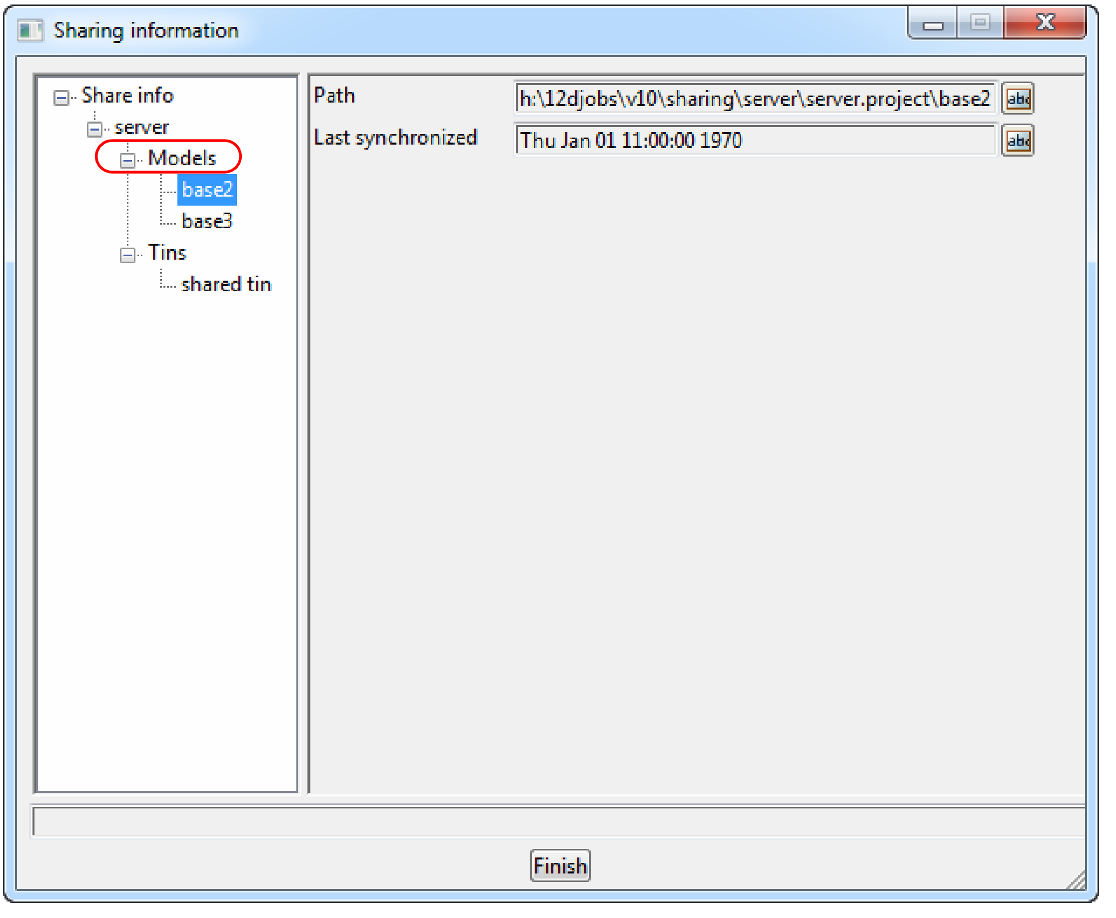
Server Node

Each server you are sharing from is listed in the tree.
Selecting the server node displays the path of the server, the project description and an option to view the diary for that project.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View diary	button		

Views the diary for that project - disabled if no project diary created



Models Node

Each Model Node shows details about the shared model.

The fields and buttons used in this panel have the following functions.

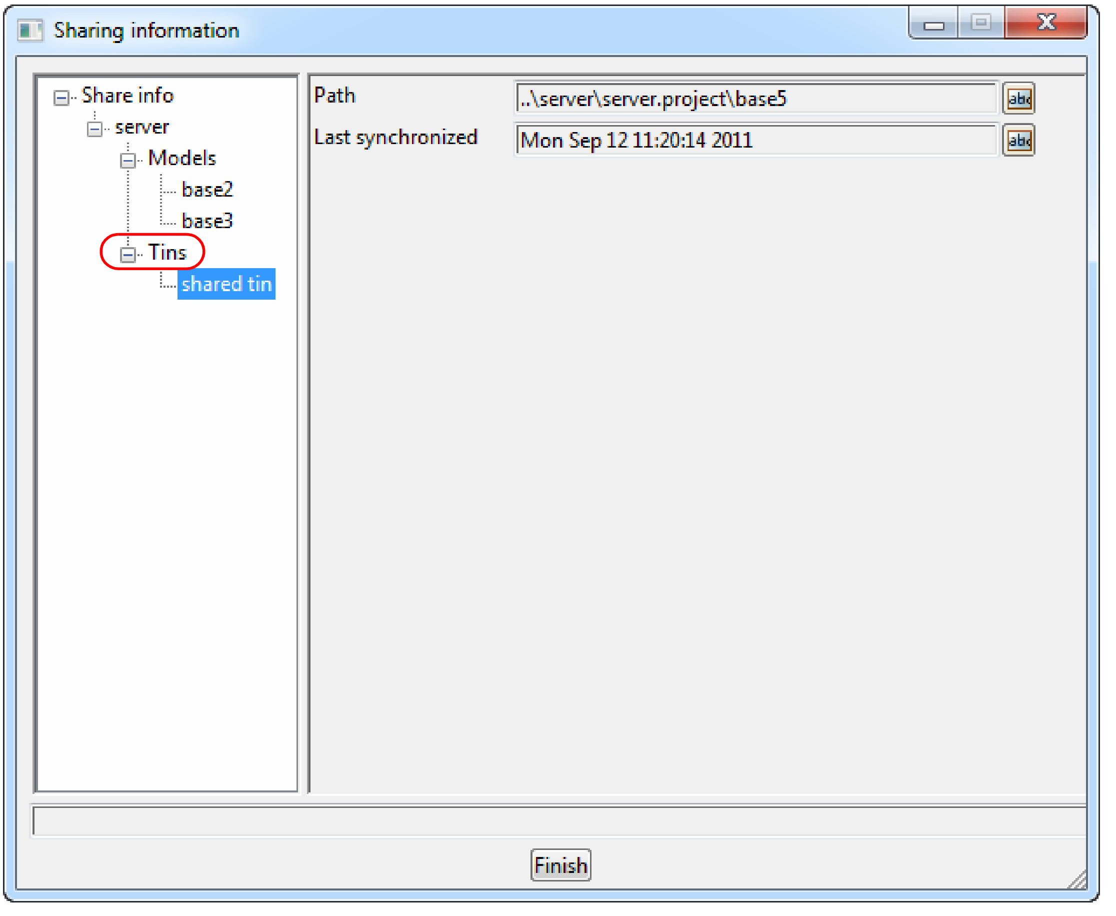
Field Description Type Defaults Pop-Up

Path

the path to the original source of the model

Last Synchronized

the time the model was last synchronized



Tin Node

Each Tin Node shows details about the shared tin.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Path

the path to the original source of the tin

Last Synchronized

the time the tin was last synchronized

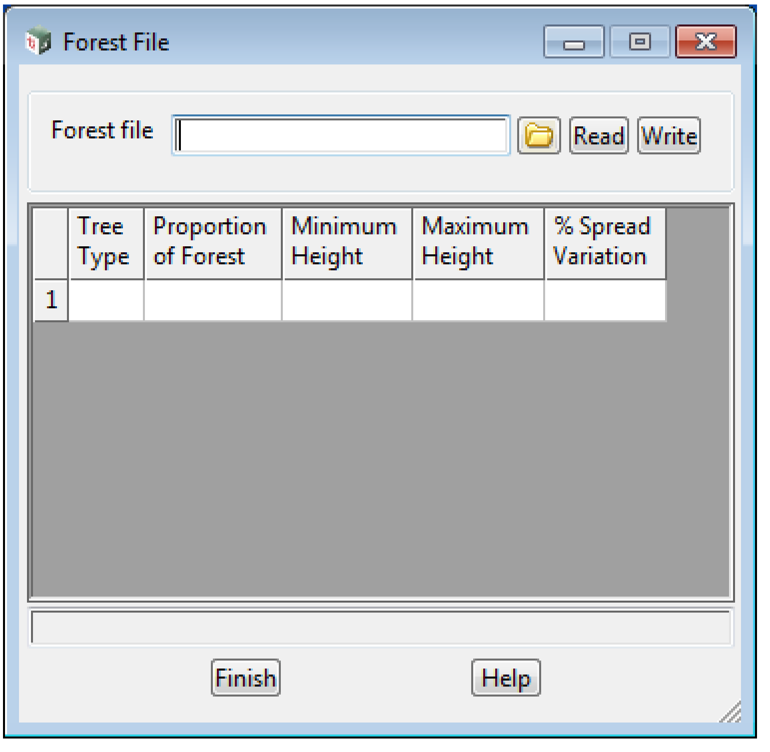
Return to 7.6.13 Sharing.

7.6.14 Forest File

Position of option on menu: **Project =>Management =>Forest file**

The **Forest file** option creates files to control the types of trees, variation in heights and spreads and relative proportions of the various tree types in the file.

Selecting **Forest file** brings up the **Forest file** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Forest file	file box		*.forest

name for the forest definitions.

Read button

read in the forest file given in **Forest file**

Write button

write out to forest file to the file given in **Forest file**.

Tree grid grid

Tree type billboard select

name of the billboard to be placed for the tree - 12d trees are under the Trees, Palms and Shrubs section of the billboards.

Proportion of Forest positive real *.forest

relative proportions of the forest made up of this tree. The actual proportion is this value over the sum of all the values in this column.

Maximum/Minimum Height positive reals

min and maximum heights to use for this tree type.

% Spread Variation	positive real between 0 and 100

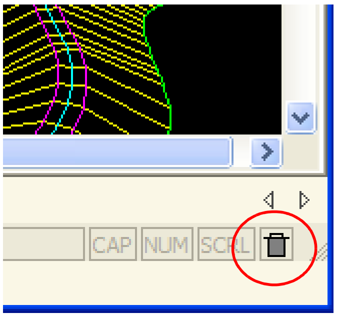
Go to the next section 7.6.15 Trash Bin or return to 7.6 Management.

7.6.15 Trash Bin

Position of option on menu: **Project =>Management =>Trash bin**

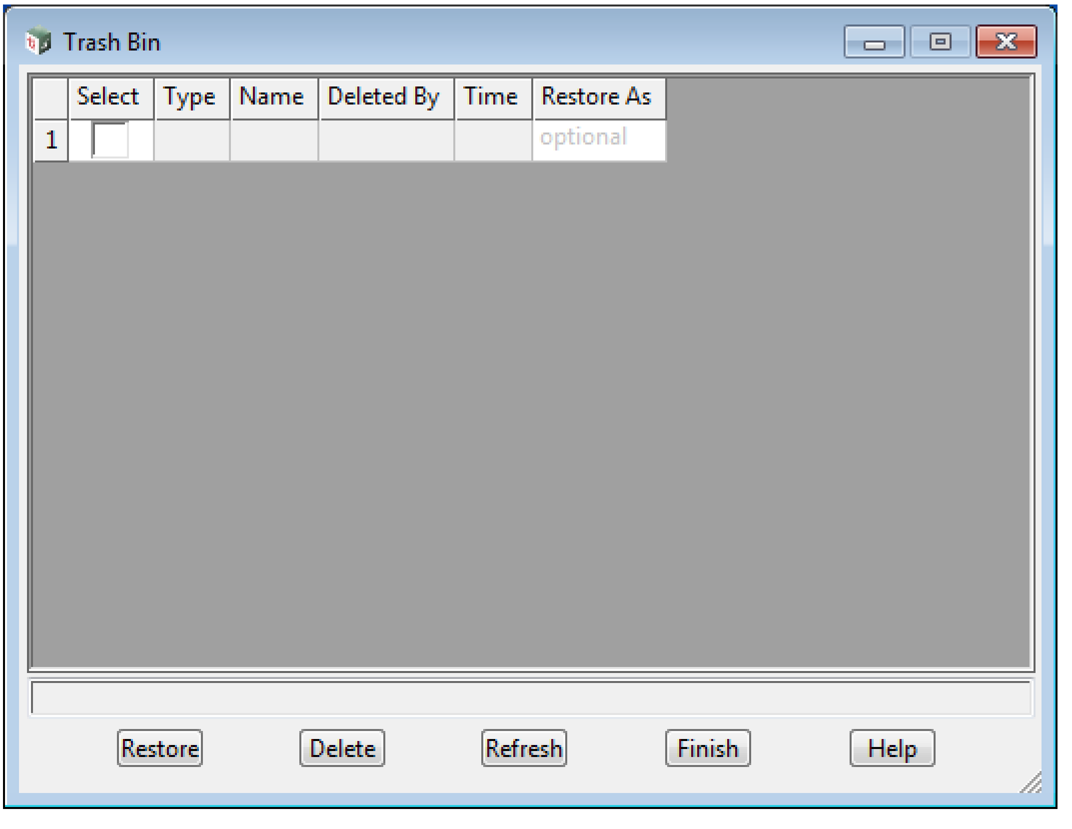
If the ***Trash Bin*** is turned on (by setting the env variable USE_TRASH_BIN_4D) then any deleted models, tins, functions and templates are not deleted from the disk but moved to the 1***2d Trash Bin***. Also for any models that are cleaned, the strings are moved to the trash bin.

If there is any data in the trash bin, a trash bin icon is displayed in the bottom left had corner of the project window.



Clicking on the trash bin icon, brings up the **Trash Bin** panel which displays the tins, templates or functions that have been deleted, and the models that have been deleted or cleaned. The delete/ cleaned objects can be restored to the project.

Selecting **Trash bin** from **Project =>Management =>Trash bin**, also brings up the **Trash Bin** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Trash Bin Grid grid

Type output only model, tin

type of object - model or tin.

Name output only

name of the object.

Deleted by output only

name of the user who deleted/cleaned the object.

Time output only

time of the deletion.

Select tick box

*ticked if this object is to be Restored/Deleted. Note that right bottom on Select brings up a menu to **Toggle** (tick to no tick, no tick to tick), **Set** (set all to tick), or **Clear** (set all to no tick) for the entire column.*

Restore As text

if not blank, the name the restore the object as.

If blank, restore the object with its original name in the **Name** *column.*

Buttons grid

Restore button

restore all the ticked objects.

Delete button

delete all the ticked objects from the trash. These items are then permanently deleted.

Refresh button

refresh the grid.

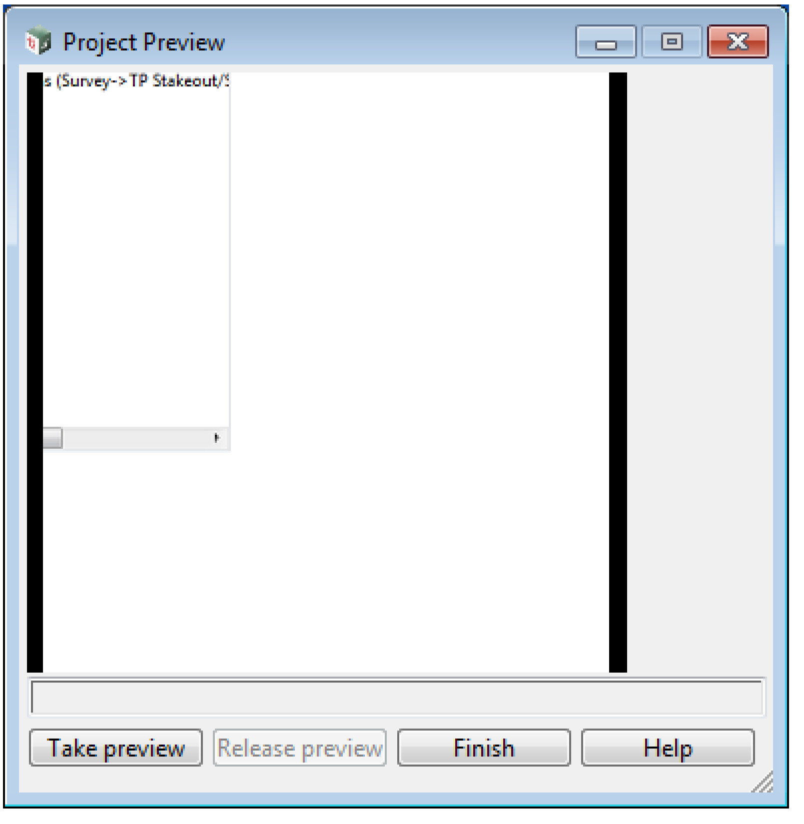
Go to the next section 7.6.16 Project Preview or return to 7.6 Management.

7.6.16 Project Preview

Position of option on menu: **Project =>Management =>Project preview**

When a ***12d Model*** project is exited, an image is saved to display in the New/Open project options. The image can be the last active view or an image defined by the user. The *Project preview* option can write out a user selected image or remove one if a fixed image has been previously set.

Selecting **Project preview** brings up the **Project Preview** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Take preview	button		

if clicked, the image of the current active view is written and set to be used as a fixed project preview image. That is, this image is always used as the project preview.

Release preview	button		

active when a fixed image is being used for the project preview. In that case if it is then clicked, the fixed image is deleted. An automatic image of the last active view will then be saved each time the project is exited.

Go to the next section 7.6.17 Toggle Density Drawing or return to 7.6 Management.

7.6.17 Toggle Density Drawing

Position of option on menu: **Project =>Management =>Toggle density drawing**

Toggles the **Use density drawing** tick box in the **Defaults** panel.

For more information on **density drawing**, see Use density drawing tick box.

Note: This setting is only applicable to the 250M version of ***12d Model.***

Continue to the next section 7.6.18 Toggle Topmost Buttons or return to 7.6 Management.

7.6.18 Toggle Topmost Buttons

Position of option on menu: **Project =>Management =>Toggle topmost buttons**

Toggles on buttons to use instead of a keyboard or mouse when working on a tablets.

Clicking on **Toggle topmost buttons** toggles the following buttons on and off.

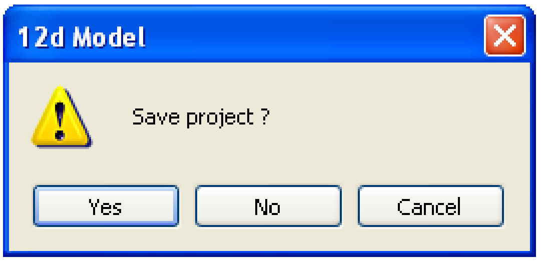
Return to 7.6 Management.

7.7 Restart

Position of option on menu: **Project =>Restart**

The **Restart** option exits the current 12d Model project and then restart using the same project. Useful for testing changes to set up files etc.

It will prompt if project *Save* is required.



Go to the next section 7.8 Save or return to 7 Project.

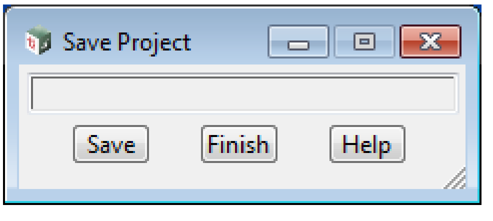
7.8 Save

Position of option on menu: **Project =>Save**

The **Save** option saves the working project to disk.

On the Save from the Main menu, simply select the option and the project is saved.

On selecting **Save** from the floating Projects menu, the **save project** panel is displayed.



The position of the **save project** panel is also saved and the panel automatically placed on the screen when the project is started up again.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Save	button		

after selecting this button, the working project is saved to disk.

Go to the next section 7.9 Tree or return to 7 Project.

7.9 Tree

Position of option on menu: **Project =>Tree**

Position of option on menu: **Project =>Management =>Tree**

The **Tree** option is under continual development and being extended with each version of 12d Model.

Tree is used to drill down through information about the data in the project (for example models, tins and views) and also to interactive create/edit/edit most of the set-up information that is contained in text files. These include:

(a) Name mapping (file names.4d) documented in the section 7.9.1 Name Mappings - Names.4d File

(b) Plotters set-ups (file plotters.4d) which in not yet documented. See the section 7.9.2 Plotters.

(c) Survey data collectors (file survey.4d) documented in the section 7.9.3 Survey Data Collectors

(d) Linestyles (file linestyl.4d) documented in the section 7.9.4 Linestyles

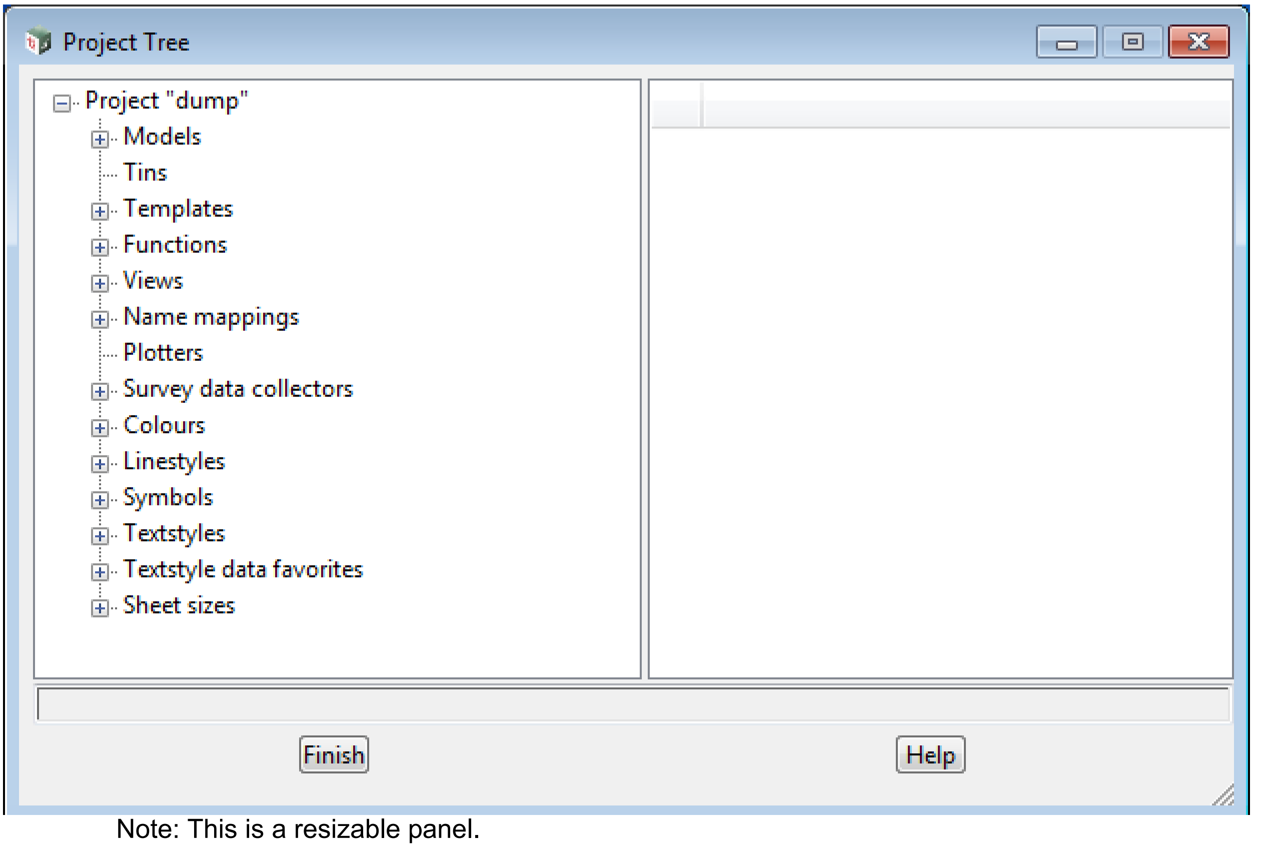
(e) Symbols (file symbols.4d) documented in the section 7.9.5 Symbols

(f) Textstyles (file textstyl.4d) documented in the section 7.9.6 Textstyles

(g) Textstyle data favourites (file textstyle_names.4d) documented in 7.9.7 Textstyle Data Favourites

(h) Sheet sized (file sheets.4d) documented in the section 7.9.8 Sheet Sizes

On selecting the **Tree** option, the **Project Tree** panel is displayed.

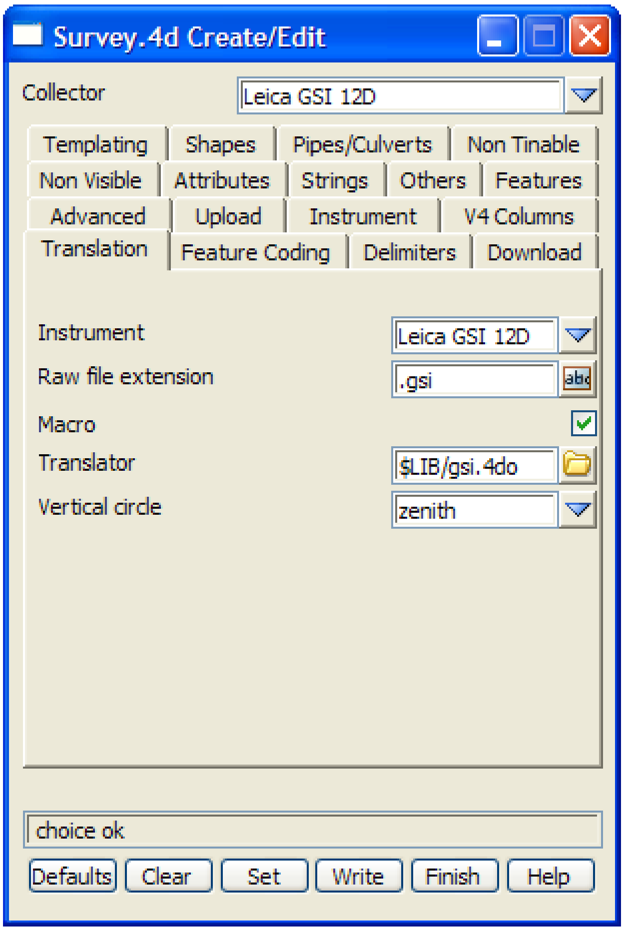


Note: This is a resizable panel.

Clicking on a **+** expands that browse tree node to show what items are available to get more information on. Clicking on a **-** collapses that browse tree node,

For the items *Name mappings*, *Plotters*, *Survey data collectors*, *Textstyles* and *Textstyle data favourites*, once they are expanded then the items displayed need no further expansion (there is no **+** displayed in front of the items) and double clicking on the expanded items brings up the create/edit panels for the item.

For example, clicking on + for *Survey data collector*s and then double clicking on a data collector brings up the *Survey.4d Create/Edit* panel.



For the option *Name mappings*, go to	7.9.1 Name Mappings - Names.4d File
Plotters	7.9.2 Plotters
Survey data collectors	7.9.3 Survey Data Collectors
Linestyles	7.9.4 Linestyles
Symbols	7.9.5 Symbols
Textstyles	7.9.6 Textstyles
Textstyle data favourites	7.9.7 Textstyle Data Favourites
Sheet sizes	7.9.8 Sheet Sizes

7.9.1 Name Mappings - Names.4d File

Position of option on menu: **Project =>Tree**

The **name mapping** file is used in all panel fields requiring the *name* of a string and the name field in the **CAD Controlbar**.

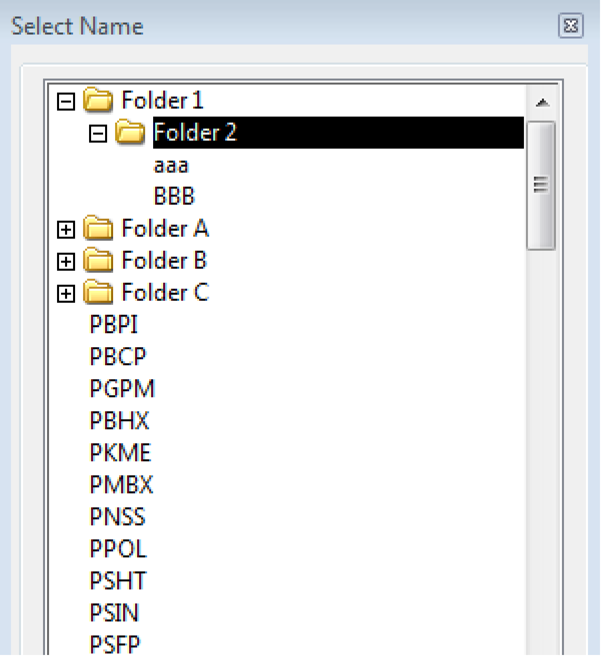
After the **string name** is typed, if <Enter> is pressed then each section of the name mapping file being used for the project is searched for matches with the Key for the Basic node, or Name field for the other nodes (*Symbol*, *Tinable* etc).

If there is a match of the string name with a key/name, then the name, model, colour point/line type etc. for that key/name may be used in the appropriate panel fields, toolbar fields, ControlBars etc that go with the string name.

Note:

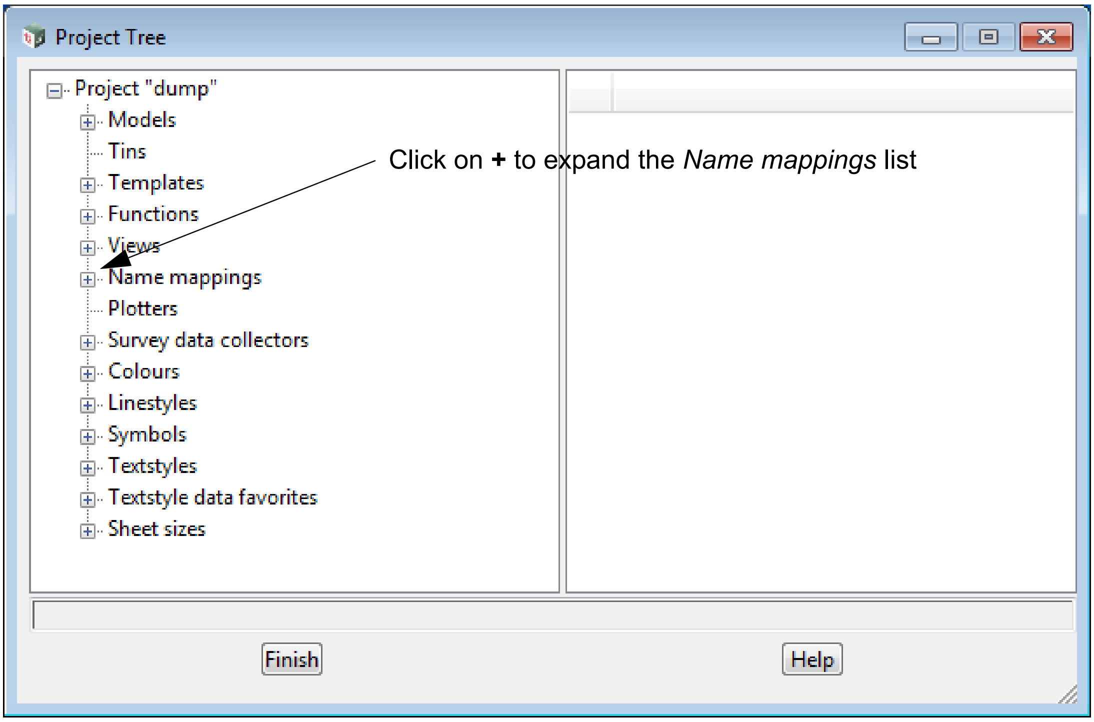
From ***12d Model 11*** onwards, there is a **Group** column in the grid for the **Basic** node in the ***Names.4d*** file so that the individual rows of the grid can be given a group/subgroup structure.

When the ***Groups*** column is used, the ***Names*** pop-up can look like:



To edit the **names.4d** file, either:

(a) Click on the option **Project=> Tree**, to bring up the **Project tree** panel, and then click on the **+** on *Name mapping* to expand the item:

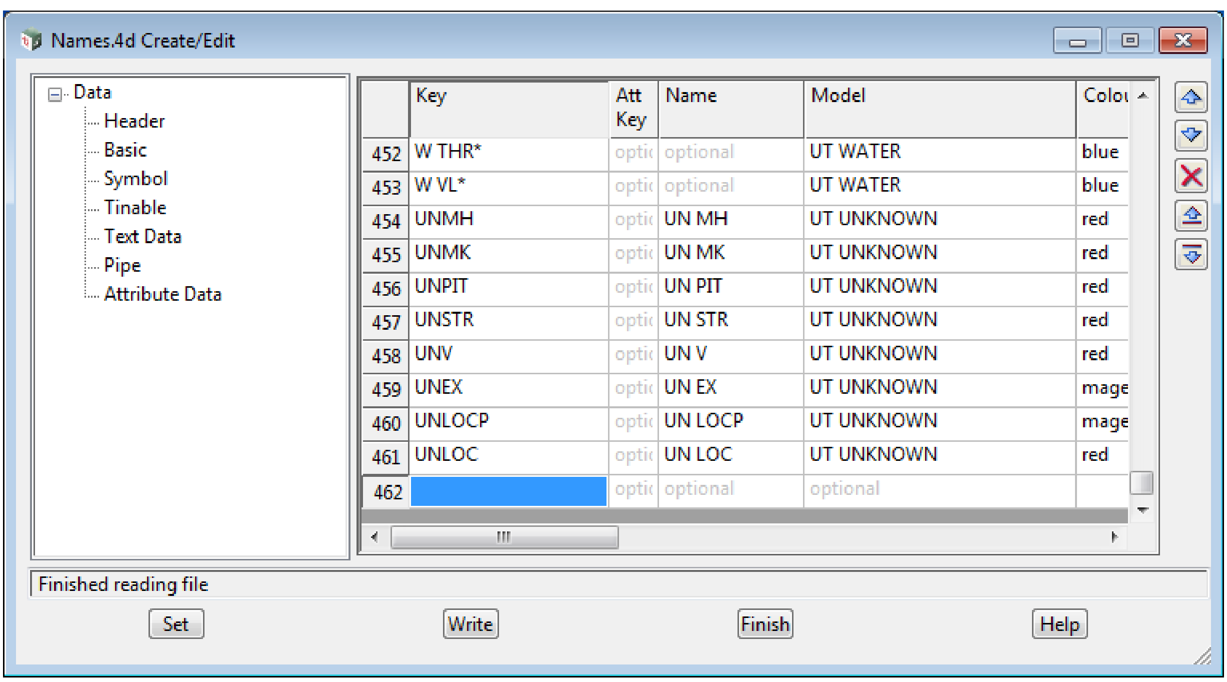


Double clicking LB on the item *Create name mapping* to bring up the **Names.4d Create/Edit** panel which will be already editing the *names.4d* file.

Or double clicking LB on any of the items below *Create name mapping* in the expansion of *Name mappings* will also bring up the **Names.4d Create/Edit** panel.

(b) Clicking LB on the Names icon in any panel or ControlBar field will bring up the **Select name** panel and selecting [Edit] at the bottom of the panel brings up the **Names.4d Create/Edit** panel.

The **Names.4d Create/Edit** panel that appears is.



Buttons

Set button

sets the definition for this editing session of the project - the information will be lost when the project is exited.

Write button

write the information to the file names.4d. The file can then be used when projects are started. The information won't be used for the current session unless the **Set** *button is selected as well. For more information on the* **Write** *button, go to the section* 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d

The nodes on the ***Names.4d Create/Edit*** panel are a subset of those on the ***Map File Create/ Edit*** panel. Some information will be given for each node but most of it, a link will be given to the appropriate section of the ***Map File Create/Edit*** panel.

For more information on *Header*, go to 7.9.1.1 Header Node
Basic 7.9.1.2 Basic Node
Symbols 7.9.1.3 Symbol Node
Tinable 7.9.1.4 Tinable Node
Text Data 7.9.1.5 Text Data Node
Pipe 7.9.1.6 Pipe Node
Attribute Data 7.9.1.7 Attributes Data Node

7.9.1.1 Header Node

The **Header** just has lines of comment text. A common use is to document which client the file is to be used for, or the revision history.

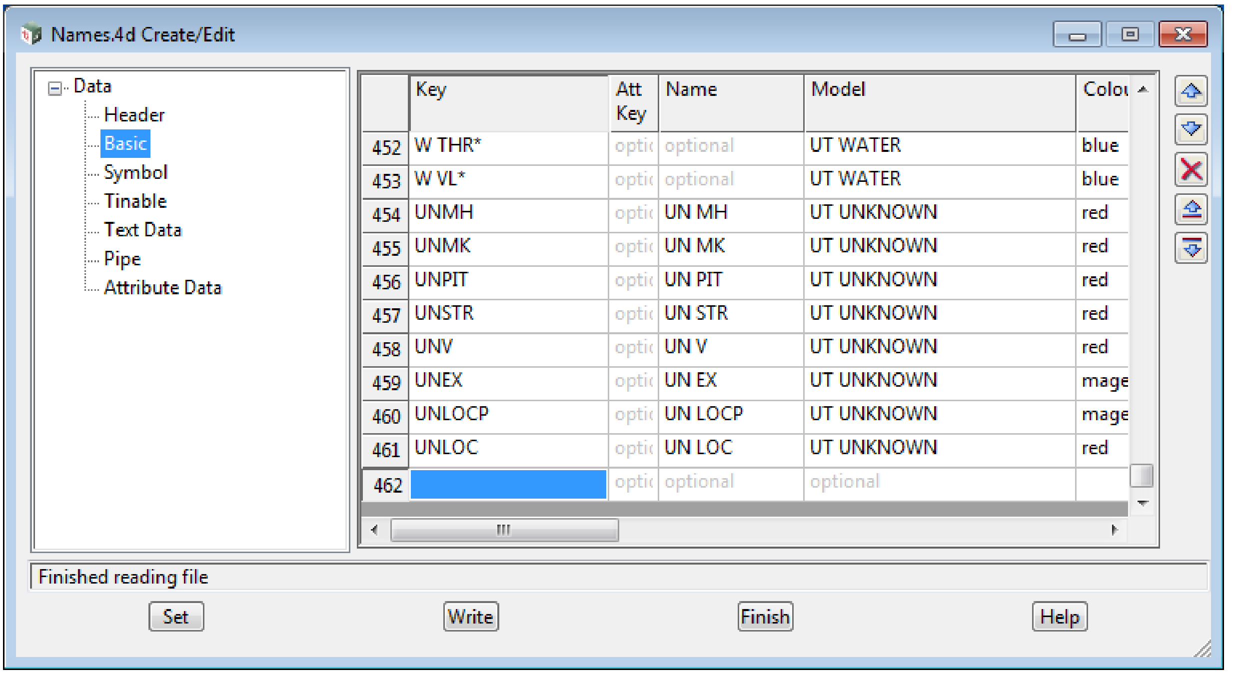
Go to the next section 7.9.1.2 Basic Node or return to 7.9.1 Name Mappings - Names.4d File.

7.9.1.2 Basic Node

The **Basic** grid selects data using the typed in value in the **Name** field of the CAD ControlBar, or any other appropriate **Name** panel fields.

The typed in value is checked against the **Key** column and if a match occurs, sets the name, model, colour, linestyle, point-line type and weight fields. The **Att Key column** is not used.

Note: If the is a name is the ***Name*** column of the **Basic** node, then that name replaces the value typed into the **Name** field in the panel or the CAD ControlBar. If the Name column for the match is blank, the text that is typed in is left and used in the **Name** field of the panel or the CAD ControlBar.



Processing Using Key for Basic Node

*the typed in value is searched against the list of names in the **Key** column until a **first** match with* Key *is found.*

If a match is found, then any non-blank data in the grid is used to fill out the appropriate panel fields or toolbar fields. The Key *column can include wild cards (*) and/or wild characters. The **Att Key** column is not used.*

If no match is found then none of the grid fields are used.

Name input

if not blank, name used to replace the typed in value. This is usually blank.

Model model grid available models

if not blank, model to use

Colour colour grid available colours

if not blank, colour to use

Point Line point/line grid point/line

if not blank, point-line type to use

linestyle available linestyles

if not blank, the linestyle to use

Weight input

if not blank, weight to use for strings with linestyle 1

Comment input

user comment

Group text input

There is now an optional **Group** *column in the grid for the **Basic** node in the **Names.4d** file so that the individual rows of the grid can be given a group/subgroup structure.*

If the Group column for a row is not blank, then the information is used as a group/subgroup structure in any names.4d pop up.

The group/subgroup structure is written as the top group name first, followed by the first level subgroup name, the second level subgroup name, etc., with each of the names separated by a forward slash /.

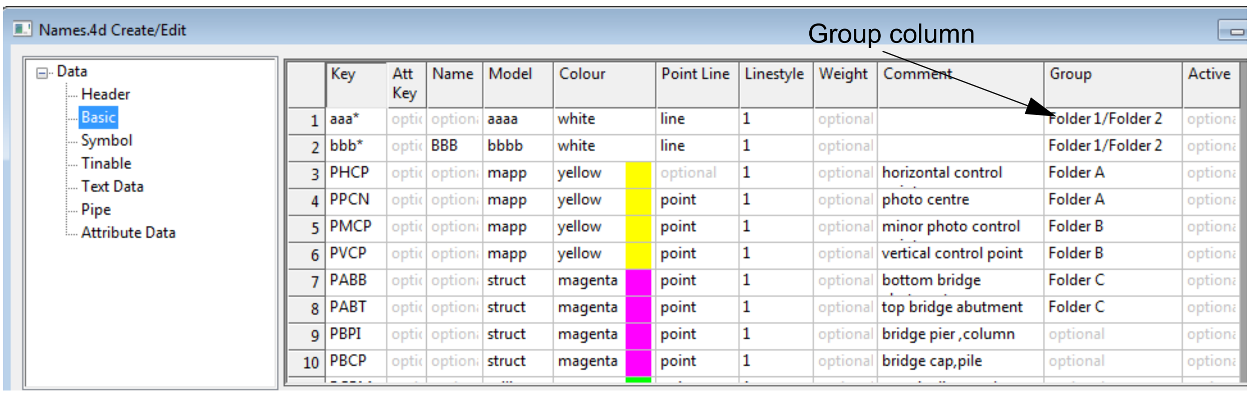
group_name/first_level_subgroup_name/second_level_subgroup_name etc.

For example, a top level group Folder1 with the first level subgroup Folder2 is written as

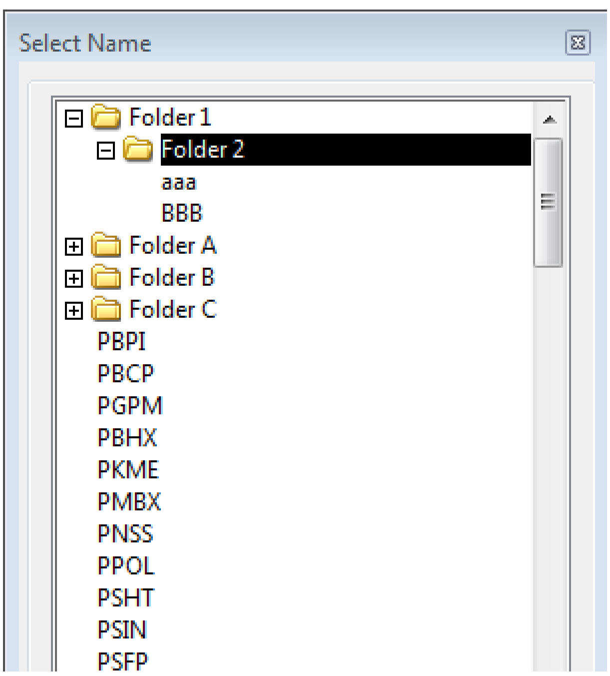
Folder1/Folder2

IMPORTANT NOTE:

Regardless of the group/subgroup structure, the search order for ***finding a match*** *with the key in the* ***Basic*** *node of the* ***Names.4d*** *file is still the order that the rows occur in the* ***Basic*** *grid.*



In a ***Names.4d*** *pop, the above names.,4d file will look like*



If you ***don't*** *want the* ***Group Column*** *to be used then you have to set the environment variable* ***USE_TREE_NAME_BOX_4D*** *to* ***0****. By default is has the value* ***1****.*

Comment and Active

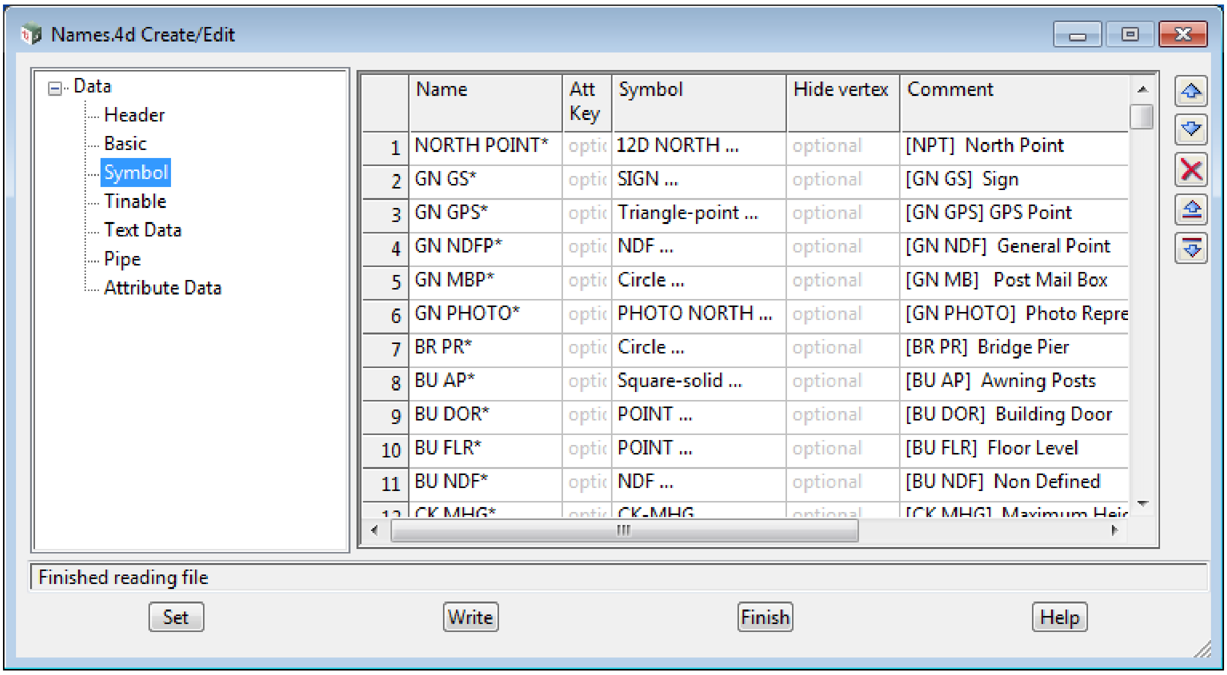
See 8.8.2 Comment and Active Column in Grids.

Go to the next section 7.9.1.3 Symbol Node or return to 7.9.1 Name Mappings - Names.4d File.

7.9.1.3 Symbol Node

The **Symbols** grid selects data using either the typed in value in the **Name** field of the CAD ControlBar or any other appropriate **Name** panel fields. Or, if there was a substituted *Name* from the **Names** column in the **Basic** node, then that is used.

The **Att Key column** is not used.



Processing Using Name in the Symbol Node

*the typed in value, or **Name** if one has been substituted from the **Name** column in the **Basic** node, is searched against the list of names in the **Name** column until a **first** match with* Name *is found.*

If a match is found, then any non-blank data in the grid is used to fill out the appropriate panel fields or toolbar fields. The Name *column an include wild cards (*) and/or wild characters. The **Att Key** column is not used.*

If no match is found then none of the grid fields are used.

Symbol Symbols grid

*when the CAD ControlBar **Name** field is being used the* **Symbol** *name from the **Symbol column** is used in the Symbol name fields in the Symbol ControlBar.*

*When a **Name** field is used in other appropriate panels, the* **Symbol** *name from the **Symbol column** is used in Symbol fields.*

Comment and Active

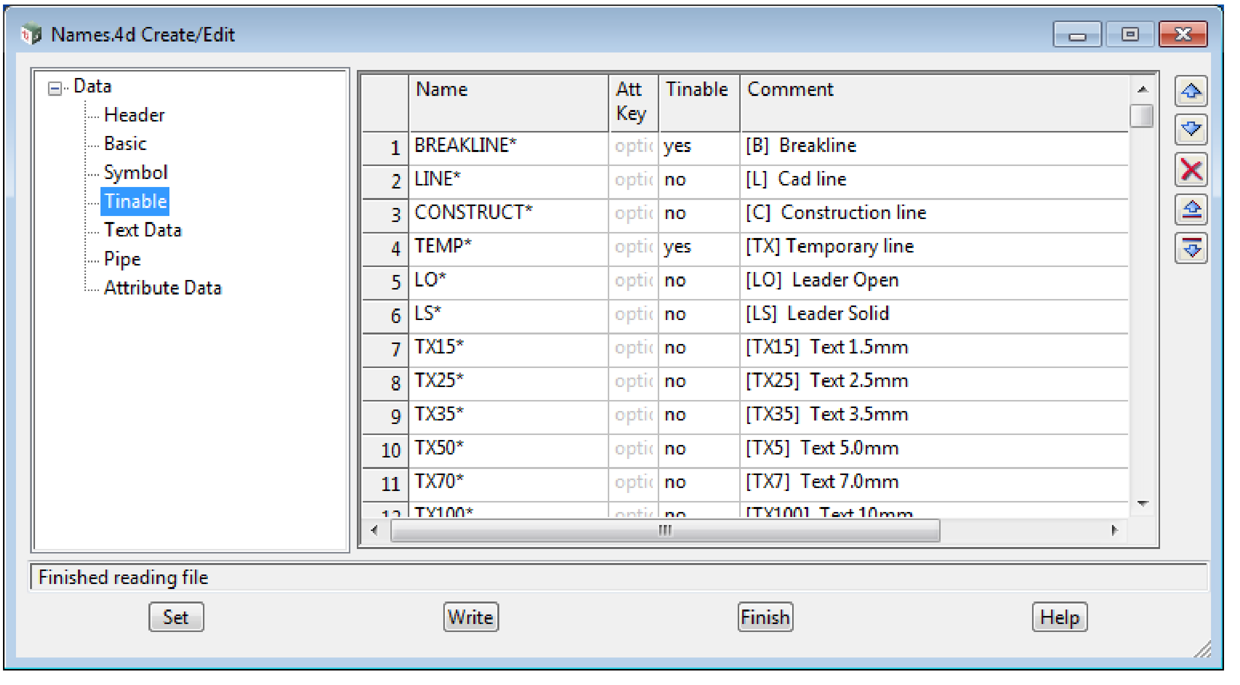
See 8.8.2 Comment and Active Column in Grids.

Go to the next section 7.9.1.4 Tinable Node or return to 7.9.1 Name Mappings - Names.4d File.

7.9.1.4 Tinable Node

The **Tinable** grid selects data using either the typed in value in the **Name** field of the CAD ControlBar or any other appropriate **Name** panel fields. Or, if there was a substituted *Name* from the **Names** column in the **Basic** node, then that is used.

The **Att Key column** is not used.



Processing Using Name in the Tinable Node

*the typed in value, or **Name** if one has been substituted from the **Name** column in the **Basic** node, is searched against the list of names in the **Name** column until a **first** match with* Name *is found.*

If a match is found, then any non-blank data in the grid is used to fill out the appropriate panel fields or toolbar fields. The Name *column an include wild cards (*) and/or wild characters. The **Att Key** column is not used.*

If no match is found then none of the grid fields are used.

Tinable tinability grid

*when the CAD ControlBar **Name** field is being used the* **Tinable** *value from the **Tinable column** is used in the Tinability fields in the CAD ControlBar.*

*When a **Name** field is used in other appropriate panels, the* **Tinable** *value from the **Tinable column** is used in Tinability fields.*

For the Tinable value:

*if the Tinable value is **no**, the entire string is non tinable. That is, the vertices are not included in any triangulation.*

*If **yes**, the entire string is tinable. That is, the vertices are used in any triangulation and the segments between the vertices are used as breaklines.*

*If **points**, the vertices of a string are tinable but the segments are not. That is, the vertices are used in any triangulation but the segments between the vertices are used as breaklines.*

Comment and Active

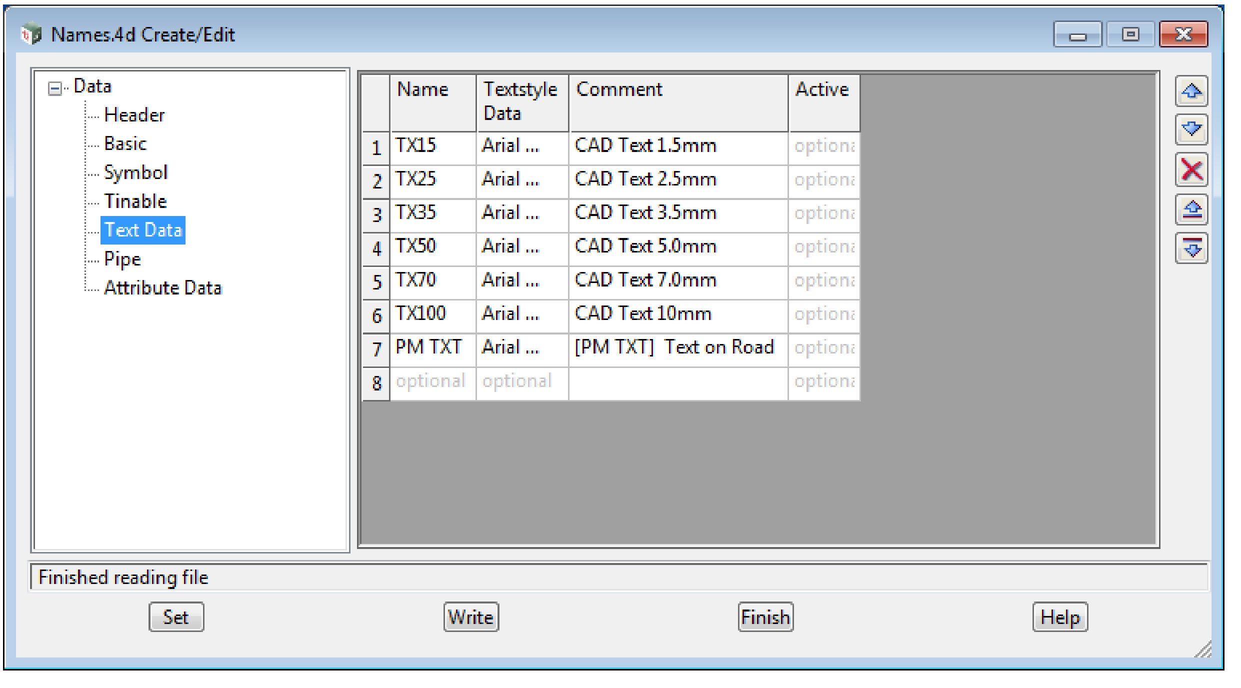
See [8.8.2 Comment and Active Column in Grids](#).

Go to the next section [7.9.1.5 Text Data Node](#) or return to [7.9.1 Name Mappings - Names.4d File](#).

7.9.1.5 Text Data Node

The **Text Data** grid selects data using either the typed in value in the **Name** field of the CAD ControlBar or any other appropriate **Name** panel fields. Or, if there was a substituted *Name* from the **Names** column in the **Basic** node, then that is used.

The **Att Key column** is not used.



Processing Using Name in the Text Data Node

*the typed in value, or **Name** if one has been substituted from the **Name** column in the **Basic** node, is searched against the list of names in the **Name** column until a **first** match with* Name *is found.*

If a match is found, then any non-blank data in the grid is used to fill out the appropriate panel fields or toolbar fields. The Name *column an include wild cards (*) and/or wild characters. The **Att Key** column is not used.*

If no match is found then none of the grid fields are used.

Textstyle Data textstyle Data grid

*when the CAD ControlBar **Name** field is being used, the* **Textstyle Name** *and the* **Textstyle Size** *from the **Textstyle Data** is used in the fields in the Text ControlBar.*

*When a **Name** field is used in other appropriate panels, the **Textstyle Data** is used in Textstyle Data fields.*

Comment and Active

See [8.8.2 Comment and Active Column in Grids](#).

Go to the next section 7.9.1.6 Pipe Node or return to 7.9.1 Name Mappings - Names.4d File.

7.9.1.6 Pipe Node

The **Pipe** grid selects data using either the typed in value in the **Name** field of the CAD ControlBar or any other appropriate **Name** panel fields. Or, if there was a substituted *Name* from the **Names** column in the **Basic** node, then that is used.

The **Att Key column** is not used.

	Name	Att Key	Justify	Shape	Size 1	Size 2	Comment	Active

Processing Using Name in the Pipe Node

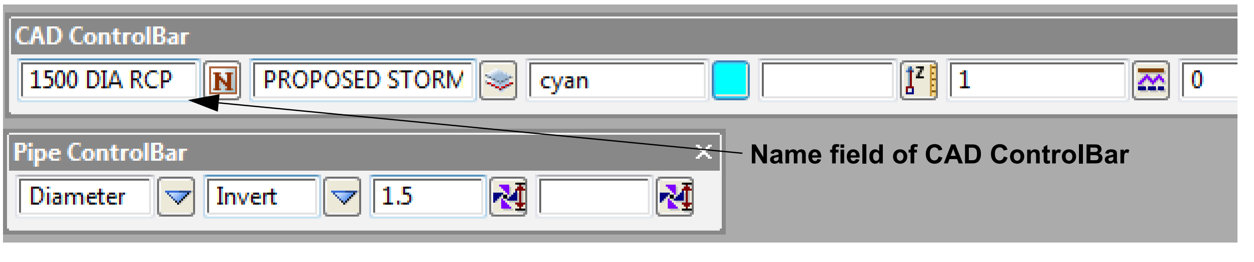
*the typed in value, or **Name** if one has been substituted from the **Name** column in the **Basic** node, is searched against the list of names in the **Name** column until a **first** match with* Name *is found.*

If a match is found, then any non-blank data in the grid is used to fill out the appropriate panel fields or toolbar fields. The Name *column an include wild cards (*) and/or wild characters. The **Att Key** column is not used.*

If no match is found then none of the grid fields are used.

Justify, Shape, Size 1, Size 2 Pipe grid

*when the CAD ControlBar **Name** field is being used, the* **Justify**, **Shape**, **Size 1** *and* **Size 2** *from the **Pipe grid** are used in the fields in the Pipe ControlBar.*



*Note that there does not need to be a match in the **Basic** section of Names.4d, just a match in the* **Pipe** *section of **Names.4d**.BUT if it is not in the **Basic** section of the Names.4d file then it won't appear in the **Names** pop up and the name will have to be typed into the **Name** field by hand followed by <Enter>.*

*When a **Name** field is used in other appropriate panels, the grid data is used in Pipe fields.*

Comment and Active

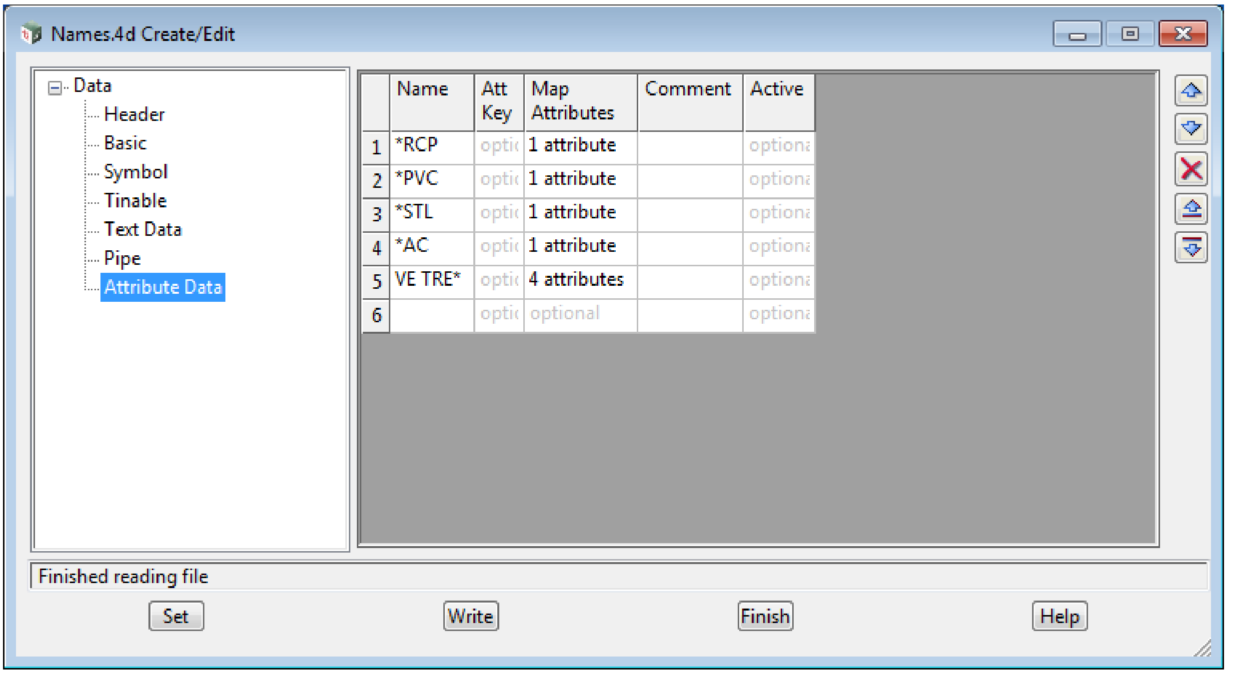
See 8.8.2 Comment and Active Column in Grids.

Go to the next section 7.9.1.5 Text Data Node or return to 7.9.1 Name Mappings - Names.4d File.

7.9.1.7 Attributes Data Node

The **Attribute Data** grid selects data using either the typed in value in the **Name** field of the CAD ControlBar or any other appropriate **Name** panel fields. Or, if there was a substituted *Name* from the **Names** column in the **Basic** node, then that is used.

The **Att Key column** is not used.



Processing Using Name in the Attribute Node

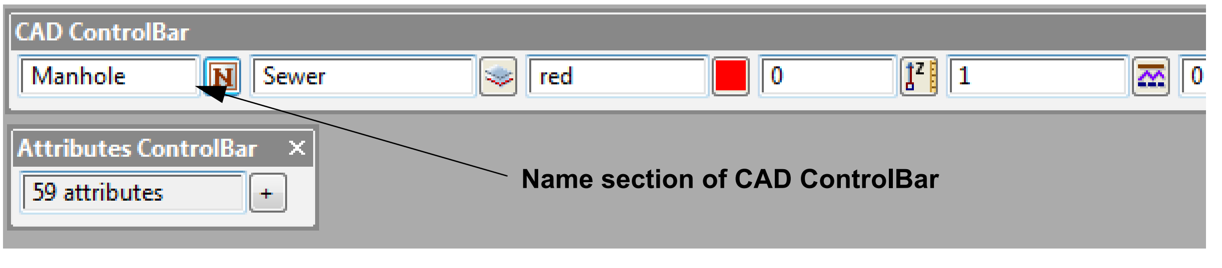
*the typed in value, or **Name** if one has been substituted from the **Name** column in the **Basic** node, is searched against the list of names in the **Name** column until a **first** match with* Name *is found.*

If a match is found, then any non-blank data in the grid is used to fill out the appropriate panel fields or toolbar fields. The Name *column an include wild cards (*) and/or wild characters. The **Att Key** column is not used.*

If no match is found then none of the grid fields are used.

Map Attributes Attributes grid

*when the CAD ControlBar **Name** field is being used, the* **Attributes** *from the **Map Attributes column** are used in the field in the Attributes ControlBar.*



*Note that there does not need to be a match in the **Basic** section of Names.4d, just a match in the* **Attributes Data** *section of **Names.4d**, BUT if it is not in the **Basic** section of the Names.4d file then it won't appear in the **Names** pop up and the name will have to be typed into the **Name** field by hand followed by <Enter>.*

*When a **Name** field is used in other appropriate panels, the Attributes are used in Attribute fields.*

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

Return to 7.9.1 Name Mappings - Names.4d File.

7.9.2 Plotters

User defined plotters can be set up in ***12d Model*** and the information is stored in the file plotters.4d which is fully documented in the section 43.2 Defining Plotters - Plotters.4d in the Appendix 43 Plotters and Plotting.

The interactive editor **Plotters** on the Browse option is not yet fully implemented or documented.

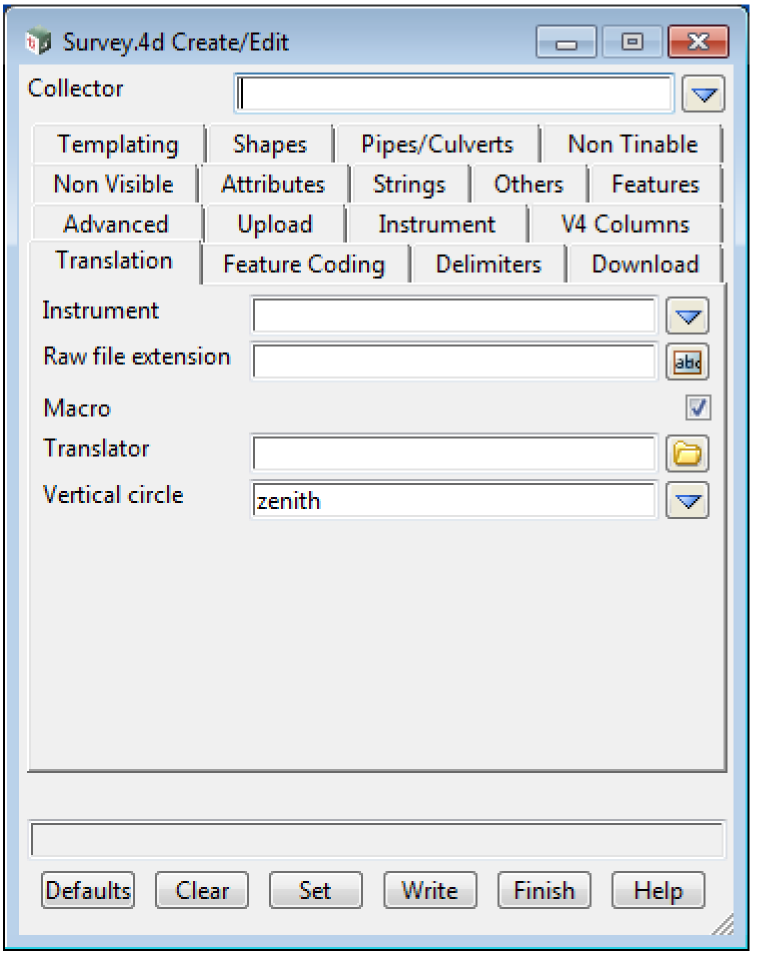
Go to the next section 7.9.3 Survey Data Collectors or return to 7.9 Tree.

7.9.3 Survey Data Collectors

Position of option on menu: **Project =>Tree**

Click on *Survey data collectors* to expand the item and then double click LB on *Create data collector* to create a new data collector, or double click LB on an existing data collector in the list to edit an existing data collector definition.

The **Survey.4d Create/Edit** panel will then appear.



This option is fully documented in the 36.9 Data Collector Definitions section in the Appendix 36 12d Survey Guide.

Go to the next section 7.9.4 Linestyles or return to 7.9 Tree.

7.9.4 Linestyles

Position of option on menu: **Project =>Tree**

Click on *Linestyles* to expand the item and then double click LB on *Create linestyle* to create, edit or delete linestyles, or double click LB on an existing textstyle in the list to edit an existing linestyle definition. The **Linestyle Create/Edit/Delete** panel will then appear.

The linestyle can be created interactively in ***12d Model*** by drawing the new linestyle using strings containing lines, arcs, circles and text. This information can then be used to create the linestyle.

To edit a linestyle, the current definition is written to a model which can then be edited to create the modified linestyle.

The definition of a linestyle includes:

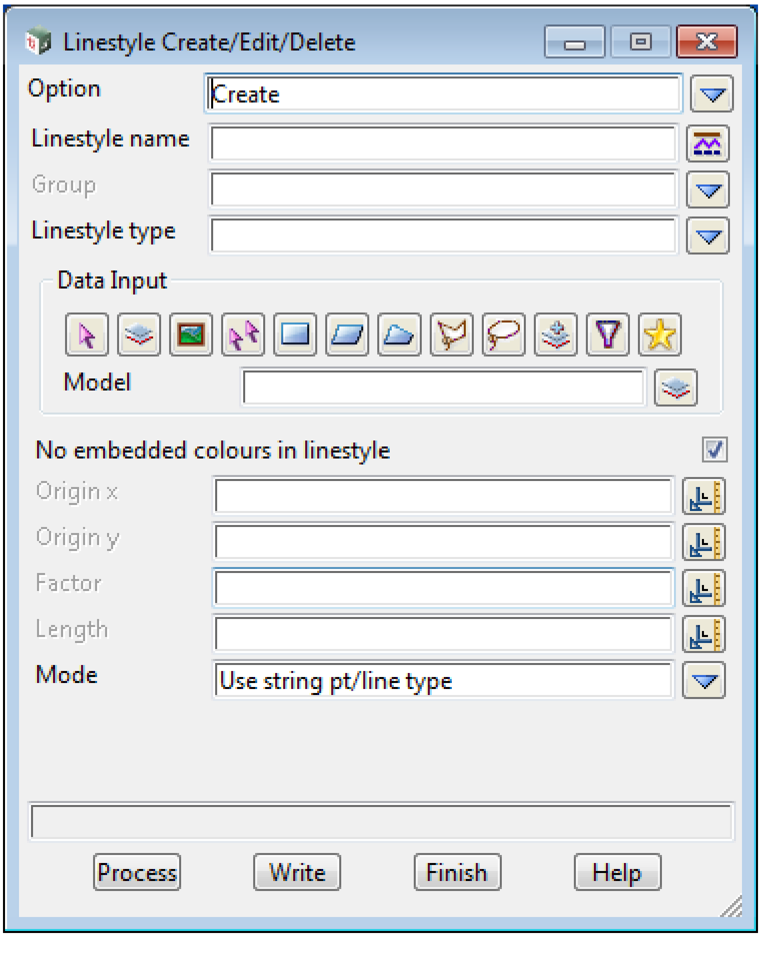
(a) a unique name

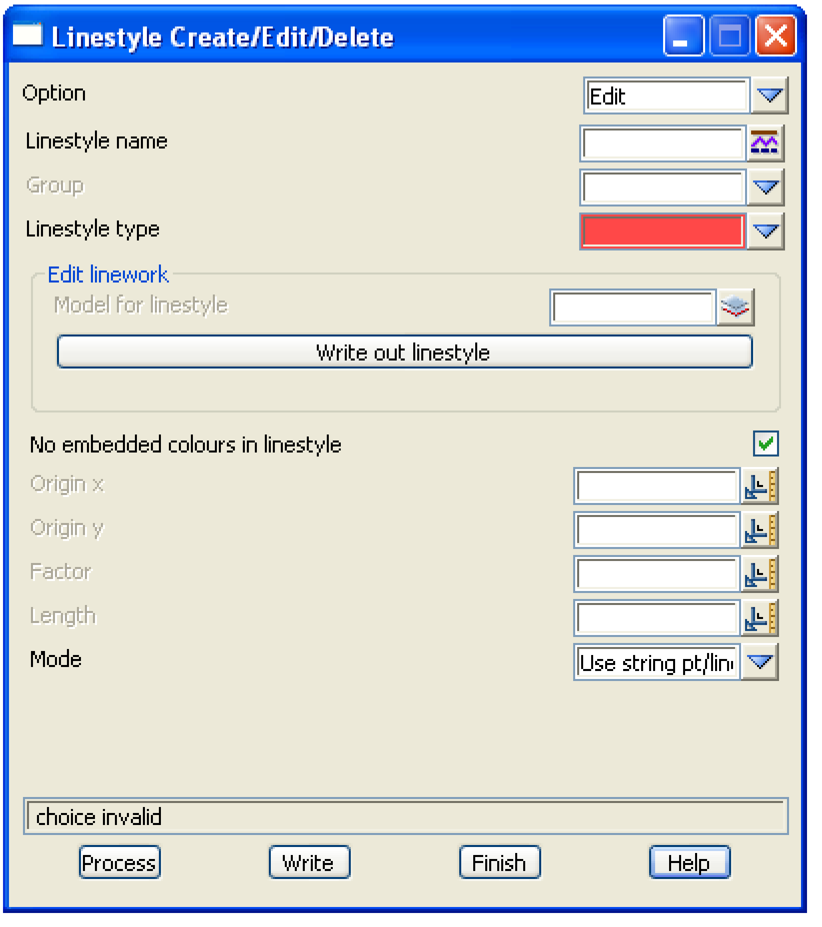
(b) the Group to show the linestyle under in the linestyle pop-up

(c) the linestyle type

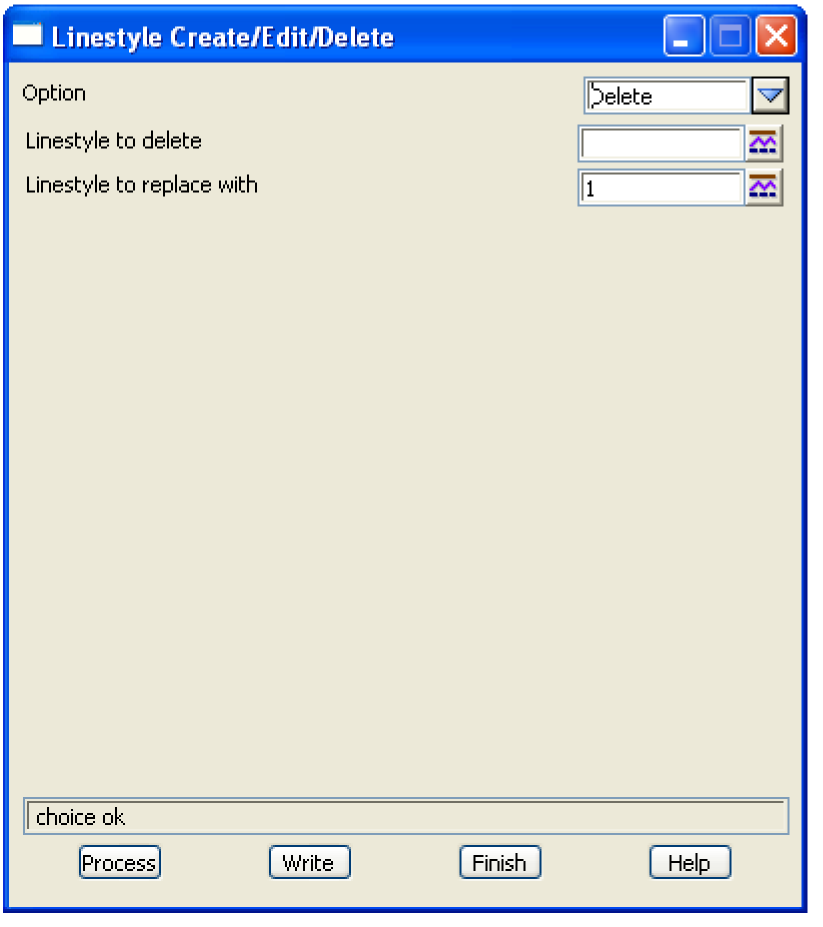
All the information for linestyles is stored in the text file linestyl.4d but the **Linestyle Create/Edit/Delete** panel is normally used to create and modify the file rather than using a text editor. (the file *linestyl.4d* is fully documented in the 40.1 Line Styles section of the Appendix 40 Linestyles, Symbols, Textstyles &Patterns).

The **Linestyle Create/Edit/Delete** panel is:





Linestyle Create/Edit/Delete
Option
Edit
Linestyle name
Group
Linestyle type
Edit linework
Model for linestyle
Write out linestyle
No embedded colours in linestyle
Origin x
Origin y
Factor
Length
Mode
Use string pt/lin
choice invalid
Process
Write
Finish
Help



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Option	choice box	Create	Create, Edit, Delete
type of edit			
Linestyle name	input		available linestyles
name of the linestyle to be created, edited or deleted.			
Group	input		available groups
name of the group for the linestyle - can be a new group name.			
Linestyle type	choice box	world	user, pixel, world, paper, *2 point, group*
type of the linestyle.			

For Option choice "*Create*" - Data input

Data input	source box		model
data to be used to create the linestyle.			

For Option choice "*Edit*" - Edit line work

Model for linestyle	model box		available models
model to write the linestyle out to so that it can be edited.			
Write out linestyle	button		
when selected, the linestyle is written out to the **Model for linestyle**.			

For Option choice *"Delete"*

Linestyle to delete linestyle box available linestylesl

name of the linestyle to delete.

Linestyle to replace it with linestyle box 1available linestyles

when the linestyle is deleted, any string with that linestyle has to have a new linestyle. This is the linestyle that is set for strings with the deleted linestyle

For the Linestyle type - User, Pixel, World, Paper

No imbedded colours in linestyle tick box tick

*if **ticked** then no colours from the data are used in the linestyle.*
*If **not ticked** then any colours used in the data are used in the linestyle*

Origin x/y double box

if non blank, the x/y value for the origin of the linestyle.
If blank, a value is calculated by 12d.

Factor double box

if non blank, the linestyle is factored up by this value.
If blank, the factor is taken to be 1.

Length double box

if non blank, the linestyle is repeated after this length.
If blank, the linestyle length is calculated by 12d.

Mode choice box use string pt/line type
only at vertices, repeat style

*if **use string pt/line type**, then if the string pt/line type is **line** then the linestyle is repeated after the Length value. If the string pt/line type is **point**, then the linestyle is only drawn at each vertex of the string.*
*If **only at vertices**, then the linestyle is only drawn at each string vertex regardless of the strings pt/line type.*
*If **repeat style**, then the linestyle is repeated after the Length value regardless of the strings pt/line type.*

For the Linestyle type - 2 point

No imbedded colours in linestyle tick box tick

*if **ticked** then no colours from the data are used in the linestyle.*
*If **not ticked** then any colours used in the data are used in the linestyle*

Origin x/y double box

if non blank, the x/y value for the first origin of the linestyle.
If blank, a value is calculated by 12d.

Origin 2 x/y double box

if non blank, the x/y value for the second origin of the linestyle.
If blank, a value is calculated by 12d.

Stretch in choice box one direction, both directions

if "one direction", the linestyle is only stretched along the axis joining the two original points. The linestyle is not stretched perpendicular to that axis.
If "both directions", the linestyle is stretched in all directions.

Drawn on choice box every line/arcevery line/arc,
every second line/arc

if "one direction", the linestyle is only stretched along the axis joining the two original points. The linestyle is not stretched perpendicular to that axis.
If "both directions", the linestyle is stretched in all directions.

For Linestyle type - Group

Linestyle grid

list of linestyles that make up the this one linestyle.

Buttons

Process button

process the data in the panel fields. The internal definitions of the linestyles is modified. The definitions are not written to the linestyle file.

Write button

write the modifications to the file linestyl.4d file. This files can then be used when projects are opened up. The information won't be used for the current session unless the **Process** *button is selected as well. For more information on the* **Write** *button, go to the section* 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d

This option updates the files *linestyles.4d* which is fully documented in the 40.1 Line Styles section in the Appendix 40 Linestyles, Symbols, Textstyles &Patterns.

Go to the next section 7.9.5 Symbols or return to 7.9 Tree.

7.9.5 Symbols

Position of option on menu: **Project =>Tree**

Click on *Symbols* to expand the item and then double click LB on *Create symbol* to create, edit or delete symbols, or double click LB on an existing symbol in the list to edit an existing symbol definition. The **Symbol Create/Edit/Delete** panel will then appear.

The symbol can be created interactively in ***12d Model*** by drawing the new symbol using strings containing lines, arcs, circles and text. This information can then be used to create the symbol.

To edit a symbol, the current definition is written to a model which can then be edited to create the modified symbol.

The definition of a symbol includes:

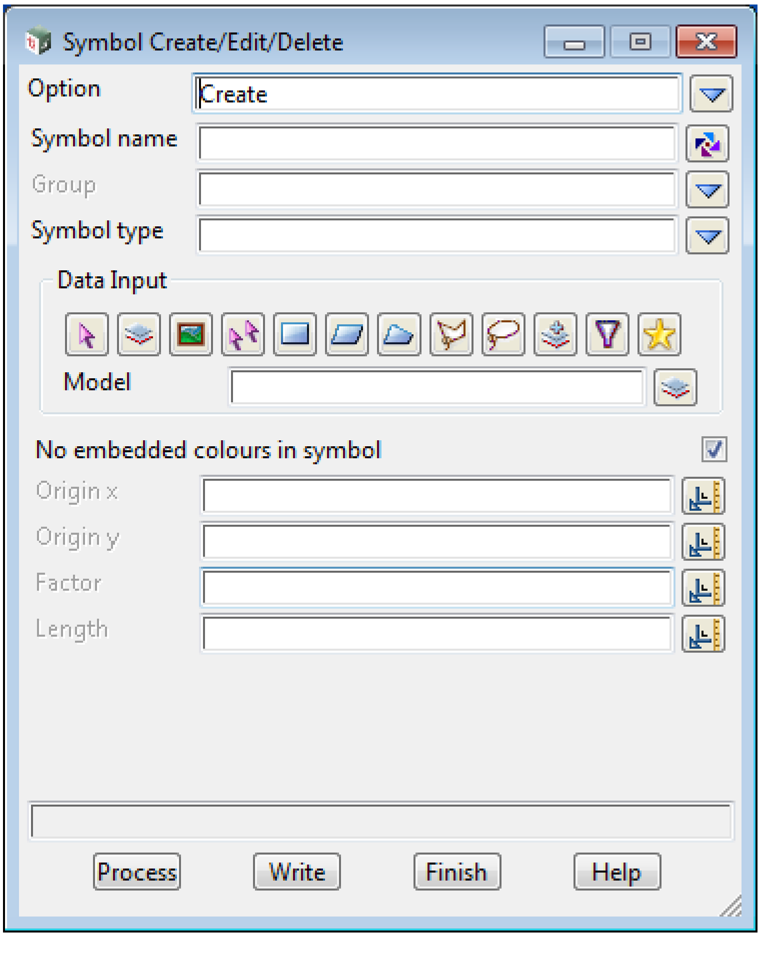
(a) a unique name

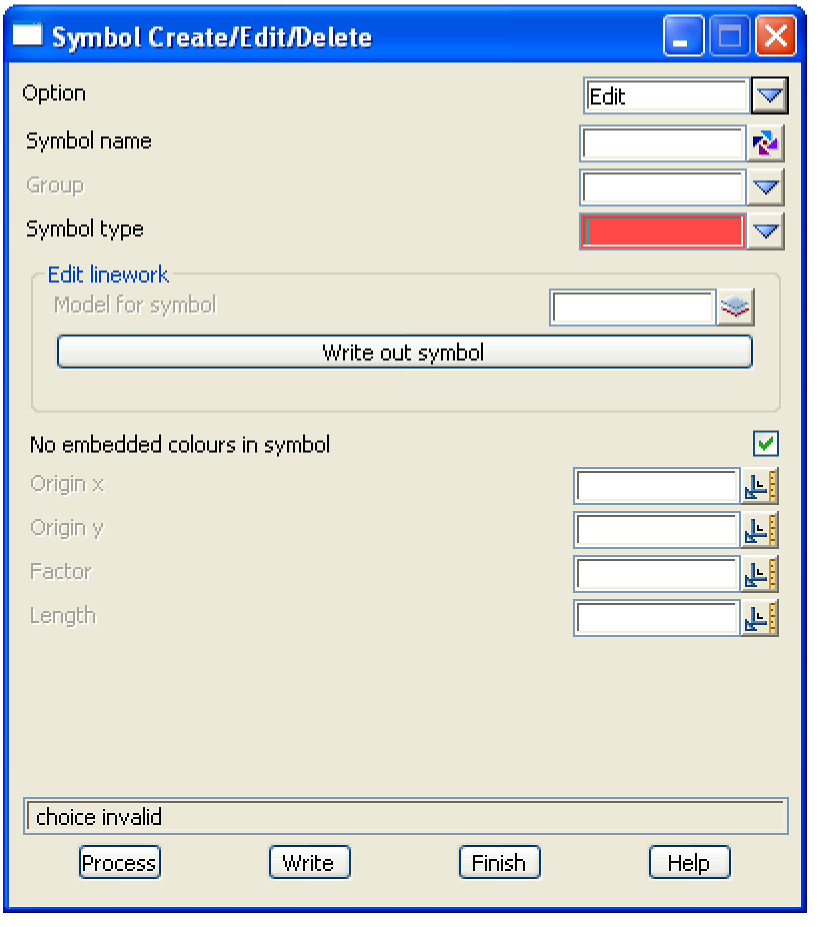
(b) the Group to show the symbol under in the symbol pop-up

(c) the symbol type

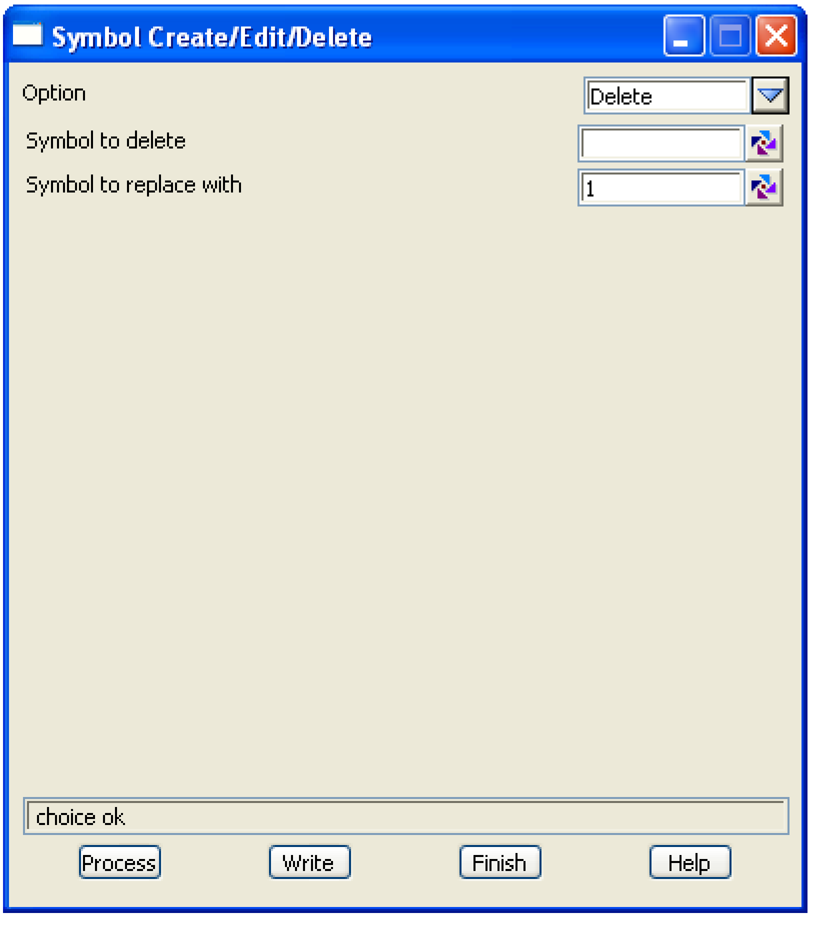
All the information for linestyles is stored in the text file symbols.4d but the **Symbol Create/Edit/Delete** panel is normally used to create and modify the file rather than using a text editor. (the file *symbols.4d* is fully documented in the 40.1 Line Styles section of the Appendix 40 Linestyles, Symbols, Textstyles &Patterns).

The **Symbol Create/Edit/Delete** panel is:





Symbol Create/Edit/Delete
Option
Edit
Symbol name
Group
Symbol type
Edit linework
Model for symbol
Write out symbol
No embedded colours in symbol
Origin x
Origin y
Factor
Length
choice invalid
Process
Write
Finish
Help



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Option	choice box	Create	Create, Edit, Delete
type of edit			
Symbol name	input		available symbols
name of the linestyle to be created, edited or deleted.			
Group	input		available groups
name of the group for the symbol - can be a new group name.			
Symbol type	choice box	world	pixel, world, paper
type of the symbol.			

For Option choice "*Create*" - Data input

Data input	source box		model
data to be used to create the symbol.			

For Option choice *"Edit"* - Edit line work

Model for symbol	model box		available models
model to write the symbol out to so that it can be edited.			
Write out symbol	button		
when selected, the symbol is written out to the **Model for symbol**.			

For Option choice *"Delete"*

Symbol to delete symbol box available symbols

name of the linestyle to delete.

Symbol to replace it with symbol box 1available symbols

when the symbol is deleted, any vertex of a string with that symbol has to have a new symbol. This is the symbol that is set for strings with the deleted symbol

No imbedded colours in symbol tick box tick

*if **ticked** then no colours from the data are used in the symbol.*
*If **not ticked** then any colours used in the data are used in the symbol*

Origin x/y double box

if non blank, the x/y value for the origin of the symbol.
If blank, a value is calculated by 12d.

Factor double box

if non blank, the symbol is factored up by this value.
If blank, the factor is taken to be 1.

Length double box

if non blank, the symbol is repeated after this length.
If blank, the symbol length is calculated by 12d.

Process button

process the data in the panel fields. The internal definitions of the symbols is modified. The definitions are not written to the symbol file.

Write button

write the modifications to the file symbols.4d file. This files can then be used when projects are opened up. The information won't be used for the current session unless the **Process** *button is selected as well. For more information on the* **Write** *button, go to the section* 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d

This option updates the files *symbols.4d* which is fully documented in the 40.2 Symbols section of the Appendix 40 Linestyles, Symbols, Textstyles &Patterns.

Go to the next section 7.9.6 Textstyles or return to 7.9 Tree.

7.9.6 Textstyles

Position of option on menu: **Project =>Tree**

Click on *Textstyles* to expand the item and then double click LB on *Create textstyle* to create a new textstyle, or double click LB on an existing textstyle in the list to edit an existing textstyle definition. The **Create/Edit Textstyle** panel will then appear.

The textstyle definition includes

(a) a unique name

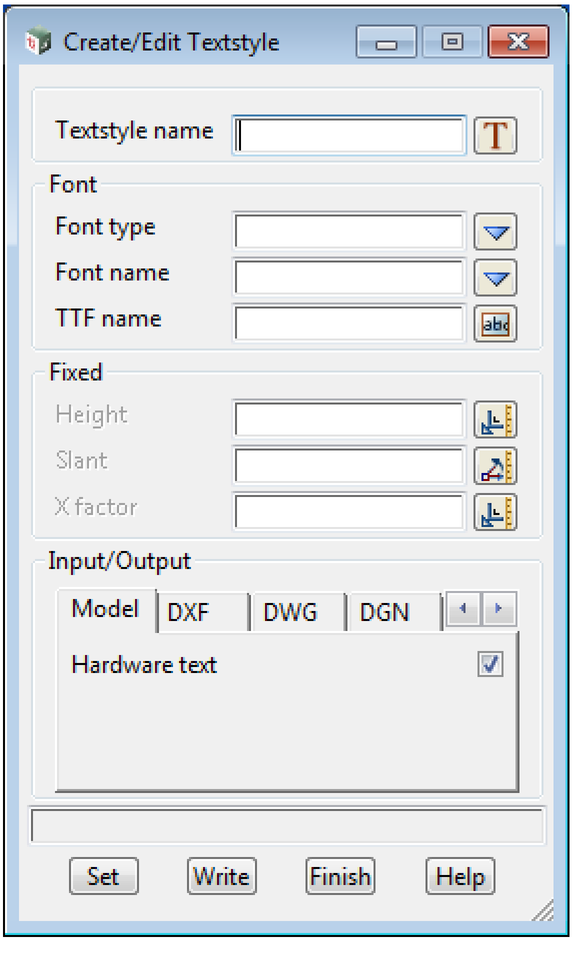
(a) the font used for textstyle - this may be a true type font

(b) mappings of textstyle names when reading in data from AutoCAD and Microstation

(c) mappings of textstyle names when writing data out to AutoCAD, Microstation and ***12d Model*** Models.

All the information for textstyles and fonts is stored in text files (textstyl.4d and fonts.4d) but the **Create/Edit Textstyle** panel is normally used to create and modify the files rather than using a text editor. (the files *textsyles.4d* and *fonts.4d* which are fully documented in the 40.3 Textstyles and Fontssection of the Appendix 40 Linestyles, Symbols, Textstyles &Patterns).

The **Create/Edit Textstyle** panel is:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Textstyle name	input		available textstyles

name of the textstyle to be defined or edited.

Font section

Font name output recent projects

name of the font to be used for the textstyle.

True type font tick box tick

*if **ticked** then the font is a true type font. The next box asks for the True Type Font name.*
*If **not ticked** then the font needs an SHP file to define the characters. The next box asks for the SHP name.*

TTF name input available true type fonts

name of the true type font.

SHP name input available SHP files

name of the SHP file to define the characters.

Fixed section

Input/Output section

Model tab

Hardware text tick box tick

*if **ticked** then any **12d Model** text is written out to a model as text strings.*
*If **not ticked** then each characters of a text string is turned into individual lines and arcs (i.e. each character is stroked).*

DXF tab

Hardware text tick box tick

*if **ticked** then any **12d Model** text is written out to the DXF file as text.*
*If **not ticked** then each characters of a text string is turned into individual lines and arcs (i.e. each character is stroked).*

Input name input

*when a DXF file is read in, any text in the DXF file with style of this **Input name,** is converted to **12d Model** text strings with the textstyle **Textstyle name**.*

Output name input

*if the **Hardware text** flag is set to tick - when data is written out to a DXF file, any **12d Model** text with the textstyle of the name in the field **Textstyle name**, is converted to DXF text with style of this **Output name**.*

*If the **Hardware text** flag is not set to tick, then this field is ignored.*

DWG tab

Hardware text tick box tick

*if **ticked** then any **12d Model** text is written out to the DWG file as text.*
*If **not ticked** then each characters of a text string is turned into individual lines and arcs (i.e. each character is stroked).*

Input name input

*when a DGN file is read in, any text in the DGN file with style of this **Input name**, is converted to **12d Model** text strings with the textstyle **Textstyle name**.*

Output name input

*if the **Hardware text** flag is set to tick - when data is written out to a DWG file, any **12d Model** text with the textstyle of the name in the field **Textstyle name**, is converted to DWG text with style of this **Output name**.*

*If the **Hardware text** flag is not set to tick, then this field is ignored.*

DGN tab

Hardware text tick box tick

*if **ticked** then any **12d Model** text is written out to the DGN file as text.*
*If **not ticked** then each characters of a text string is turned into individual lines and arcs (i.e. each character is stroked).*

Input name input

*when a DGN file is read in, any text in the DGN file with style of this **Input name**, is converted to **12d Model** text strings with the textstyle **Textstyle name**. For DGN, the text style must be a number between 1 and 64.*

Output name input

*if the **Hardware text** flag is set to tick - when data is written out to a DGN file, any **12d Model** text with the textstyle of the name in the field **Textstyle name**, is converted to DGN text with style of this **Output name.** For DGN, the text style name must be a number between 1 and 64.*

*If the **Hardware text** flag is not set to tick, then this field is ignored.*

Other tab

Hardware text tick box tick

*if **ticked** then any **12d Model** text is written out to the file as text.*
*If **not ticked** then each characters of a text string is turned into individual lines and arcs (i.e. each character is stroked).*

Input name input

*when a file is read in, any text in the file with style of this **Input name**, is converted to **12d Model** text strings with the textstyle **Textstyle name**.*

Output name input

*if the **Hardware text** flag is set to tick - when data is written out to a file, any **12d Model** text with the textstyle of the name in the field **Textstyle name**, is converted to text with style of this **Output name**.*

*If the **Hardware text** flag is not set to tick, then this field is ignored.*

Buttons

Set button

sets the definition for this editing session of the project - the information will be lost when the project is exited.

Write button

write the information to the files textstyle.4d and fonts.4d files. These files can then be used when projects are started. The information won't be used for the current session unless the Set button is selected as well. For more information on the **Write** *button, go to the section* 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d

This option updates the files *textsyles.4d* and *fonts.4d* which are fully documented in the 40.3 Textstyles and Fontssection of the Appendix 40 Linestyles, Symbols, Textstyles &Patterns.

Go to the next section 7.9.7 Textstyle Data Favourites or return to 7.9 Tree.

7.9.7 Textstyle Data Favourites

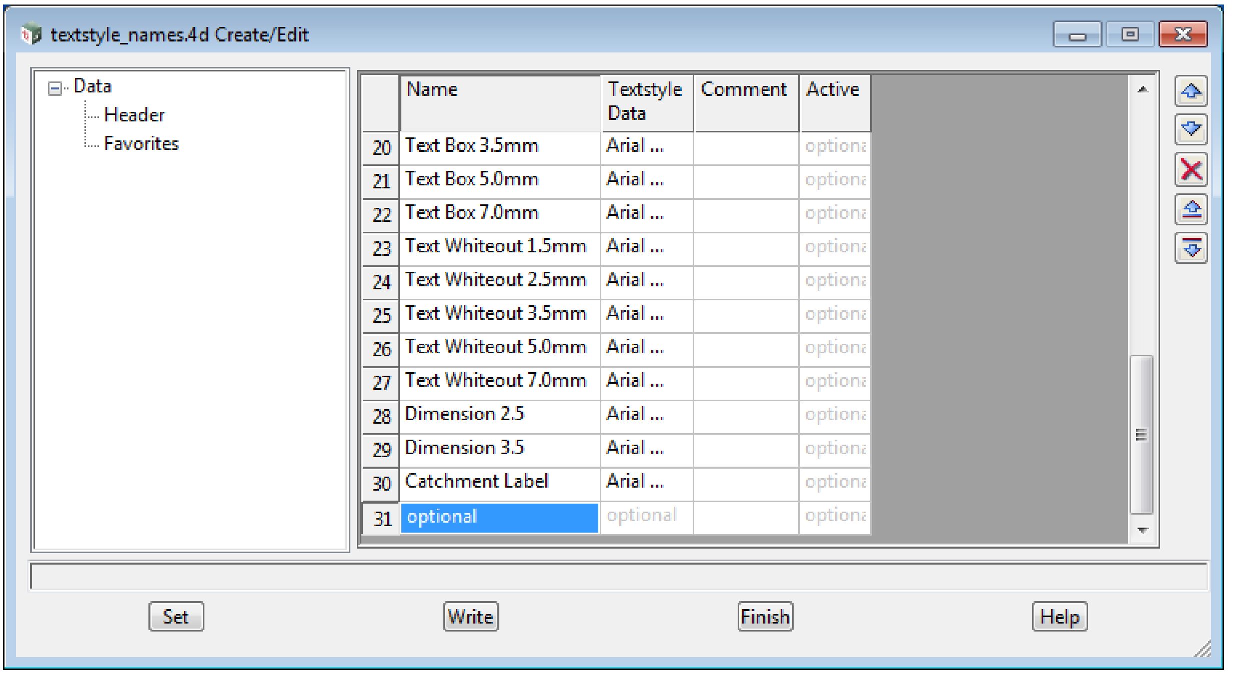
Position of option on menu: **Project =>Tree**

The *textstyle data favourites* option defines a set of text style parameters recorded with a user given name. When ever a text style needs to be defined, the name of a *textstyle data favourite* can be selected and the values of the favourite used for the text.

To define or modify a textstyle favourite, click on *Textstyle data favourites* in the *Browse* list to expand the item and then double click LB on *Create textstyle data favourite* to create/edit the *textstyle_names.4d* file.

Double clicking LB on any of the items below *Create textstyle data favourite* will also create/edit the *textstyle_names.4d* file.

In either case, the **Textstyle_names.4d Create/Edit** panel will then appear.



Buttons

Set button

sets the definition for this editing session of the project - the information will be lost when the project is exited.

Write button

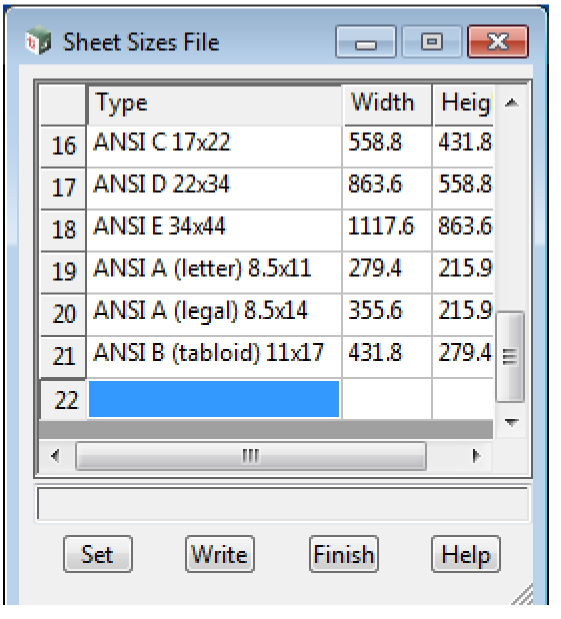
write the information to the textstyle_names.4d file. The file can then be used when projects are started. The information won't be used for the current session unless the Set button is selected as well. For more information on the **Write** *button, go to the section* 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d.

Go to the next section 7.9.8 Sheet Sizes or return to 7.9 Tree.

7.9.8 Sheet Sizes

Position of option on menu: **Project =>Tree**

Click on *Sheet sizes* to expand the item and then double click LB on *Create sheet size* to bring up the **Sheet Sizes File** panel to create, edit or delete sheet size definitions, or double click LB on an existing sheet size in the list to also bring up the **Sheet Sizes File** panel.



Buttons

Set button

sets the definition for this editing session of the project - the information will be lost when the project is exited.

Write button

write the information to the file sheets.4d. The file can then be used when projects are started. The information won't be used for the current session unless the **Set** *button is selected as well. For more information on the* **Write** *button, go to the section* 39.2.6 Writing Out Setup Files *in the Appendix* 39 Setting Up & Configuring 12d

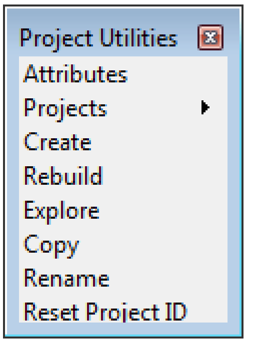
This option updates the file *sheets.4d* which is fully documented in the 39.2.7.4 Sheet Sizes File (sheets.4d) section of the Appendix 39 Setting Up & Configuring 12d.

Return to 7.9 Tree.

7.10 Utilities

Position of menu: **Project =>Utilities**

The **utilities** walk-right menu contains various project items.



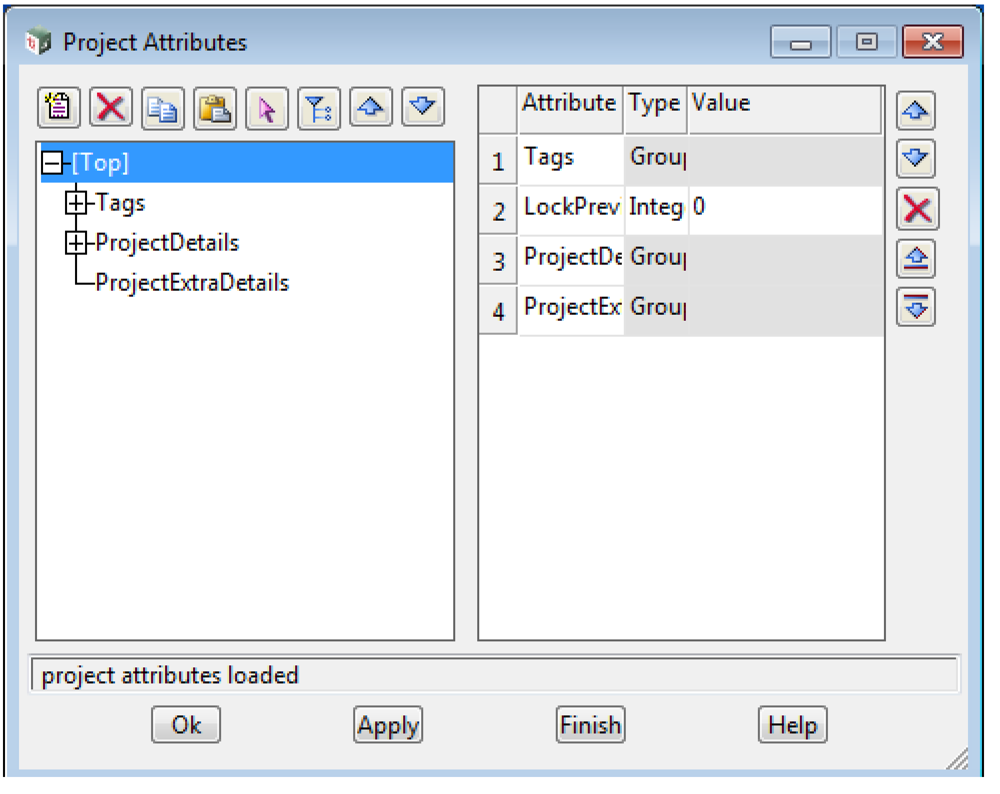
For the option *Attributes*, go to	7.10.1 Attributes
Projects	7.10.2 Projects
Create	7.10.3 Create
Rebuild	7.10.4 Rebuild
Explore	7.10.5 Explore
Copy	7.10.6 Copy
Rename	7.10.7 Rename
Reset Project Id	7.10.8 Reset Project ID

7.10.1 Attributes

Position of option on menu: **Project =>Utilities =>Attributes**

The **Attributes** options displays, creates and edits the attributes for the current project

On selecting **Attributes**, the **Project Attributes** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Name			
name of the attribute			
Type	integer, real, text		
type of attribute - integer, real or text			
Data			
value for the attribute			
OK	button		
set the attributes to the values in the panel and then exit the panel.			
Apply	button		
set the attributes to the values in the panel but don't exit the panel.			

Go to the next section 7.10.2 Projects or return to 7.10 Utilities.

7.10.2 Projects

Position of option on menu: **Project =>Utilities =>Projects**

The **projects** walk-right menu provides a list of all the projects available in the working folder. Each project is contained in a sub-folder of the working folder.

Selecting a project from the walk-right list will bring up the **Change Project** panel with the selected project name already in the **New project** panel field.

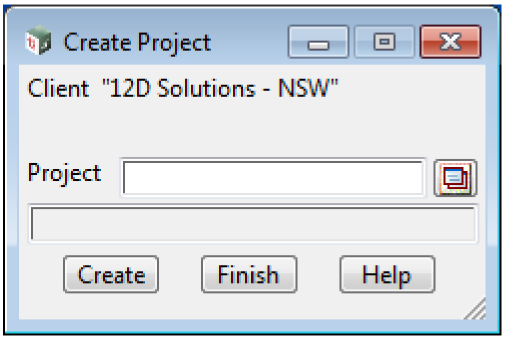
For more in formation on the **Change Project** panel, go to the earlier section 7.2.2 Open.

Go to the next section 7.10.3 Create or return to 7.10 Utilities.

7.10.3 Create

Position of option on menu: **Project =>Utilities =>Create**

On selecting the **Create** option, the **Create Project** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Project	input		

name of the new project to be created.

Create	button		

after selecting this button, a new project folder is created. The working project does not change to the new project.

Go to the next section 7.10.4 Rebuild or return to 7.10 Utilities.

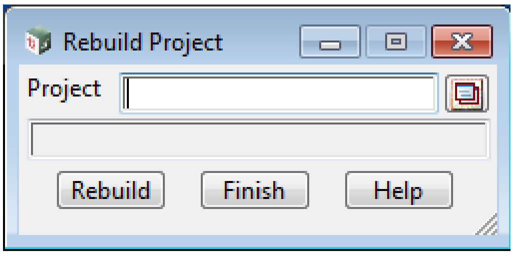
7.10.4 Rebuild

Position of option on menu: **Project =>Utilities =>Rebuild**

The **rebuild** option is used to try and rebuild a project if some of the information has been corrupted.

On selecting the option, the project header file will be deleted and re-created and all the models, tins, templates and functions inside the project's folder added back into the project. The view information for the original project will be lost.

On selecting the **rebuild** option, the **rebuild project** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Project	input		

the name of the project to be rebuilt.

Rebuild	button		

after selecting this button, the project given in the **project** *field is rebuilt.*

Note - the current (working) project cannot be rebuilt.

Go to the next section 7.10.5 Explore or return to 7.10 Utilities.

7.10.5 Explore

Position of option on menu: **Project =>Utilities =>Explore**

The **Explore** brings up the Windows Explorer showing the contents of the working folded. That is, showing the contents of the folder *containing* the project.

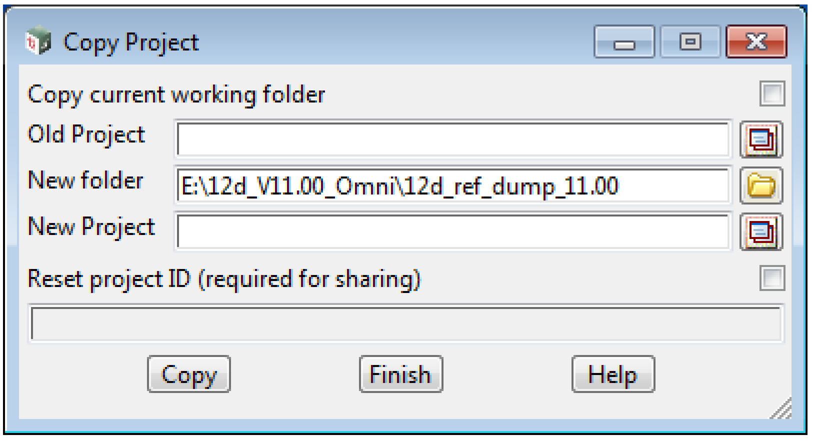
Go to the next section 7.10.6 Copy or return to 7.10 Utilities.

7.10.6 Copy

Position of option on menu: **Project =>Utilities =>Copy**

The **copy** option is used to make a copy of any project (other than the current project) in the working folder.

On selecting the **copy** option, the **copy project** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Copy current working folder	tick box		none

if ticked, the entire working folder containing the project is copied to the **New folder***.*

Old project	input	none	projects in folder

name of the project to be copied.

New folder	input		current working folder

name of the folder to copy the project to.

New project	input		

name of the copy of the project. The new project name cannot be the same as an existing project in the **New folder***.*

Reset project ID (required for sharing) tick box

if ticked, 12d will automatically reset the project id in the new copy of the project. This will prevent multiple projects with the same id, which are not allowed when sharing from one project to another. if not ticked, 12d will not reset the project id in the new copy of the project.

Copy	button		

after selecting this button, a complete copy of the project given in the **old project** *field is made and saved under the name given in the* **new project** *field. If* **Copy current working folder** *is ticked, the contents of the working folder containing the project is also copied.*

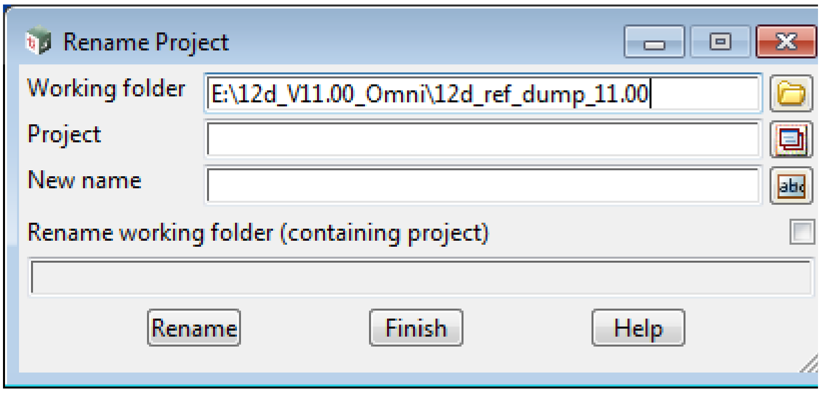
Go to the next section 7.10.7 Rename or return to 7.10 Utilities.

7.10.7 Rename

Position of option on menu: **Project =>Utilities =>Rename**

The **Rename** option is used to rename any project (other than the current project) in the working folder, and if required, the working folder as well.

On selecting **Rename**, displays the **Rename project** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Working folder folder box folder browse

name of the folder that contains the project to be renamed (the working folder for the project).

Project project box projects in working folder

name of the project to rename - this can't be the project currently opened.

New name input

name of the new name for the project. The new project name cannot be the same an existing project in the working folder.

Rename working folder (containing the project) tick box

if tick, if the working folder containing the project to be renamed is the same as the project name, then the working folder will also be renamed.

Rename button

after selecting this button, the selected project will be given the new name. If **Rename working folder (containing project)** *is ticked and the name working folder is the same as the project, then the working folder will also be renamed.*

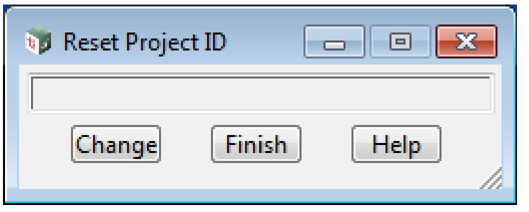
Go to the next section 7.10.8 Reset Project ID or return to 7.10 Utilities.

7.10.8 Reset Project ID

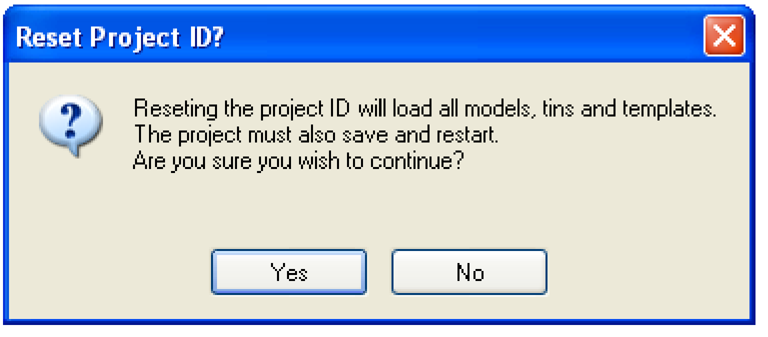
Position of option on menu: **Project =>Utilities =>Reset Project ID**

This option is used when a project has the same id as another project. If a user wishes to share from a server project that is a copy of another project, then the project ID must be reset.

On selecting the **Reset Project ID** option, the **Reset Project ID** panel is displayed.



Selecting **Change** displays the **Reset Project ID?** panel on the screen.



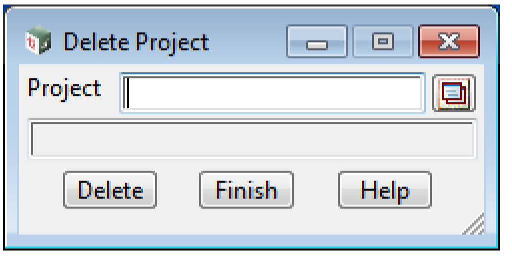
Selecting the **Yes** button will cause the project to resave and ***12d Model*** will restart.

Go to the next section 7.11 Delete or return to 7.10 Utilities.

7.11 Delete

Position of option on menu: **Project =>Delete**

On selecting the **delete project** option, the **delete project** panel is displayed.



The fields and buttons used in the delete project panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Project	input		available projects

name of project to delete

Delete	button		

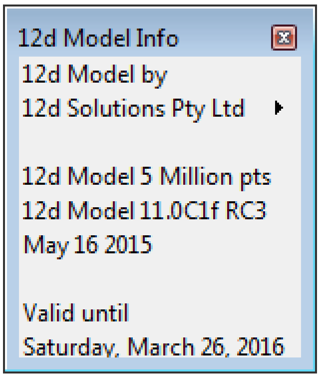
after selecting this button, a **yes-no** *pop-up menu appears to confirm that deleting the project is required. If deletion is confirmed, the selected project is deleted from the computer disk.*

Go to the next section 7.12 12d Model or return to 7 Project.

7.12 12d Model

Position of option on menu: Project =>12d Model

The **12d model** walk-right menu and the walk-right **by** menu are



12d Solutions phone, fax etc.

12d Model version
date version compiled

12d Solutions phone, fax etc.

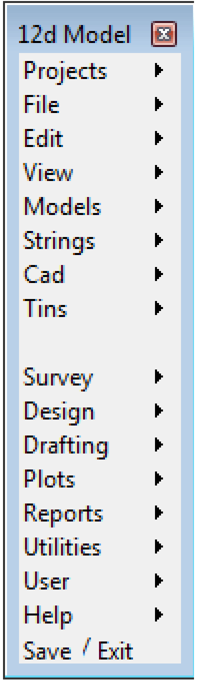
The walk-right menu for **Originators** is:

Go to the next section 7.13 12d Model Menu or return to 7 Project.

7.13 12d Model Menu

Position of option on menu: Project =>12d Model menu

Selecting the **12d Model Menu** option brings up the floating **12d Model** menu as described at the beginning of this chapter.



For the options, see

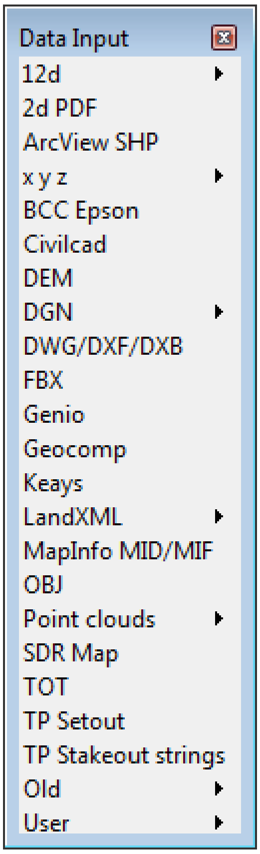
8.1 Data Input

Position of menu: **File I/O =>Data input**

The facilities for reading data files into 12d Model are collected under the **File I/O =>Data input** menu.

Some of the formats are provided in the base product (xyz data, BCC Epson, 12d Model HP plots and 12d Model 12da files) and the rest are optional (dxf, genio, geocomp, *etc*.).

The default *Input null value* is described in the section 8.1.1 Input Null Value.



bring up the 12d Input menu
read a 2d PDF file
ArcView shape files
read in x y z s and attribute data
BCC Epson data file
Civilcad text files
USGS DEM files
dgn V7 and V8 binary files
dwg/dxf Version 12 to 2010
FBX file
genio data
Geocomp.pts,.str data
Keays data
LandXML
MapInfo mid/mif files
Wavefront OBJ
LAS, SRTM files
SDR Map file
TOT files
TP Setout .pta file
TP Stakeout strings file
Old readers
Data Input User menu

The default *Input null value* is described in the section 8.1.1 Input Null Value

For the options:

12d	8.1.2 12d Input
2d PDF	8.1.3 Import 2D PDF
ArcView SHP	8.1.4 ArcView SHP Input
x y z	8.1.5 Input X Y Z Text Files
BCC Epson	8.1.6 BCC Epson Input
Civilcad	8.1.7 CivilCad Input
DEM	8.1.8 DEM Input
DGN	8.1.9 Input DGN Binary Files
DWG/DXF/DXB	8.1.10 DWG/DXF Input
FBX	8.1.11 FBX Input
Genio	8.1.12 Genio Input
Geocomp	8.1.13 Geocomp Input
Keays	8.1.14 Keays Input

8.1.1 Input Null Value

In three dimensional data, it is possible that a point can have a valid plan position but an undefined height. In 12d Model, there is a special **null** value (-9.9e29) which is used internally when height is undefined.

In other software systems, the null value may be different.

To allow for different null values, 12d Model has an **i/o null height** parameter.

As data is read in, the height is checked and if it is equal to the **i/o null height**, then it is replaced by the 12d Model null height.

The **i/o null height** is set in **Default Settings** tab of the **Defaults** panel in the **Project =>Management =>Defaults** (see 7.6.1 Defaults).

Note - some input panels have their own special **null value** field which is used instead of the i/o null height.

Return to 8.1 Data Input

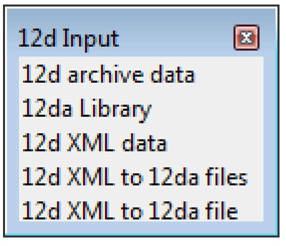
8.1.2 12d Input

Position of menu: **File I/O =>Data input =>12d**

The facilities for reading data files into 12d Model are collected under the **File I/O =>Data input =>12d** menu.

Some of the formats are provided in the base product (xyz data, BCC Epson, 12d Model HP plots and 12d Model 12da files) and the rest are optional (dxf, genio, geocomp, *etc*.).

The default *Input null value* is described in the section 8.1.1 Input Null Value



12d Model archive file
insert a 12d archive file
read 12d XML file
convert 12d XML files to 12da files
convert 12d XML files to a 12da file

For the options:

12da archive data	8.1.2.1 12d Archive Input
12da Library	8.1.2.2 12da Library
12d XML data	8.1.2.3 12d XML Data
12d XML to 12da files	8.1.2.4 12d XML to 12da files
12d XML to 12d file	8.1.2.5 12d XML to 12da file

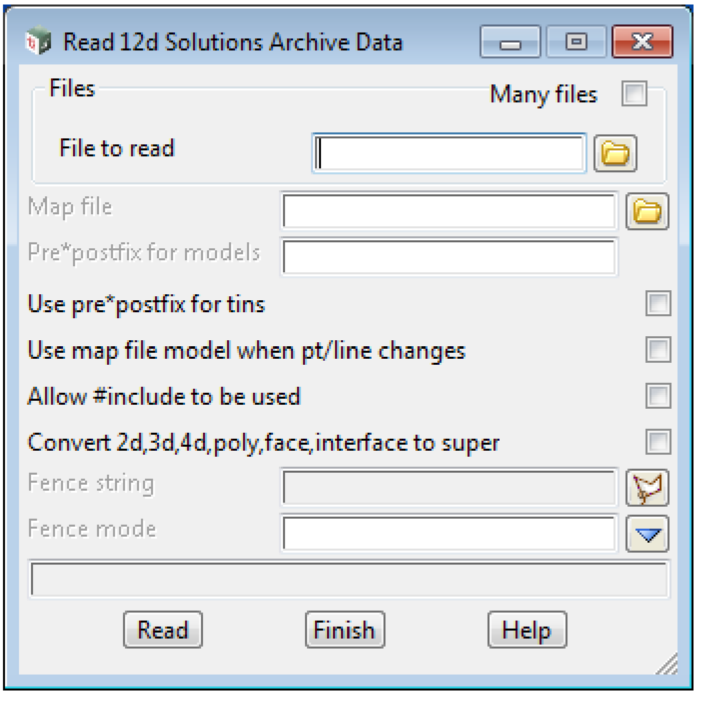
8.1.2.1 12d Archive Input

Position of option on menu: **File I/O =>Data input =>12d =>12d archive data**

The ***12d Archive*** format is a special format defined by 12d Solutions to allow data to be easily transferred from other programs into 12d Solutions software such as 12d Model. The 12d Archive format is given in the 34 12d Archive File Format.

Note that there is also an XML format for writing out the data in ***12d Model***. See 35 12d XML File Format.

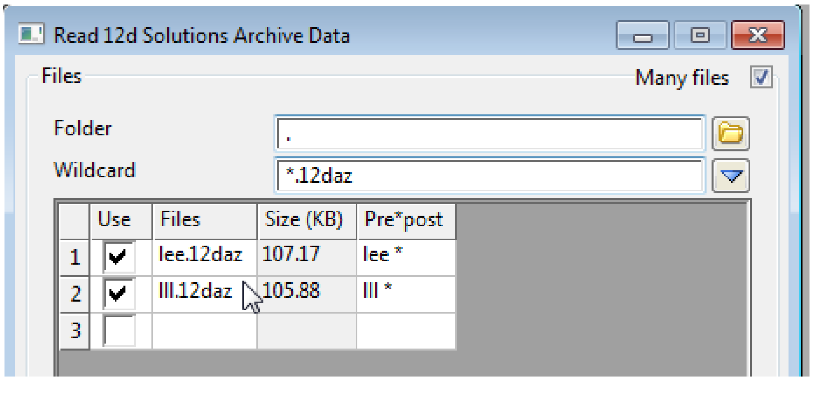
Selecting **12d archive data** brings up the **Read 12d Solutions Archive Data** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Many files	tick box		

*if **ticked**, a grid to allow multiple 12d archive files to be read in, is opened. A wild card is used to select all the files to be read in.*



Folder	folder box	

folder to search for files using the **Wild card**

Wildcard	text box	

wild card to use in search for files in the given folder

Use tick box

*if **ticked**, read in the file*

Files file box

name of the file in the folder

Size (KB) output only

file size

Pre*post text box

*if **non blank**, pre*post text to use for the models in this 12d archive file (see* 4.19.2 Pre*Postfix in Panel Fields*) for information on using pre*postfix.*
*If **blank**, use the pre*post text from the* **Pre*postfix for models** *panel field.*

***Note** - if a non-blank value for **Pre*post is** given in the column for a file then the **Pre*postfix for models** is ignored.*

File to read file box *.12daz, *.12da or *.4da files

name of the **12d Model** *Archive file to be read in.*

*Note that **Drag and Drop** works for 12daz, 12da and 4da files.*
It will also work for files that are email attachments in Outlook 2002 and above.

*If you are dragging and dropping more than one **12daz, 12da** or **4da** file at a time, then one panel will be opened and all the dropped files listed in the **Many Files** grid.*

Map file file box *.mapfile, *.mf files

*if **not blank**, the name of the 12d Map File to be used for all strings read in, including any files given with the **Many files** mode ticked on.*
*If **blank**, no map file is used*

When using a map file, the string name is used as the entity-name for matching with the keys in the map file. See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Pre*postfix for models pre*postfix box

if non-blank, a prefix and a postfix to be applied to the model names used in the map file.
Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

***Note** - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.*

Use pre*postfix for tins tick box not ticked

if ticked, a prefix and a postfix are to be applied to any tin names in the 12d Archive data.
Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

***Warning** - if a tin already exists in 12d Model with the tin name, then the tin cannot be read in from the 12d Archive file.*

Use map file model when pt/line changes tick box

*if **not ticked** and the pt/line type of the string does not match that in the map file, then the string is placed in.*
*If **tick**, the.*

Allow #include to be used tick box

if ticked, expand an files referenced by an #include.
If not ticked, ignore the #includes

Convert 2d, 3d, 4d, poly, face, interface to super tick box

if ticked, non super string versions of 2d/3d/4d/poly/face/interface strings are converted to super strings.

Fence string polygon box

A polygon is selected/created and used with the **Fence mode** *choice to restrict the selection of strings* *read in from the 12d Archive file.*

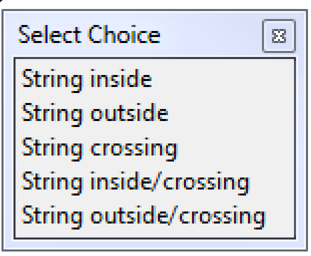
Clicking LB on the Select Polygon icon on the right hand side of the **Fence string** *field allows the user to select a polygon.*

Clicking RB on the Select Polygon icon on the right hand side of the **Fence string** *field brings up the* ***Polygon Choice*** *Box for the user to select a method of creating/selecting a polygon.*

Clicking MB does nothing.

Fence mode choice box available choices

The strings selected are then restricted to those using the polygon and satisfying the **Fence mode**:



String inside - strings totally inside the polygon
String outside - strings totally outside the polygon
String crossing - strings crossing the polygon
String inside/crossing - strings totally inside or crossing the polygon
String outside/crossing - strings totally outside or crossing the polygon

Fence Modes

Read button

reads the data in.

<u>Special Note</u>

Pressing the <Esc> key will interrupt and terminate the reading in of the files.

8.1.2.2 12da Library

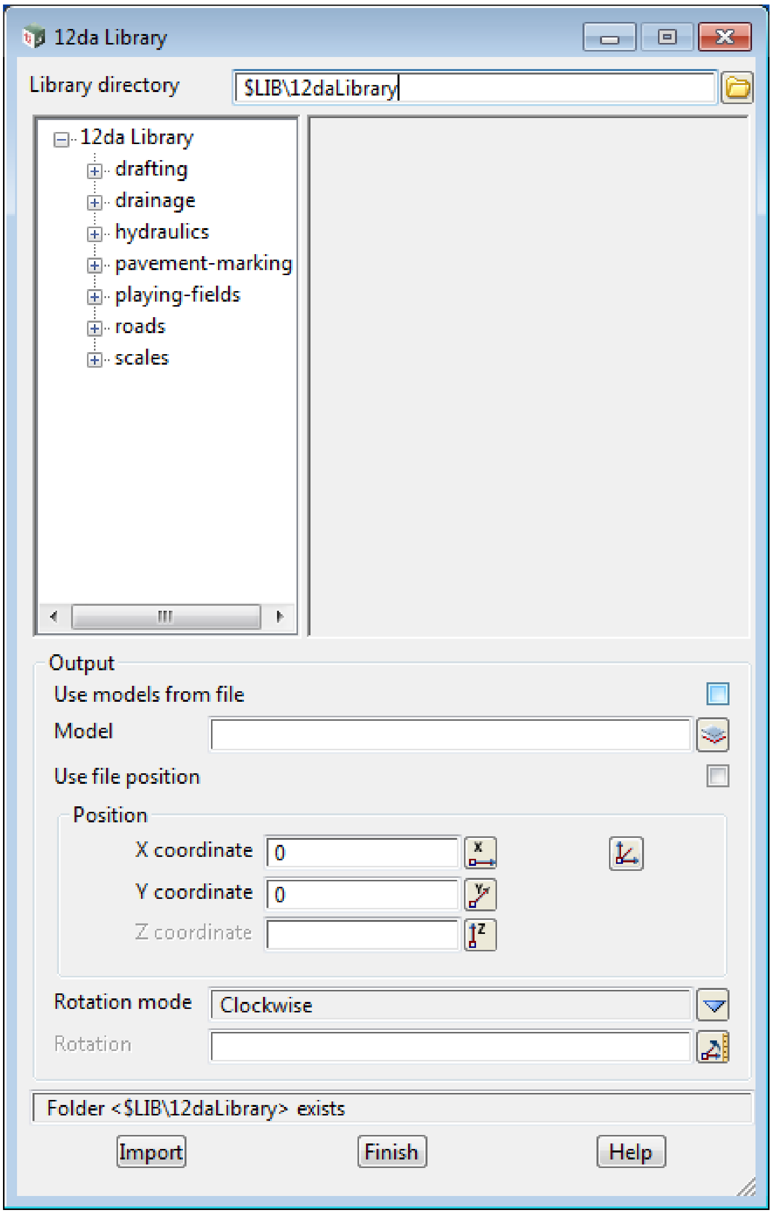
Position of option on menu: **File I/O =>Data input =>12d =>12da Library**

The **12da Library** allows a user to load 12da's from a 'library', defined by a directory structure.

Every folder within the nominated directory will be searched for 12da files, and this directory structure will be shown in the tree on the left hand side of the panel. When selected, the 12da will be shown in a preview on the right.

These 12das can be output into a nominated model, and a specific position, or you can choose to use the file position.

Selecting **12da Library** brings up the **12da Library** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Library directory	file		

the directory to search for 12das in

Use models from file tick box

if ticked use the models specified in the 12da

Model model box

if not using the models listed in the file, the model for the data in the 12da

Use file position tick box

if ticked use the file specified in the file position

Position x coordinate

the x-coordinate for the data, if not using the position in the file

Position y coordinate

the y-coordinate for the data, if not using the position in the file

Position z coordinate

an optional y-coordinate for the data, if not using the position in the file

Rotation mode choice box Clockwise, Anti- clockwise

how to apply an optional rotation (Clockwise or *Anti -clockwise)*

Rotation

an optional rotation to apply

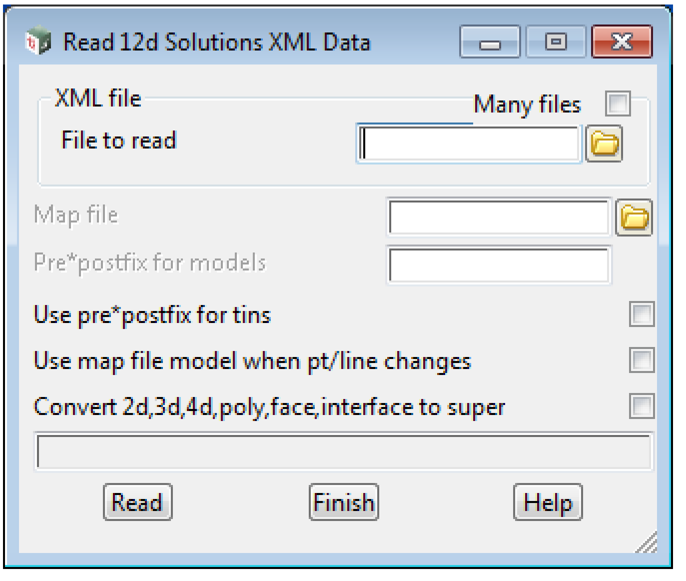
8.1.2.3 12d XML Data

Position of option on menu: **File I/O =>Data input =>12d =>12d XML data**

The ***12d XML*** format is a special format defined by 12d Solutions to allow data to be easily transferred from other programs into 12d Solutions software such as 12d Model. The **12d XML** format is given in the 35 12d XML File Format.

Note - ***12d XML*** contains the same information as a 12da file but it is a XML format.

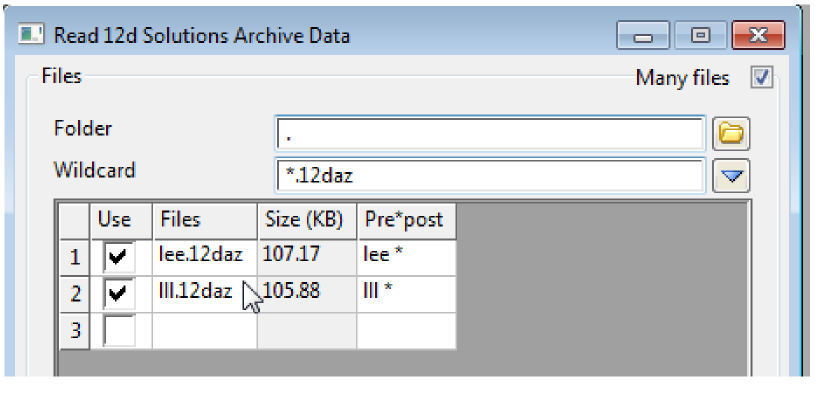
Selecting **12d XML data** brings up the **Read 12d Solutions XML Data** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Many files	tick box		

*if **ticked**, a grid to allow multiple 12d XML files to be read in, is opened. A wild card is used to select all the files to be read in.*



Folder folder box

folder to search for files using the **Wild card**

Wildcard text box

wild card to use in search for files in the given folder

Use tick box

*if **ticked**, read in the file*

Files file box

name of the file in the folder

Size (KB) output only

file size

Pre*post text box

*if **non blank**, pre*post text to use for the models in this 12d XML file (see* 4.19.2 Pre*Postfix in Panel Fields*) for information on using pre*postfix.*
*If **blank**, use the pre*post text from the* **Pre*postfix for models** *panel field.*

***Note** - if a non-blank value for **Pre*post is** given in the column for a file then the **Pre*postfix for models** is ignored.*

File to read file box *.12dxmlz, *.12dxml

name of the **12d Model** *XML file to be read in.*

*Note that **Drag and Drop** works for 12dxmlz and 12dxml files.*
It will also work for files that are email attachments in Outlook 2002 and above.

*If you are dragging and dropping more than one **12dxmlz** or **12dxml** file at a time, then one panel will be opened and all the dropped files listed in the **Many Files** grid.*

Map File file box *.mapfile, *.mf files

*if **not blank**, the name of the 12d Map File to be used for all strings read in, including any files given with the **Many files** mode ticked on.*
*If **blank**, no map file is used*

When using a map file, the string name is used as the entity-name for matching with the keys in the map file. See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Pre*postfix for models pre*postfix box

if non-blank, a prefix and a postfix to be applied to the model names used in the map file.
Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

***Note** - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.*

Use pre*postfix for tins tick box not ticked

if ticked, a prefix and a postfix are to be applied to any tin names in the 12d XML data.
Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

***Warning** - if a tin already exists in 12d Model with the tin name, then the tin cannot be read in from the 12d XML file.*

Use map file model when pt/line changes tick box

*if **not ticked** and the pt/line type of the string does not match that in the map file, then the string is placed in.*
*If **tick**, the.*

Allow #include to be used tick box

if ticked, expand an files referenced by an #include.
If not ticked, ignore the #includes

Convert 2d, 3d, 4d, poly, face, interface to super tick box

if ticked, non super string versions of 2d/3d/4d/poly/face/interface strings are converted to super strings.

Read button

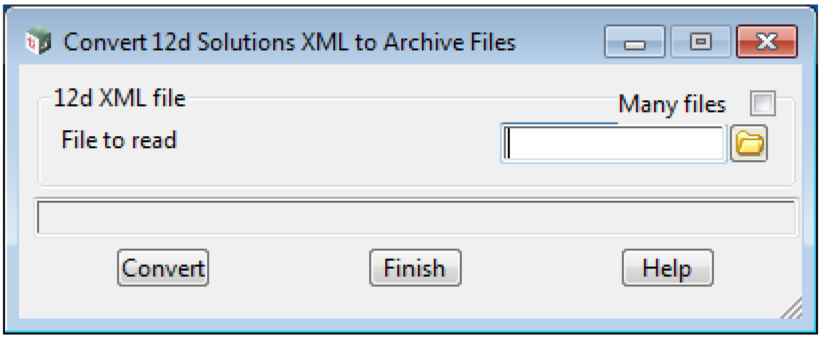
reads the data in.

8.1.2.4 12d XML to 12da files

Position of option on menu: **File I/O =>Data input =>12d =>12d XML to 12da files**

The ***12d XML to 12da*** option converts **12d XML** files to **12da** files.

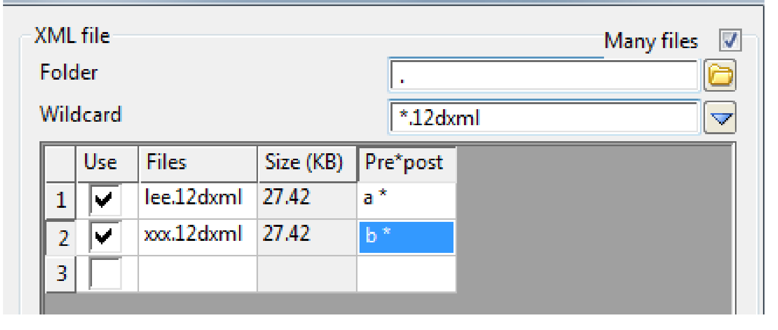
Selecting **12d XML to 12da files** brings up the **Convert 12d Solutions XML to Archive Files** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Many files	tick box		

*if **ticked**, a grid to allow multiple 12d XML files to be converted to 12d XML files. A wild card is used to select all the files to be converted.*



Folder folder box

folder to search for files using the **Wild card**

Wildcard text box

wild card to use in search for files in the given folder

Use tick box

*if **ticked**, convert the file*

Files file box

name of the file in the folder

Size (KB) output only

file size

Pre*post text box

*if **non blank**, pre*post text.*
*If **blank**, use.*

Convert button

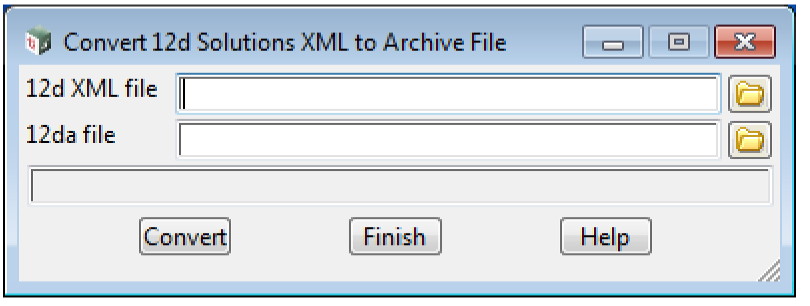
converts the 12d XML files to 12da files with the same name stem.

8.1.2.5 12d XML to 12da file

Position of option on menu: **File I/O =>Data input =>12d =>12d XML to 12da file**

The ***12d XML to 12da*** option converts **12d XML** file to a **12da** file.

Selecting **12d XML to 12da file** brings up the **Convert 12d Solutions XML to Archive File** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
XML file	file box		*.12dxmlz, *.12dxml

name of the 12d XML file to convert to a 12da file.

12da file	file box		*.12a files

name of the 12da file to convert the 12d XML file to.

Convert	button		

convert the 12d XML file to the 12da file.

8.1.3 Import 2D PDF

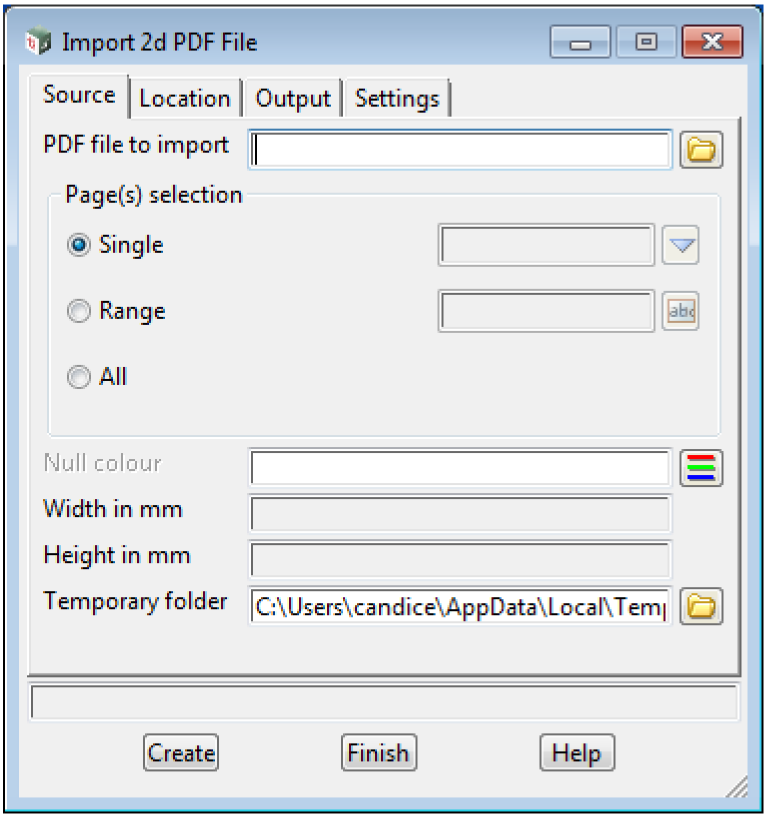
Position of option on menu: **File I/O =>Data input =>2d PDF**

This is option reads in a 2d pdf file and can create an image of the pdf and/or extract any line work (vectors) and text that may exist in the 2d pdf.

Note1

1. Although you can "see" lines and text in the raster does not mean that they exist inside the pdf as lines (vectors) and text data. They may be in the image only. This option **does not** do text and/or line recognition from the raster.
2. If the font for any text inside the pdf file does not exist in 12d, then another existing 12d font will be used. This can mean that the character positions are not correct.
3. if the font is encoded, then in some instances, the incorrect text will be displayed.

Selecting **Import 2d pdf** displays the **Import 2d PDF File** panel.



The fields and buttons used in this panel have the following functions:

Field Description Type Defaults Pop-Up

Source tab

PDF file to import file *.pdf files

name of the PDF file to import/read in.

Page(s) selection

only one of **Single**, **Range** *or* **All** *can be selected.*

Single radio button and choice box page numbers

if selected, this is the page number to import from the pdf file. The pop up has a list of pages and the page size (in mm) of each page in the pdf.

Range radio button, number box

if selected, the range of the page numbers to read in from the pdf file.

The page numbers and/or page ranges are separated by commas, and the pages in a range are separated by a minus. For example 1,3,5-12

All radio button

if selected, all the pages in the pdf file are imported.

Null colour colour box

*if **not blank**, the colour to use for the background colour in the pdf images.*
*If **blank**, leave the colours as they are in the pdf.*

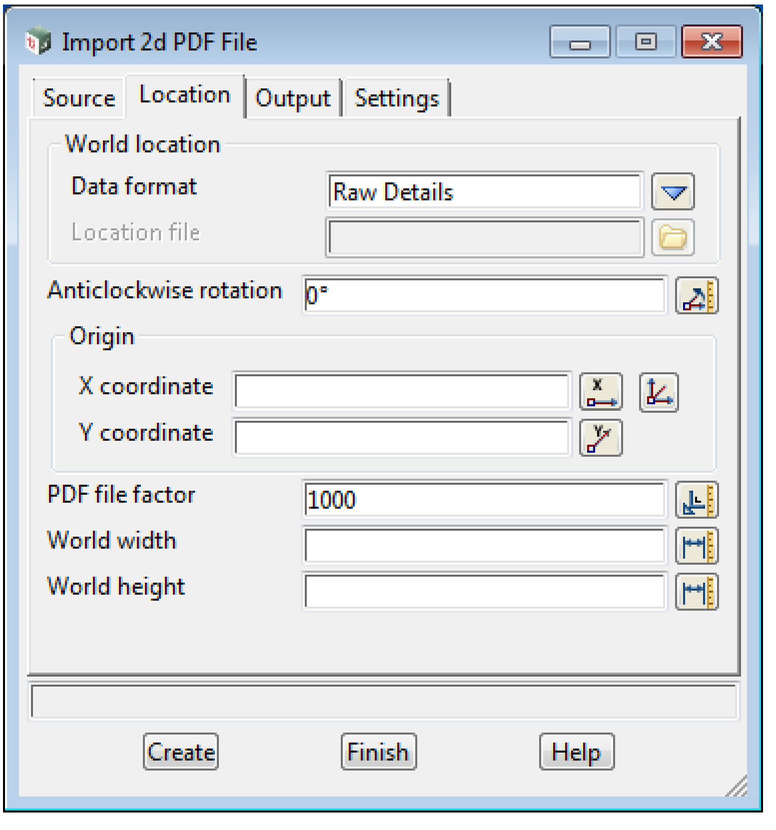
Width/Height in mm output only

the width/height (in mm) of the page selected from the pdf is written out to these fields.

Temporary folder folder box

the folder to use for temporary files created whilst processing the pdf.

Location tab



*The units in the pdf file are paper units and not world coordinates. The location tab supplies the information for positioning the data in the pdf file in world units by either typing in a world origin, anticlockwise rotation angle and world width and height, or by using supplying a file in **ESRI world** format with the information in it.*

Data format choice box Raw details Raw Details or ESRI world

*if **Raw details**, the location details are typed into the* **World Location Details** *section as rotation, world origin, world width and height.*

If **ESRI world**, *the location details are taken from the ESCRI world file given in* **Location file.** *An ESRI world file gives the xscale, row rotation, column rotation, yscale, x origin and y origin. For use with 12d, the row and column rotations must be the same and yscale = - xscale.*

Location file file box

*file with the location details if **ESRI world** is selected as the* **Data format**.

World Location information

*if **Raw Details** is selected as the* **Data format**, *the Anticlockwise rotation, (X,y) origin, World width, World height and Source file factor are used to position and scale the data in the pdf file.*

Anticlockwise rotation angle box

the world rotation to rotate the raster, text and vectors in the pdf file. The units are dms in hp notation and the rotation is measured in a counter clockwise direction from the positive x-axis.

X/Y coordinate real box

the world x/y coordinate of the left hand bottom corner of the raster in the pdf file.

Only one of **PDF file factor, World width**, *and* **World height** *is needed and the others are calculated.*
That is, if one of **PDF file factor**, **World width**, *or* **World height** *is typed and <Enter> pressed, then the other two are automatically calculated using the entered value and the **Width in mm** and **Height in mm** from the first page of the pdf file itself. However only the* **PDF file factor** *is used to scale the pdf's.*

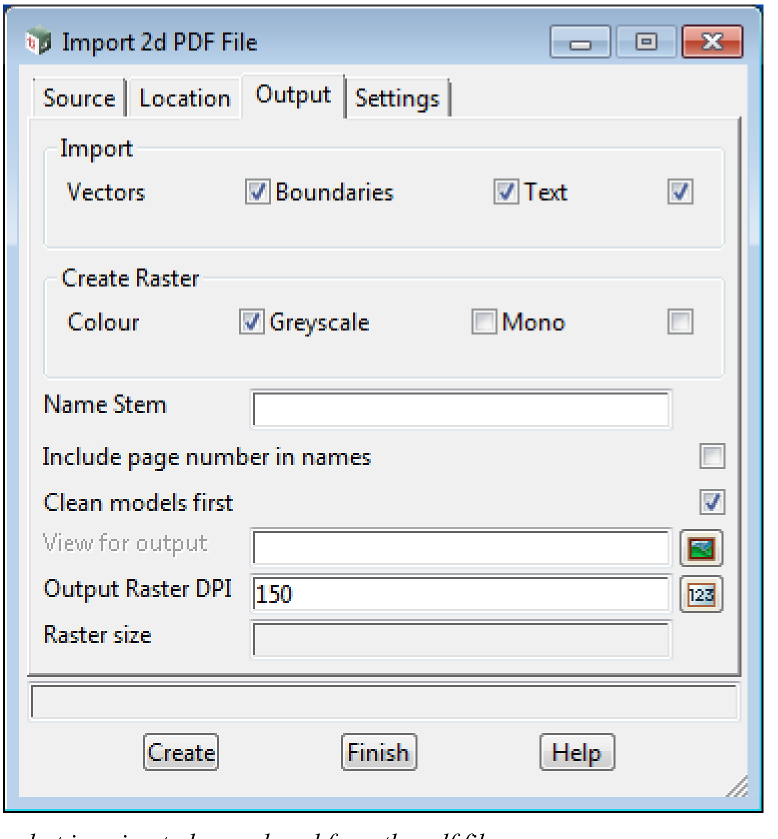
PDF file factor real box 1000

*multiplication factor to apply to the units in the each of the pages of the pdf file. Normally 1000 so millimetres in the pdf go to metres in **12d Model**.*

World width/height real box

the width/height in world units of the raster in the first page of the pdf file. The values are not used to scale the pdf. Only the **PDF file factor** *is used.*

Output tab



Controls what is going to be produced from the pdf file.

Import

*if **Raw Details** is selected as the* **Data format** *in the Location tab, the Anticlockwise rotation, (x,y) origin, World width, World height and Source file factor are used to position and scale the rasters, vectors and the text placement positions.*

Vectors tick box

if ticked, any vectors (line work) in the pdf file are read in and placed in the model given by the field **Name stem**.

Boundaries tick box

if ticked, any polygon boundaries in the pdf file are read in and placed in the model given by the field **Name stem** *followed by " **ClipBnd**"*

Text tick box

if ticked, any text in the pdf file is read in and placed in the model given by the field **Name stem** *followed by " **Text**"*

Create Raster

only one of **Colour***,* **Greyscale** *or* **Mono** *can be ticked. If none are ticked then no rasters are created from the pdf.*
Any created rasters are placed in a model given by the field **Name stem** *followed by " **raster**".*

Colour tick box

if ticked, a raster for each selected page of the pdf is created and the colours in the pdf are retained in the raster.

Greyscale tick box

if ticked, a raster for each selected page of the pdf is created and the colours in the rasters are grey scaled.

Mono tick box

if ticked, a raster for each selected page of the pdf is created and any colours are mapped to black.

Name stem text box name of the pdf file with each non alphanumeric character replaced by a space

the name stem used to generate the model names for the created models.

Include page number in names tick box ticked

if ticked, the page numbers in the pdf are also included as part of the model names.

Clean models first tick box ticked

if ticked, the models are cleaned before the pdf pages are read in.

View for output view box

if non-blank, add the models to this view

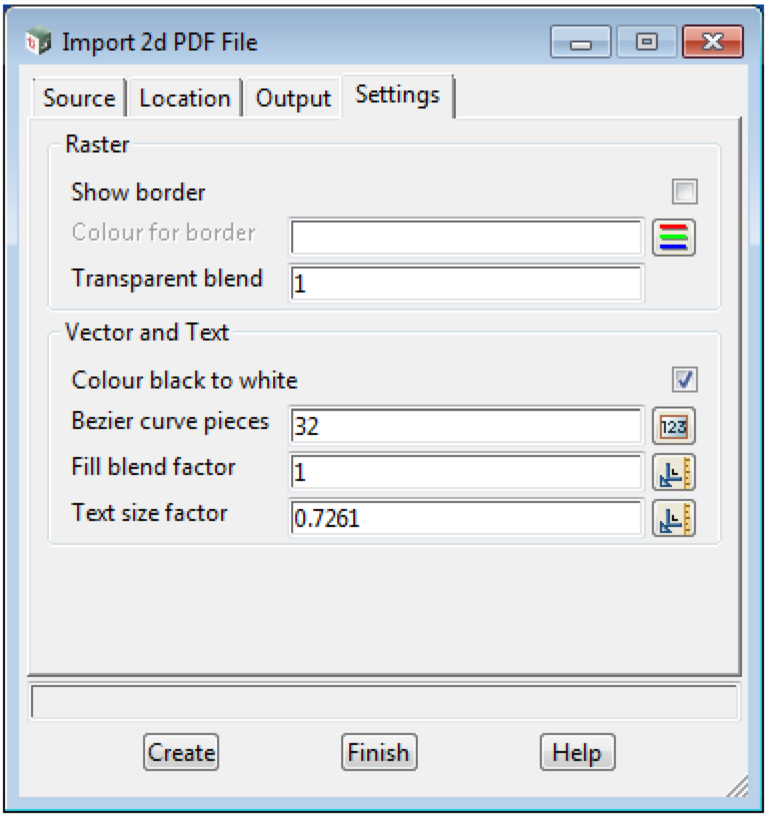
Output Raster DPI number box 150

the number of dots per inch for the created rasters.

Raster size output

the size of the produced raster.

Settings tab



Raster

Settings to use for rasters.

Show border tick box

if ticked, a border is drawn around the raster.

Colour for border colour box available colours

colour to draw the border around the raster.

Transparent blend real box 1

blend (transparency) to apply to the rasters. The value is between 0 and 1 and 1 means it is fully opaque (i.e. no transparency).

Vector and Text

Settings to use for vectors (line work) and text.

Colour black to white tick box

if ticked, black colour are changed to white. Useful when using a black background for a view.

Bezier curve pieces number box 32

if there are Bezier curves in the vectors, then they are broken into this many linear segments.

Fill blend factor real box 1

extra Blend (transparency) to apply to polygon fills. The value is between 0 and 1 and 1 means it is fully opaque (i.e. no transparency).

Text size factor real box 0.7261

the text size in pdf is different to traditional 12d text sizing (pdf size includes descenders). This factor is applied to any text to correct for the difference is size definitions.

Button at bottom

Create button

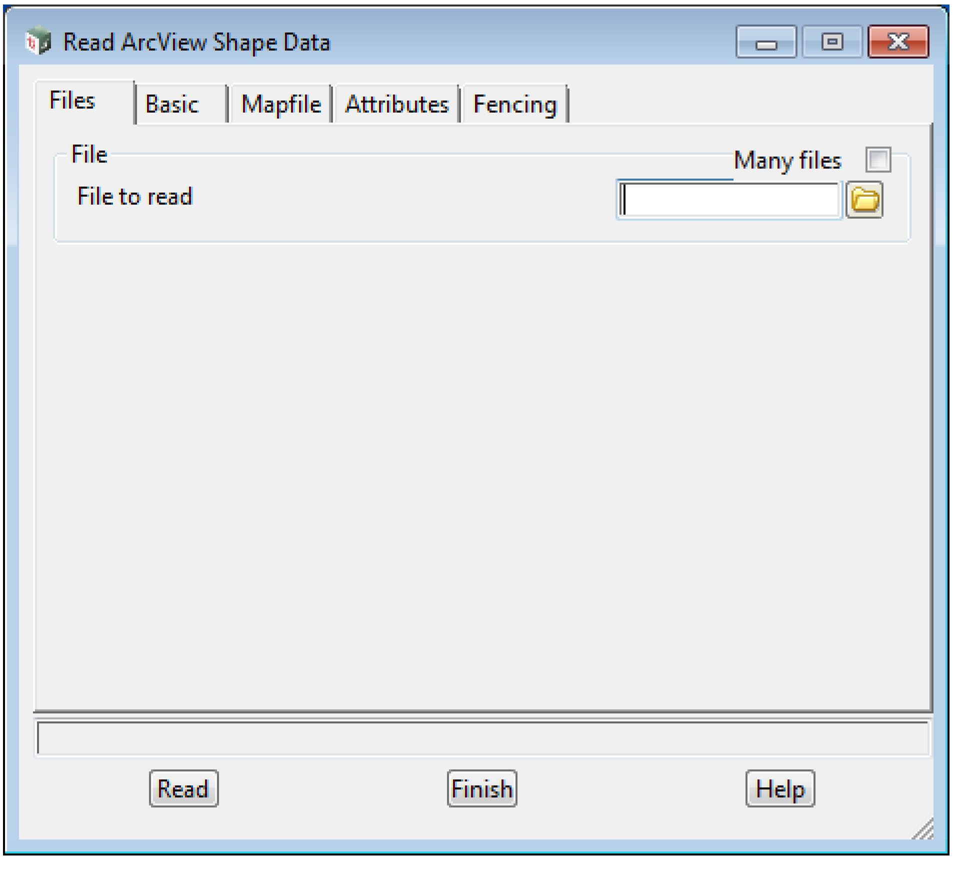
import the 2d PDF file into the appropriate model.

8.1.4 ArcView SHP Input

Position of option on menu: **File I/O =>Data input =>ArcView SHP**

Option to read in ArcView shaped files.

Selecting **ArcView SHP** brings up the **Read ArcView Shape Data** panel.



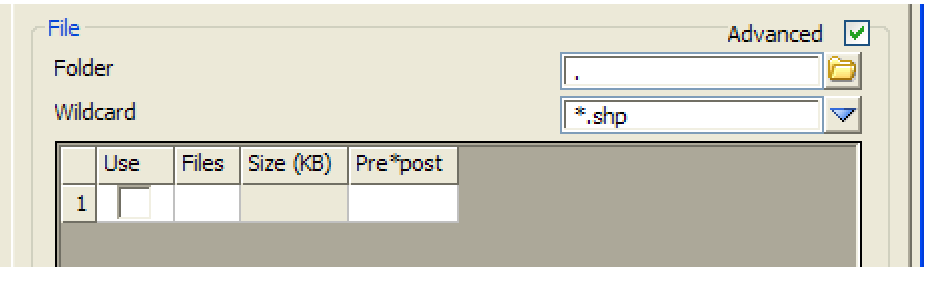
The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Files tab

Advanced tick box

*if **ticked**, a grid to allow multiple ArcView shape files to be read in, is opened. A wild card is used to select all the files to be read in.*



Folder folder box

folder to search for files using the **Wild card**

Wildcard input

wild card to use in search for files in the given folder

Use tick box

*if **ticked**, read in the file*

Files output

name of the file in the folder

Size output

file size

Pre*post text input

*if **non blank**, pre*post text to use for the models in this Arcview shp file (see* 4.19.2 Pre*Postfix in Panel Fields*) for information on using pre*postfix.*

*If **blank**, use the pre*post text from the* **Pre*postfix for models** *panel field.*

***Note** - if a non-blank value for **Pre*post is** given in the column for a file then the **Pre*postfix for models** is ignored.*

File to read file box *.shp files

name of the ArcView shape file. **12d Model** *then reads this and the two (2) other files that go with the shape file. The two other file extensions are *.shx and *.dbf.*

If no attribute is mapped to model, then the file name (minus the .shp) is used as the model for the data.

Map file tab

Map file file box *.mf and *.mapfile files

*if **non-blank**, the name of the 12d map file to be used for all strings read in.*

*If **blank**, no map file is used*

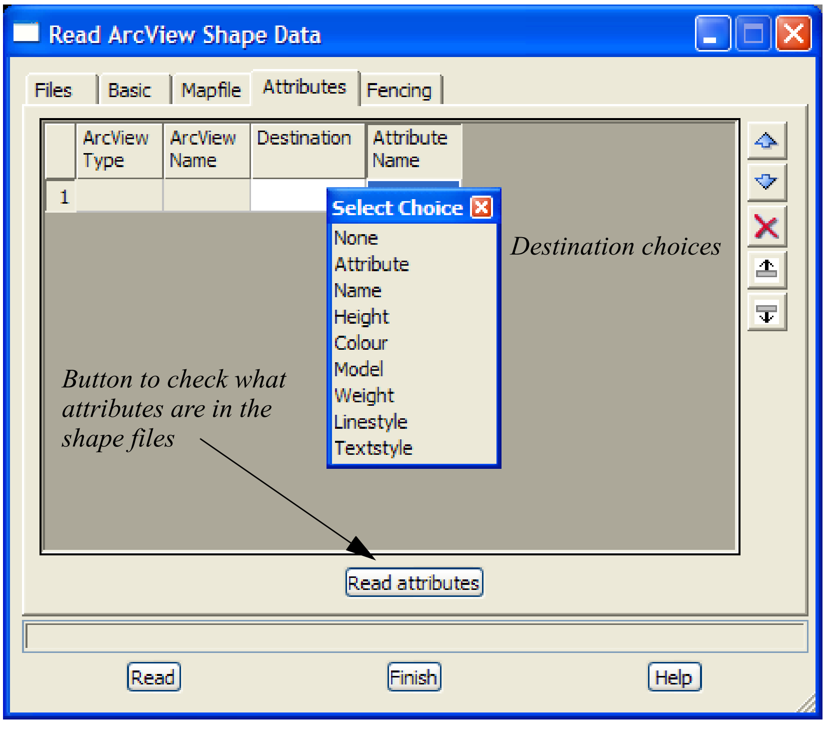
When using a map file, the string name is used as the entity-name for matching with the keys in the map file. See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Pre*postfix for models pre*postfix box

if non-blank, a prefix and a postfix to be applied to the model names used in the Map File.

Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

Attributes tab



Read attributes button

Click to check what attributes are present in the ArcView shape files and any ArcView attributes found are listed in the **ArcView Type** *and* **ArcView Name** *columns in the grid.*

Destination Grid column

type of 12d attribute to map the Arcview attribute to:

none - don't use the attribute - the attribute is ignored
attribute - use as 12d attribute
name - use as 12d string name
height - use as 12d vertex height

colour - use as 12d string colour

model - use as model name

weight - use as string weight

linestyle - use as 12d linestyle

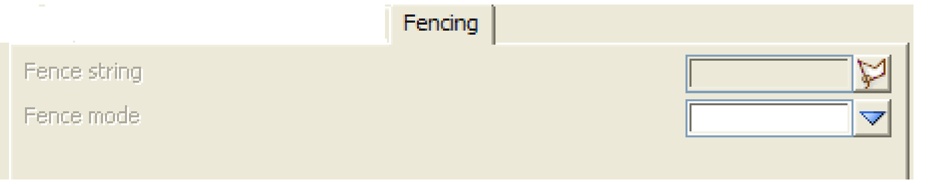
textstyle - use as 12d textstyle

***Note** - if no ArcView attribute is mapped to Model, then the file name (minus the .shp) is used as the model for the data.*

Attribute name Grid column

if non blank and the ArcView attribute is being sent to a 12d attribute, then this is the s12d attribute name

Fencing tab



Fence string polygon box

string to use to restrict the data being read in.

Fence mode choice box

String inside
String inside/crossing
String outside
String outside/crossing
String crossing

String inside - read string in if it is totally inside the polygon

String inside/crossing - read string in if it is totally inside, or crossing the polygon

String outside - read string in if it is totally outside the polygon

String outside/crossing - read string in if it is totally outside, or crossing the polygon

String crossing - string in if it is crossing the polygon

***Note** - only whole strings are read in.*

Read button

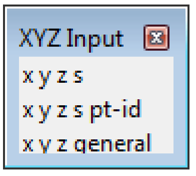
read the data in.

8.1.5 Input X Y Z Text Files

Position of menu: **File I/O =>Data input =>x y z**

The options under **x y z** read in vertices of strings from a text format. It is also possible to read in string names, point id's, string, segment and vertex attributes.

The **X Y Z** walk-right menu is



read in x y z s data
user specified x y z s point id
user specified x y z s point no and attribute

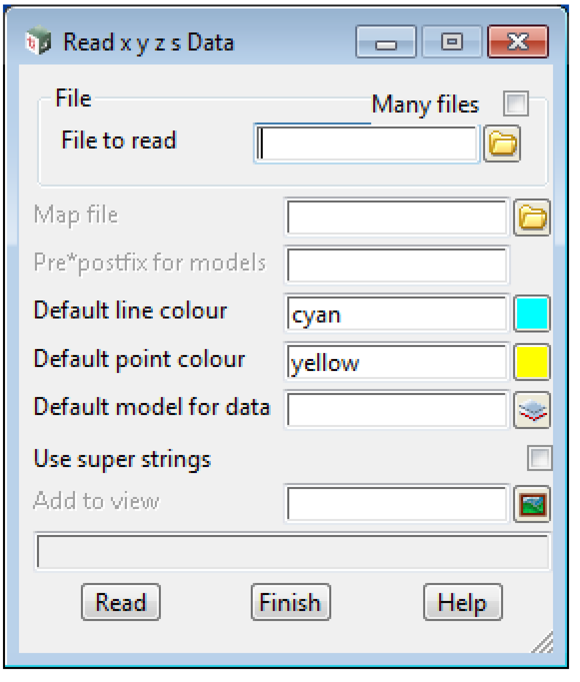
For *x y z s*, go to 8.1.5.1 X Y Z S Input
x y z pt_id 8.1.5.2 X Y Z S Point Id File Format
x y z general 8.1.5.3 X Y Z and Attributes User Format Input

8.1.5.1 X Y Z S Input

Position of option on menu: **File I/O =>Data input =>x y z s**

The x-y-z-s option reads in the xyzs format which is designed so that point and line strings can be quickly and easily coded and entered into 12d Model. It is **not** intended for more complex strings such as alignments and text where the 12d Model 12da format is more suitable. See 8.1.5.1.1 Input X Y Z S File Format)

Selecting **xyzs** brings up the **Read xyzs Data** panel.

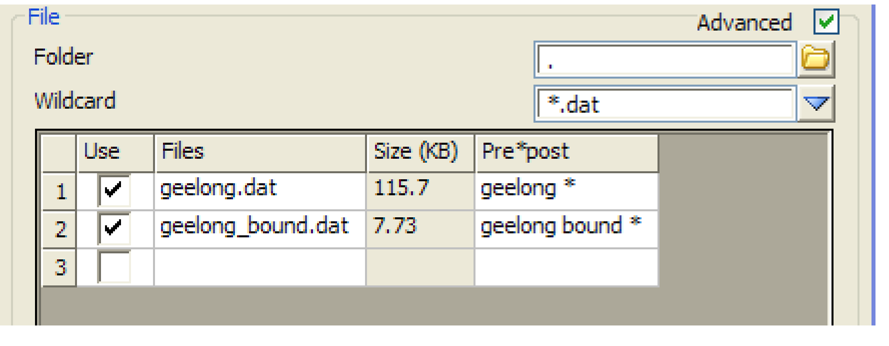


The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Many files tick box

*if **ticked**, a grid to allow multiple files to be read in, is opened. A wild card is used to select all the files to be read in.*



Folder folder box

folder to search for files using the **Wild card**

Wildcard input

wild card to use in search for files in the given folder

Use tick box

*if **ticked**, read in the file*

Files output

name of the file in the folder

Size output

file size

Pre*post text input

*if **non blank**, pre*post text to use for the models in this xyzs file (see* 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

*If **blank**, use the pre*post text from the* **Pre*postfix for models** *panel field.*

***Note** - if a non-blank value for **Pre*post is** given in the column for a file then the **Pre*postfix for models** is ignored.*

File file box *.dat files

name of the data file to be read in

Map file map file box *.mf files

*if **non-blank**, the name of the 12d map file to be used for all strings read in.*

*If **blank**, no map file is used*

When using a map file, the string name is used as the entity-name for matching with the keys in the map file. See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Pre*postfix for models pre*postfix box

if non-blank, a prefix and a postfix to be applied to the model names used in the Map File.

Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix*

Default line colour colour box default colour available colours

colour used for line-strings (if no colour is defined in the file)

Default point colour colour box default pt colour available colours

colour used for the crosses in point-strings (if no colour is defined in the file)

Default model for data model box available models

name of the model that the data is to be placed in. The model will be created if it does not already exist. This field must be filled in.

Use super strings tick box

*if **ticked**, super strings will be created.*

If not ticked, 3d strings will be created.

Add to view view box available views

if non blank, the default model will be automatically added to the given view

Read button

read the data into the model given in the model field.

8.1.5.1.1 Input X Y Z S File Format

The x-y-z-s format is designed so that point and line strings can be quickly and easily coded and entered into 12d Model. It is **not** intended for more complex strings such as alignments and text where the 12d Model 12da format is more suitable.

For the x-y-z format, **point** data is set out with one point of x y z data per line. The three values are separated by one or more spaces (free format). For example

990 3 10

112 1001 23.5

A point-string is represented in 12d Model with a cross at each point. The colour of the cross can be defined by including a POINT_COLOUR command on the line before the point-string begins.

For example, a two point point-string with red crosses would be coded as

POINT_COLOUR red

100.3 990.3 10

112 1001 23.5

Line string data is also set out with one point per line (in the order that the points occur in the string) but with a string label included at the end of each line. The string label is repeated for each point in the string. The line string terminates when the string label changes to another name for a new line string or is blank for a point string.

A line-string is drawn with a line connecting a point to its neighbouring points in the string (the string links). The colour of the links of the string can be set using the LINE_COLOUR command.

For example, a green, three point line-string called S1 becomes

LINE_COLOUR green

100.3 990.3 10 S1

112 1001 23.5 S1

119.3 1203.1 29.4 S1

Notes

(a) The name of the line string can include spaces but in that case the name must be enclosed in quotes **"**. For example, the string name may be "toe 1".

(b) If a string of a certain name is created and the string name reoccurs in the file, then a new string with the same name is created. It is not joined to the earlier string.

xyz Map File

See the section 8.8.1 Create/Edit a Map File for information about ***12d Map Files***.

The **name** of the xyzs string is used as the entity-name to be used for matching with a map file. The map file can be used to override the breakline type of line-strings in the x-y-z file.

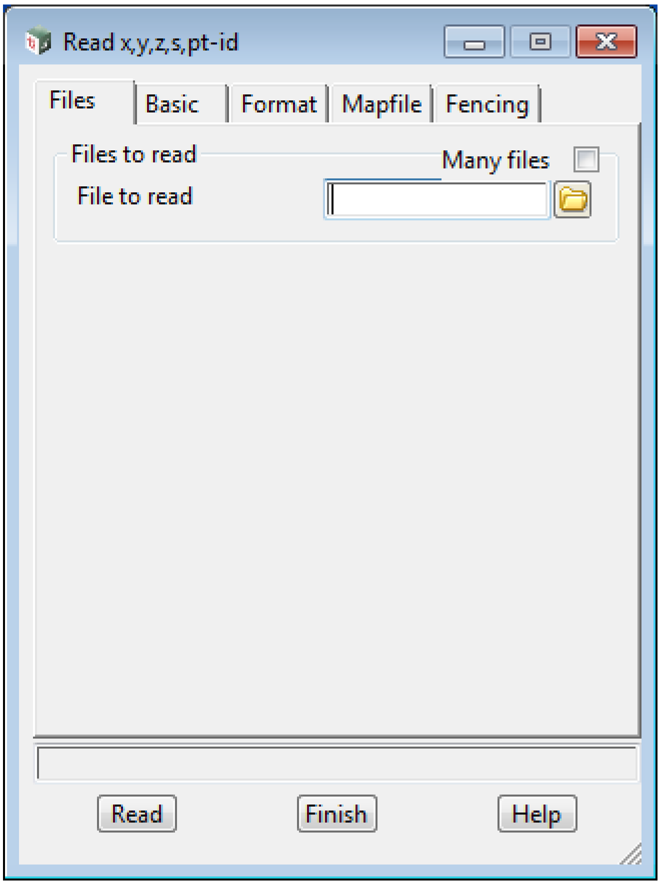
8.1.5.2 X Y Z S Point Id File Format

Position of option on menu: **File I/O =>Data input =>x y z s pt_no**

On selecting the **read x,yzs,pt_no** option, the **read xyzs pt no** panel is displayed.

This option reads data in one line at a time with the values separated by a delimiter (tab, space, semi-colon or comma) or the data on each line can be in fixed width columns.

In either case, the user specifies the order that the x, y, z, s and point number are in and if desired, only an x and y value needs to be read in.



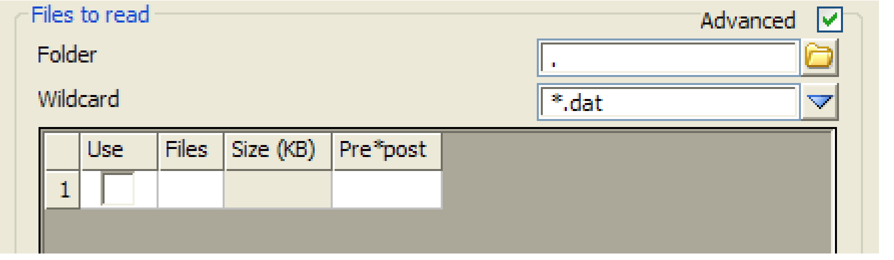
The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Files tab

Advanced tick box

*if **ticked**, a grid to allow multiple files to be read in, is opened. A wild card is used to select all the files to be read in.*



Folder folder box

folder to search for files using the **Wild card**

Wildcard input

wild card to use in search for files in the given folder

Use tick box

*if **ticked**, read in the file*

Files output

name of the file in the folder

Size output

file size

Pre*post text input

*if **non blank**, pre*post text to use for the models in this file (see* 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

*If **blank**, use the pre*post text from the* **Pre*postfix for models** *panel field.*

***Note** - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.*

File to read input *.dat files

name of the data file to be read in

Basic tab

Default line colour colour box default colour available colours

colour used for line-strings (if no colour is defined in the file)

Default point colour colour box default pt colour available colours

colour used for the crosses in point-strings (if no colour is defined in the file)

Default text style input available textdatas

textdata for the point ids

Skip column headers tick box

if ticked, the first line of the file is skipped.

Join all tick box

*if **ticked**, all vertices with the same string names are joined together regardless of where they are in the file. The order of the vertices is the order they occur in the file.*

*If **not ticked** then any time a string name changes in the file, a new string is created. So if the same string name occurs but separated by a different string name, then more than one string of that same name will be created. The order of the vertices is the order they occur in the file.*

Default model for data model box available models

name of the model that the data is to be placed in. The model will be created if it does not already exist. This field must be filled in.

Add to view view box available views

if non blank, the default model will be automatically added to the given views

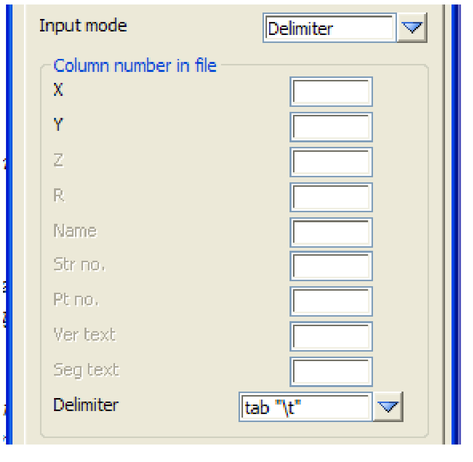
Format tab

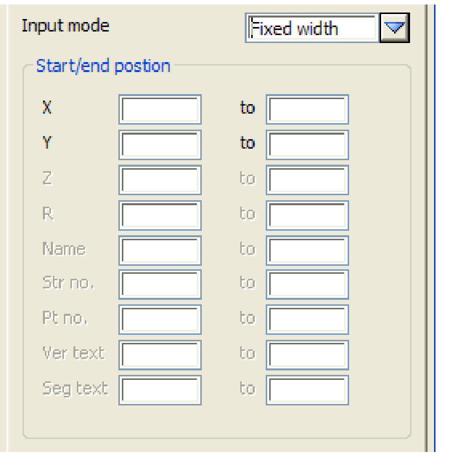
Input mode choice box delimiter delimiter, fixed width

*if **delimiter**, the type of delimiter and the columns for the x, y and optionally z, name and point number are given.*

Delimiter choice box tab \f one space, tab \t,
semi colon, comma
many spaces

*if **fixed width**, the start and end positions are given for x, y and optionally z, name and point number.*





Mapfile tab

Map file file box *.mf files

*if **non-blank**, the name of the 12d map file to be used for all strings read in, including any files given with the **Advanced** mode ticked on.*

*If **blank**, no map file is used*

When using a map file, the string name is used as the entity-name for matching with the keys in the map file. See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

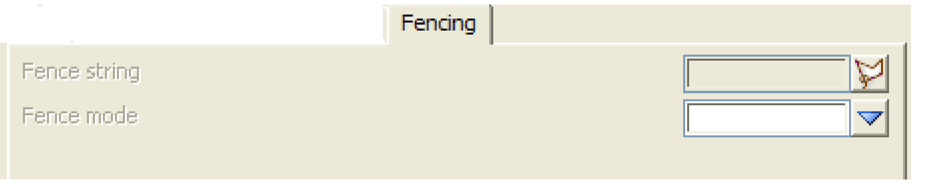
Pre*postfix for models pre*postfix box

if non-blank, a prefix and a postfix to be applied to the model names used in the Map File.

Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

***Note** - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.*

Fencing tab



Fence string polygon box

string to use to restrict the data being read in.

Fence mode choice box String inside
String inside/crossing
String outside
String outside/crossing
String crossing

String inside - read string in if it is totally inside the polygon

String inside/crossing - read string in if it is totally inside, or crossing the polygon

String outside - read string in if it is totally outside the polygon

String outside/crossing - read string in if it is totally outside, or crossing the polygon

String crossing - string in if it is crossing the polygon

***Note** - only whole strings are read in.*

Read button

read the data into the model given in the model field.

8.1.5.3 X Y Z and Attributes User Format Input

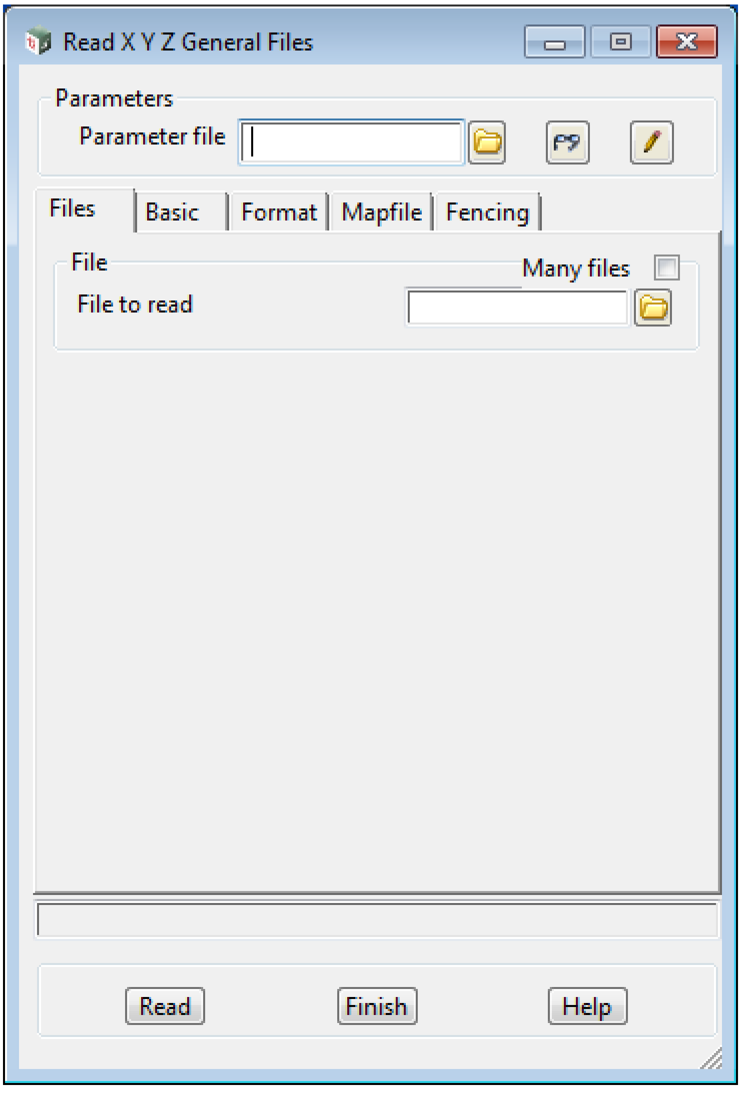
Position of option on menu: **File I/O =>Data input =>x y z general**

On selecting the **read x,y,z general** option, the **Read x y z s General Files** panel is displayed.

This option reads data in one line at a time with the values separated by a delimiter (tab, space, semi-colon or comma) or the data on each line can be in fixed width columns.

In either case, the user specifies the order that the x, y, z, string name, point number and attributes appear in the file. If desired, only an x and y value needs to be read in.

The set-ups for defining all the positions of all the data in the file can be written out to a file (.xyf) for re-use.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Parameters section

Parameter file input *.xyf files

name of the file containing the settings for how the data is positioned in the input file.

Read icon button

read the parameter file in.

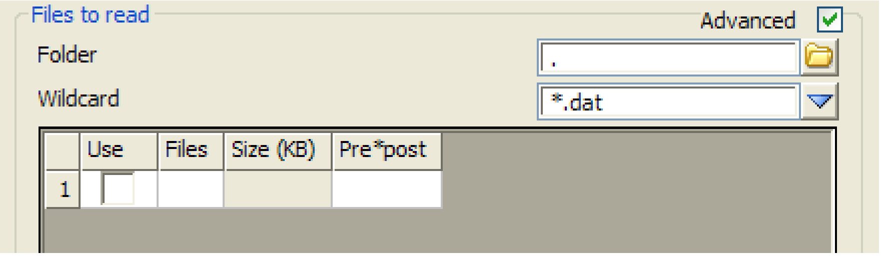
Write icon button

write the setting in the panel out to a parameter file.

Files tab

Advanced tick box

*if **ticked**, a grid to allow multiple files to be read in, is opened. A wild card is used to select all the files to be read in.*



Folder folder box

folder to search for files using the **Wild card**

Wildcard input

wild card to use in search for files in the given folder

Use tick box

*if **ticked**, read in the file*

Files output

name of the file in the folder

Size output

file size

Pre*post text input

*if **non blank**, pre*post text to use for the models in this file (see* 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

*If **blank**, use the pre*post text from the* **Pre*postfix for models** *panel field.*

***Note** - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.*

File to read input *.dat files

name of the data file to be read in

Basic tab

Default line colour colour box default colour available colours

colour used for line-strings (if no colour is defined in the file)

Default point colour colour box default pt colour available colours

colour used for the crosses in point-strings (if no colour is defined in the file)

Default text style input available textdatas

textdata for the point ids

Skip column headers tick box

if ticked, the first line of the file is skipped.

Join all tick box

*if **ticked**, all vertices with the same string names are joined together regardless of where they are in the file. The order of the vertices is the order they occur in the file.*

*If **not ticked** then any time a string name changes in the file, a new string is created. So if the same string name occurs but separated by a different string name, then more than one string of that same name will be created. The order of the vertices is the order they occur in the file.*

Default model for data model box available models

name of the model that the data is to be placed in. The model will be created if it does not already exist. This field must be filled in.

Add to view view box available views

if non blank, the default model will be automatically added to the given views

Format tab

Input mode choice box delimiter delimiter, fixed width

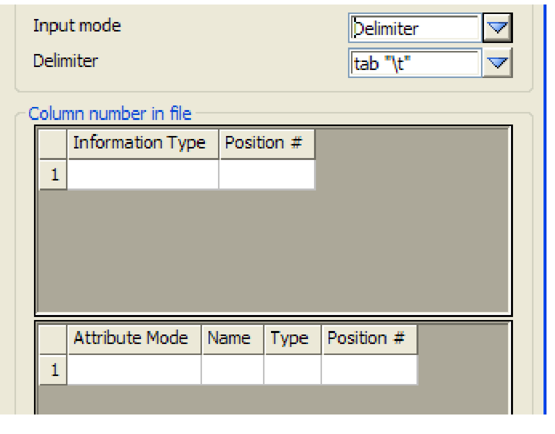
*if **delimiter**, the type of delimiter and the columns for the x, y and optionally z, name and point number are given.*

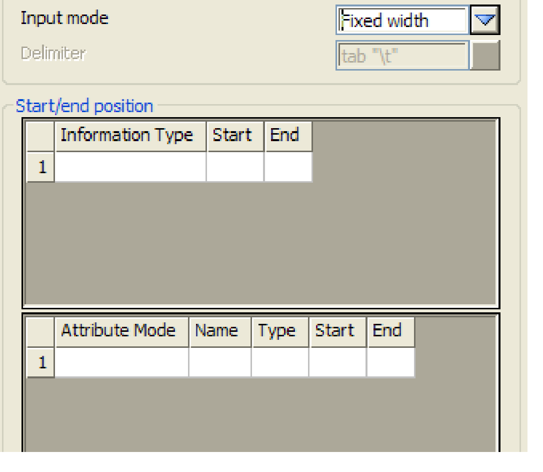
Delimiter choice box tab \f one space, tab \t,
semi colon, comma
many spaces

*if **fixed width**, the start and end column positions are given for x, y and optionally z, name and point number.*

Column number/Start end position section

information to read in (x,y,z, attributes etc.) and its position in the input file.





Mapfile tab

Map file file box *.mf files

*if **non-blank**, the name of the 12d map file to be used for all strings read in, including any files given with the **Advanced** mode ticked on.*

*If **blank**, no map file is used*

When using a map file, the string name is used as the entity-name for matching with the keys in the map file. See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

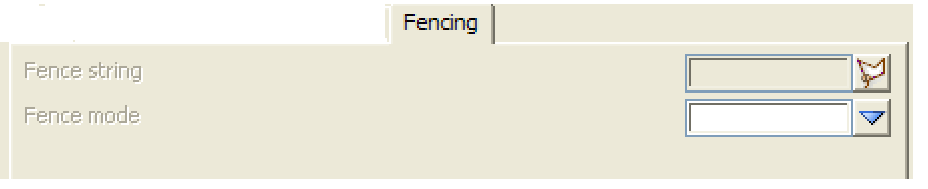
Pre*postfix for models pre*postfix box

if non-blank, a prefix and a postfix to be applied to the model names used in the Map File.

Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

Note *- if a non-blank value for* ***Pre*post*** *is given in the column for a file then the* ***Pre*postfix for models*** *is ignored.*

Fencing tab



Fence string polygon box

string to use to restrict the data being read in.

Fence mode choice box

String inside
String inside/crossing
String outside
String outside/crossing
String crossing

String inside - read string in if it is totally inside the polygon

String inside/crossing - read string in if it is totally inside, or crossing the polygon

String outside - read string in if it is totally outside the polygon

String outside/crossing - read string in if it is totally outside, or crossing the polygon

String crossing - string in if it is crossing the polygon

Note *- only whole strings are read in.*

Read button

read in the data

8.1.6 BCC Epson Input

Position of option on menu: **File I/O =>Data input =>BCC Epson**

The **BCC Epson** input option is designed to read in files in the BCC (Brisbane City Council) Epson format.

The BCC Epson format is point based with unique point numbers for each point. It also has the concept of **non-tinable** points. Since the super string supports vertex tinability, it is the best string type to use for storing data coming in BCC Epson format. Also the BCC Epson point ids are stored as the point ids of the super string vertices.

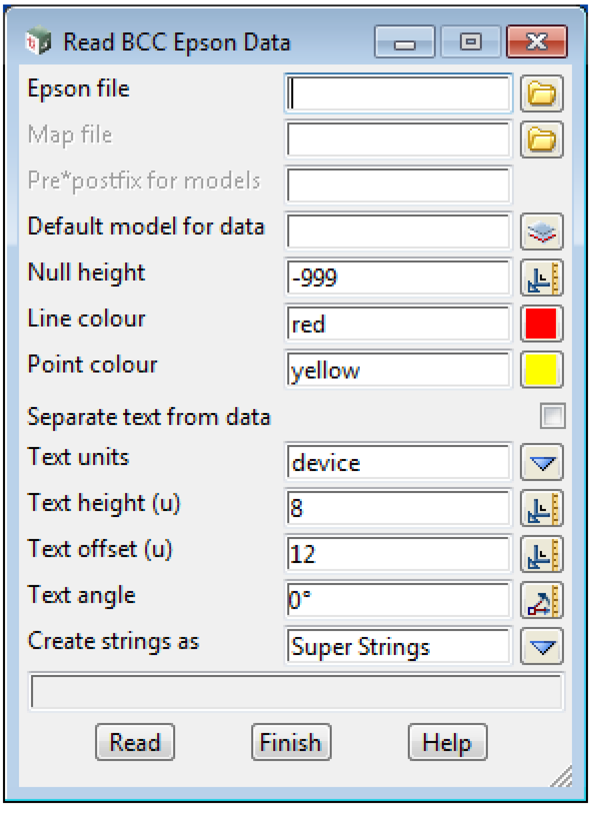
BCC Epson breaks its data up by a feature code and a 12d Model map file can be used to define models, colours, linestyles *etc*. where the BCC **feature code** as the entity-name (key) in the map file.

The best way to read in BCC Epson data is to have a map file which maps BCC Epson feature codes into strings with the same name as the feature code, and also places the strings into sensible models.

See the section 8.8.1 Create/Edit a Map File for information about 12d map files used in this option.

Note:
All text after column 68 in the BCC Epson file is considered to be a note.

On selecting the **BCC Epson** option, the **Read BCC Epson Data** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Epson file	input		.dat and .sur files

name of the BCC Epson file to be read in.

Map file input *.mf files

if non-blank, the name of the map file to be used for all strings read in.

If blank, no map file is used.
The BCC Epson feature code is used as the entity-name to match against the key in the 12d map file.

See the section 8.8.1 Create/Edit a Map File *for information about 12d map files used in this option.*

Pre*postfix for models pre*postfix box

if non-blank, a prefix and a postfix to be applied to the model names used in the Map File.

Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

Default model for data input available models

name of the model that any unmapped data is placed in. The model will be created if it does not already exist. This field must be filled in.

Null height input -999

*if **non-blank,** any BCC Epson z values equalling this value are taken as null values.*

Line colour input red available colours

colour for BCC Epson string s.

Point colour input yellow available colours

colour for BCC Epson points that are not part of strings.

Separate text from data tick box

if not ticked, text is used in 4d or super stings
if ticked, separate text strings are created.

Text units input pixels pixels, world

units for the height of the text label.

Text height (u) input

height of the text (in text units).

Text offset (u) input

distance (in text units) to offset the text from its (x,y) placement position.

Text angle input

angle of the text.

Create strings as input Super Strings 3d, 4d, Polyline, Super

type of strings to create.

Read button

read the data in.

8.1.7 CivilCad Input

CivilCad input is a separate chargeable module.

Position of option on menu: **File I/O =>Data input =>Civilcad**

The **civilcad** input option is designed to read in CivilCad Version 4, 5 and some 6 text files.

CivilCad breaks its data up by a layer name only. By default, CivilCad layers are mapped into 12d Model models.

CivilCad has no strings but only points, lines, arcs and circles. CivilCAD spirals are ignored. When reading in CivilCad data, ***12d Model*** will try to head to tail consecutive lines from the same layer to create strings.

The CivilCad format is point based with unique point ids for each point. It also has the concept of **non-contourable** or **non-tinable** points.

Since the super string supports point tinability, it is the best string type to use for storing data coming in CivilCad format. CivilCad point ids are stored as the point numbers of the super string vertices.

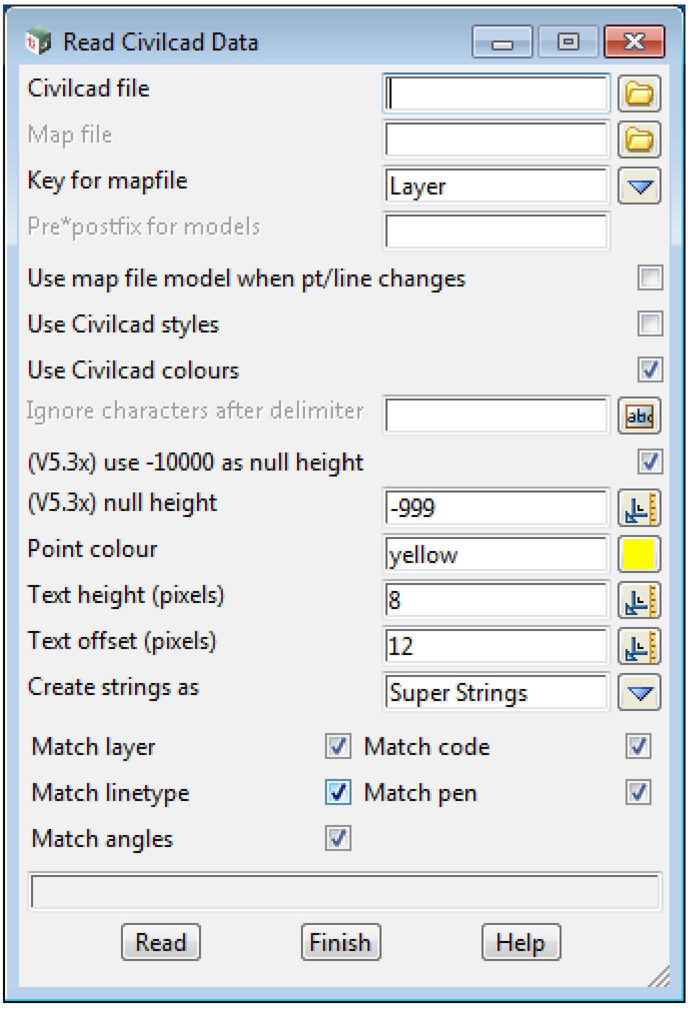
In CivilCad, a layer is defined to contain only breaklines or non-breaklines. In 12d Model, this simply corresponds to strings having a line or point *breakline* type.

If a **map** file is used when reading CivilCad data, either the CivilCad **layer** name, entity code, layer/code or code/layer can be used as the entity-name to match against the **key**.

See the section 8.8.1 Create/Edit a Map File for information about 12d map files.

Warning - CivilCad has a null value of -10,000 - these values may need to be nulled in 12d Model after the CivilCad data is read in.

On selecting **CivilCAD**, the **Read Civilcad Data** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Civilcad file	file box		*.asc and *.as5 files

name of the Civilcad text file to be read in.

Map file	map file box		*.mf files

if non-blank, the name of the map file to be used for all strings read in

If blank, no map file is used.
The **Key for map file** *defines what is used to match against the key in the map file.*

See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Key for map file	choice box	Layer	Code, Layer, Code/Layer, Layer/Code

if Layer, the Civilcad layer is used as the entity-name to match against the key in the map file.
if Code, the Civilcad layer is code as the entity-name to match against the key in the map file.

Pre*postfix for models	pre*postfix box		

if non-blank, a prefix and a postfix to be applied to the model names used in the Map File.

Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

Use CivilCad styles	tick box		

*if **ticked,** then the CivilCad linestyle number is used as the 12d Model linestyle name.*

Use CivilCad colours tick box

*if **ticked,** then the CivilCad colour number is used as the 12d Model colour number.*

Ignore characters after delimiter tick box

*if **ticked,** r.*

(V5.3x) use -10000 as null height tick box tick

*if **ticked,** any CivilCad z values of -10,000 are taken as null values.*

(V5.3x) null height input -999

the value in the CivilCAD file to use as null height if User -10000 is not ticked.

Point colours colour box yellow available colours

colour for CivilCad points that are not part of strings.

Text height (pixels) input 8

the height in pixels of any text created, or for point numbers.

Text offset (pix) input 12

the offset (in pixels) from the (x,y) coordinate position for any text or point numbers.

Create strings as input Super Strings Lines and Arcs
3d Strings and Arcs,
Polyline Strings
Super Strings

type of strings to create.

Match flags tick box

CivilCad data consists of individual lines and arcs. When reading CivilCad data, it undergoes head to tail processing and the match flags specify what CivilCad data can be joined.

Match layer/code/linetype/angles/pen tick box

*if **ticked,** then any CivilCad lines and arcs must have the same layer/code/linetype/angle/pen before they can be joined in the head to tail process.*

Read button

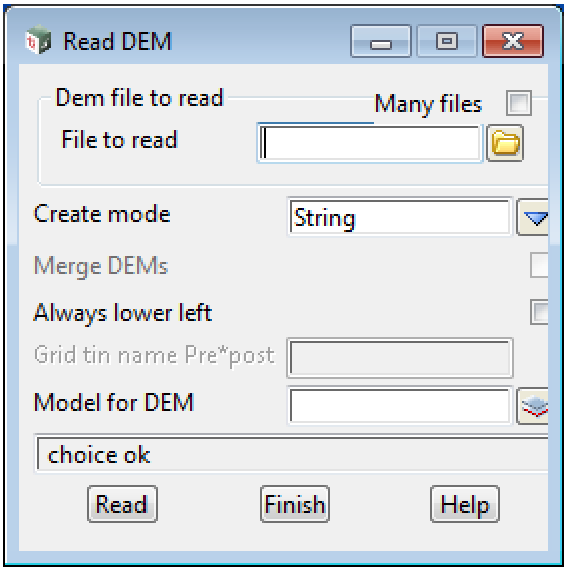
read the data in.

8.1.8 DEM Input

Position of option on menu: **File I/O =>Data input =>DEM**

The **DEM** option is designed to read in Digital Elevation Model data in the Arc/Info format.

On selecting **DEM**, the **Read DEM** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format	choice box	Arc/Info ASCII	Arc/Info ASCII Grid *.dem

format of the DEM to read in.

Dem file to read	file box		

name of the DEM file to be read in.

File to read

Create mode	choice box	String	String, Grid string, Grid tin

see 14.10 Grids *for an explanation of* **Grid string** *and* **Grid tin**

Single grid	tick box	not ticked	

if ticked, all points from all selected files are used in the creation of a single grid.

Grid tin name Pre*post

Model for DEM	model box		available models

model to put the DEM data in.

Read	button		

read the data in.

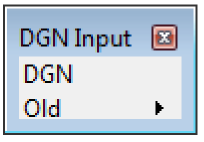
8.1.9 Input DGN Binary Files

Position of menu: **File I/O =>Data input =>DGN**

DGN input and output is a separate chargeable module.

The options under **DGN** read DGN V7 and DGN V8 binary files.

The **DGN** walk-right menu is



read DGN V8 binary file
read DGN V7 binary file

For *DGN V8*, go to 8.1.9.1 Input DGN V8

DGN V7 8.1.9.2 DGN V7 Binary Input

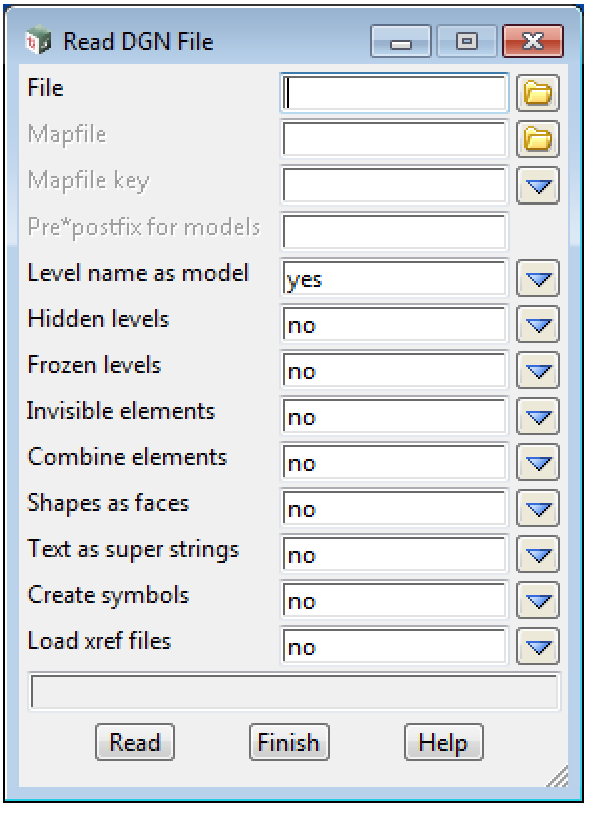
8.1.9.1 Input DGN V8

Position of option on menu: **File I/O =>Data input =>DGN =>DGN V8**

NOTE: the format for DGN V8 has been changed and has not been published. There is a beta version of the DGN reader to try and read DGNV8. At this stage it is probably better to use DWG I/O to go in and out of Microstation V8.

Note: this option is under development, and its documentation is a work in progress.

Selecting **DGN V8** brings up the **Read DGN File** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File	input		*.dgn files

name of the DGN V8 binary file to be read in

Read	button		

read the data in.

8.1.9.2 DGN V7 Binary Input

DGN binary input is a separate chargeable module.

Position of option on menu: **File I/O =>Data input =>DGN =>DGN V7**

The **DGN** input option is designed to read in Intergraph and Microstation binary models (**.dgn** files) up to V7. Microstation V8 has a new undocumented format which is read in with the DGN V8 options (.

Because of the limited number of levels available in an DGN file, the colour, linestyle and weight of items are often used to differentiate data types. For special files for VicRoads, there is also an DGN attribute which can be used to tag data.

Hence the entity-name used for matching in a map file when reading DGN files into 12d Model can be either the:

- DGN **level**
- VicRoads **attribute**
- DGN level, colour, linestyle, weight
- VicRoads attribute, colour, linestyle, weight

In the DGN map file, the four level key is given as a single key made up of the four items separated by **|** (with no additional spaces) in the order:

level or VicRoads attribute | colour | line style | weight

For example, the key

30|2|0|0 means level 30, colour 2, style 0 and weight 0

A ***** can be used for any of the four items to indicate that no match is required for that item.

30|*|0|* means level 30, any colour, style 0, any weight

If a map file is not used, the DGN data is read into a ***12d Model*** string of the same **name** as the DGN level and the DGN colour numbers are mapped to ***12d Model*** colours. All the strings created go to the **Default model for data** specified in the *Read DGN Data* panel.

See the section 8.8.1 Create/Edit a Map File for information about 12d map files.

Text for Points in DGN

A further complication with DGN is that many Microstation users record individual points as a text entity with a character from a possibly user defined DGN font to represent a symbol at the point. The text then often has a justification other than left-bottom.

However, Microstation does not record the (x,y) coordinates of the justification point but only the left-bottom position to draw the symbol at. The actual (x,y) point needs to be calculated from the text justification and the actual symbol size.

Unfortunately this requires a knowledge of the DGN font symbol being used to calculate the true (x,y) position for the text justification point.

To help read in text as points so that they may be included in processes such as triangulation, in the DGN reader, it is possible to create 4d strings (which consist of an (x,y,z) point plus a piece of text) instead of a text string.

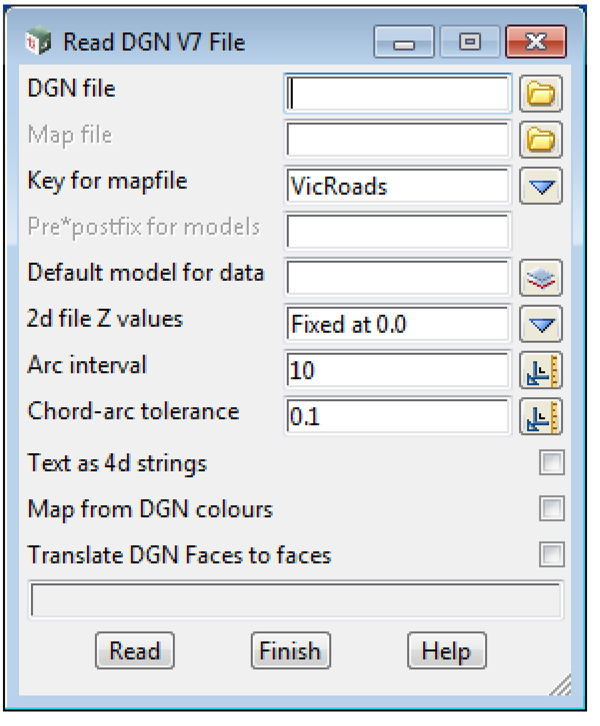
Warning

Because of the problem with needing to know the DGN font information to correctly calculate the (x,y) coordinate of the text, creating a 4d string instead of text will not fix the error in the (x,y) coordinates if an incorrect font is used in 12d Model.

The only safe solution is to avoid data in DGN format if the points are being represented by text.

NOTE: the format for DGN V8 has been changed and has not been published. There is a beta version of the DGN reader to try and read DGNV8. At this stage it is probably better to use DWG I/O to go in and out of Microstation V8.

On selecting the **DGNV7** option, the **Read DGN V7 File** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

DGN file input *.dgn files

name of the DGN binary file to be read in

Map file input *.mf files

if non-blank, the name of the map file to be used for all strings read in.

*If blank, no map file is used.The DGN level is used as the string name and all strings go to the **Default model for data**.*

See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Key for mapfile input VicRoads level, VicRoads, level/colour/linestyle/weight Vicroads/colour/linestyle/weight

specifies how the key from the mapfile is interpreted.

Pre*postfix for models pre*postfix box

if non-blank, a prefix and a postfix to be applied to the model names used in the Map File.

Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

Default model for data input available models *model to use for strings not mentioned in the map file or if no map file is used.*

2d file Z values	input	Fixed at 0.0	fixed at 0.0, contour Z low, contour Z high element Z low, element Z high

z value to use for 2d .dgn file

Arc interval	input	10

interval to use to break 3d circles into segments.

***Note** - a 3d circle in DGN is a circle in an included plane. This is not the same as a circle in civil work which is a circle in **plan view**. A 3d circle in an included plane does not project onto a circle in a plan view except in the special case when the inclined plane in parallel to the x-y plane.*

Chord-arc tolerance	input	0.1

chord to arc tolerance to use when breaking 3d circles into segments.

Text as 4d strings tick box

*if **ticked**, text is read in as a 4d string (an (x,y,z) coordinate plus a piece of text)*

Map from DGN Colours tick box

*if **not ticked**, DGN colour number n is mapped to* **12d Model** *colour n.*
*if **ticked**, some of the DGN colours are attempted to be mapped to* **12d Model** *colours.*

Translate DGN faces to faces tick box

*if **ticked**, DGN faces are read in as* **12d Model** *face strings.*

Read button

read the data in.

8.1.10 DWG/DXF Input

DWG/DXF input is a separate chargeable option

Position of option on menu: **File I/O =>Data input =>DWG/DXF/DX8**

The **DWG/DXF** input option is designed to read most Autocad DWG and DXF files.

Each DWG/DXF item has an associated layer. By default, 12d Model creates models of the same name as the layers (or with an additional user supplied prefix) and the DWG/DXF items placed in them.

However, this can be over written using a standard **12d map file** where the key is matched against Autocad **layers** rather than string names.

See the section 8.8.1 Create/Edit a Map File for information about 12d map files.

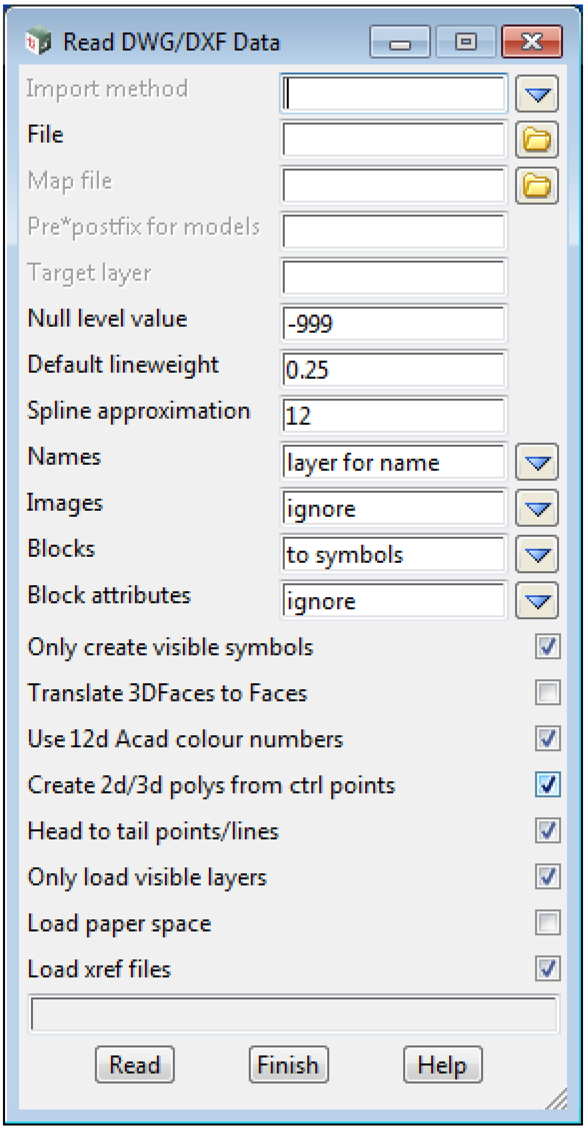
Autocad blocks are recognised and either a point with the block name is created or the blocks are expanded into their components, each time they are referenced in the DWG/DXF file.

Bulges in polylines can only be interpreted correctly when the polyline has a constant z-value. For this case, a 12d Model polyline string is created from the DXF polyline.

A Polyface Mesh in the DWG/DXF file is read in as a Trimesh.

Finally, DWG/DXF POINT entities of the same layer and colour can be concatenated into one point string as they are read in.

Selecting **DWG/DXF/DX8** displays the **Read DWG/DXF Data** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format	choice box	DWG	DWG, DXF

type of Autocad file to read in

File	file box		*.dwg or *.dxf files

name of the DWG or DXF file to read in

Map file	map file box		*.mf, *.mapfile files

if non-blank, the name of the map file to be used for all DWG/DXF layers read in. The DWG/DXF layer is the entity-name for matching against the key in the map file.
If blank, no map file is used.

See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Pre*postfix for models	pre*postfix box		

if non-blank, a prefix and a postfix to be applied to the model names used in the Map File.

Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

Target layer	input		

if non-blank, only autocad items in the layer with the name given in the **target layer** *field will be read in.*

Null level value input -999

z-value to treat as a null level

Default AutoCAD lineweight input 0.25

lineweight to use when it is undefined in an AutoCAD entity.

Spline approximation input 12

splines are broken into small segments

Names choice box layer for name no name, layer for name

*if **no name**, strings are not given a name.*

*If **layer for name**, strings are given the name of the AutoCAD layer they were on.*

Images choice box to plan images to plan images, to rasters, ignore

Blocks choice box to symbols to symbols, explode, to points

*if **to symbols**, blocks are read in as 12d Symbols of the same name.*

*If **explode**, blocks are read in and exploded into vertices and line work.*

*If **to points**, a 12d vertex is created at each block.*

Only create visible symbols tick box tick

Translate 3DFaces to faces tick box

*if **tick**, DWG/DXF faces are read in as* ***12d Model*** *face strings.*

User 12d ACAD colour numbers tick box

Create 2d/3d polys from ctrl points tick box

Head to tail points/lines tick tick

*if **ticked**,* DWG/DXF POINT entities of the same layer and colour are concatenated into one point string as they are read in and DWG/DXF LINE entities of the same layer and colour are

Only load visible layers tick tick

*if **ticked**, only* DWG/DXF visible layers are read in otherwise all layers are read in.

Load paper space tick no tick

*if **ticked**, paper space data will be read in.*

Load xref files tick no tick

*if **ticked**, an xref files in the DWG/DXF are also read in.*

Read button

read the data in.

8.1.11 FBX Input

Position of option on menu: **File I/O =>Data input =>FBX**

Position of option on menu: **Strings =>Trimesh =>Trimeshes from FBX file**

This option is documented in 14.3.4 Trimeshes from FBX File.

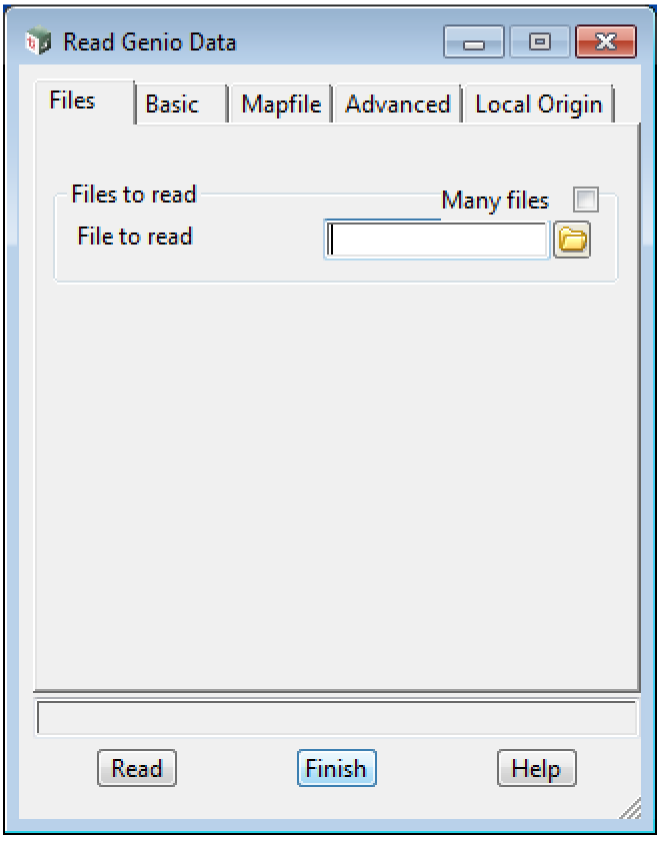
8.1.12 Genio Input

Position of option on menu: **File I/O =>Data input =>Genio**

The software package MX (formerly called Moss) includes a data file format called GENIO for use in transferring data between Moss and other programs (see the MX Manual for a partial description of genio). There is currently two default genio input formats - versions 6 and 7. 12d Model recognises both formats.

For information on the Genio file format support by 12d Model, please go to the section 8.1.12.1 Genio File Format

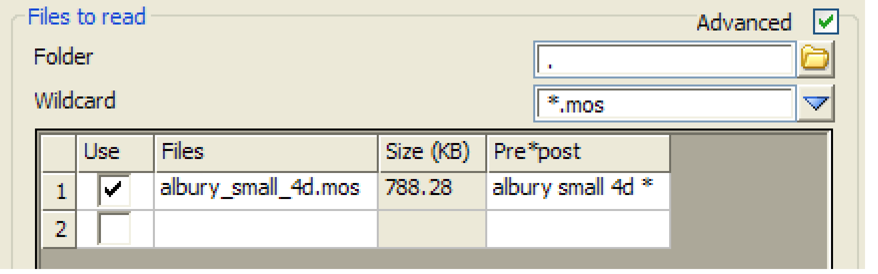
On selecting the **Genio** option, the **Read Genio Data** panel is displayed.



The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
Files tab			
Advanced	tick box		

*if **ticked**, a grid to allow multiple files to be read in, is opened. A wild card is used to select all the files to be read in.*



Folder folder box

folder to search for files using the **Wild card**

Wildcard input

wild card to use in search for files in the given folder

Use tick box

*if **ticked**, read in the file*

Files output

name of the file in the folder

Size output

file size

Pre*post text input

*if **non blank**, pre*post text to use for the models in this file (see* 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

*If **blank**, use the pre*post text from the* **Pre*postfix for models** *panel field.*

***Note** - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.*

File to read file box default *.mos files
This can be modified by the environment variable GENIO_WILDCARD_4D

name of the genio file to be read in

Basic tab

Transition type transition box clothoid transition pop-up

type of transition used in the genio file

Line colour colour box default colour available colours

colour used for line-strings

Point colour colour box default pt colour available colours

*colour used for the crosses in point-strings (genio string labels starting with **P**).*

Text style data for 4d strings

the text style data to use for the text in any 4d strings in the genio file

Text style data for text

the text style data to use for text strings in the genio file

Multiply text height by 10 **tick box**

if ticked, the text size is multiplied by 10

Mapfile tab

Map file file box *.mf files

*if non-blank, the name of the 12d map file to be used for all strings read in, including any files given with the **Advanced** mode ticked on.*

If blank, no map file is used

When using a map file, the string name is used as the entity-name for matching with the keys in the map file. See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Pre*postfix for models pre*postfix box

if non-blank, a prefix and a postfix to be applied to the model names used in the Map File.

Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

***Note** - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.*

Advanced tab

Compress 3d to 2d tick box tick

*if **ticked**, convert any 3d strings with constant z-value to 2d strings.*

Convert 6d to alignment tick box tick

*if **ticked**, convert any 6d strings to 12d Model alignment strings.*

Generate Point ID's tick box no tick

*if **ticked**,.*

Create control stations from SSTN tick box no tick

*if **ticked**, control stations are created in **12d Model** for each point in a genio string named SSTN*

Smigs file ? tick box no tick

*if **ticked**, try to interpret the genio file as a Smigs genio file.*

Use super strings tick box tick

*if **ticked**, all strings are read in as super string*

Use invisible segments for discontinuities tick box

*if **ticked**, MX strings with discontinuities are read in as super strings with invisible segments.*

*If **not ticked**, MX strings with discontinuities are broken into pieces when read in.*

G strings to super alignments tick box no tick

*if **ticked**, MX G strings are read in as 12d super alignments*

Debug G strings tick box no tick

because of the lack of documentation of the G string in MX, a G string may not be interpreted correctly.

*If **ticked**, a super string is created with the information from the MX G string to try and help interpret what the data was.*

Reverse calc super alignments tick box no tick

Better way of interpreting VG tick box tick

*if **ticked**, a different method for interpreting vertical geometry in a MX G strings is used.*

This may or may not be successful.

Local Origin tab

Local origin x y box x y selector

*if **non-blank**, the given coordinates are used as a local origin when reading in the data. That is, the* **local origin** *values are subtracted from each data point as it is read in.*

Read button

read in the genio data from the file given in the file field.

8.1.12.1 Genio File Format

The software package MX (formerly called Moss) includes a data file format called GENIO for use in transferring data between Moss and other programs (see the MX Manual for a partial description of genio). There is currently two default genio input formats - versions 6 and 7. 12d Model recognizes both formats.

MX provides three options (001,003,017) to allow variations in the format of the genio 080 records. 12d Model recognizes and uses each option.

MX free format (that is, using commas and the 'field-number=' syntax) is allowed.

For example

080,ABCD,   ,5=0.0

MX 2d, 3d, 4d, 6d, text and most 12d and text strings are loaded directly into 12d Model strings. For 5d, the strings are processed but only the 3d information is used and loaded into 12d Model. The MX 10d (volume string) is allowed in the genio file but will not be read into 12d Model.

In the genio file, the GENIO card defines the name of the MX model for the following strings. 12d Model loads the strings into a 12d Model model with the same name as the MX model. However, 12d Model allows the user to define a **map file** which may over-ride the Genio card.

A genio file may contain more than one MX model, each genio model being separated by a 999 card. 12d Model will load each separate MX model into a 12d Model model with the same name as the MX model.

If an error occurs whilst reading a genio record, the genio record will be skipped and, if possible, the next genio record read.

12d Map File

See the section 8.8.1 Create/Edit a Map File for information about 12d map files.

The **name** of the MX string is used as the entity-name to be used for matching in a 12d map file.

The MX model given in the GENIO record is taken to be the default model for the genio reader.

Hence the genio map file can be used to over-ride the MX GENIO card and the MX default for point strings (this is necessary for genio files generated from non MX systems that don't use the correct point string convention).

For **text** in a Genio file (the string name for text must start with a * in the Genio file), the *key in the map file must* start with ***geniotext*** followed by the characters to match on which will be matched against the characters following the * in the genio string name. For example

    geniotextEB*   *   text   yellow   point   "PHCP"   // matches text

will match any Genio text with the string name starting with "*EB"

Note that * is not a wild card in the Genio string name but the "EB*" after "geniotext" is for use by the 12d map file and hence is an "EB" followed by a wild card. Hence it matches against any Genio text name starting with "*EB".

Summary

12d Model **recognizes** the following genio options for MX V6 and V7 formats -

GENIO
FINISH

001	format card
003	order card
017	angle card
080	for 2d, 3d, 4d, 6d, 12d and text strings
080	the 3d information only for 5d strings
090	triangulation information
999	

genio comment lines

12d Model accepts MX null values of -999.0

12d Model **ignores** the genio options:

080 for **10d** strings

A12d map file can be used to select the colour and model for any strings read in from the MX genio file whose names match the keys in the map file.

8.1.13 Geocomp Input

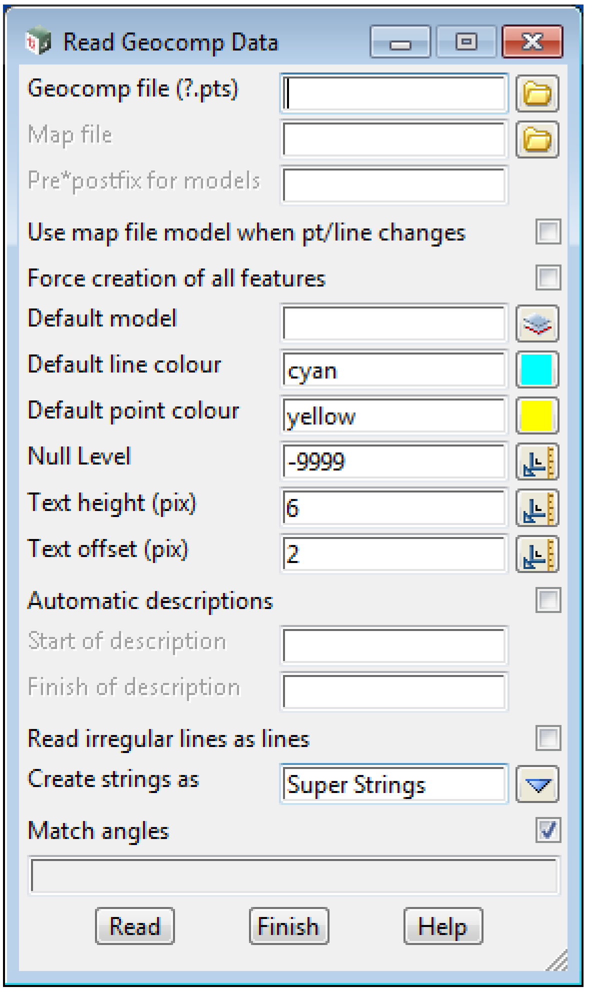
Position of option on menu: **File I/O =>Data input =>Geocomp**

Geocomp input is a separate chargeable module.

Geocomp is a points based software package used for manipulating and reducing survey data on a PC.

Geocomp data is held in two text files - the points file and the strings file. These text files can be used to transfer data from Geocomp to 12d Model. More information on the Geocomp data structure is given in the previous section 8.1.13.1 Geocomp File Format.

Selecting **Geocomp** displays the **Read Geocomp Data** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Geocomp file (?.pts)	file box		*.pts files

name of the Geocomp points file to be read in. The corresponding strings file is also used.

Map file	map file box		*.mf and *.mapfile files

if non-blank, the name of the map file to be used for all strings read in.

If blank, no map file is used.

See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Pre*postfix for models	pre*postfix box		

if non-blank, a prefix and a postfix to be applied to the model names used in the Map File.

Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

Use mapfile model when pt/line changes	tick box	no tick	

if ticked, then if the geocomp.str file says the entity is a line (point) feature and the map file says it is a point (line), the mapfile is used.

Default model	model box		available models

model to use for strings not mentioned in the map file

Default line colour	colour box	default colour	available colours

colour used for line-strings

Default point colour	colour box	default pt colour	available colours

colour used for the crosses in point-strings.

Null level	input	-9999

the Geocomp z-values to be considered null z-values.

Text height (pix)	input	8

the height in pixels of any text created for point number or Geocomp descriptions.

Text offset (pix)	input	2

the offset (in pixels) from the (x,y) coordinate position for the text of a 4d string.

Automatic descriptions	tick box

if ticked, then the first three characters of the entity code are compared to the first 3 characters of the 20 character description and if they are the same, the text is only characters 6 to 15 of the description.

Start of description	input

the user can restrict the amount of the geocomp description that is read in. if non-blank, this is the number of the character position to start reading the description from. If blank, the start position is 1.

Finish of description	input

if non-blank, this is the number of the character position to end reading the description from. If blank, it is the end of the geocomp description.

Read irregular lines as lines	tick

if ticked, Geocomp irregular lines are read in as strings.

Create strings as	input	Super Strings	Polyline Strings Super Strings

type of strings to create.

Match angles	tick	tick

if ticked, preference is given to joining geocomp lines of similar angles first.
if not ticked, geocomp lines are joined in the order they are in the file.

Read	button

read in the Geocomp data from the points file and (corresponding strings file) given in the file field.

8.1.13.1 Geocomp File Format

Geocomp input is a separate chargeable module.

Geocomp is a software package used for manipulating and reducing survey data on a PC.

Geocomp is a point based system. The fundamental data consists of individual points with unique point numbers and entities such as lines and arcs defined in terms of the points.

Geocomp data is held in two text files - the points file and the strings file. These text files can be used to transfer data from Geocomp to 12d Model.

The Geocomp **points file** is a sequential list of points, one point per line. Each point consists of the data

easting, northing, elevation, stand-point-number

that is

x-value, y-value, z-value, stand-point-number

The line number of each point in the file is also the unique **point number** for that point. For example, the point defined on the eleventh line of the points file, **is** point number eleven.

The stand-point-number is the point number of the instrument station used for collecting the points coordinates. The stand-point-number is not used in 12d Model.

The Geocomp **strings file** defines how the Geocomp **entity types** are constructed from points in the point file. The Geocomp entity types are

Entity Number	Description
1	two point lines
2	irregular lines
3	arc defined by start point, point on arc, end point
4	arc defined by start point, arc centre, end point
5	point feature
6	circle defined by centre and a point on the circle

The strings file also gives each defined entity an **entity number**.

The 12d Model Geocomp data reader recognises all the entity types in the strings file **except** for irregular lines (type 2).

All point numbers referred to in the strings file are references to the (implied) point numbers of points in the points file. Hence both files are needed to define the Geocomp data and the order of points in the point file is critical and cannot be modified.

The Geocomp naming convention for the two files is to use the six digit Geocomp job number as a name stem and append **.pts** for the points file and **.str** for the strings file.

That is,

geocomp-job-number.pts	points file
geocomp-job-number.str	strings file

For example

099999.pts	is the point file for Geocomp job number 099999
099999.str	is the strings file for Geocomp job number 099999

12d Model uses a wider data set than is directly represented in the Geocomp points and strings files. However, by observing a number of conventions and processing the strings file data according to these conventions, the Geocomp data can be sensibly passed across to 12d Model.

For example, although the Geocomp strings file only defines two-point lines, 12d Model can construct strings of many points from consecutive two-point lines by joining the lines together whenever

(a) the second point of one line is the same as the first point of the next line in the file

and

(b) the lines have the same entity number.

The entity number of the consecutive lines is used as the 12d Model string name.

Similarly, consecutive point features with the same entity number are joined to form a 12d Model 4d **point** string with the entity number as the string name.

In the Geocomp strings file, **descriptive text** can also be included at the end of each line defining an entity. The text is enclosed within double quotes **"**. The descriptive text is ignored for all entities **except point features**.

For a point-feature, which is represented in 12d Model as a 4d string, the descriptive text is recorded as the text label for that point.

By using a systematic entity and descriptive text labelling system in Geocomp, it is possible to sensibly transfer all of the Geocomp data to 12d Model.

Note - in Geocomp, a z-value of -9999 represents a null z-value, that is, a z-value that has **not** been defined. Any Geocomp null values are recorded as 12d Model null values.

Geocomp Map File

See the section 8.8.1 Create/Edit a Map File for information about 12d map files.

Using the conventions described in the previous section, Geocomp data can be interpreted as 12d Model strings with entity-names corresponding to the Geocomp entity numbers.

Hence the Geocomp **entity numbers** are used as the entity-names for matching with a map file.

If no match is found with the map file, the default colours and model given in the Geocomp read panel are used. The point-line type is taken to be **point** for point feature entities (entity type 5) and **line** point-line type for all other entities. The geocomp entity number is used as the string name and the style set to 1.

WARNING

If the **breakline type** in the map file is set to point or line and this does not match the point or string type coming from the geocomp file, then the string is placed in the **defaults** model. This is a consistency check for entities that can only be a point **or** a line breakline type (but not both). To disable this feature, a ***** can be used in the map file for the breakline type and then the breakline type is determined by whether the Geocomp entity is a point feature or not.

Summary

12d Model **recognizes** the following Geocomp entity types

Entity Number	Entity type
1	two point lines
3	arc defined by start point, point on arc, end point
4	arc defined by start point, arc centre, end point
5	point feature
6	circle defined by centre and a point on the circle

12d Model **recognizes** the Geocomp null values of -9999

12d Model **ignores** the entity type

2	irregular lines

A Geocomp map file can be used to specify the string name, breakline type, colour, style and model for strings read from the Geocomp text files.

Note - the breakline type of a string of Geocomp point features (entity type 5) will always be set to **point** regardless of the Geocomp map file.

8.1.14 Keays Input

Position of option on menu: **File I/O =>Data input =>Keays**

The **Keays** input option is designed to read in Keays (RoadPak) files in trf format.

The Keays data has a code and notes, and the code and notes can be used with a 12d Model map file to define models, colours, linestyles *etc*.

The Keays note is made up of individual notes separated by spaces. Each individual note (in order) can be used as part of the entity-name for use with the map file.

In the Keays map file, the multi-level key is given as a single key made up of the required items separated by **|** (with no additional spaces) in the order:

Code | note 1| note 2 | ... | note n

For example, the key:

BD|building| means code BD, note 1 = "building"

A ***** can be used for any of the items to indicate that no match is required for that item.

BD|*|top| means code BD, anything for note 1, note 2 = "top"

A * and nothing else after the code means that all notes are accepted.

BD* means code BD and any notes

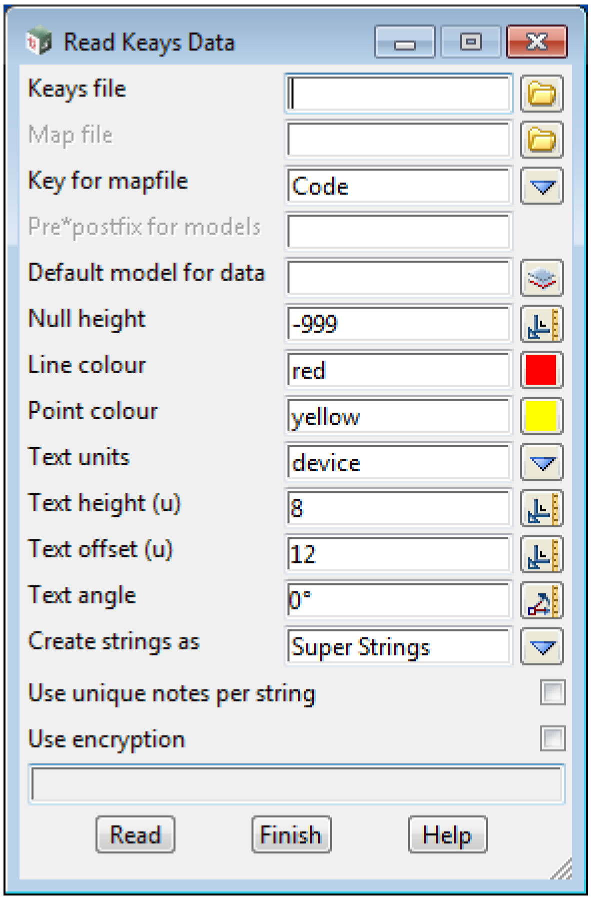
A * at the end of the notes means any note is a match from that point onwards.

BD|*|top|* means code BD, anything for note 1, note2 = "top", and any note after note 2.

If a map file is not used or no match is found in the map file, the Keays data is placed into the default model with its code as the string name.

See the section 8.8.1 Create/Edit a Map File for information about 12d map files.

On selecting the **Keays** option, the **Read Keays Data** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Keays file	file box		*.trf

name of the Keays trf file to be read in.

Map file	map file box		*.mf files

if non-blank, the name of the map file to be used for all strings read in. If blank, no map file is used. The Keays code and note can be used as the entity-name to match against the key in the map file.

See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Key for map file	input	code	code, code/note

*if **code**, the Keays code is used as the key for the map file.*
*If **code/note**, the Keays code and note is used as the key for the map file.*

Pre*postfix for models	pre*postfix box		

if non-blank, a prefix and a postfix to be applied to the model names used in the Map File.

Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

Default model for data	model box		available models

name of the model that any unmapped data is placed in. The model will be created if it does not already exist. This field must be filled in.

Null height	input	-999	

*if **non-blank,** any Keays z values equalling this value are taken as null values.*

Line colour	colour box	red	available colours

colour for Keays string s.

Point colour	colour box	yellow	available colours

colour for Keays points that are not part of strings.

Text units	input	pixels	pixels, world

units for the height of the text label.

Text height (u) input

height of the text (in text units).

Text offset (u) input

distance (in text units) to offset the text from its (x,y) placement position.

Text angle input 0

angle of the note text.

Create strings as	input	Super Strings	3d, 4d, Polyline, Super

type of strings to create.

Use unique notes per string tick box

if ticked, a change of code or note is used to break Keays string data into strings. This also applies to the point ids and notes text.

Use encryption tick box

if ticked, then the last 4 characters of the code is used to denote tinability and boundary information.

Read button

read the data in.

8.1.15 LandXML Input

Position of menu: **File I/O =>Data input =>Landxml**

LandXML is a format that attempts to cover some civil and surveying entities. It includes some of the geometry definitions but not display information such as colours, styles *etc*.

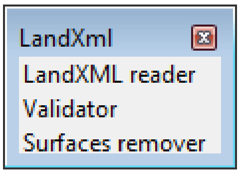
The format was started by Autodesk but the LandXML committee now appears to be defunct.

Unfortunately due to limitations in the LandXML format, many vendors added their own proprietary extensions which makes the LandXML format of only limited value and a different tailored LandXML reader is required for each vendor variation. The names and definitions of transitions can vary from vendor to vendor.

Finally the methodology behind the LandXML model is based on the restricted US approach of using X-sections and not strings to model data. This makes it unsuitable except for simple civil models.

One use of LandXML is to get some access to data from vendor software that only has unpublished encrypted proprietary binary formats. For example, AutoCAD DWG, Civil3D, Microstation DGN V8, InRoads and InRail.

This option is under continual developed as the LandXML standard keep changing.



read a Land XML file
validate a Land XML file
remove the surfaces section from a Land XML file

See

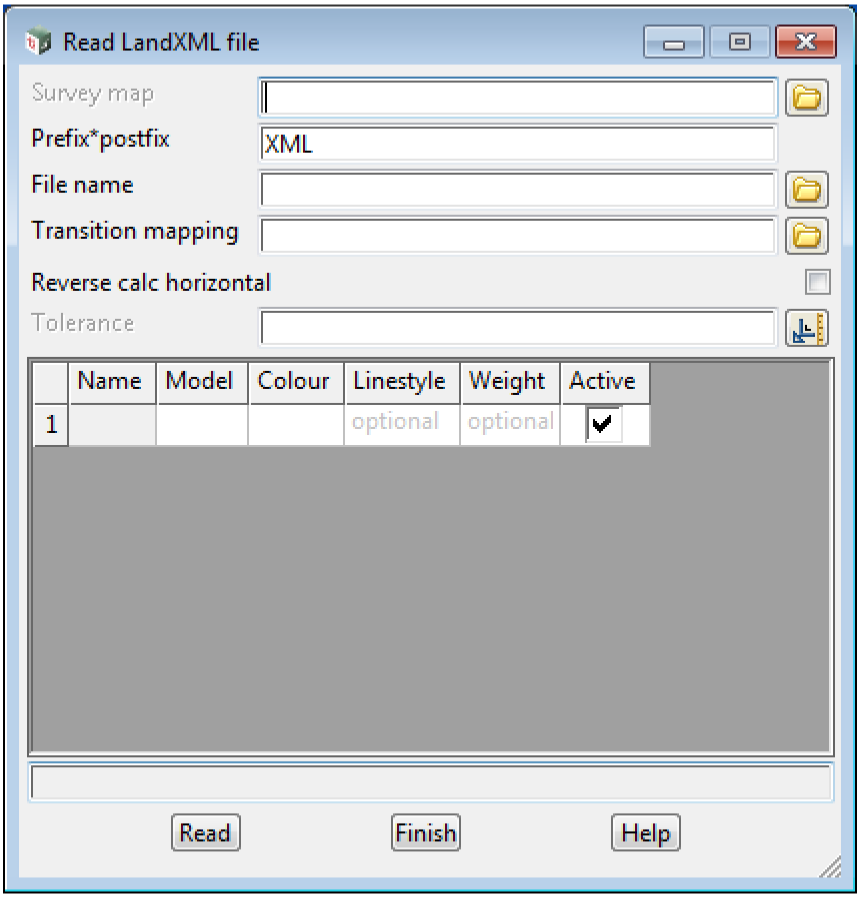
8.1.15.1 Read LandXML
8.1.15.2 LandXML Validator
8.1.15.3 LandXML Surfaces Remover

Note: ***12d Model*** has special LandXML readers for LINZ-XML (for LandOnline NZ), ePlan NSW, ePlan Queensland, ePlan Victoria and Leica-XML.

8.1.15.1 Read LandXML

Position of option on menu: **File I/O =>Data input =>LandXML =>LandXML reader**

Selecting **LandXML reader** brings up the **Read LandXML File** panel.



The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

Survey map map file box *.mf files

*if **not blank,** the name of a map file to used for a special mapping of data in the Survey sections of a Land XML file.*
*If **blank**, no map file is used.*

See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Pre*postfix for models pre*postfix box

if non-blank, a prefix and a postfix to be applied to the model names used in the Model field.
Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

File file box *.xml files

name of the LandXML file to read in.

Transition mapping file box *.trans_map files

file containing the mapping of transitions between the names of LandXML transitions and equivalent transitions in 12d Model.

Reverse calc horizontal tick box

if ticked, try and turn the segments of an Alignment in the LandXML file into an editable Super

Alignment.

Tolerance real box

if not zero,

Grid for Sections of the Land XML File

Name

name of the section of the Land xml definition that is in the file. If it is a Survey section, is the name of the plan.

Model model cell available models

model to read the Land xml data into

Colour colour cell available colours

colour to use for the strings in the xml file

Linestyle linestyle cell available linestyles

linestyle to use for the strings

Weight input

weight to use for the strings

Active tick box

if ticked, load this section of the Land xml file in.

Read button

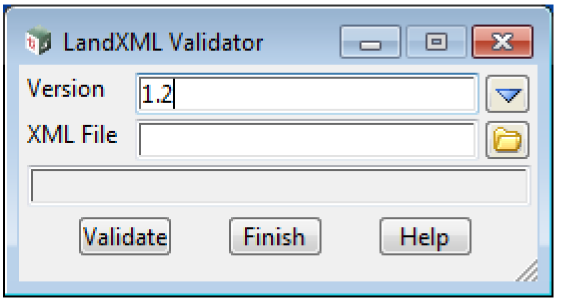
read the data into the models given in the **Model** *field of the grid.*

8.1.15.2 LandXML Validator

Position of option on menu: File I/O =>Data input =>LandXML =>Validator

This option validates an XML file against the LandXML schema.

Selecting **Validator** brings up the **LandXML Validator** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Version	choice box	1.2	LandXML versions

the version of Land XML to validate the XML file against.

XML File	file box		*.xml files

name of the XML file to validate against the Land XML Schema.

Validate	button		

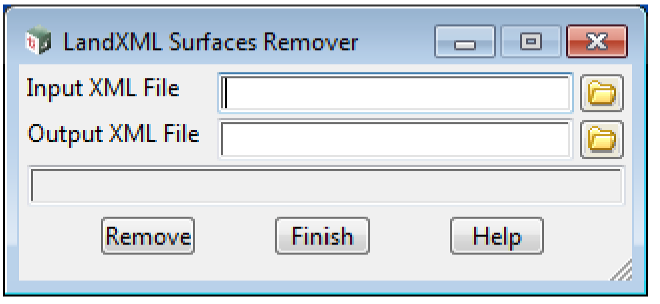
validate the XML file against the LandXML schema.

8.1.15.3 LandXML Surfaces Remover

Position of option on menu: **File I/O =>Data input =>LandXML =>Surfaces remover**

This option removes the Surfaces section from a given LandXML file.

Selecting **Surfaces remover** brings up the **LandXML Surfaces Remover** panel.



The fields and buttons used in this panel have the following functions.

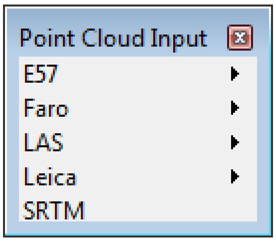
Field Description	Type	Defaults	Pop-Up
Input XML File	file box		*.xml files
name of the Land XML file to remove the Surfaces section from.			
Output XML File	file box		*.xml files
name of the file to write the landXML XML file out to but with the Surfaces section removed.			
Remove	button		
create a new file with the Surfaces sections removed.			

8.1.16 Input Point Cloud Files

Position of menu: **File I/O =>Data input =>Point clouds**

The options under **Point Cloud Input** read data in various formats.

The **Point Cloud Input** walk-right menu is



read data in E57 format
read data in Faro format
read data in LAS format
read data in Leica format
read data in SRTM format

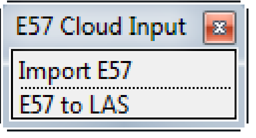
See

E57	8.1.16.1 E57 Cloud Input
Faro	8.1.16.2 Faro Point Cloud Input
LAS	8.1.16.3 LAS Cloud Input
Leica	8.1.16.4 Leica Point Cloud Input
SRTM	8.1.16.5 Read SRTM Files

8.1.16.1 E57 Cloud Input

Position of menu: **File I/O =>Data input =>Point clouds =>E57**

The **E57 Cloud Input** walk-right menu is



import E57 files
convert E57 files to LAS files

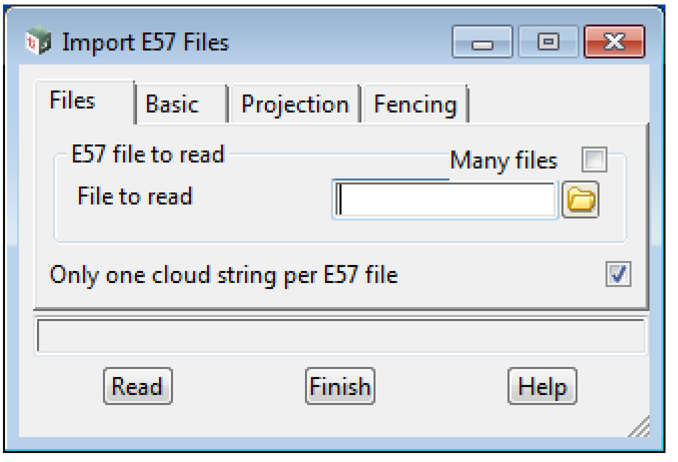
See

Import E57	8.1.16.1.1 Import E57 Files
E57 to LAS	8.1.16.1.2 E57 to LAS Files

8.1.16.1.1 Import E57 Files

Position of option on menu: **File I/O =>Data Input =>Point Clouds =>E57 =>Import E57**

Selecting **Import E57** brings up the **Import E57 Files** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Files tab

Many files tick box not ticked

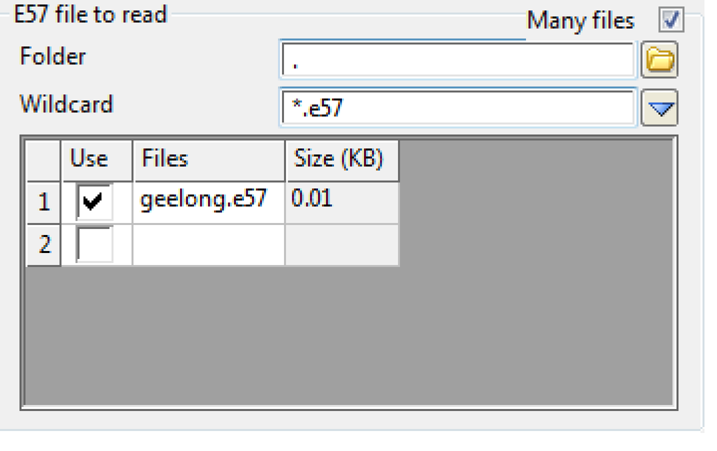
*if **ticked**, a grid to allow multiple e57 files to be read in is opened. A wild card is used to select all the files to be read in.*

Folder file box

folder to search for files using the **Wild card**

Wildcard input

wild card to use in search for files in the given folder



Use tick box

*if **ticked**, read in the file*

Files output

name of the file in the folder

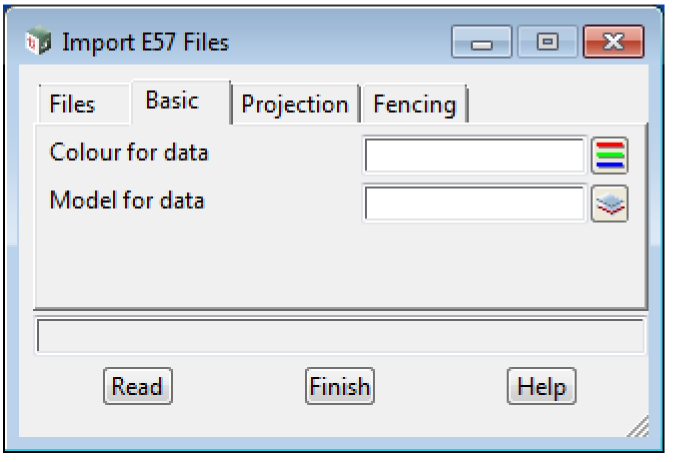
Size output

file size

Only one cloud string per E57 file tick box ticked

if ticked, all cloud points will be combined into one 12d cloud string.

Basic tab



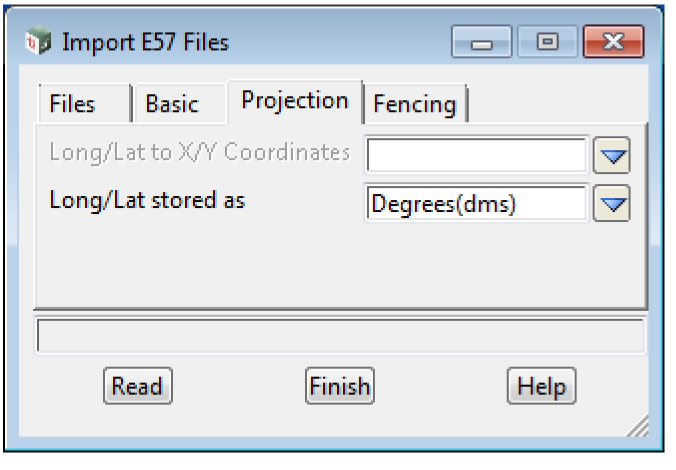
Colour for data colour box

string colour to be used if the cloud object does not have colour for each point

Model for data model box

name of the model that the data is to be placed in. The model will be created if it does not already exist. This field must be filled in.

Projection tab



Long/Lat to X/Y Coordinates choice box available projections

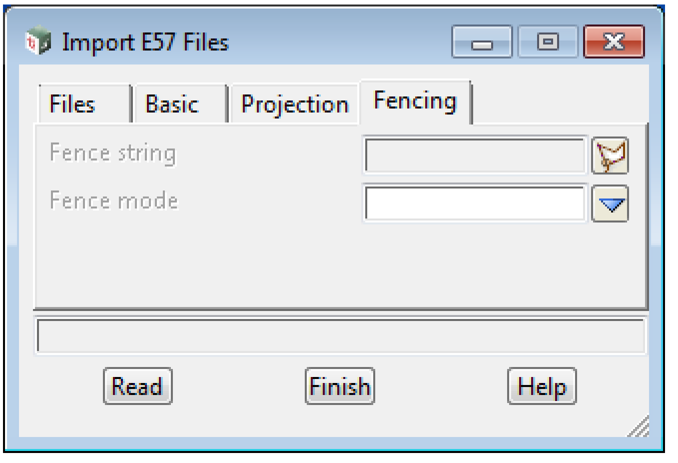
if ***non-blank****, the cartographic projection to apply to the longitude-latitude values.*
If ***blank****, the co-ordinates are not transformed from (longitude, latitude) to (x,y). Hence the initial (x,y) co-ordinates are transformed to (longitude, latitude) by the transformation given in the* **x/y co-ordinates to Long/Lat** *field and then left in (longitude, latitude). Note that in the southern hemisphere, the latitude values are* ***negative****.*

Long/Lat stored as choice box degrees radians
degrees

decimal degrees

format for the longitude and latitudes - either radians, degrees (in 4.17.1 HP Notation *for degrees, minutes and seconds) or decimal degrees.*

Fencing tab



Fence string polygon box

string to use to restrict the data being read in.

folder to search for files using the **Wild card**

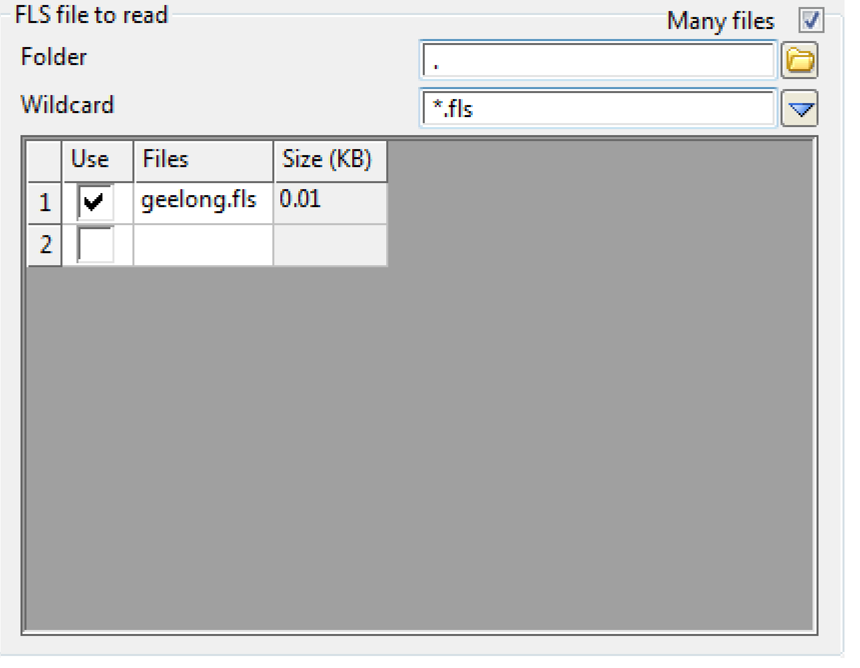
Wildcard	input		

wild card to use in search for files in the given folder



Use tick box

*if **ticked**, read in the file*

Files output

name of the file in the folder

Size output

file size

Basic tab

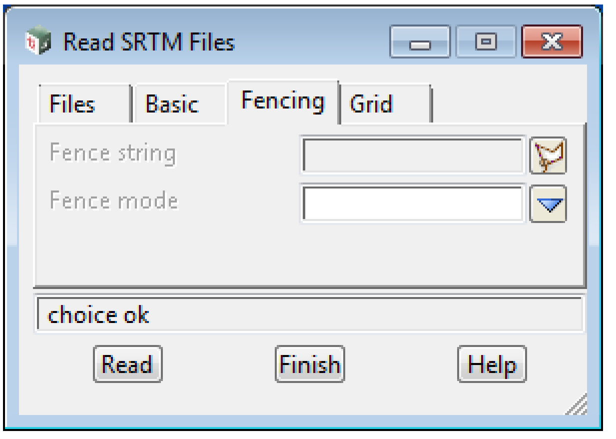
Model for SRTM model box

name of the model that the data is to be placed in. The model will be created if it does not already exist. This field must be filled in.

Fencing tab



Fence string polygon box

string to use to restrict the data being read in.

Fence mode choice box
File inside
File inside/crossing
File outside
File outside/crossing
File crossing

File inside - read file in if it is totally inside the polygon

File inside/crossing - read file in if it is totally inside, or crossing the polygon

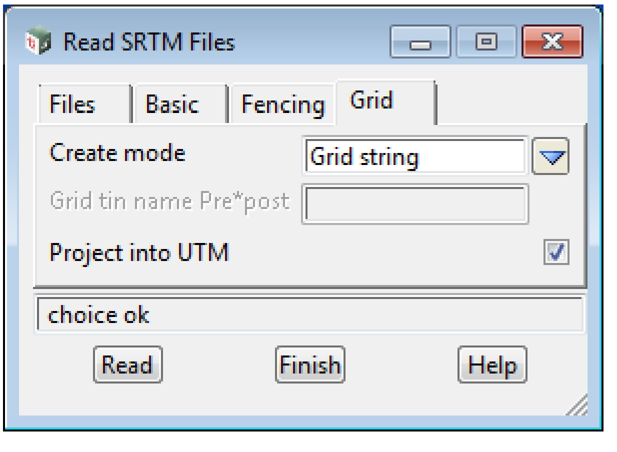
File outside - read file in if it is totally outside the polygon

File outside/crossing - read file in if it is totally outside, or crossing the polygon

File crossing - read file in if it is crossing the polygon

***Note** - only whole files are read in.*

Grid tab



Create mode choice box Grid string Grid string, Grid tin, Strings

see 14.10 Grids *for an explanation of* **Grid string** *and* **Grid tin**

Grid tin name Pre*post input

only enabled if **Grid tin** *is selected. All grid tins created will have their names derived from the text entered with the * character beginning at 1 and incrementing for each tin created.*

Project into UTM tick box ticked

if ticked, the project will be uploaded into the Universal Transverse Mercator coordinate system.

Button at bottom

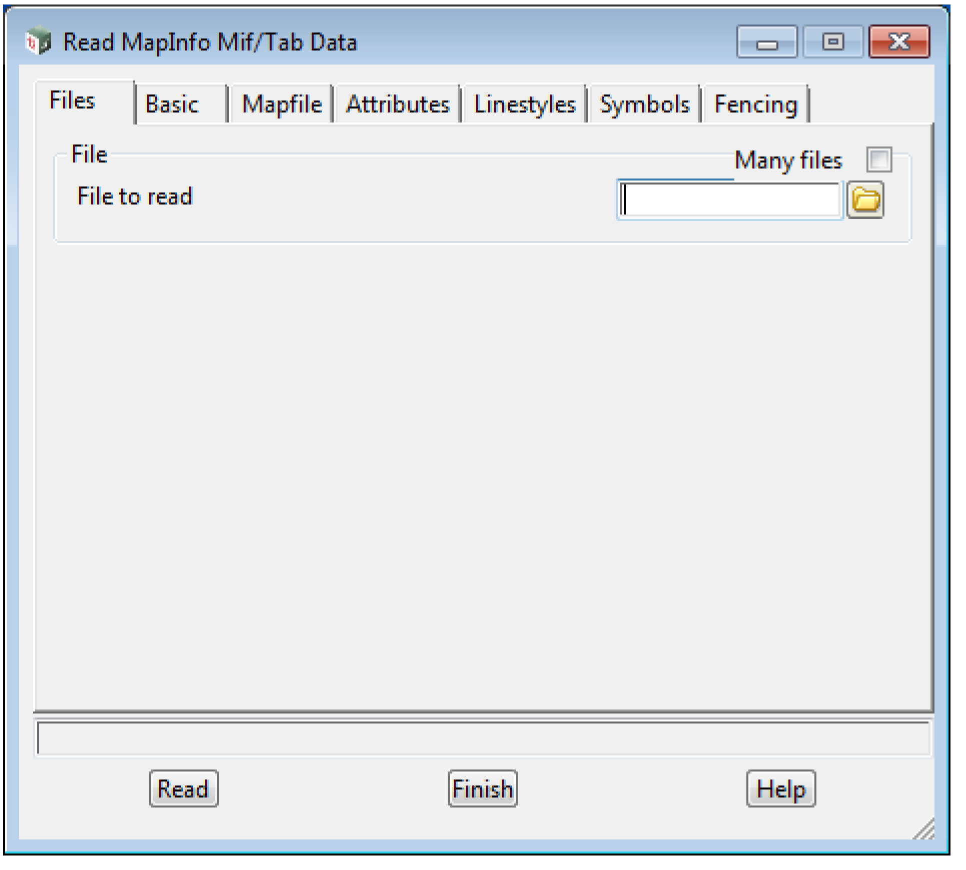
Read button

read the data into the model given in the model field.

8.1.17 Mapinfo Input

Position of option on menu: **File I/O =>Data input =>Mapinfo MID/MIF**

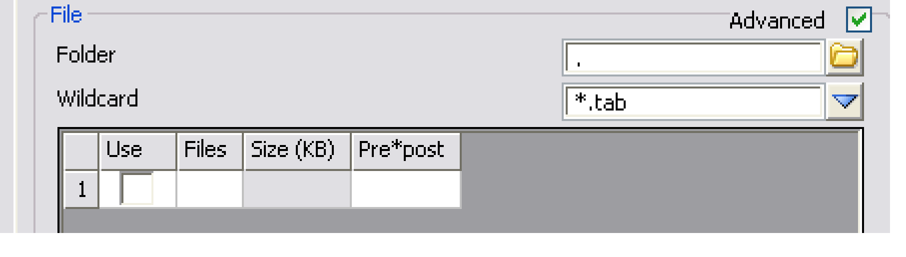
Selecting **MapInfo MID/MIF** brings up the **Read MapInfo Mif/Tab Data** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Advanced	tick box		

*if **ticked**, a grid to allow multiple files to be read in, is opened. A wild card is used to select all the files to be read in.*



Folder	folder box

folder to search for files using the **Wild card**

Wildcard	input

wild card to use in search for files in the given folder

Use	tick box

*if **ticked**, read in the file*

Files output

name of the file in the folder

Size output

file size

Pre*post text input

*if **non blank**, pre*post text to use for the models in this file (see* 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

*If **blank**, use the pre*post text from the* **Pre*postfix for models** *panel field.*

***Note** - if a non-blank value for **Pre*post** is given in the column for a file then the **Pre*postfix for models** is ignored.*

File to read file box *.tab or *.mif files

name of the MapInfo file.

If no attribute is mapped to model, then the file name (minus the .tab or .mif) is used as the model for the data.

Basic tab

Default colour for black colour box white available colours

colour to use in 12d for black in MapInfo

Map file tab

Map file file box *.mf and *.mapfile files

*if **non-blank**, the name of the 12d map file to be used for all strings read in.*

*If **blank**, no map file is used*

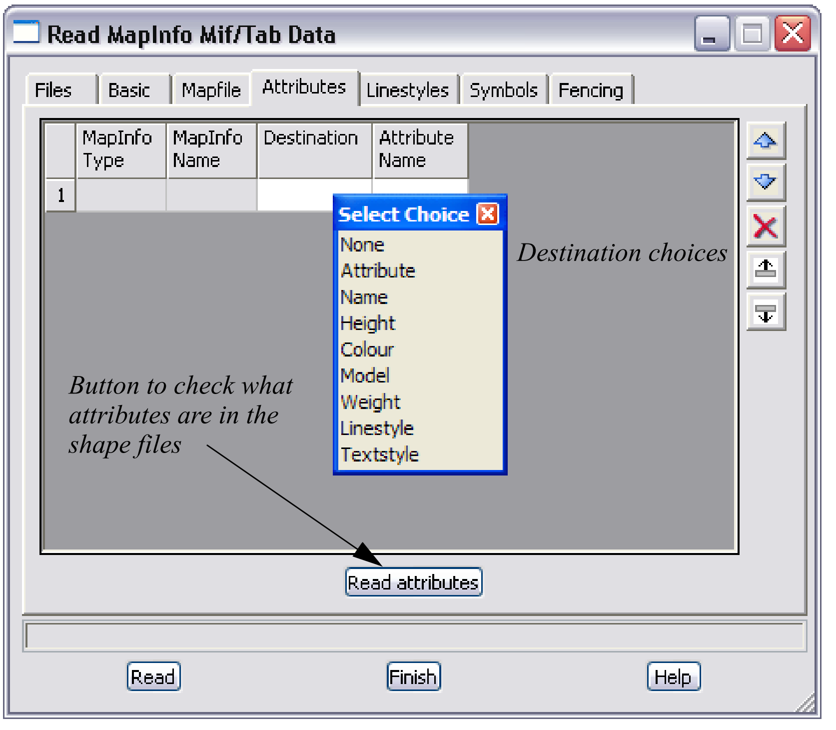
When using a map file, the string name is used as the entity-name for matching with the keys in the map file. See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Pre*postfix for models pre*postfix box

if non-blank, a prefix and a postfix to be applied to the model names used in the Map File.

Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

Attributes tab



Read attributes button

Click to check what attributes are present in the MapInfo files and any MapInfo attributes found are listed in the **MapInfo Type** *and* **MapInfo Name** *columns in the grid.*

Destination Grid column

type of 12d attribute to map the MapInfo attribute to:

none - don't use the attribute - the attribute is ignored
attribute - use as 12d attribute
name - use as 12d string name
height - use as 12d vertex height

colour - use as 12d string colour

model - use as model name

weight - use as string weight

linestyle - use as 12d linestyle

textstyle - use as 12d textstyle

***Note** - if no MapInfo attribute is mapped to Model, then the file name (minus the .tab or .mif) is used as the model for the data.*

Attribute name Grid column

if non blank and the MapInfo attribute is being sent to a 12d attribute, then this is the 12d attribute name

Linestyles tab

MapInfo linestyle Grid column

MapInfo linestyle name

12d linestyle Grid column

12d linestyle to map the MapInfo linestyle to

String outside/crossing - read string in if it is totally outside, or crossing the polygon

String crossing - string in if it is crossing the polygon

***Note** - only whole strings are read in.*

Read button

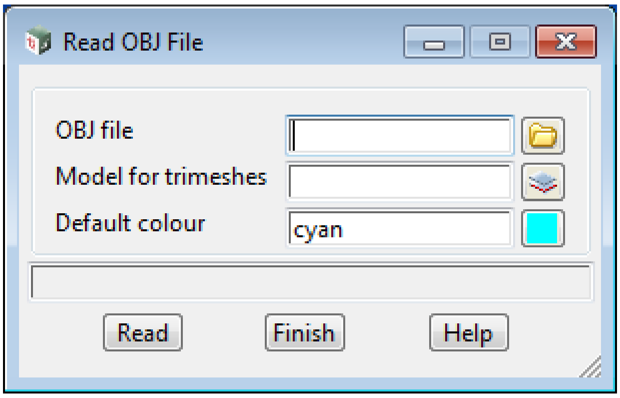
read the data in.

8.1.18 Wavefront OBJ Input

Position of option on menu: **File I/O =>Data input =>OBJ**
Position of option on menu: **Strings =>Trimesh =>Read OBJ file**

The **OBJ** option reads in a Wavefront OBJ file and creates trimeshes.

Selecting **OBJ** brings up the **Read OBJ File** panel.



The fields and buttons used in this panel have the following functions.

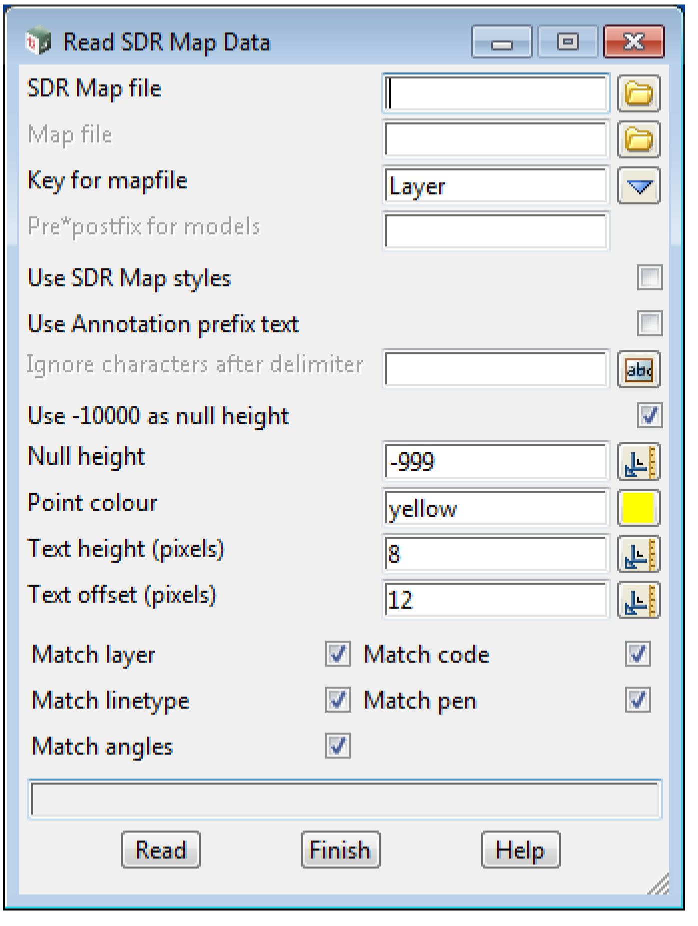
Field Description	Type	Defaults	Pop-Up
Obj file	file box		*.OBJ files
name of the OBJ file to read in			
Model for trimeshes	model box		available models
model to put the created trimeshes in.			
Default colour	colour box		available colours
Read	button		
read the obj data in			

8.1.19 SDR Map Input

Position of option on menu: **File I/O =>Data input =>SDR Map**

The **SDR Map** input option is designed to read in files in the SDR Map ASCII format.

On selecting the **SDR Map** option, the **Read SDR Map Data** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
SDR Map file	file box		*.txt

name of the SDR Map text file to be read in.

Map file	map file box		*.mf and *.mapfile files

if non-blank, the name of the map file to be used for all data read in.

See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Key for map file	choice box	code	code, layer code/layer, layer/code

*if **code**, the SDRmap code is used as the key for the map file.*
*If **layer**, the SDRmap layer is used as the key for the map file.*

*If **code/layer**, the SDRmap code/layer is used as the key for the map file.*

*If **layer/code**, the SDRmap layer/code is used as the key for the map file.*

Pre*postfix for models	pre*postfix box		

if non-blank, a prefix and a postfix to be applied to the model names used in the Map File.

Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

Use SDR Map styles tick box

if ticked,

Use Annotation prefix text tick box

if ticked,

Ignore characters after delimiter input

if non-blank, all characters on the line after the given delimiter will be ignored.

Use -10000 as null height tick box tick

if ticked, any z value of -10000 is converted to a null height in ***12d Model****.*

Null height input -999

if ***non-blank,*** *any SDR Map z values equalling this value are converted to null values in* ***12d Model****.*

Point colour colour box yellow available colours

colour for SDR Map points that are not part of strings.

Text height (pixels) input

height of the text in pixels

Text offset (pixels) input

distance in pixels to offset the text from its (x,y) placement position.

Match flags tick box

SDRMap data consists of individual lines and arcs. When reading SDRMap data, it undergoes head to tail processing and the match flags specify what SDRMap data can be joined.

Match layer/code/linetype/angles/pen tick box

if ***ticked,*** *then any SDRMap lines and arcs must have the same layer/code/linetype/angle/pen before they can be joined in the head to tail process.*

Read button

read the data in

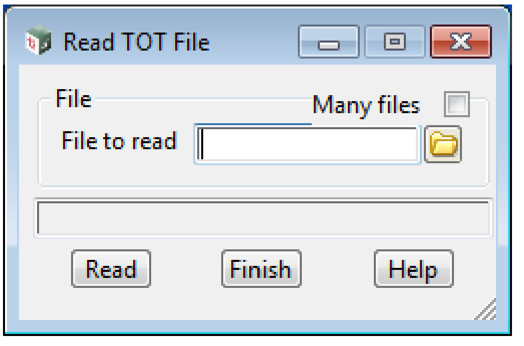
8.1.20 TOT Input

Position of option on menu: **File I/O =>Data input =>TOT**

The **TOT** option attempts to read in TOT files.

Note: TOT is a format used by Model Maker, a software program from South Africa.

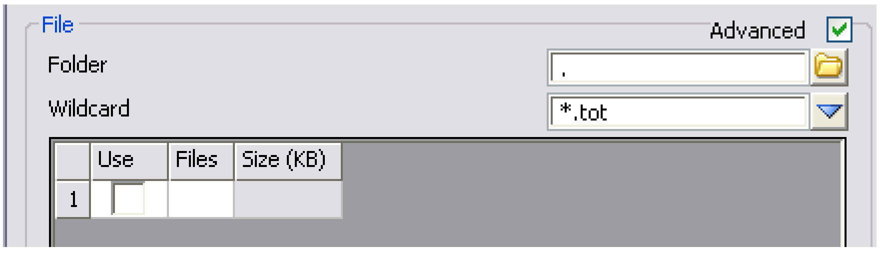
Selecting **TOT** brings up the **Read TOT File** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Advanced	tick box		

*if **ticked**, a grid to allow multiple TOT files to be read in, is opened. A wild card is used to select all the files to be read in.*



Field Description	Type	Defaults	Pop-Up
Folder	folder box		

folder to search for files using the **Wild card**

Field Description	Type	Defaults	Pop-Up
Wildcard	input		

wild card to use in search for files in the given folder

Field Description	Type	Defaults	Pop-Up
Use	tick box		

*if **ticked**, read in the file*

Field Description	Type	Defaults	Pop-Up
Files	output		

name of the file in the folder

Field Description	Type	Defaults	Pop-Up
Size	output		

file size

Field Description	Type	Defaults	Pop-Up
File to read	file box		*.TOT files

name of the TOT file to read in

Read button

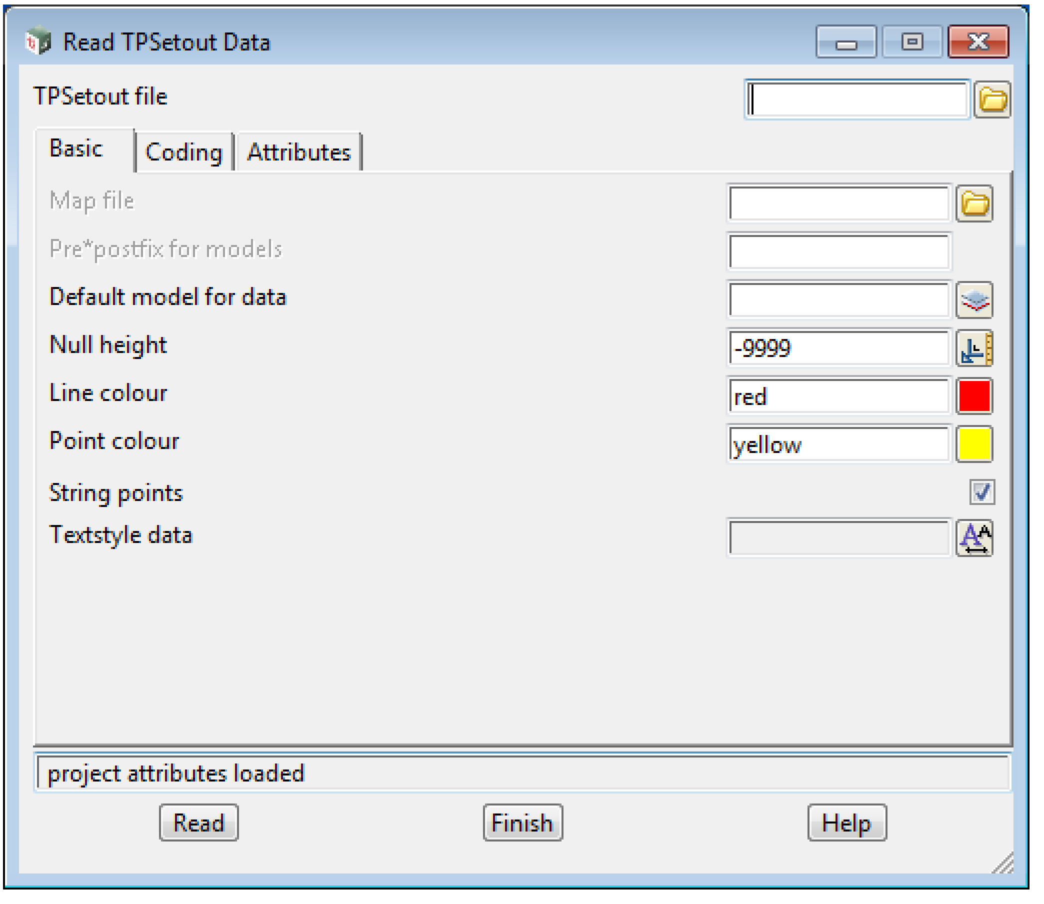
read the data in

8.1.21 TP Setout Input

Position of option on menu: **File I/O =>Data input =>TP Setout**

The **TP Setout** input option is designed to read in .pta files from *TP Setout*

Selecting **TP Setout** brings up the **Read TP Setout Data** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
TP Setout file	file box		*.pta

name of the TP Setout .pta file to be read in.

Basic tab

Map file	map file box		*.mf files

if non-blank, the name of the map file to be used for all strings read in. If blank, no map file is used. The TP Setout code is used as the entity-name to match against the key in the map file.

See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Pre*postfix for models	pre*postfix box		

if non-blank, a prefix and a postfix to be applied to the model names used in the Map File.

Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

Default model for data	model box		available models

name of the model that any unmapped data is placed in. The model will be created if it does not already *exist. This field must be filled in.*

Null height input -9999

*if **non-blank,** any TP Setout z values equalling this value are taken as null values.*

Line colour colour box red available colours

colour for TP Setout strings.

Point colour colour box yellow available colours

colour for TP Setout points that are not part of strings.

String points tick box tick

if ticked, points with the same description are joined together.
If not ticked, points with the same description are not joined together.

Textstyle data textstyle data box available textstyle datas

textstyle data used for any text labels

Coding tab

Point ids in column 5 tick box

*if **ticked**, there are points ids in column 5 of the file.*

Feature code input

number of characters in the feature code

String number input

number of characters in the string number

Point ids input

number of characters in the point ids

Attributes tab

Name

Type

Data

Read button

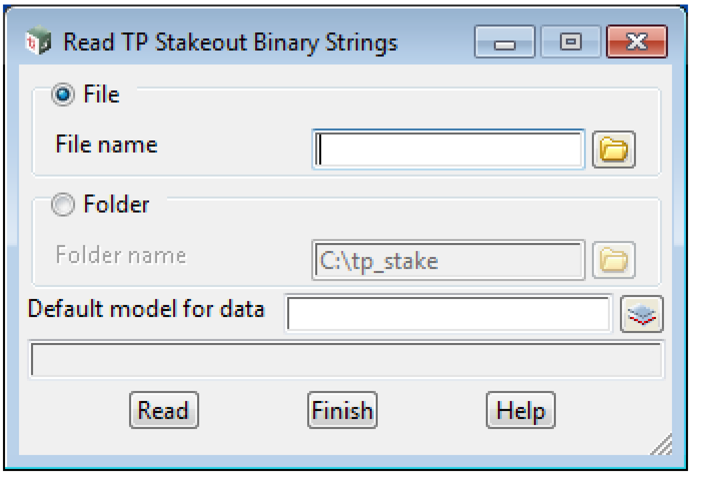
read the data in.

8.1.22 TP Stakeout Strings Input

Position of option on menu: **File I/O =>Data input =>TP Stakeout strings**

The **TP Stakeout strings** input option is designed to read in .3db files (binary strings) from TP Stakeout.

Selecting **TP Stakeout strings** brings up the **Read TP Stakeout Binary Strings** panel.



The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults | Pop-Up

File radio button

*if **on** then an individual binary string file is to be read in.*

File name file box *.3db files

if non-blank, the name of the binary string file to read in.

Folder radio button

*if **on** then the all the binary string files in the folder are to be read in.*

Folder name folder box

if non-blank, all the binary string files in this folder are read in.

Default model for data input available models

name of the model to read the binary strings into.

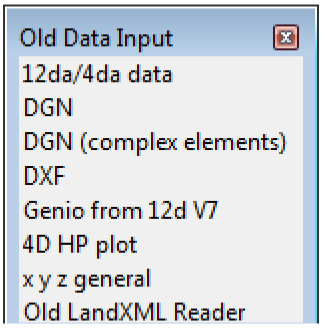
Read button

read the data in.

8.1.23 Old Inputs

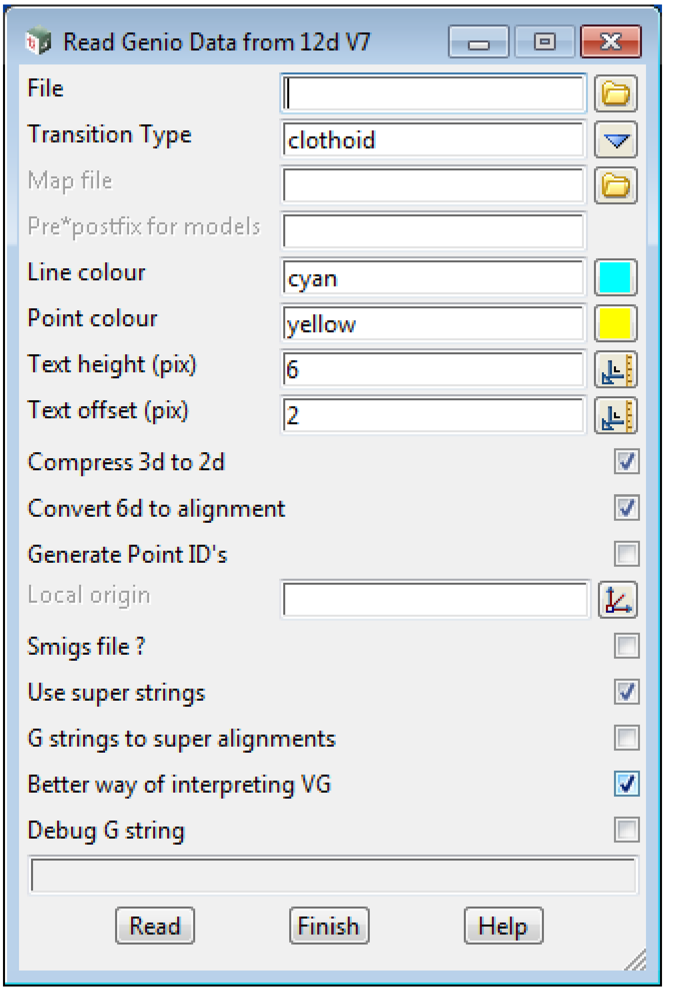
Position of menu: **File I/O =>Data input =>Old**

The **Old** menu contains superseded options. The **Old** walk-right menu is



8.1.23.1 Genio from 12d V7

This section of documentation is a work in progress and will be updated in subsequent releases.



8.1.23.2 12D HP Plot File

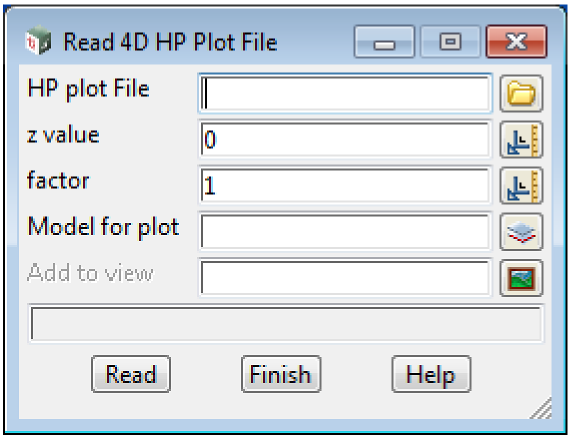
Position of option on menu: **File I/O =>Data input =>Old =>4D HP plot**

12d Model has options to create plots for HPGL compatible plotters. This option reads back into 12d Model any plots created by 12d Model using HPGL plot options.

A plot file is only a two dimensional file defined in millimetres. When read back into 12d Model, the units are automatically multiplied by 1000.

In the option, the user can supply a further factor to multiply the x and y coordinates by and also a z-value which is used as a z coordinate for all the lines in the plot file.

On selecting the 12d HP plot option, the **read 4D HP plot file** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
HP plot file	input		*.hp files

name of the 12d HP plot file to be read in

z value	input	0.0	

z coordinate to use for the lines read in from the plot file

Factor	input	1.0	

the default units used when reading in a plot file are multiplied by 1000. They are then multiplied by this value.

Model for plot	input		available models

name of the model that the plot file is to be placed in. The model will be created if it does not already exist. This field must be filled in.

Add to view	input		available views

if a view name is entered, then the model will be automatically added to the view. This field can be blank.

Read	button		

read the plot file into the model given in the model field.

8.1.23.3 DXF Input

Position of option on menu: **File I/O =>Data input =>Old =>DXF**

DXF input is a separate chargeable option

The **DXF** input option is designed to read most autocad DXF files (up to Version 12), including binary DXF which was introduced in AutoCAD Release 10 as a means of addressing the problems of large file sizes, slow processing and limited accuracy that occur when using the ASCII DXF format. ***12d Model*** will automatically sense whether the input file is binary or ASCII.

The standard Autocad colours can be mapped to the equivalent 12d Model colours or just mapped on a one-to-one basis to 12d Model colour numbers.

Each DXF item has an associated layer. By default, 12d Model creates models of the same name as the layers (or with an additional user supplied prefix) and the DXF items placed in them.

However, this can be over-written using a standard **12d map file** where the key is matched against Autocad **layers** rather than string names.

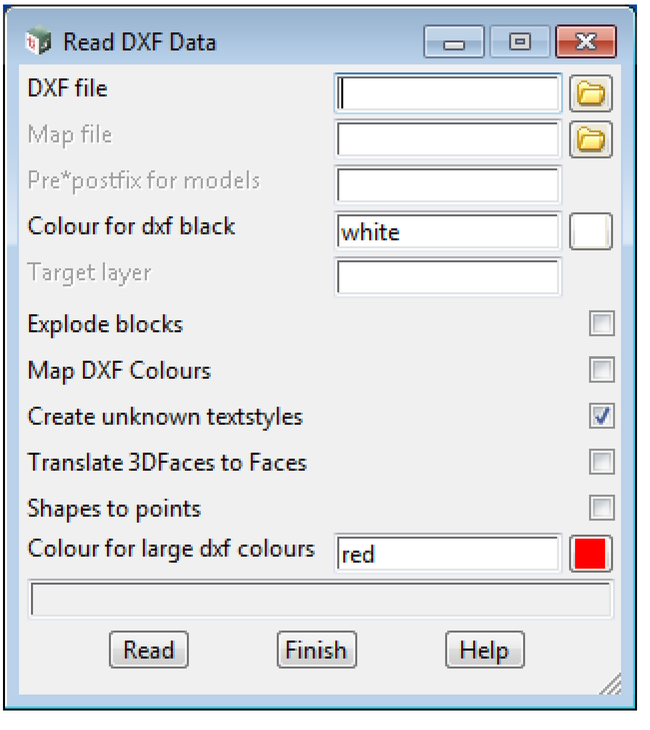
See the section 8.8.1 Create/Edit a Map File for information about 12d map files.

Autocad blocks are recognised and either a point with the block name is created or the blocks are expanded into their components, each time they are referenced in the DXF file.

Bulges in polylines can only be interpreted correctly when the polyline has a constant z-value. For this case, a 12d Model polyline string is created from the DXF polyline.

Finally, DXF POINT entities of the same layer and colour are concatenated into one point string as they are read in.

On selecting the **DXF** option, the **read dxf data** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
DXF File	input		*.dxf files

name of the DXF file to be read in

Map file input *.mf files

if non-blank, the name of the map file to be used for all DXF layers read in. The DXF layer is the entity-name for matching against the key in the map file.
If blank, no map file is used.

See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Prefix for models input

if non-blank, all 12d Model model names created by the reader will be prefixed by this name.

Colour for dxf black input white available colours

if the DXF colour of an item is black, then the colour in the **colour for black** *field is used for the item in 12d Model.*

Target layer input

if non-blank, only autocad items in the layer with the name given in the **target layer** *field will be read in.*

Explode blocks tick no tick

if ***ticked****, autocad blocks are exploded in 12d Model.*
If ***not ticked****, blocks are not exploded and a point string is placed at the position of the block.*

Map DXF colours tick no tick

if ***ticked****, the first seven DXF colours are mapped to the corresponding default 12d Model colours.*
If ***no ticked****, the nth DXF colour is mapped to the nth 12d Model colour.*

Create unknown textstyles tick tick

if ***ticked****, then if a textstyle in the DXF file is not already defined in* ***12d Model****, then a new* ***12d Model*** *textstyle of the same name is created.*
If ***no ticked****, then the* ***12d Model*** *textstyle "1" is used for any unknown DXF textstyles.*

Translate 3DFaces to faces tick no tick

if ***ticked****, DXF faces are read in as* ***12d Model*** *face strings.*

Colour for large dxf colours input red available colours

if the DXF colour is greater than the largest colour number defined in the 12d Model colour map, then the colour in the **colour for large dxf colours** *field is used for the DXF colour.*

Read button

read the data in.

8.1.23.4 User X Y Z and Attributes Input - Pre V9

Position of option on menu: **File I/O =>Data input =>Old => x y z general**

Note - this option was replaced in ***12d Model*** 9.

On selecting the **read x,y,z general** option, the **Read x y z s General File** panel is displayed.

This option reads data in one line at a time with the values separated by a delimiter (tab, space, semi-colon or comma) or the data on each line can be in fixed width columns.

In either case, the user specifies the order that the x, y, z, string name, point number and attributes appear in the file. If desired, only an x and y value needs to be read in.

The set-ups for defining all the positions of all the data in the file can be written out to a file (.xyf) for re-use.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Parameters section			
Parameter file	input		*.xyf files

name of the file containing the settings for how the data is positioned in the input file.

Read icon	button		

read the parameter file in.

Write icon	button		

write the setting in the panel out to a parameter file.

Input settings section

File	input		*.dat files

name of the data file to be read in

Map file	file box		*.mf files

if non-blank, the name of the map file to be used for all strings read in. If blank, no map file is used. The string name is used as the entity-name for matching with the keys in the map file.

See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Pre*postfix for models	pre*postfix box		

if non-blank, a prefix and a postfix to be applied to the model names used in the Map File.

Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

Default line colour	input	default colour	available colours

colour used for line-strings (if no colour is defined in the file)

Default point colour	input	default pt colour	available colours

colour used for the crosses in point-strings (if no colour is defined in the file)

Default text style	input		available textdatas

textdata for the point ids and other text

Default model for data	input		available models

name of the model that the data is to be placed in. The model will be created if it does not already exist. This field must be filled in.

Add to view	input		available views

if a view name is entered, then the model will be automatically added to the view. This field can be blank.

Skip column headers	tick box		

if ticked, the first line of the file is skipped.

Join all	tick box		

*if **ticked**, all vertices with the same string names are joined together regardless of where they are in the file. The order of the vertices is the order they occur in the file.*

*If **not ticked** then any time a string name changes in the file, a new string is created. So if the same string name occurs but separated by a different string name, then more than one string of that same name will be created. The order of the vertices is the order they occur in the file.*

Input mode	choice box	delimiter	delimiter, fixed width

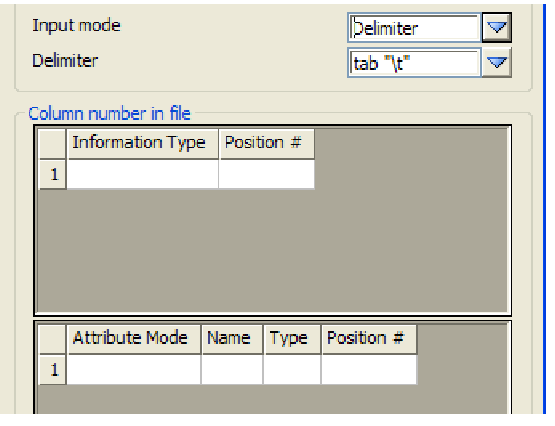
*if **delimiter**, the type of delimiter and the columns for the x, y and optionally z, name and point number are given.*

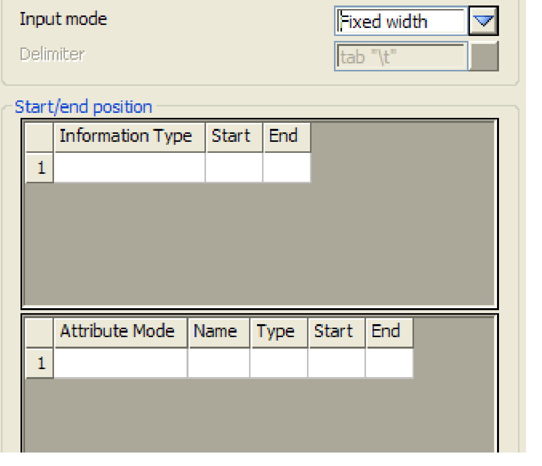
Delimiter	choice box	tab \f	one space, tab \t, semi colon, comma many spaces

*if **fixed width**, the start and end column positions are given for x, y and optionally z, name and point number.*

Column number/Start end position section

information to read in (x,y,z, attributes etc.) and its position in the input file.





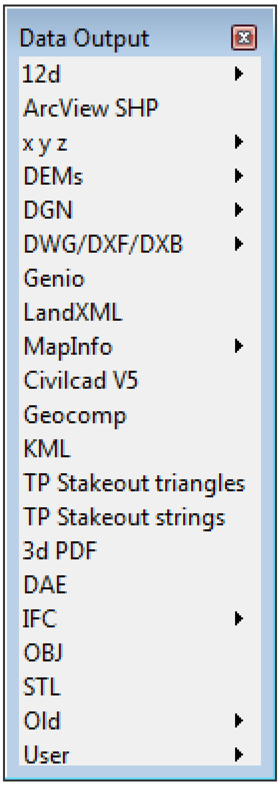
8.2 Data Output

Position of menu: **File I/O =>Data output**

12d Model provides output options so that data in a model or on a view can be written out to a disk file. this may be to allow data to be transferred to other programs for further processing or simply to get a readable list of data.

The default *Output null value* is described in the section 8.2.1 Output Null Value

The **Data Output** walk-right menu containing these options is



bring up the 12d Output panel

STL	8.2.18 Export STL

8.2.1 Output Null Value

When writing out data for other systems, it is usually not appropriate to write out the internal 12d Model null height (- 9.9e29).

Consequently as data is written out, any 12d Model null heights are replaced by the value given by the **I/O null height** parameter.

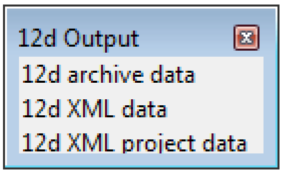
The **I/O null height** is set in **Default Settings** tab of the **Defaults** panel in the option **Utilities=>Defaults.**

Return to 8.2 Data Output

8.2.2 12d Output

Position of menu: **File I/O =>Data output =>12d**

Selecting **12d** brings up this walk-right menu



write out data in ***12d Model*** Archive format
write out XML data
write out XML project data

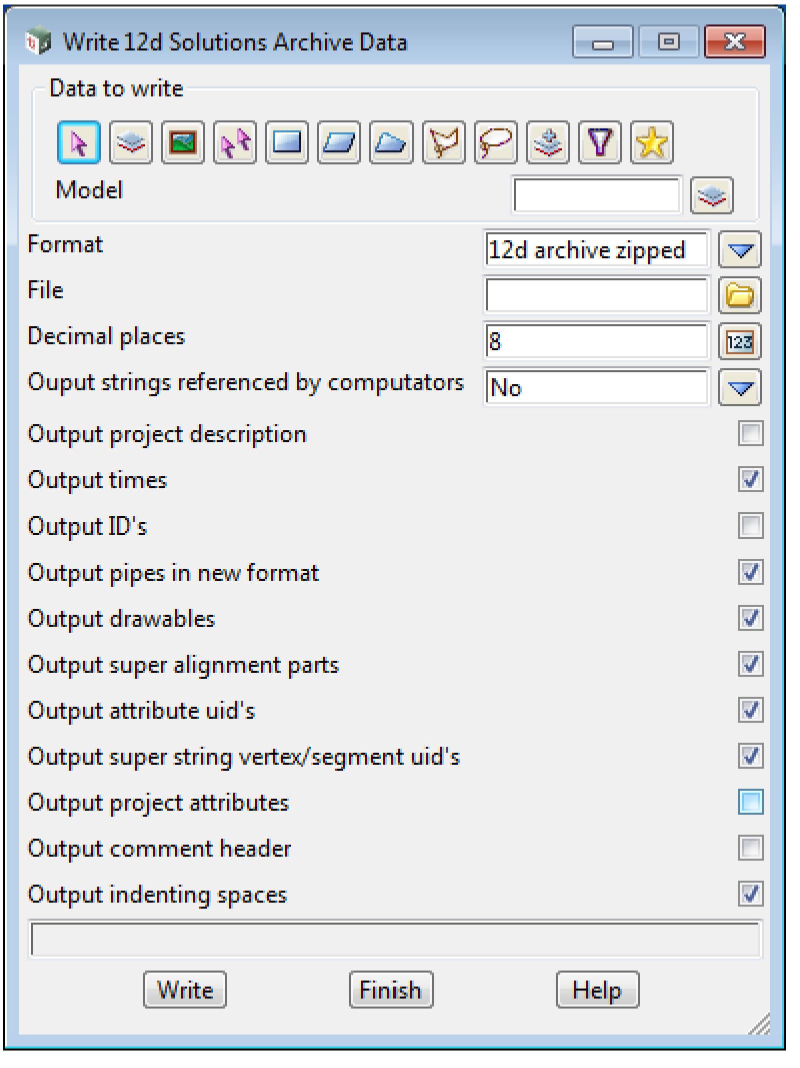
For the option *12d archive data*, 8.2.2.1 12d Archive Output
12d XML data 8.2.2.2 12d XML Data
12d XML project data 8.2.2.3 12d XML Project Data

8.2.2.1 12d Archive Output

Position of option on menu: **File =>Data output =>12d =>12d archive data**

The ***12d Archive*** format is a special format defined by 12d Solutions to allow data to be easily transferred from other programs into 12d Solutions software such as ***12d Model***. The ***12d Archive*** format is given in the Appendix.

Selecting the **12d archive data** brings up the **Write 12d Solutions Archive Data** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

Data to search - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data is to be written out to a file.

Format	choice	12d archive zipped	12d archived zipped, 12d archive

use 12d archive zipped (12daz) or 12d archive format (12a). The only difference is that the 12az file is a zipped 12da file with the same name stem.

File file box *.12da or *.12daz

name of the file for the information to be written out to in 12d Archive format. If the file already exists, then you are asked to Append, Replace or Cancel.

Decimal places integer box 8

the number of decimal places used when writing the data out.

Output string references by computators choice box No Yes, No, De-reference

*if **Yes**, any strings referenced by computators by strings in the data source that are not in the data source, are also written out.*

*If **No**, any strings referenced by computators by strings in the data source that are not in the data source, are NOT written out.*

*If **De-reference**, any super strings in the data source with computators are de-referenced. That is, the computators are replaced by internal elements of the string.*

Output project description tick box

if ticked, the project description is written out as comments at the top of the file.

Output times tick box

if ticked, write out the creation times etc. for the objects.
If not ticked, don't write out the creation times etc. for the objects.

Output ID's tick box

if ticked, write out the object IDs.
If not ticked, don't write out the object IDs.

Output pipes in new format tick box

if ticked,
If not ticked, don't write out.

Output drawables tick box

if ticked, write out the internal super alignment labelling as text.

Output super alignment parts tick box

if ticked, write out all the construction details for super alignments.
If not ticked, don't write out the construction details. Just write out the HG and VG segments.

Output attribute uid's tick box

if ticked, write out the attribute uids.

Output super string vertex/segment uid's tick box

if ticked, write out the any vertex and segment UIDs.

Output project attributes tick box

if ticked, write out the project attributes.

Output comment header tick box

if ticked, write out information as comments at the top of the 12da file.

Output indenting spaces tick box

if ticked, leave out spaces for indenting lines in the file. This will reduce the size of the text 12da file.

Write button

write out the data specified by the Data source.

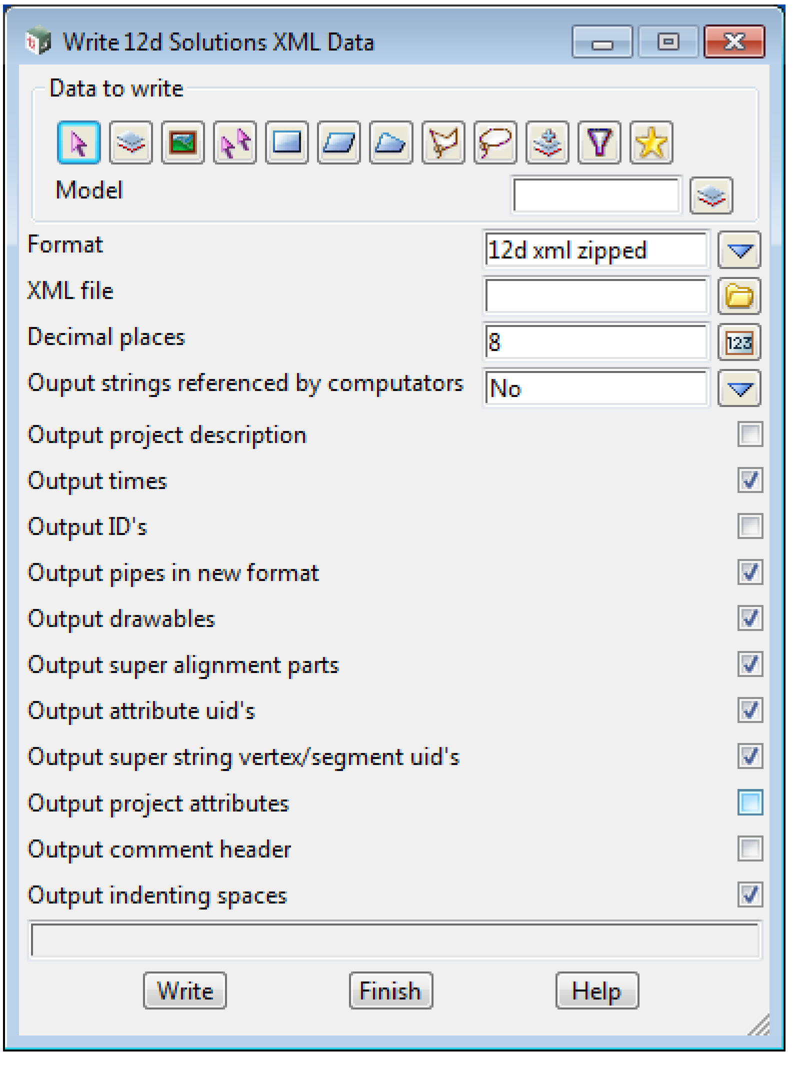
8.2.2.2 12d XML Data

Position of option on menu: **File I/O =>Data output =>12d =>12d XML data**

The ***12d XML*** format is a special format defined by 12d Solutions to allow data to be easily transferred from other programs into 12d Solutions software such as 12d Model. The **12d XML** format is given in 35 12d XML File Format.

Note - 12d XML contains the same information as a 12da file but it is a XML format.

Selecting **12d XML data** brings up the **Write 12d Solutions XML Data** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

Data to search - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to be written out to a file.

Format	choice	12d xml zipped	12d xml zipped, 12d xml

use 12d xml zipped (12dxmlz) or 12d xml format (12xml). The only difference is that the 12xmlz file is a zipped 12dxml file with the same name stem.

XML file file box

name of the file for the information to be written out to in 12d XML format. If the file already exists, then you are asked to Append, Replace or Cancel.

Decimal places integer box 8

the number of decimal places used when writing out the data.

Output string references by computators choice box No Yes, No
, De-reference

*if **Yes**, any strings referenced by computators by strings in the data source that are not in the data source, are also written out.*

*If **No**, any strings referenced by computators by strings in the data source that are not in the data source, are NOT written out.*

*If **De-reference**, any super strings in the data source with computators are de-referenced. That is, the computators are replaced by internal elements of the string.*

Output project description tick box

if ticked, the project description is written out as comments at the top of the file.

Output times tick box

if ticked, write out the creation times, etc. for the objects.
If not ticked, don't write out the creation times etc. for the objects.

Output ID's tick box

if ticked, write out the object IDs.
If not ticked, don't write out the object IDs.

Output pipes in new format tick box

if ticked,
If not ticked, don't write out.

Output drawables tick box

if ticked, write out the internal super alignment labelling as text.

Output super alignment parts tick box

if ticked, write out all the construction details for super alignments.
If not ticked, don't write out the construction details. Just write out the HG and VG segments.

Output attribute uid's tick box

if ticked, write out the attribute uids.

Output super string vertex/segment uid's tick box

if ticked, write out the any vertex and segment UIDs.

Output project attributes tick box

if ticked, write out the project attributes.

Output comment header tick box

if ticked, write out information as comments at the top of the 12da file.

Output indenting spaces tick box

if ticked, leave out spaces for indenting lines in the file. This will reduce the size of the text 12d XML file.

Write button

write out the data specified by the Data source.

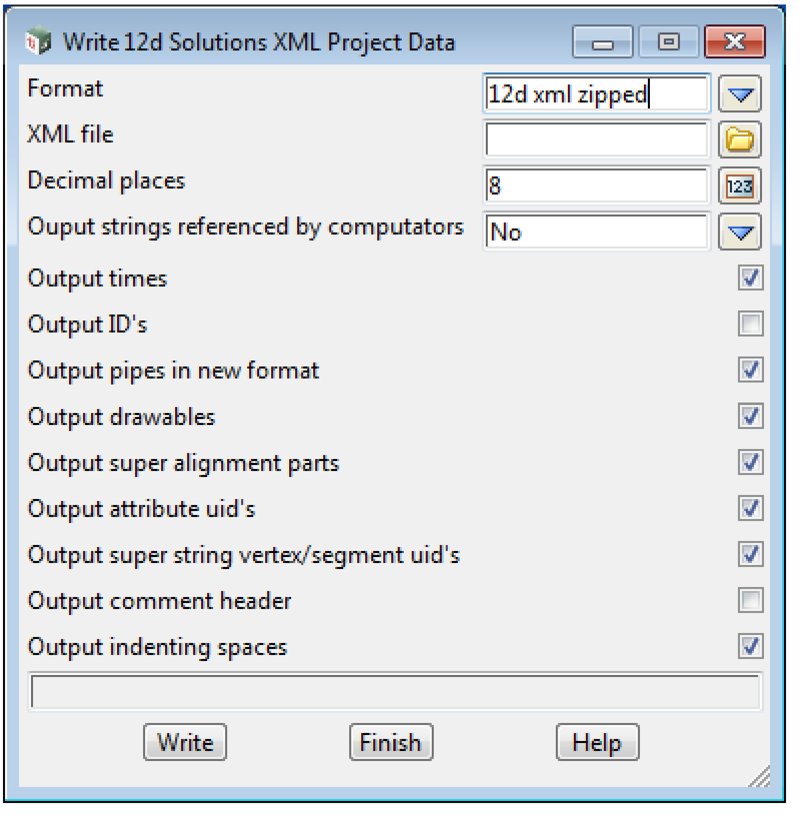
8.2.2.3 12d XML Project Data

Position of option on menu: **File I/O =>Data output =>12d =>12d XML project data**

The ***12d XML*** format is a special format defined by 12d Solutions to allow data to be easily transferred from other programs into 12d Solutions software such as 12d Model. The **12d XML** format is given in the Appendix.

Note - 12d XML contains the same information as a 12da file but it is a XML format.

Selecting **12d XML project data** brings up the **Write 12d Solutions XML Project Data** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
XML file	folder box		

name of the file for the information to be written out to in 12d XML format. If the file already exists, then you are asked to Append, Replace or Cancel.

Decimal places	integer box	8	

the number of decimal places used when writing out the data.

Output strings referenced by computators	choice box	No	Yes, No , De-reference

*if **Yes**, any strings referenced by computators by strings in the data source that are not in the data source, are also written out.*

*If **No**, any strings referenced by computators by strings in the data source that are not in the data source, are NOT written out.*

*If **De-reference**, any super strings in the data source with computators are de-referenced. That is, the* *computators are replaced by internal elements of the string.*

Output times tick box

if ticked, write out the creation times, etc. for the objects.
If not ticked, don't write out the creation times etc. for the objects.

Output ID's tick box

if ticked, write out the object IDs.
If not ticked, don't write out the object IDs.

Output pipes in new format tick box

if ticked,
If not ticked, don't write out.

Output drawables tick box

if ticked, write out the internal super alignment labelling as text.

Output super alignment parts tick box

if ticked, write out all the construction details for super alignments.
If not ticked, don't write out the construction details. Just write out the HG and VG segments.

Output attribute uid's tick box

if ticked, write out the attribute uids.

Output super string vertex/segment uid's tick box

if ticked, write out the any vertex and segment UIDs.

Output comment header tick box

if ticked, write out information as comments at the top of the 12da file.

Output indenting spaces tick box

if ticked, leave out spaces for indenting lines in the file. This will reduce the size of the text 12d XML file.

Write button

write out the data specified by the Data source.

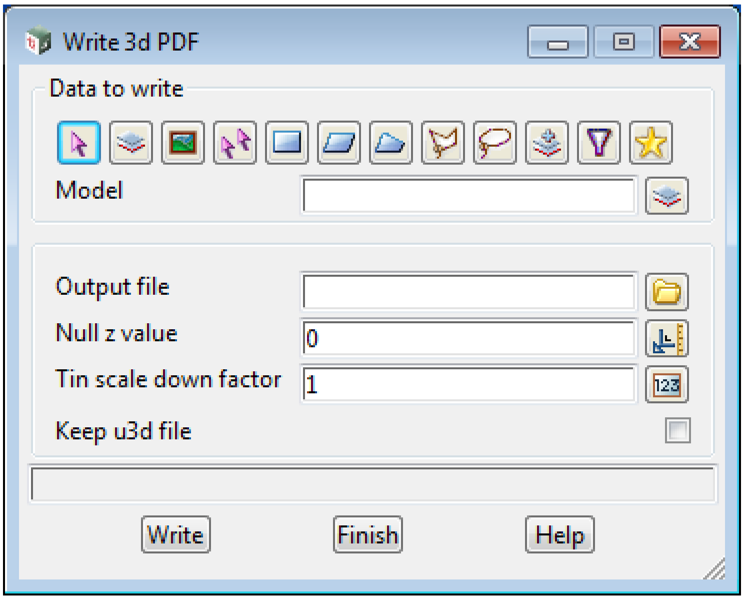
8.2.3 Write 3D PDF

This option writes out a Data Source as a 3D pdf file.

Currently no textures are applied.

Position of option on menu: **File =>Data output =>Export 3d pdf**

Selecting **Export 3d pdf** brings up the **Write 3d pdf** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

Data to search - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data is to be written out to a 3d pdf file.

Output file	file box		*.pdf

name of the 3d pdf that is created.

Null z value real box

z-value to use in place of null z-values in 12d strings.

Tin scale down factor integer box

if this value is greater than one then triangles from tins start to be dropped out.

Keep u3d file tick box

if ticked, the u3d file that becomes part of the 3d PDF is also kept as a separate file.

Write button

write out the specified data to the pdf file.

To view the 3D PDF, see 8.2.3.1 How to View the Generated 3D PDF

8.2.3.1 How to View the Generated 3D PDF

At the moment the option is not setting an eye and target point do to look at the data in the generated 3d pdf file, follow these steps:

1. Open the 3d pdf file with Acrobat pdf viewer. You'll then get a bit of a box drawn on the screen.
2. Move the cursor into the box and you will see the message **Click to activate**.Then click anywhere inside the box.
3. Then Right click to bring up a menu and choose **Full Screen Multimedia** from the menu. You should then see your data fitted in the view and displaying.

   Hold down the left mouse button to rotate. Wheel to zoom in and out. Shift LB to pan.

Return to 8.2.3 Write 3D PDF.

8.2.4 ArcView SHP Output

Position of option on menu: **File I/O =>Data output =>ArcView SHP**

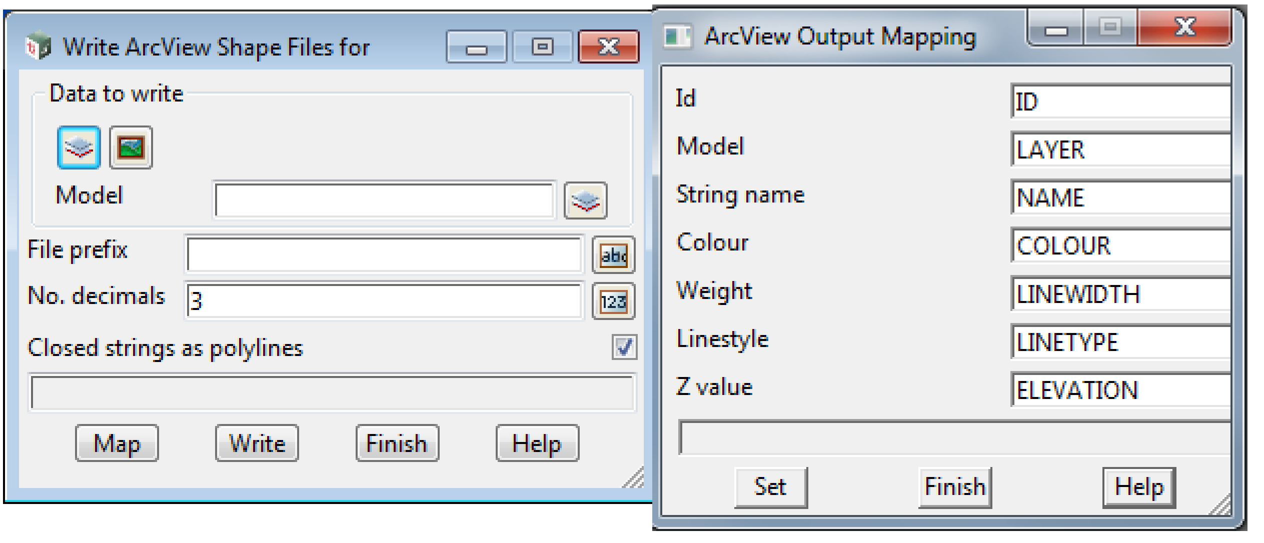
ArcView i/o is a separate chargeable module.

This Option is currently under development.

The *ArcView Shape File* format consists of nine different files containing different data types.

The ArcView shape format has no colour, model or layer information, string names, *etc.*, so this information has to be passed through as attributes for the data.

Selecting **ArcView SHP** displays the **Write ArcView Shape Files for** panel.



The fields and buttons used in the **Write ArcView Shape Files for** panel have the following functions.

Field Description Type Defaults Pop-Up

Data source type Model

Data to search - for a full description go to 4.19.3 Data Source.

Data source input

source of data is to be written out to a file.

File prefix input

prefix to use for the nine different shape files to be produced for the data.

No. decimals integer box 3

number of decimal places to use in the shape files.

Closed strings as polylines tick box 3

if ticked, write out closed strings in polyline shape files

Map button

brings up the **ArcView Mapping** *panel which defines the ArcView attributes to write the standard* ***12d Model*** *string header information out to.*

Write button

write out, in ArcView shape file format, all the string data specified by the Data source.

The fields and buttons used in the **ArcView Mapping** panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Id		ID	

if non blank, write out an integer number which increments from 1.

Model		LAYER	

if non blank, write out the model of the string to this attribute.

String name		NAME	

if non blank, write out the name of the string to this attribute.

Colour		COLOUR	

if non blank, write out the colour of the string to this attribute.

Weight		LINEWIDTH	

if non blank, write out the weight of the string to this attribute.

Linestyle		LINETYPE	

if non blank, write out the linestyle of the string to this attribute.

Z value		ELEVATION	

if non blank, write out the first z-value of the string to this attribute.

Set	button		

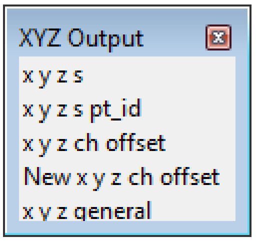
record the attribute names given in the panel as the ones to be use when writing out the data.

8.2.5 Output X Y Z Text Files

Position of menu: **File I/O =>Data output =>x y z**

The options under **x y z** out write out vertices of selected strings in a text format. It is also possible to write out string names, point IDs, string, segment and vertex attributes, and chainages and offsets from a selected string.

The **X Y Z** walk-right menu is



x y z s data
user specified x y z s point ID
user specified x y z chainage and offset
new user specified x y z chainage and offset
user specified x y z s point no and attribute

For *x y z s*, go to	8.2.5.1 X Y Z S Output
x y z pt_id	8.2.5.2 User X Y Z S Output
x y z ch offset	8.2.5.3 User X Y Z Chainage and Offset Output
New *x y z ch offset*	8.2.5.3 User X Y Z Chainage and Offset Output
General *x y z etc.*	8.2.5.4 User X Y Z and Attributes Output

8.2.5.1 X Y Z S Output

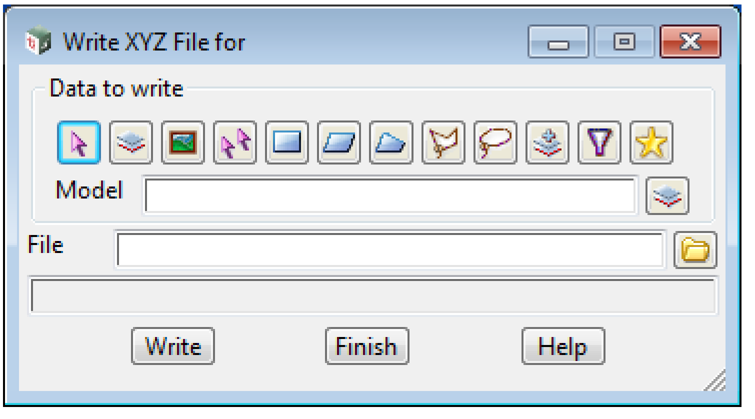
Position of option on menu: **File I/O =>Data output =>x y z =>x y z s**

The xyzs output format is identical to the input format - one point per line with the ***x y*** and ***z*** values separated by spaces, and ***s*** is the string name.

A string's colour and label are used as colour records and string labels in the output file.

4d, interface, super strings and alignment strings are only output as 3d strings. The use of the 12d Model 12da file format is formatted for writing out all ***12d Model*** string types.

Selecting the **xyzs** option brings up the **Write XYZ File for** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
data selection type - for a full description go to 4.19.3 Data Source.			
Data source	input		
source of data is to be written out to a file.			
File	input		*.dat files
name of the file for the information to be written out to.			
Write	button		
write out, in x y z s format, all the string data specified by the Data source.			

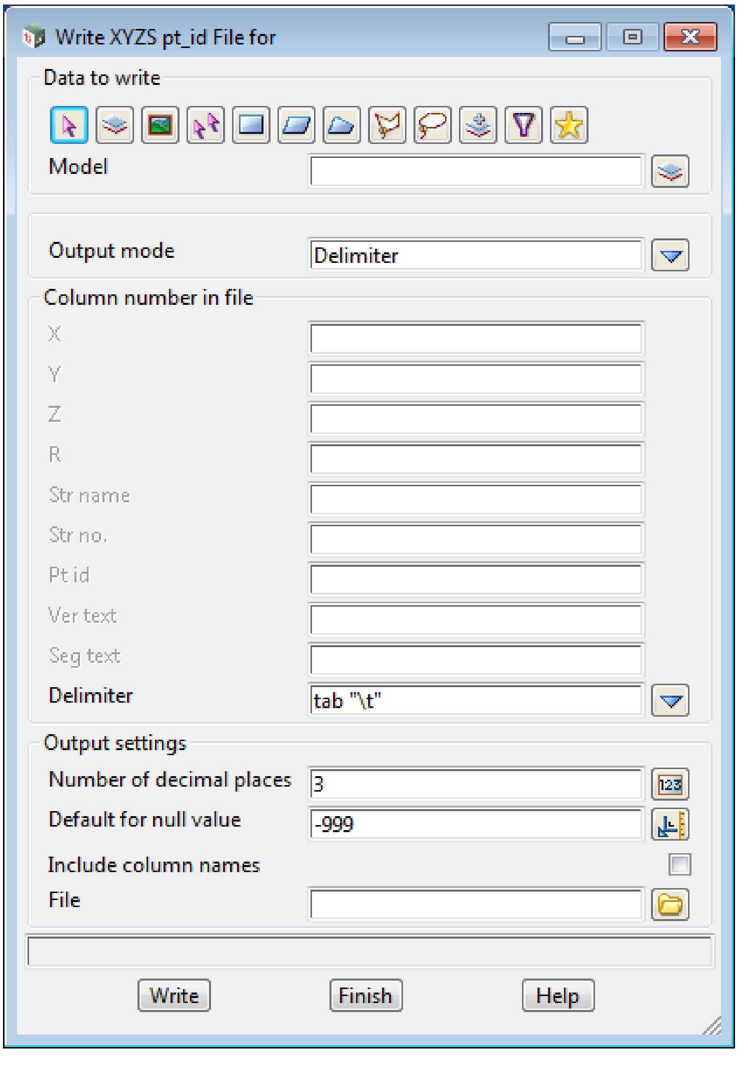
8.2.5.2 User X Y Z S Output

Position of option on menu: **File I/O =>Data output =>x y z =>x y z s pt_id**

The xyzs output format is identical to the user specified input format - one point per line with the x y z s and point id values in a user specified order separated by either delimiters or in fixed width columns.

super strings, 4d, interface and alignment strings are only output as 3d strings. The use of the 12d Model 12da file format is used for writing out all ***12d Model*** strings types.

Selecting the **xyzs pt_id** brings up the **Write XYZS pt_id File for** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data is to be written out to a file.

Output mode	choice box	delimiter	delimiter, fixed width

*if **delimiter**, the type of delimiter and the columns for the x, y, z, name and point number are given (and* *are all optional).*

If ***fixed width****, the start and end column positions are given for x, y, z, name and point number which are all optional.*

Output Settings

Number of decimal places input box 3

number of decimal places to use in the x, y and z values.

Default for null value input box -999

value to write out for z when it is a null value in ***12d Model****.*

Include column names tick box

if ticked, the names x, y, z etc. are written out in the appropriate columns as the first line of the file.

File input *.dat files

name of the file for the information to be written out to.

Write button

write out all the string data specified by the Data source.

8.2.5.3 User X Y Z Chainage and Offset Output

Position of option on menu: **File I/O =>Data output =>x y z =>x y z s ch offset**

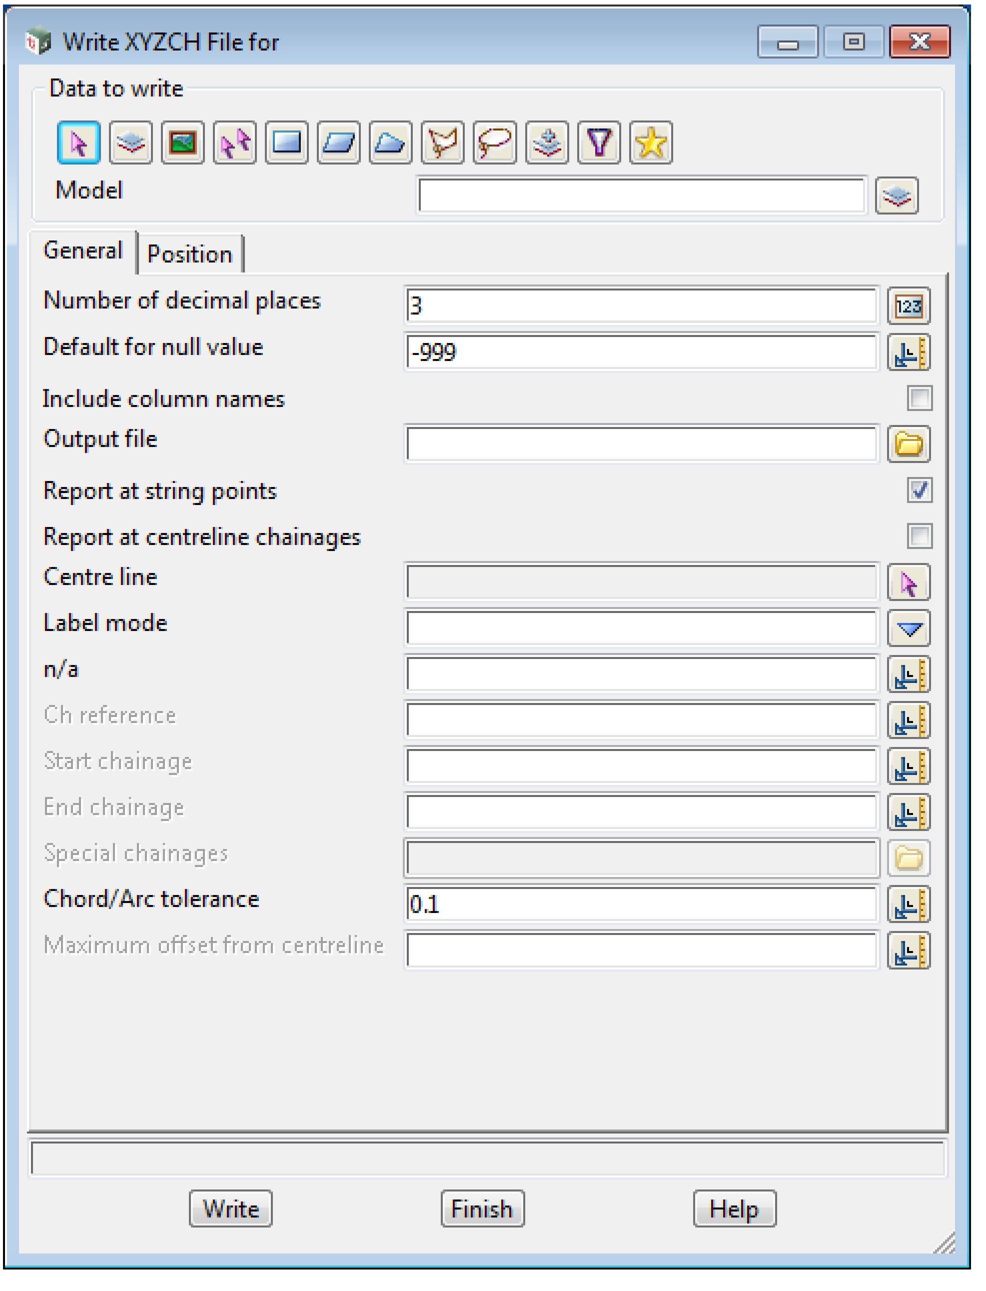
Position of option on menu: **File I/O =>Data output =>x y z =>New x y z s ch offset**

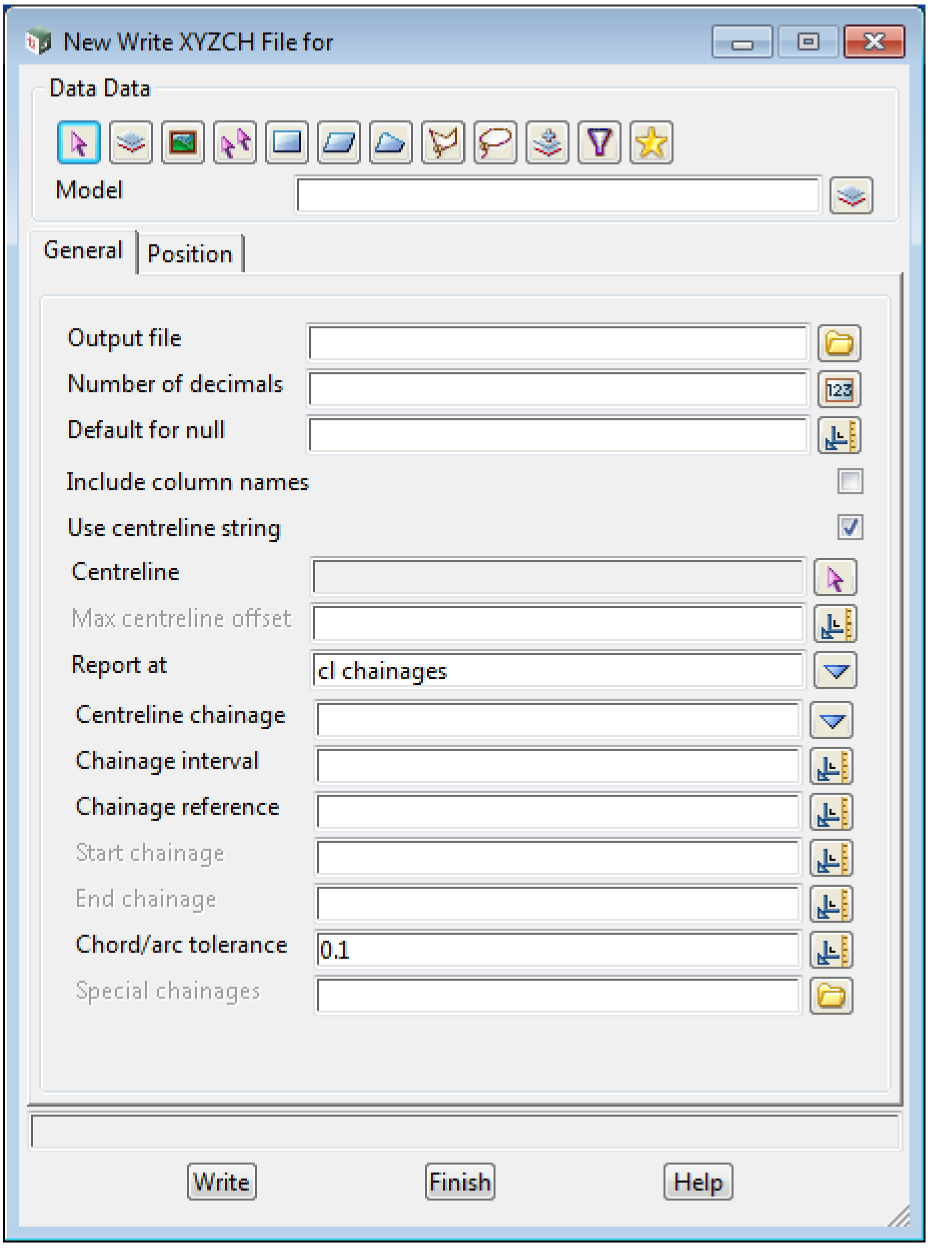
The *New xyz ch offset* option was introduced in V7C1g and will replace the standard option.

The difference is that the new option turns off the panel fields that are not required.

The *xyz and ch* output option writes out the x, y, z and chainage values for each string or a centreline string can be selected and the x, y, z and chainage values from the original string are output along with the chainage and offset from the selected reference string.

Selecting **xyzs ch offset** brings up the **Write XYZSCH File for** panel.





The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Data source type Model

data selection type - for a full description go to 4.19.3 Data Source.

Data source input

source of data is to be written out to a file.

Write button

write out all the data specified by the Data source.

General tab

Number of decimal places input box 3

number of decimal places to use in the x, y, z and chainage values.

Default for null value input box -999

value to write out for z when it is a null value in ***12d Model.***

Include column names tick box

if ticked, the names x, y, z etc. are written out in the appropriate columns as the first line of the file.

Output File input *.dat files

name of the file for the information to be written out to.

Report at string points tick box

if ticked, the values are output for the points (vertices) of the strings from the data source. If a centre line has been selected, then the chainage for the centre line is calculated by dropping the string vertex onto the centre line.

Report at centreline chainages tick box

if ticked, the specified chainages of the selected centre line (given by label mode etc.) are used and then the positions on the strings from the data source are calculated by going out at right angles to the centre line at the chainage.

Centreline string select

optional - a selected centreline to use for chainages.

Label mode input regular interval,
regular interval (plus end pts)
end points only
horizontal TPs,
vertical TPs,
horizontal discontinuities
vertical discontinuities
all discontinuities,
crests/sags
all horizontal points

type of chainages to use from the centreline.

Ch interval or n/a input

the regular interval to use for chainages.

Ch reference input 0

the chainages to user are integer multiples of the chainage interval added to the reference chainage. For example, if the reference chainage is 23.2 and the chainage interval 10, the chainages 3.2, 13.2, 23.2, 33.2 etc. will be used.

Start chainage input

if non-blank, the string chainage to start using.
If blank, start at the beginning of the string.

End chainage input

if non-blank, the string chainage to finish.
If blank, go to the end of the selected string.

Special chainage file box

file of special chainages to use.

Chord/arc tolerance input default chord/arc tolerance

the chord to arc tolerance to use on the centreline string for determining how many points are used around horizontal curves.

Maximum offset from centreline

if non blank, any vertices further than this distance from the centreline will NOT be written out.

If non blank, all vertices will be written out.

Position tab

Output mode choice box delimiter delimiter, fixed width

*if **delimiter**, then the specified data is written out, each value separated by the delimiter given in the* **Delimiter** *field.*

*If **fixed width**, the specified data is written out to a fixed position on the line. An end position is also given.*

String name

if the column number (delimiter) or start-end position (fixed width) is given, then the name of the string from the data source is written out. Otherwise it is not written out.

String vertex index

if the column number (delimiter) or start-end position (fixed width) is given, then the vertex index of the string vertex is written out.

String point id

if the column number (delimiter) or start-end position (fixed width) is given, then the point id of the vertex of the string is written out.

String chainage

if the column number (delimiter) or start-end position (fixed width) is given, then the string chainage of the vertex of the string is written out (not the centre line chainage).

String x/y/z

if the column number (delimiter) or start-end position (fixed width) is given, then the x/y/z co-ordinate of the position on the string is written out (not the centre line x/y/z).

CL offset

if the column number (delimiter) or start-end position (fixed width) is given, then the offset of the string from the centre line is written out.

CL chainage

if the column number (delimiter) or start-end position (fixed width) is given, then the chainage of the centre line is written out.

CL x/y/z

if the column number (delimiter) or start-end position (fixed width) is given, then the x/y/z co-ordinate of the position on the centre line string is written out.

8.2.5.4 User X Y Z and Attributes Output

Position of option on menu: **File I/O =>Data output =>x y z =>x y z general**

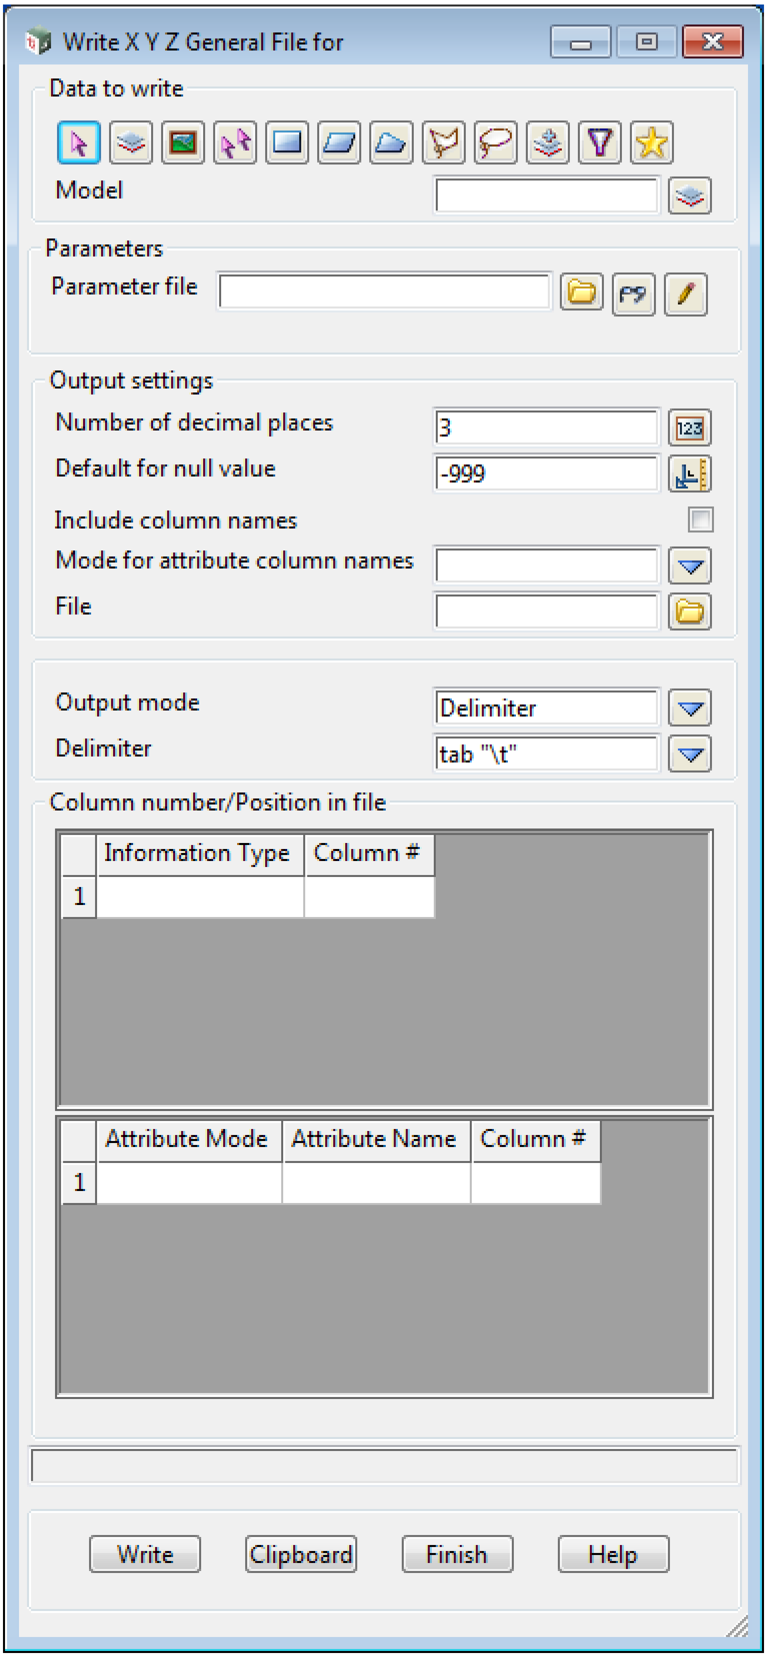
The xyzs output format is identical to the user specified input format - one point per line with the x y z s, point ID and attribute values in a user specified order separated by either delimiters or in fixed width columns.

In either case, the user specifies the order that the x, y, z, string name, point ID and attributes appear in the file. Only one or more of the items needs to be written out.

The set-ups for defining all the positions of all the data in the file can be written out to a file (.xyf) for re-use.

Super strings, 4d, interface and alignment strings are only output as 3d strings. The 12d Model 12da file format is used for writing out all string types.

Selecting **xyz general** brings up the **Write X Y Z General File for** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Data to write section

Data source type Model

data selection type - for a full description go to 4.19.3 Data Source.

Data source input

source of data is to be written out to a file.

Parameters section

Parameter file input *.xyf files

name of the file containing the settings for how the data is positioned in the output file.

Read icon button

read the parameter file in.

Write icon button

write the setting in the panel out to a parameter file.

Output settings section

Number of decimal places input box 3

number of decimal places to use in the x, y and z values.

Default for null value input box -999

value to write out for z when it is a null value in ***12d Model****.*

Include column names tick box

if ticked, the names x, y, z etc. are written out in the appropriate columns as the first line of the file.

File input *.dat files

name of the file for the information to be written out to.

Output mode choice box Delimiter Delimiter, Fixed width

*if **Delimiter**, the type of delimiter and the columns for the x, y, z, string name, attributes etc. are given (and are all optional).*

*If **Fixed width**, the start and end column positions are given for x, y, z, string name, attributes etc. which are all optional.*

Delimiter choice box tab \f one space, tab \t,
semi colon, comma
many spaces

*if **Output mode** is **Delimiter**, then this is the type of delimiter to separate data in the output file.*

Information Type Grid - Column number in file (Delimiter) or **Start/ End** (Fixed Width)

Information Type choice box x coord, y coord, z coord, chainage, radius
segment major, string name, string number
string name/string number, point id
vertex text, segment text

information to write out (x,y,z, attributes etc.) and this position in the output file.

Position # (Delimiter) or **Start/ End** (Fixed Width)

if Delimiter, the position number of the information in the tab separated file.

If Fixed Width, the start and end column position for the information.

Attribute Grid

Attribute Mode choice box string, segment, vertex *type of attribute to write out*

Attribute Name

name of the attribute to write out

Position # (Delimiter) or **Start/ End** (Fixed Width)

if Delimiter, the position number of the information in the tab separated file.

If Fixed Width, the start and end column position for the information.

Write button

write out all the string data specified by the Data source to the given file.

Clipboard button

write out all the string data specified by the Data source to the clipboard.

8.2.6 Output DGN Binary Files

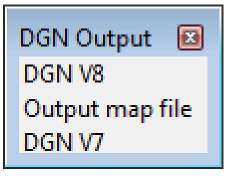
Position of menu: **File I/O =>Data output =>DGN**

DGN output is a separate chargeable module.

The options under **DGN** write DGN V7 and DGN V8 binary files.

There is also an option to create/edit a DGN output map file.

The **DGN** walk-right menu is



write DGN V8 binary file
Create/edit Output map file for DGN V8 binary
write DGN V7 binary file

For *DGN V8*, go to 8.2.6.1 Output DGN V8
Output map file 8.2.6.2 DGN V8 Output Map File Create/Edit
DGN V7 8.2.6.3 Output DGN V7

8.2.6.1 Output DGN V8

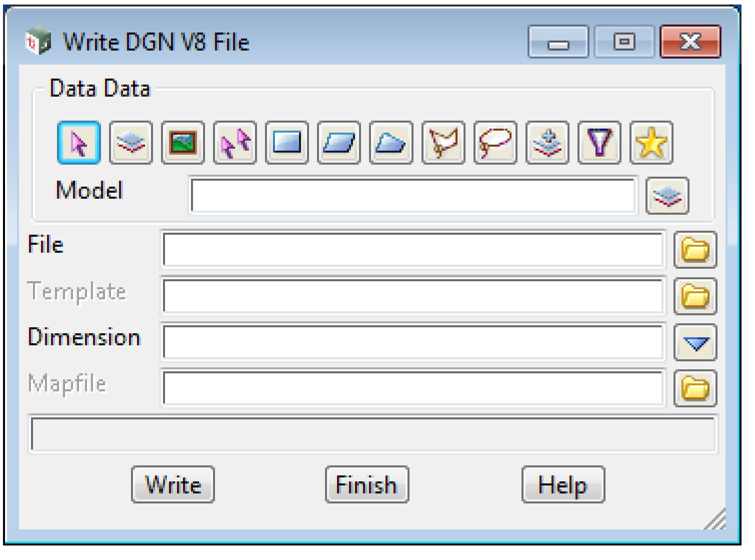
Position of option on menu: **File I/O =>Data output =>DGN = >DGN V8**

DGN output is a separate chargeable module.

NOTE: the format of the DGN file has changed for DGN V8 but it is proprietary to Bentley and it has not been published. This is a beta version of the DGN V8 Writer to try and write DGN V8 binary files. At this stage it is better to use DWG I/O to go in and out of Microstation V8.

Note: this option is under development

On selecting the **DGN V8** option, the **Write DGN V8 File** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data is to be written out to the DGN file.

DGN V8 file	file box		*.dgn files

name of the DGN V8 binary file to be write out to

Dimension	choice box		2d. 3d

dimension of the DGN file

Template	file box		*.dgn files

name of the DGN binary file to use as a DGN template

DGN output map file	file box		*.dgnmfx files

name of the DGN output mapping file to use

Write	button		

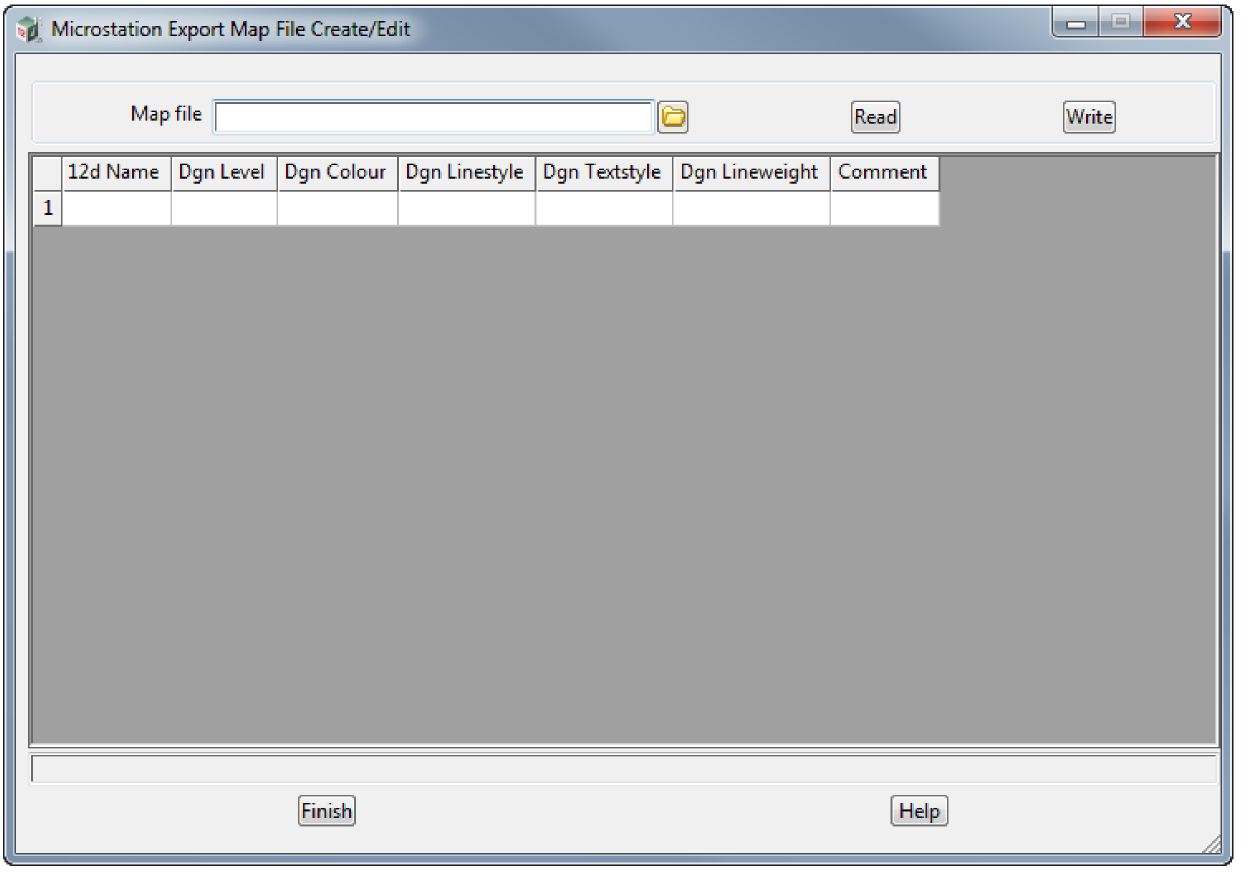
read the data out as a DGN V8 binary file.

8.2.6.2 DGN V8 Output Map File Create/Edit

Position of option on menu: **File I/O => Data Output => DGN => Output map file**

The **DGN output map file** option **creates** or **edits** the map files used when writing data out to Microstation DGN V8 binary format using the DGN V8 option (not used for plotting to DGN V8).

Selecting **DGN output map file** brings up the **DGN Export Map File Create/Edit** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Map file	input		*.acadmf

name of the DGN output map file to be created or edited.

Read button

read in the DGN output map file given in the **map file** *field and load the data into the fields of the table. If the file doesn't exist, an error message is given.*

Write button

write out the data in the table to the file name given in the **map file** *field. If the file already exists, a Replace-Cancel panel checks to see if the existing file is to be over written - if no or cancel is selected, nothing is written out.*

Grid Cells

12d Name

12d Model *string names for the mapping to apply to - wild cards (*) and characters (!) can be used.*

DGN level

*Microstation level to send the selected strings to. Use * to write the **12d Model** model of the string out*

Dgn colour

*Microstation colour to use for the selected strings. Use * for **12d Model** colour number.*

Dgn linestyle

*Microstation linestyle to use for the selected strings. Use * for **12d Model** linestyle*

Dgn Textstyle

*Microstation Textstyle to use for the selected strings. Use * for **12d Model** text style*

Dgn lineweight

Microstation lineweight to use for the selected strings.

8.2.6.3 Output DGN V7

Position of option on menu: **File I/O =>Data output =>DGN =>DGN V7**

DGN output is a separate chargeable module.

Using the **DGN V7** option,***12d Model*** produces DGN binary files (***.dgn** files - as defined in the public domain by Intergraph Corp) as used by Intergraph and Microstation. Since DGN V7 supports 3d faces, the triangles created in 12d Model can be transferred to DGN V7 for use in shaded models and walk-throughs.

DGN V7 files are either 2d or 3d. ***12d Model*** can write either type of file. If a 3d file is being written, the ***12d Model*** strings will be written out as three dimensional DGN lines. The alignment strings and arcs will be approximated by short lines.

If a 2d file is being written, arcs in alignment strings are written out as DGN plan arcs.

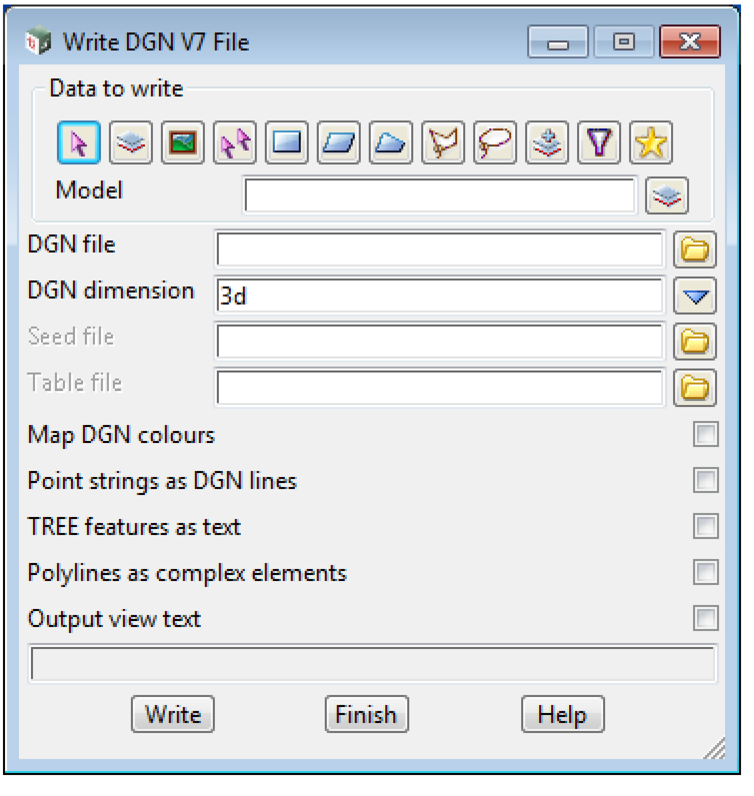
When creating a DGN V7 binary file, it is often convenient to append the information to an existing DGN file known as a **seed file** (the seed file usually contains set up information for the DGN V7 drawing).

In ***12d Model*** the user can specify a folder containing seed files by pointing to it using the environment variable MS_SEEDFILES_4D. In the DGN V7 output option, the pop-up for the **seed file** panel field displays all the files ending in **.dgn** in the folder pointed to by MS_SEEDFILES_4D.

If the environment variable MS_SEEDFILES_4D has not been set, the pop-up uses the current working folder to search for seed files.

It is possible to use an output map file (called a table file) with string name as the key to set DGN V7 levels, colours, weight, style and special symbols (see next section). Because of the limitation of 64 levels in DGN V7, using a table file is normally the best method of getting data across to DGN V7.

On selecting the **DGN V7** option, the **Write DGN V7 File** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source input

source of data is to be written out to a DGN V7 binary file.

DGN file input *.dgn

name of the DGN V7 file to write the model/view data out to. If the file exists, it is appended to, and the settings for TCB variables are read from the file. If the file does not exist, it is created with default TCB settings. The file is created either 2d or 3d depending on the **DGN Dimension** *field.*

DGN Dimension input 3d 2d/3d

this field controls the dimension of DGN files created for the case where the file named in the **Seed file** *does not exist.*

Seed file input files in the seed folder

if non-blank, this field gives the name of the DGN V7 file to be used as a seed file for the DGN V7 output. The folder containing the seed files, the seed folder, is given by the environment variable MS_SEEDFILES_4D.

Table file input *.tbl file

if non-blank, the file is used as an output map file between 12d Model and the .dgn binary file. See 8.2.6.3.1 DGN V7 Output Mapping File (Table File).

Map DGN Colours tick box

*if **not ticked**, 12d Model colour number n is mapped to DGN V7 colour n.*
*if **ticked**, some of the 12d Model colours are attempted to be mapped to DGN V7 colours.*

Point strings as DGN line tick box

*if **ticked**,* **12d Model** *points go out as DGN V7 two point strings with the same value for each point.*
*if not **ticked**,* **12d Model** *points go out to DGN V7 points.*

TREE features as text tick box

*if **ticked** and their is a table file match for TREE, then* **12d Model** *writes out feature strings of name "TREE" as text in DGN. Other feature strings go out as circles.*
*if not **ticked**, all* **12d Model** *feature strings go out as DGN V7 circles.*

Polylines as complex elements tick box

*if **ticked** and **DGN dimension** is **2d**,* **12d Model** *writes out polylines as complex elements made up of lines and arcs.*
*if not **ticked**, the polyline goes out as individual lines and arcs.*

Output view text tick box

*if **ticked**, any view text turned on (point numbers, z-values etc.) are output as text in DGN V7.*
*if not **ticked**, view text is not output.*

Write button

write out the all the data specified by the Data source to the file given in the **DGN file** *field.*

8.2.6.3.1 DGN V7 Output Mapping File (Table File)

When using the output options to write out a DGN V7 file, a DGN V7 output mapping file (table file) can be used, with string names as the key, so that the user can specify DGN level, colour, weight, style and some information which is placed in an DGN attribute. The format is based on the VicRoads specification.

The key can have wild cards (*) and wild characters (?) as for the input map files.

The table consists of lines containing either 8 or 16 free format fields. Fields 9-16 can be left off if they are not needed.

The key for the map is the ***12d Model*** string name which is given as the first field of a line. The rest of the fields on the line are used for .dgn information.

field 1	***12d Model*** string name (any length but if field 2 is a *, only the first four characters are passed)	
field 2	text of which the first four characters are used in a DGN V7 attribute. For example, the VicRoads code	
field 3	AS2482 feature code	
field 4	description	(any length but quotes needed if there are embedded spaces)
field 5	line level	(between 1 and 64)
field 6	line colour	(between 1 and 256)
field 7	line weight	(between 1 and 7)
field 8	line style	

fields 9-16 are only used for special symbols placed at points.

field 9	symbol font	(between 0 and 7)
field 10	symbol character	
field 1	symbol character justification	
field 12	symbol character height	
field 13	symbol character width	
field 14	symbol level	
field 15	symbol weight	
field 16	symbol colour	

Field 1, the 12d Model string name, can contain wild cards * or wild characters ?.

Field 2, a text string, and the first four characters of the text is inserted into a DGN V7 attribute. This DGN V7 attribute is used by the ***12d Model*** DGN V7 reader for matching with a ***12d Model*** input map file.

If field 2 is a * then the first four characters of the ***12d Model*** string name is inserted as an Intergraph attribute.

Line strings and Text strings only use fields 1 to 8 and ignore fields 9-16 (if they exist).

Fields 9 through 16 are only used for ***12d Model*** point strings which are then mapped with the specified Intergraph symbol at each point of the string.

If either field 12 or 13 is zero, then it is interpreted to mean that only the first 8 fields are used.

If any of the fields 5 through 16 (except 9 and 11) is a *, then that field is not used in the map.

Double quotes **"** are entered as text as \", a **'** as \' and a **** as \\\\.

An example of a map table where the first four characters of the ***12d Model*** string names are passed directly through to the DGN attribute.

```
CONT    *    50020000    "Contour - Standard  "    2    4    0    0
TOP     *    25060001    "Top - Cut/fill/bank "    2    11   1    2
TOE     *    25060002    "Toe - Cut/fill/bank "    3    11   1    7
ES*     *    50090001    "Existing surface-spot "  4    9    1    0    110    A    7    1000    1000    4
0   9
```

CIND * 50080000 "Contour - Index " 2 4 1 0

An example of a map table where the ***12d Model*** string names are used for mapping but different names go through to the DGN attribute.

101 CONT 50020000 "Contour - Standard " 2 4 0 0
102 TOP 25060001 "Top - Cut/fill/bank " 2 11 1 2
104 ES 50090001 "Existing surface-spot" 4 9 1 0 110 A 7 1000 1000 4 0 9

Return to 8.2.6.3 Output DGN V7

8.2.7 Output DWG/DFX/DXB Files

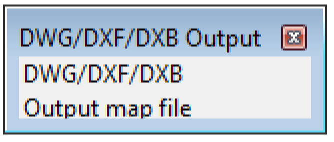
Position of menu: **File I/O =>Data output =>DWG/DXF/DXB**

DWG/DXF/DXB i/o is a separate chargeable module.

The option under **DWG/DXF/DXB** writes DWG, DXF and DXB files in a variety of AutoCAD formats.

There is also an option to create/edit an AutoCAD output map file.

The **DWG/DXF/DXB** walk-right menu is



write DWG/DXF/DXB V8 files
Create/edit Output map file for DWG

For *DWG/DXF/DXB*, go to 8.2.7.1 DWG/DXF/DXB Output
Output map file 8.2.7.2 AutoCAD Output Map File Create/Edit

8.2.7.1 DWG/DXF/DXB Output

Position of option on menu: **File I/O =>Data output =>DWG/DXF/DXB =>DWG/DXF/DXB**

DWG/DXF/DXB i/o is a separate chargeable module.

The DWG/DXF output format is for writing data out in a format compatible with AutoCAD versions 2.5 to 20010.

12d Model line strings are output as POLYLINEs, point strings as a series of AutoCAD POINTs and triangles as 3DFACEs.

By default, the string or triangle colour is used in the Autocad colour record.

Trimeshes can be written out to a DWG file as either Polyface Meshes, 3DFaces or not at all.

The choice is set by the environment variable TRIMESH_TO_DWG_MODE_4D in the External Apps > AutoCAD. node of the **Edit Environment Variables** panel.

An AutoCAD Polyface Mesh can only have one colour so if the choice is **Polyface mesh** then the trimesh colour is used and any differently coloured trimesh triangles will only go out in the trimesh colour.

If the choice is **Faces** then each 3DFace is given the colour of the corresponding triangle of the trimesh.

The DXF layer used is the items model name with any spaces in the model name replaced by a minus (-). However, a DXF output map file with matches on string name can be used to give DXF layers, colours and line type (see next section).

Super strings, 4d, interface and alignment strings can only output as Autocad POLYLINES.

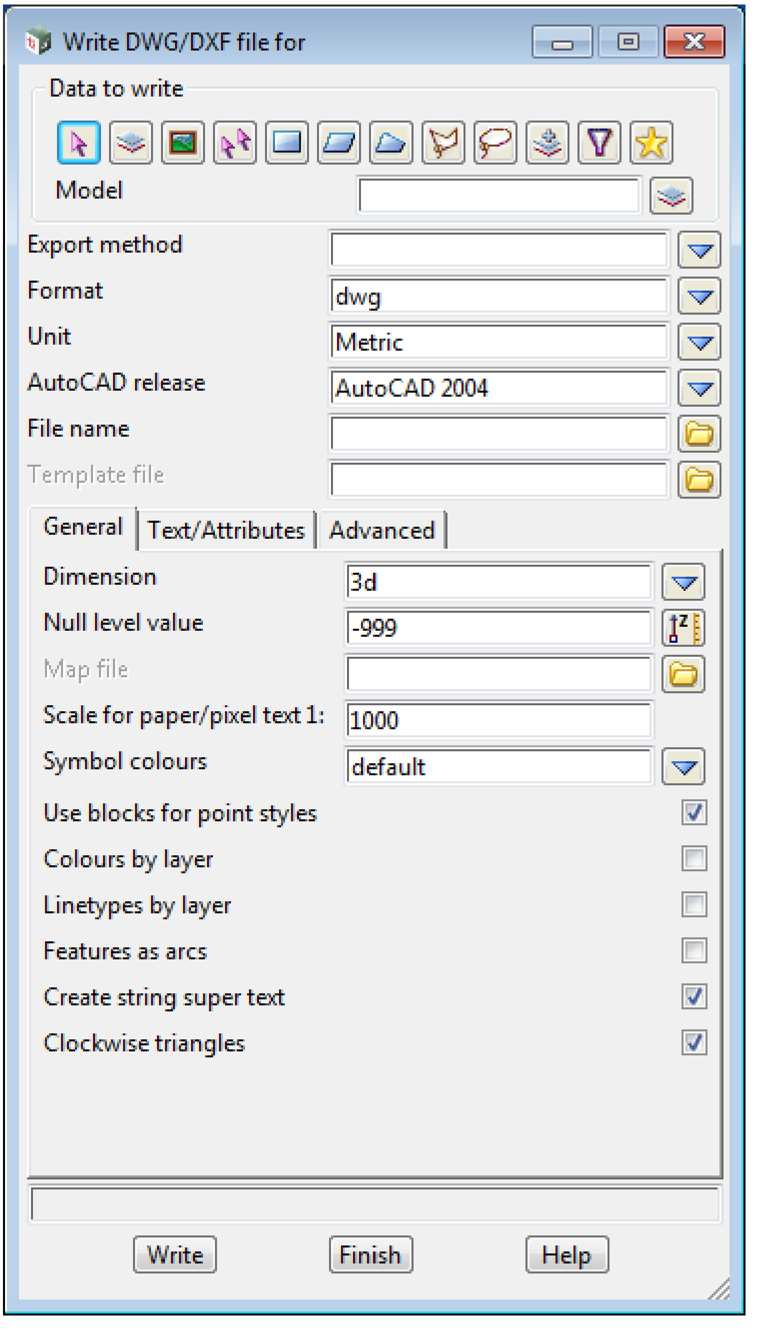
When creating an AutoCAD file, it is often convenient to use an existing AutoCAD file as a template or **seed file** (the seed file usually contains set up information for the AutoCAD drawing).

In ***12d Model***, the user can specify a folder containing seed files by pointing to it using the environment variable ACAD_SEEDFILES_4D. In the AutoCAD DWG/DXF output option, the pop-up for the **seed file** panel field displays all the files with the appropriate ending in the folder pointed to by ACAD_SEEDFILES_4D.

If the environment variable ACAD_SEEDFILES_4D has not been set, the pop-up uses the current working folder to search for seed files.

It is also possible to use a label map file to create labels for vertex information such as z-values, symbols and point numbers which are written directly to the AutoCAD file. See the section 8.7.1 Create/Edit Label Map Fileand 8.7.2 Apply a Label Map Filefor more information on the label map file.

On selecting the **DWG/DXF** output option, the **Write DWG/DXF file for** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data is to be written out to a file.

Format	choice	dwg	dwg, dxf, bdxf

AutoCAD format of the file.

Unit	choice	Metric	Metric, English

AutoCAD units type.

AutoCAD release	choice	AutoCAD 2004	AutoCAD 12, 13, 14 AutoCAD 2000, 2002, 2004 2005, 2006, 2007

AutoCAD version of the file to be produced.

File name input

name of the ACAD file for the data to be written out to.

Template file input

name of the file to use as the AutoCAD template

Button at Bottom

Write button

write out, in DWG/DXF format, all the data specified by the Data source, to the file given in the file field.

General tab

Dimension	choice	3d	2d, 2d and contours 3d,3d

*if **2d**, the z-value of all the data is set to zero and arcs and curves in alignment strings are written out as dxf polylines with bulges for the arcs.*

*If **2d and contours 3d**, the z-value of all the non-contour data is set to zero and arcs and curves in alignment strings are written out as dxf polylines with bulges for the arcs. Contours are written out as 3d polylines.*

*If **3d**, strings will be written out as three dimensional DXF polylines. Alignment strings and arcs will be approximated by short lines.*

Null level value input -999

AutoCAD z-value to use for any vertices with the **12d Model** *null value*

Map file input *.acadmf files

*if non-blank, the name of an **AutoCAD output map file** to map the data. See* 8.2.7.2 AutoCAD Output Map File Create/Edit.

Scale for paper/pixel text 1: input 1000

scale to use to convert **12d Model** *paper and pixel text to ACAD world units*

Symbol colour choice box default default, by block, by layer

*if **default**, use the* **12d Model** *colour.*

*If **By block**, write out as BY BLOCK.*

*If **By layer**, write out as BY LAYER.*

Use blocks for point styles tick box

*if **ticked**, write out blocks for symbols at vertices*

Colour by layer tick box no tick

*if **ticked**, the colour is set to BY LAYER*

Linetypes by layer tick box no tick

*if **ticked**, the linestyle is set to BY LAYER*

Features as arcs tick box no tick

*if **ticked**, feature strings output as arcs in DXF.*
*if not **ticked**, the centre of the feature string is output as a point.*

Create string super text tick box no tick

*if **ticked**, write out text for super string vertex text and segment text*

Clockwise triangles tick box tick

*if **ticked**, the vertices for triangles in a tin are written out in clockwise order.*

Text/Attributes

Label map file *.lmf files

if not blank, the name of a file to be used as label map file for creating labels that will go out to the AutoCAD file.

Layer name for symbols

if not blank, the name of the layer to place symbols in.

Text tick boxes *tick boxes*

*if **Vertex** is ticked, vertex text is written out*
*if **Vertex index** is ticked, vertex indices are written out*
*if **Point id** is ticked, point ids (vertex id's) are written out*
*if **Height** is ticked, the z-values at each vertex are written out*
*if **Code** is ticked, the string name is written out*

Att tick boxes *tick boxes*

Layer Name

name of the AutoCAD layer to write text to

Write attributes: vertex tick box

if ticked, write out vertex text

Write attributes: segment tick box

if ticked, write out segment text

Advanced

Space in model name choice box space space, underscore, hyphen

*if **space**, then spaces in* **12d Model** *names go out as spaces to ACAD layer names.*

*If **underscore**, then spaces in* **12d Model** *names go out as underscores to ACAD layer names.*

*If **hyphen**, then spaces in* **12d Model** *names go out as hyphens to ACAD layer names.*

Acad point style choice style 0 Acad point styles

Point mode choice relative relative, absolute

*if **relative**, then*

*If **absolute**, then.*

Point size (%) input 5

Output view text tick box no tick

*if **ticked**, any view text turned on (point numbers, z-values etc.) are output as text in DXF.*
*if not **ticked**, view text is not output.*

Explode interface strings tick box no tick

*if **ticked**, interface strings are broken into separate strings for the cut or fill colour.*
*If not **ticked**, interface strings are written out as one string in magenta.*

Use model name for mapping tick box no tick

*if **ticked**,*
*if not **ticked**,.*

Use symbol name for mapping tick box no tick

*if **ticked**,*
*if not **ticked**,.*

Use textstyle_data name for mapping tick box no tick

*if **ticked**,*
*if not **ticked**,.*

Associate vertex attributes with symbol tick box no tick

*if **ticked**,*
*if not **ticked**,.*

Vertex attributes height input -999

Transition chainage interval

since AutoCAD does not have a transition element (spirals etc.), a transition can only be approximated. This is the chainage length to break up transitions.

Transition chord to arc

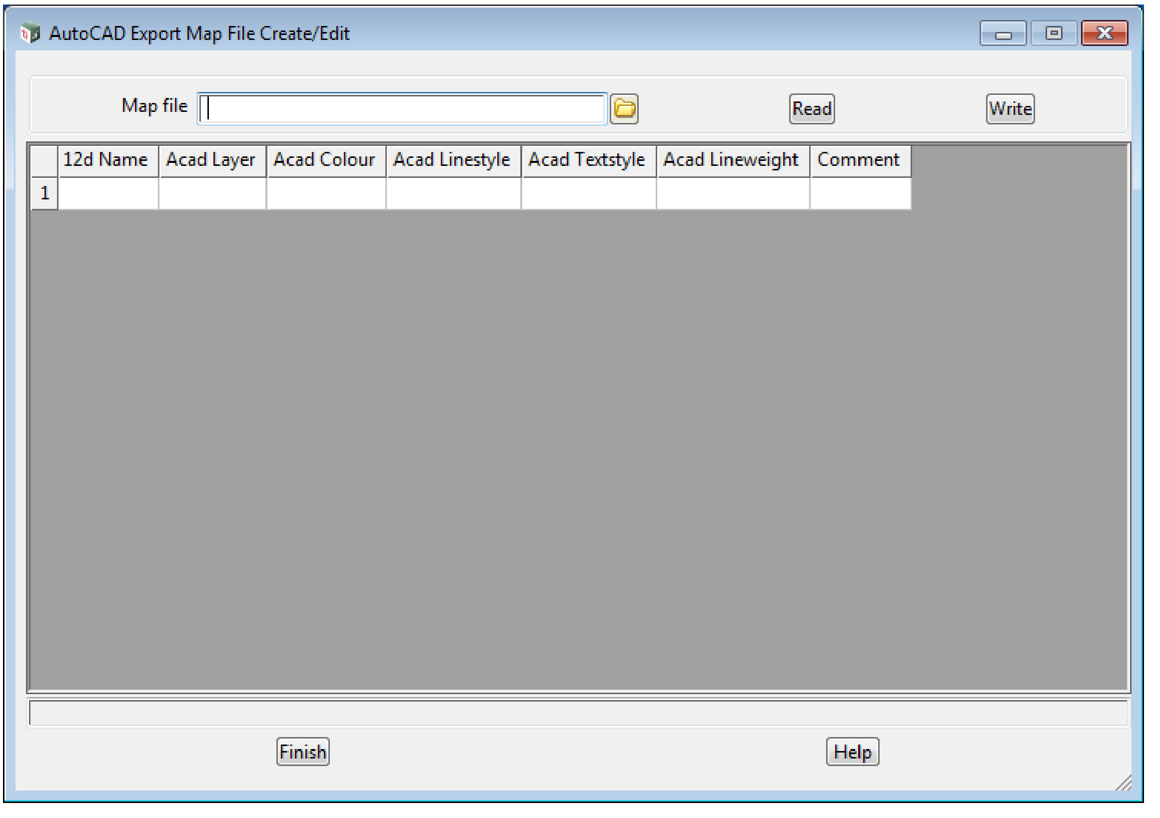
the chord-to-arc tolerance to use when approximating transitions.

8.2.7.2 AutoCAD Output Map File Create/Edit

Position of option on menu: **File I/O =>DWG/DXF/DXB => Output map file**

The **Output map file** option **creates** or **edits** the map files used when writing data out to AutoCAD using the DWG Output option (not used for plotting to AutoCAD).

Selecting **Output map file** brings up the **AutoCAD Export Map File Create/Edit** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Map file	input		*.acadmf

name of the AutoCAD output map file to be created or edited. See 8.2.7.2.1 DWG/DXF Output Map File acadmf.

Read button

read in the AutoCAD output map file given in the **map file** *field and load the data into the fields of the table. If the file doesn't exist, an error message is given.*

Write button

write out the data in the table to the file name given in the **map file** *field. If the file already exists, a Replace-Cancel panel checks to see if the existing file is to be over written - if no or cancel is selected, nothing is written out.*

Grid Cells

12d Name

12d Model *string names for the mapping to apply to - wild cards (*) and characters (!) can be used.*

Acad layer

*AutoCAD layer to send the selected strings to. Use * to write the* ***12d Model*** *model of the string out*

Acad colour

*AutoCAD colour to use for the selected strings - a number between 0 and 256. Use * for* **12d Model** *colour number.* Use BYLAYER *for* ACD BYLAYER

Acad linestyle

*AutoCAD linestyle to use for the selected strings. User * for* **12d Model** *linestyle or* BYLAYER *for* ACD BYLAYER

Acad Textstyle

*AutoCAD Textstyle to use for the selected strings. Use * for* **12d Model** *text style*

Acad lineweight

AutoCAD lineweight to use for the selected strings.

Comment

Place comments in this field.

8.2.7.2.1 DWG/DXF Output Map File acadmf

See 8.2.7.2 AutoCAD Output Map File Create/Edit.

When using the output options to write out a DWG/DXF file, an output map file can be used, with 12d Model string names as the entity-name to match the key, so that the user can specify AutoCAD colour and style. BYLAYER can be used with colour and style.

The key can have wild cards (*) and wild characters (?) as for the input map files.The fields in the DWG/DXF output map file are (ACD = AutoCAD):

field 1	key - string name	can include wild cards * and wild characters ?
field 2	ACD layer	* for ***12d Model*** name
field 3	ACD colour	number between 0 and 256, * for ***12d Model*** colour mapped to ACD, BYLAYER for ACD BYLAYER
field 4	ACD line type	* for ***12d Model*** linestyle, BYLAYER for ACD BYLAYER
field 5	ACD text style	not yet used, * for ***12d Model*** text style

An example of an DWG/DXF output map file is.

```
//      1       2         3         4             5
//      key     layer     colour    linetype      textstyle
        cont*   CONTOURS  1         1             *
        EB*     ROAD      2         CONTINUOUS    *
        103     *         3         *             *
        fe*     FENCE     *         BYLAYER       *
        SURV*   SURVEY    BYLAYER   DASH          *
```

Return to8.2.7.1 DWG/DXF/DXB Output.

8.2.8 Genio Output

Position of option on menu: **File I/O =>Data output =>Genio**

Genio i/o is a separate chargeable module.

The **Genio output** option write out the strings selected by the data source, to a genio file, the format used by MX (formerly Moss). A genio 001 option is used to specify the record format.

Because MX and in 12d Model have different data types, not all 12d Model data can be transferred to MX. The user must be aware of what data can be transferred to MX.

1. MX model names are limited to thirty two characters (in upper case). Hence the first thirty two characters of the 12d Model model name are converted to upper case and used as the MX model name.
2. MX string names can only be four characters and each string in MX must have a unique name. This limits MX to a maximum of 1,679,616 string. Strings can have the same name in the genio file but the strings will be *renamed* when read into MX to give each string a unique name.

   Since 12d Model places no restrictions on string name length, the following rules are used to produce genio string names.

   For a ***line-string***, the first four characters of the string name are used as the genio string name. The four characters are mapped to upper case. Remember that MX line strings can not start with a P.

   For a ***point-strings*** whose names start with **P,** the first four characters of the string name are used as the genio string name. Otherwise the genio string name is **P** plus the first three letters of the point-string name. The three letters are mapped to upper case.
3. 12d Model null heights go out as -999 to MX.
4. The four character limit and uniqueness for MX string names restricts the number of strings that can be read into MX. For example, since points strings must start with P so there can be a maximum of 46,656 point strings. Or if a MX string must start with ABB say, then there can only be 36 distinct ABB strings in the MX project.
5. All MX x and y co-ordinates have to be positive. That is, all co-ordinates must be in the first quadrant.
6. 12d text strings go out as MX text strings but there is a maximum of 44 characters in the MX text string. There is no unit for height in the MX text string as well as no font.The name of a MX text string must start with a * so 12d Model uses * and the first three characters of the text string's name.
7. 2d and 3d strings in 12d Model go out to MX as 2d and 3d strings respectively.
8. 4d strings in 12d Model go out to MX as 4d strings except that the text is restricted to four characters.
9. Alignment and super alignments can be written out to MX as MX 3d, 6d or 12d string.
10. For super strings:

    Point id's are ignored in all cases.
    On the Genio output panel, this is a tick box *Include segment text* and if it is ticked then segment text is written out as MX text strings, otherwise segment text is ignored.
    On the Genio output panel, this is a tick box *Include vertex text* and if it is ticked then the super string is written out as a MX 4d string and with the first four characters as the vertex text for a point.
    Attributes are ignored in all cases.
    Diameter and culvert ***width*** and ***height*** are ignored.
    Colour and **segment colour** are ignored.
    If there is an ***invisibility*** segment, the string is broken into two.
    Tinability is a real problem. MX has no such concept apart from the entire string being a point

string or a line string. There is a tick box to write out non-tinable data. If a segment is non tinable, the string is broken into two.

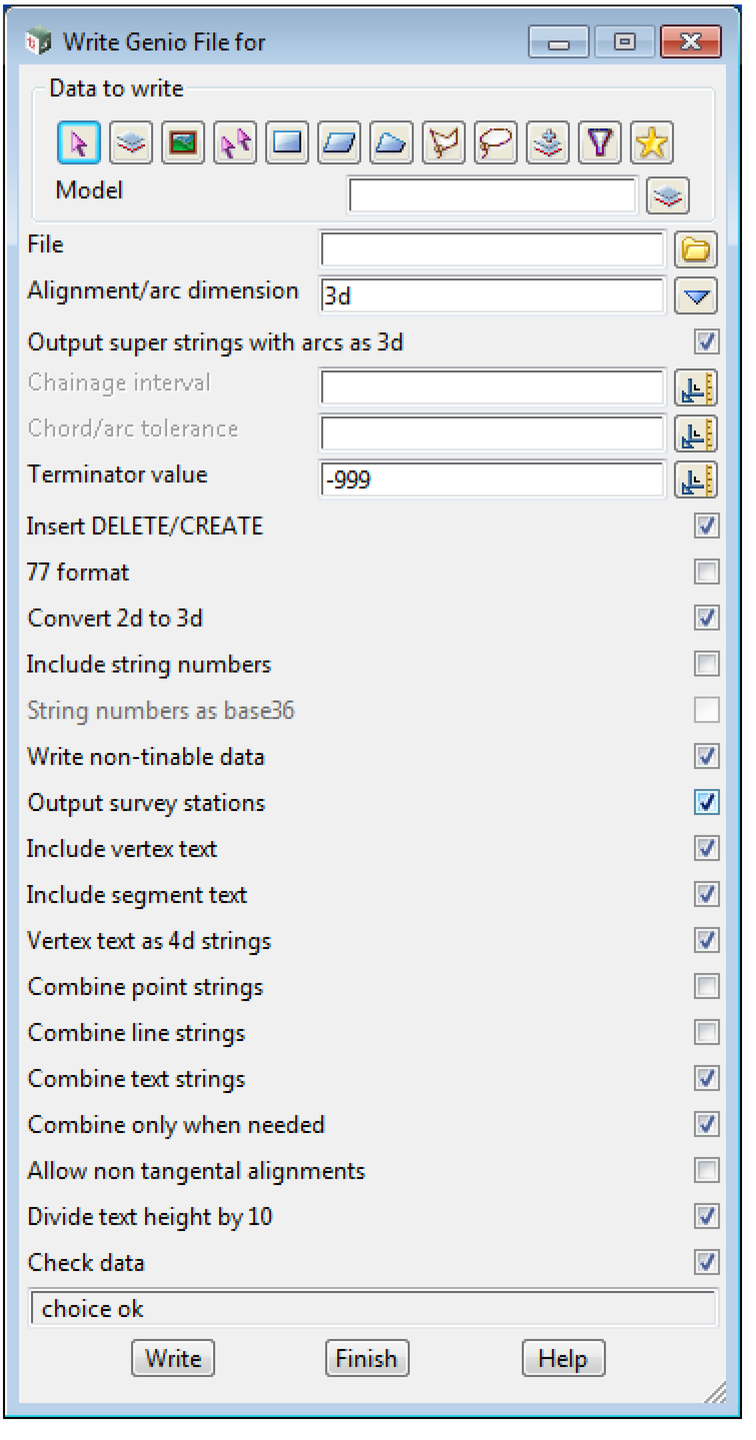
Arcs in super strings or arc strings or circles are broken into line segments using the chord to arc tolerance in the genio output panel, or the system default if there is no value in the panel.

Super strings with a fixed z-value and no vertex text (i.e. that is no z-value at each point, just the one z for the entire string) go out at MX 2d strings.

Super strings with a z-value at each vertex and no vertex text (that is a z-value at each point) go out as MX 3d string

Super strings with a z-value at each vertex and vertex text (that is a z-value at each point and text at each point) go out as MX 4d strings with the four characters of the vertex text as the forth dimension.

On selecting the **Genio** output option, the **Write Genio File for** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data is to be written out to a file.

File	input		*.mos files

name of the genio file the model/view is to be written out to. If the file already exists, the data will be appended to the bottom of the file.

Alignment/arc dimension input 3d 3d,6d,12d, 6d & 12d

*if **3d** is selected, alignment and arc strings as written out as MX 3d string as a series of straight lines (x, y, z at each point).*
*If **6d** is selected, alignment and arc strings are written out as MX 6d strings (chainage, x, y, z, bearing, and radius at each point).*
*If **12d** is selected, alignment and arc strings are written out as MX geometry strings (called 12d strings in MX). This is the only way that full horizontal and vertical geometry can be transferred to MX.*

*If **6d & 12d** is selected, alignment and arc strings are written out as MX 6d strings and MX geometry strings.*

Output super strings with arcs as 3d tick box

if ticked,

Chainage interval input

*if **3d** is selected as the* **Alignment/arc dimension***, the alignments and arcs are approximated using the* **Chainage interval** *and\ the* **Chord/arc tolerance.**

Chord/arc tolerance input

*if **3d** is selected as the* **Alignment/arc dimension***, the alignments and arcs are approximated using the* **Chainage interval** *and\ the* **Chord/arc tolerance.**

Terminator value input -999

value to use to terminate strings in the genio file.

Insert DELETE/CREATE tick box tick

if ticked, the genio commands DELETE and CREATE are written at the top of the file to correctly define the moss models for the data.

77 format tick box

*if **ticked**, use the MX 77 formats for the genio strings.*

Convert 2d to 3d tick box tick

*if **ticked**, write strings with a fixed z-value (2d strings) out in MX 3d string format in the genio file.*

Include string numbers tick box

*if **ticked**, the MX string name includes the surveyors string number. Note - the MX string name can still only be four characters.*

String numbers as base 36 tick box

*if **ticked**, the surveyors string number is converted to Base 36 (that is user 0...9, A... Z). Note - the MX string name can still only be four characters.*

Write non-tinable data tick box tick

*if **ticked**, strings that are not tinable are written out.*

*If **not ticked**, strings that are not tinable are not written out.*

Output survey stations tick box tick

*if **ticked**,.*

Include vertex text tick box tick

*if **ticked**, write out strings with vertex text as MX 4d string with the first four characters of the vertex text as the text on the MX 4d string, otherwise do not write the text out.*

Include segment text tick box tick

*if **ticked**, write out segment text as text strings otherwise do not write the text out.*

Vertex text as 4d strings tick box tick

*if **ticked**, vertex text is written out as a MX 4d string*

Combine point strings tick box

*if **ticked**, point strings of the same name in 12d are combined into one point string when written out.*

Combine line strings tick box

*if **ticked**, strings of the same name in 12d are combined into one MX string (using MX discontinuities to separate the strings) when written out. This is trying to get over the MX four character name limitation.*

Combine text strings tick box tick

*if **ticked**, text strings of the same name in 12d are combined into one MX text string when written out. This is trying to get over the MX four character name limitation.*

Combine only when needed tick box tick

*if **ticked**, when there are more strings of the same name in 12d than the MX four character name restriction would allow, the strings are combined into one MX string when written out. This is trying to get over the MX four character name limitation.*

Allow non tangential alignments tick box

*if **ticked**, alignments where some elements are not tangential are written out.*

*if **not ticked**, alignments with non tangential elements are not written out.*

Divide text height by 10 tick box tick

*if **ticked**, divide the text height by 10*

Write button

write out in genio format all the data specified by the Data source, to the file given in the **file** *field. If the file already exist, the data will be appended to the file.*

8.2.9 LandXML Output

Position of option on menu: **File I/O =>Data output =>LandXML**

LandXML i/o is a separate chargeable module.

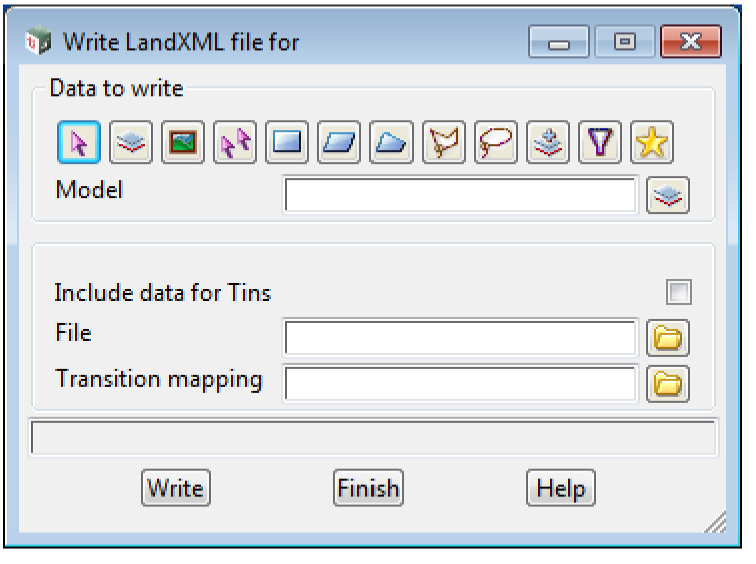
LandXML is a format that attempts to cover some civil and surveying entities. It does not include any information such as colours, styles *etc*. but just some geometry definitions.

Unfortunately to make the format useful, every vendor has their own proprietary extensions which makes the format of only limited value. A different tailored LandXML writer is required for each vendor variation. The names and definitions of transitions vary from vendor to vendor (***12d Model*** has special LandXML writers for LINZ-XML (for LandOnline NZ) and Leica-XML)

Finally the methodology behind the LandXML model is based on US ideas of using X-sections and not strings to model data. This makes is unsuitable except for simple civil models.

This option is under continual developed as the LandXML standard keep changing.

On selecting the **LandXML** option, the **Read LandXML File** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data is to be written out to a file.

Include data for Tins	tick box		

if ticked, tins are included in the LandXML output

File	input		*.xml

name of the LandXML file to write to

Transition mapping			*.trans_map files

file containing the mapping of transitions between the names of LandXML transitions and equivalent transitions in 12d Model

Write	button		

write the selected data to a LandXML file.

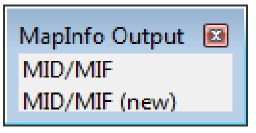
8.2.10 Output MapInfo MID/MIF Files

Position of menu: **File I/O =>Data output =>Mapinfo**

MID/MIF i/o is a separate chargeable module.

The options under **MapInfo** write out MapInfo MID and MIF files.

The **MapInfo** walk-right menu is



write out MID/MIF data
another MID/MIF writer

For *MID/MIF* — 8.2.10.1 Write Mapinfo Tab/Mif Files For

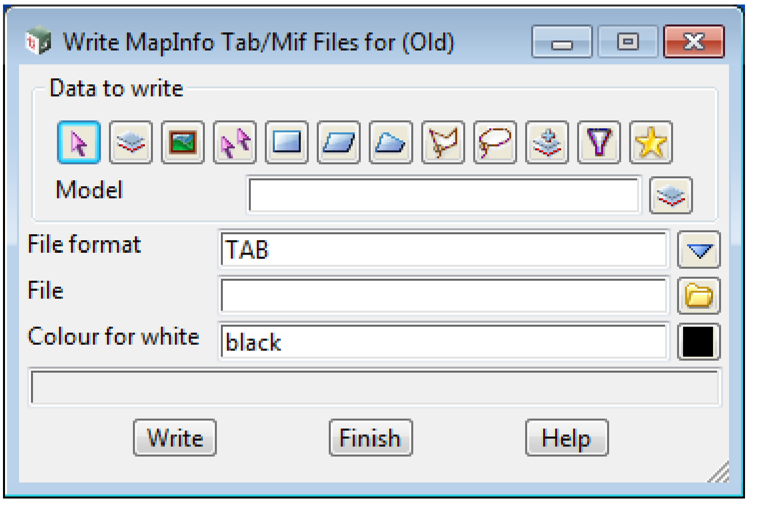
MID/MIF (new) — 8.2.10.2 Write Mapinfo Tab/Mif Files For (New)

8.2.10.1 Write Mapinfo Tab/Mif Files For

Position of option on menu: **File I/O =>Data output =>Mapinfo =>MapInfo MID/MIF**

The *MapInfo MID/MIF* format is used for sending data to MapInfo.

On selecting the **MapInfo MID/MIF** option, the **Write MapInfo Tab/Mif Files for** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data is to be written out to a file.

File format	choice box	TAB	TAB, MIF

MapInfo format to use for writing out the data.

File	choice box		*.tab, *.mif files

name of the file to write the data out to.

Colour for white	colour box		available colours

colour to use in MapInfo for white in ***12d Model*** *(because MapInfo has a white background).*

Write	button		

write out, in MapInfo file format, all the string data specified by the Data source.

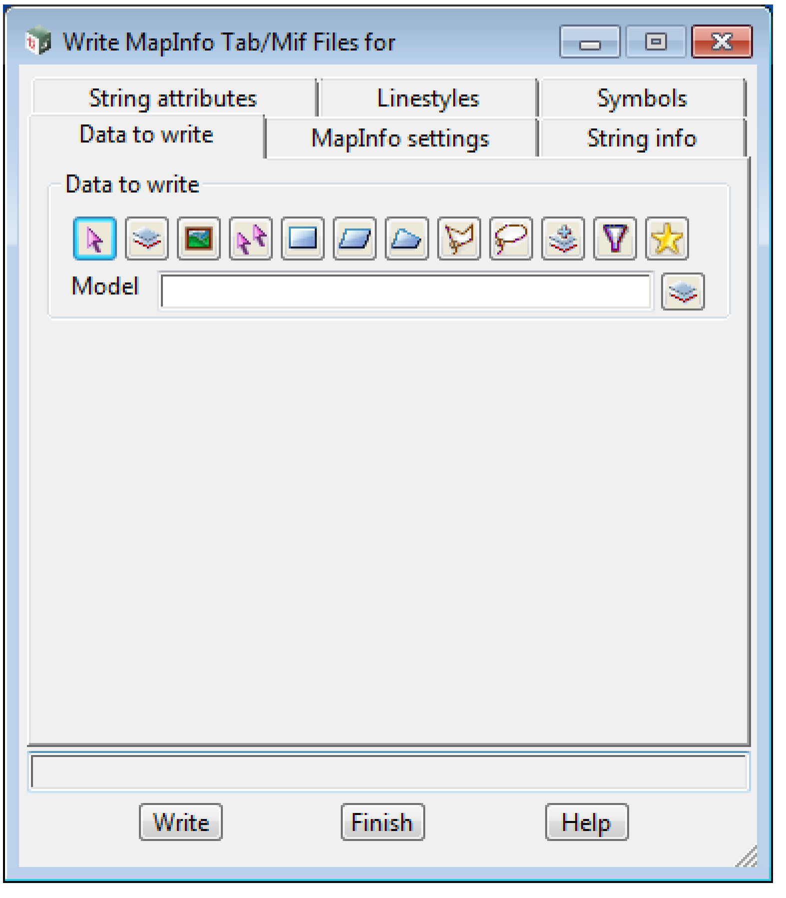
8.2.10.2 Write Mapinfo Tab/Mif Files For (New)

Position of option on menu: **File I/O =>Data output =>Mapinfo =>MapInfo MID/MIF (new)**

This section of documentation is a work in progress and will be updated in subsequent releases.

The *MapInfo MID/MIF* format is used for sending data to MapInfo.

On selecting the **MapInfo MID/MIF** option, the **Write MapInfo Tab/Mif Files for** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Data to write Tab

Data source type Model

data selection type - for a full description go to 4.19.3 Data Source.

Data source input

source of data is to be written out to a file.

MapInfo settings Tab

Coordinate system choice box

MapInfo file of coordinate definitions. The coordinate system that the current data is in is selected from the list.

Note *- data in MapInfo is stored in longitude and attitude. When MapInfo reads data in it needs to know the coordinate system that the data is in so that it can convert the data to longitude/attitude as it* *reads the file. The list of coordinate systems in the* **Coordinate system** *pop-up is in the file mapinfo.4d. Mapinfo.4d has exactly the same format as the file MAPINFOW.PJR used by MapInfo.*

If there are any coordinate systems missing that are in your MapInfo system, simply copy the file MAPINFOW.PRJ from your MapInfo system into the ***12d Model User*** *folder and give it the name mapinfo.4d instead of MAPINFOW.PRJ*

File format choice box TAB TAB, MIF

MapInfo format to use for writing out the data.

File choice box *.tab, *.mif files

name of the file to write the data out to.

Colour for white colour box available colours

colour to use in MapInfo for white in ***12d Model*** *(because MapInfo has a white background).*

Scale for paper/pixel text 1: real box 1000

scale to use to map paper and pixel text sizes

String Info Tab

String Attributes Tab

Linestyles Tab

Symbols Tab

Write button

write out, in MapInfo file format, all the string data specified by the Data source.

8.2.11 CivilCAD

Position of option on menu: **File I/O =>Data output =>Civilcad V5**

CivilCAD output is an *unsupported* option supplied to users with the CivilCAD input option. Civilcad input is a chargeable module.

Because of the limitations of the CivilCAD text format, the CivilCAD output option can only output a limited number of *12d Model* data types.

The **Civilcad output** option writes some ***12d Model*** data to a CivilCAD 5.0 text file. Because CivilCAD text can only take points, lines between two points and arcs, only ***12d Model*** data that can output that way can be written out.

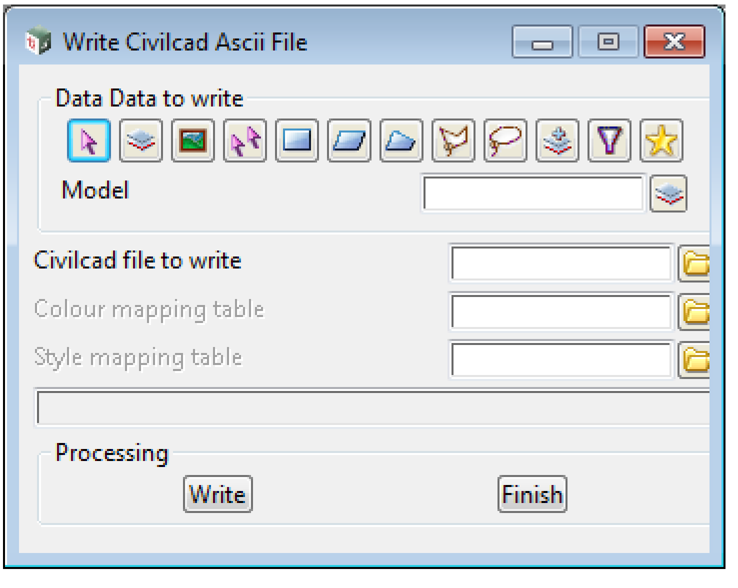
The only ***12d Model*** data types that can be written out to Civilcad text are:

2d strings
3d strings
arcs
circles
polylines
the line work from super strings
text

Note that the following ***12d Model*** data that ***can not*** be output to CivilCAD text:

alignments
super alignments
drainage/sewer strings
pipeline strings
pipe strings
attributes
most super string properties
triangulations
rasters

On selecting the **Civilcad** output option, the **Write CivilCAD Ascii File** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Data source type Model

data selection type - for a full description go to 4.19.3 Data Source.

Data source input

source of data is to be written out to a file.

CivilCAD file to write input *.as5 files

name of the file the model/view is to be written out to. If the file already exists, the data will be appended to the bottom of the file.

Colour mapping table *.as5_colour_map files

mapping of 12d colours to CivilCAD colours

Style mapping table *.as5_style_map files

mapping of 12d linestyles to CivilCAD linestyles

Write button

write the selected data out in CivilCAD format

8.2.12 Geocomp

Position of option on menu: **File I/O =>Data output =>Geocomp**

Geocomp output is a *unsupported* option supplied to users with the Geocomp input option. Geocomp input is a chargeable module.

Because of the limitations of the Geocomp points and strings files, the Geocomp output option can only output a limited number of *12d Model* data types.

The **Geocomp output** option writes some ***12d Model*** data to Geocomp Points and Strings files. Because Geocomp can only take points, lines between two points and arcs, only ***12d Model*** data that can output that way can be written out.

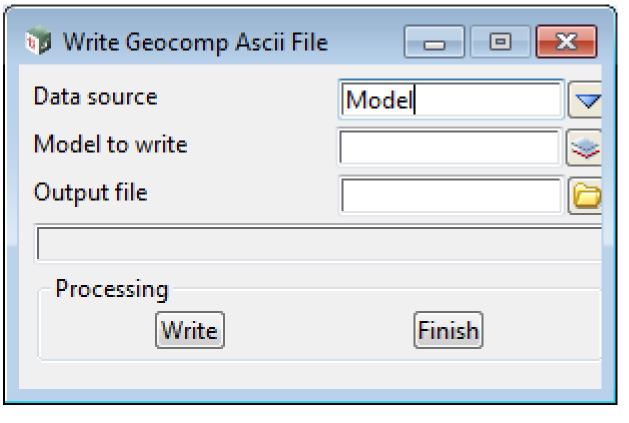
The only ***12d Model*** data types that can be written out to Geocomp points and strings files are:

2d strings
3d strings
arcs
circles
polylines
the line work from super strings
text

Note that the following ***12d Model*** data types that ***can not*** be output to Geocomp:

alignments
super alignments
drainage/sewer strings
pipeline strings
pipe strings
attributes
most super string properties
triangulations
rasters

On selecting the **Geocomp** output option, the **write Geocomp ascii file** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data to write	choice box	Model	Model, View

the type of data to be written out to a file.

Data type source

source of data is to be written out to a file.

Output file file box *.pts/*.str files

name of the file the model/view is to be written out to. If the file already exists, the data will be appended to the bottom of the file.

Write button

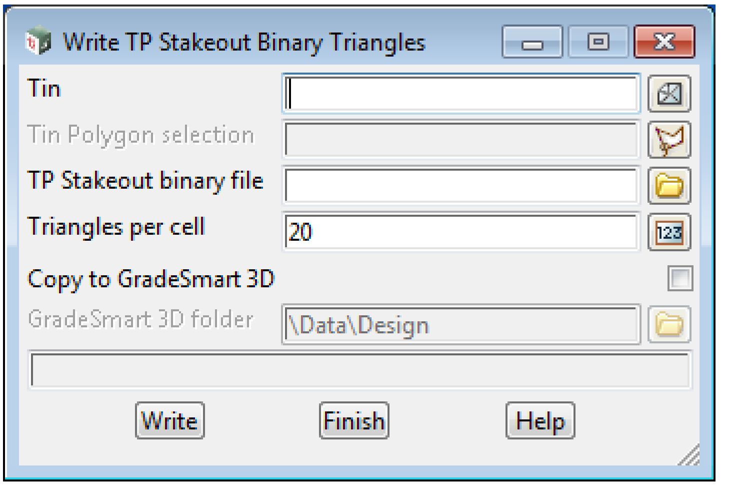
write out Geocomp Points and Strings files the data in the model/view given in the **model/view** *field, to the file given in the* **output file** *field.*

8.2.13 TP Stakeout Triangles Output

Position of option on menu: **File I/O =>Data output =>TP Stakeout triangles**

The *TP Stakeout triangles* option writes out a tin as a TP Stakeout binary file.

On selecting the **TP Stakeout triangles** output option, the **Write TP Stakeout Binary Triangles** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin	tin box		available tins

name of the tin to write out in TP Stakeout binary format.

Tin polygon selection poly string-select

if selected, only triangles with their centroid inside this string are written out

TP Stakeout binary file input *.tsb

name of the file for the triangles

Triangles per cell

a TP Stakeout parameter

Copy to GradeSmart 3D tick box

if ticked, copy file to GradeSmart folder

GradeSmart 3D folder folder box

folder for GradeSmart files

Write button

write out the tin in TP Stakeout binary format.

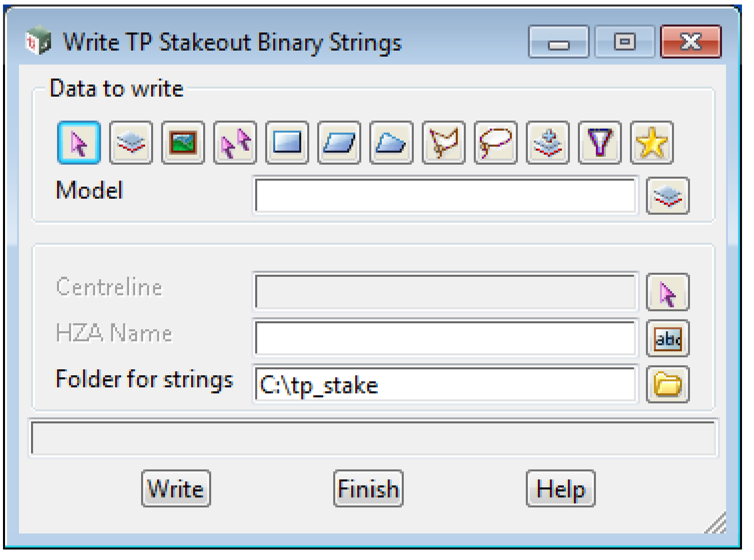
8.2.14 TP Stakeout Strings Output

Position of option on menu: **File I/O =>Data output =>TP Stakeout strings**

Note - this is a chargeable option

The *TPStakeout strings* option writes out selected strings as a TP Stakeout binary file.

Selecting **TP Stakeout strings** brings up the **Write TP Stakeout Binary Strings** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data is to be written out to a file.

Centreline	string select		

centreline string to use as the reference chainage for other strings.

HZA name

Folder for stings	folder		

name of the folder to write out the strings to.

Write	button		

write out the strings in TP Stakeout binary format.

8.2.15 KML Output

Position of option on menu: **File I/O =>Data output =>KML**

The *KML* option writes out selected **super strings** and **tins** in the KML/KMZ file format which is used by Google Earth to load users data into the Google Earth environment.

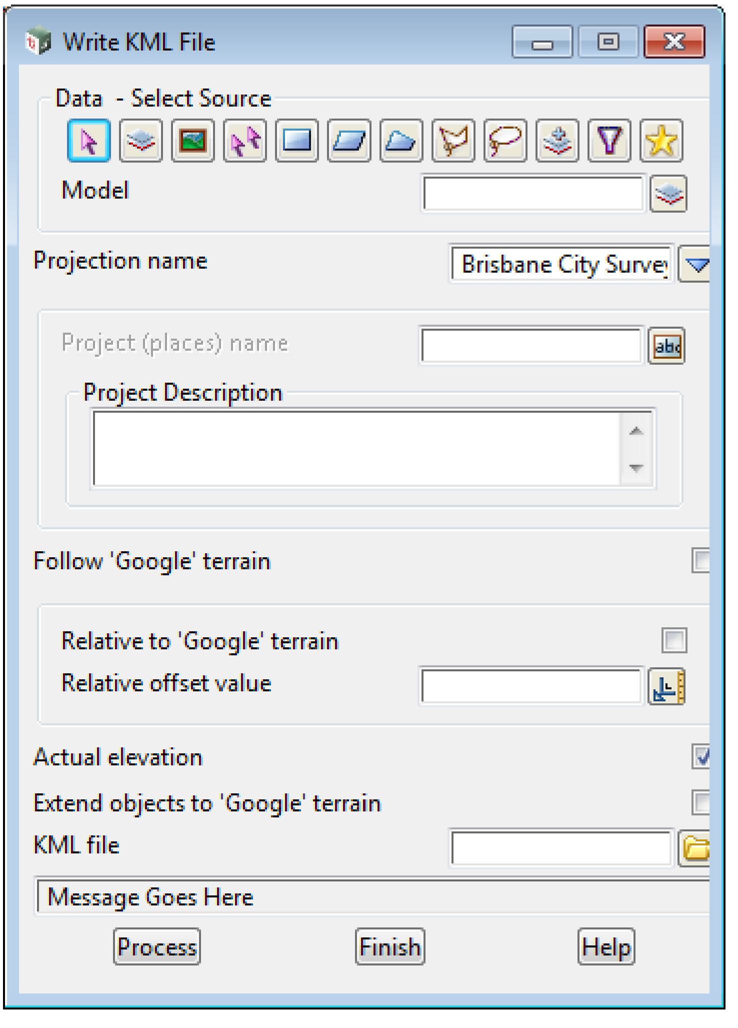
The Google terrain can be significantly different to the terrain from survey data. If the terrain is ticked on in Google Earth it may be higher than the surveyed terrain and obscure the data from 12d.

Google Earth uses the WGS84 Ellipsoid so data must be in a projection based on either the WGS84 or GSR 80 ellipsoids, and the projection for the data known.

Google Earth does not display negative elevations.

If Google Earth does not initialise correctly and centre on the data written from ***12d Model***, selecting a 'model' or 'string' will fit the data to the Google Earth display.

Selecting **KML** brings up the **Write KML** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data is to be written out to a file.
Only super strings and tins are output to the KML file

Projection name projection box

Google Earth uses Latitude and Longitude using the WGS84 spheroid (ellipsoid) to display information in its spatial location. This means that the data to be written to Google Earth should be in a coordinate system that is the same as the a mapping projection and is based on the WGS84 or GSR 80 spheroid. This field is a list of projections created from the users carto.4d file. Select the 'projection name' from the list that matches the coordinate system of the data

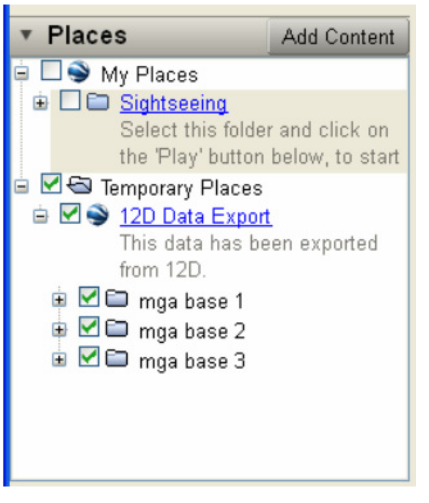
NOTE *- this projection must be based on the WGS84 or GSR80 ellipsoid (for example MGA and NOT AMG).*

Project (Places) name

Enter the name to be shown in the Google Earth 'Places'.
If left blank, the file name from the **KML file field** *is shown in the Google Earth 'Places'.*

Project Description

if non blank, this text will describe the project under the 'Project Name' in Google Earth.



Note:

One and only one of the next three options **Follow Google terrain**, **Relative to Google terrain**, *and* **Actual elevation** *can be ticked on. Ticking one on will untick the other one that was set. You can't untick one except by ticking on a different one.*

Follow Google terrain tick box

If ticked, the elevations of the data in 12d are ignored and the objects are 'clamped' to the terrain in Google Earth.

Relative to Google terrain tick box

If ticked, the elevations of the 12d data are ignored and the objects are 'clamped' to the terrain in Google Earth ***plus*** *the value given in the* **Relative offset value** *field.*

Relative offset value

if **Relative to Google terrain is** *ticked, the data is offset by this amount above the Google terrain. If this value is zero then it is the same as* **Follow Google terrain**.

Actual elevation tick box

if ticked, the z values from the 12d are used to display the objects in Google Earth

Extend objects to Google terrain tick box

if ticked the objects are displayed in Google Earth as a shape that extends from the Google terrain to the object

KML file file box *.kmz files

name of the kmz file to be written. The kml file is an xml style of file and the kmz file is the kml file in the 'zip' compression format.

Process button

write out the data in KML format.

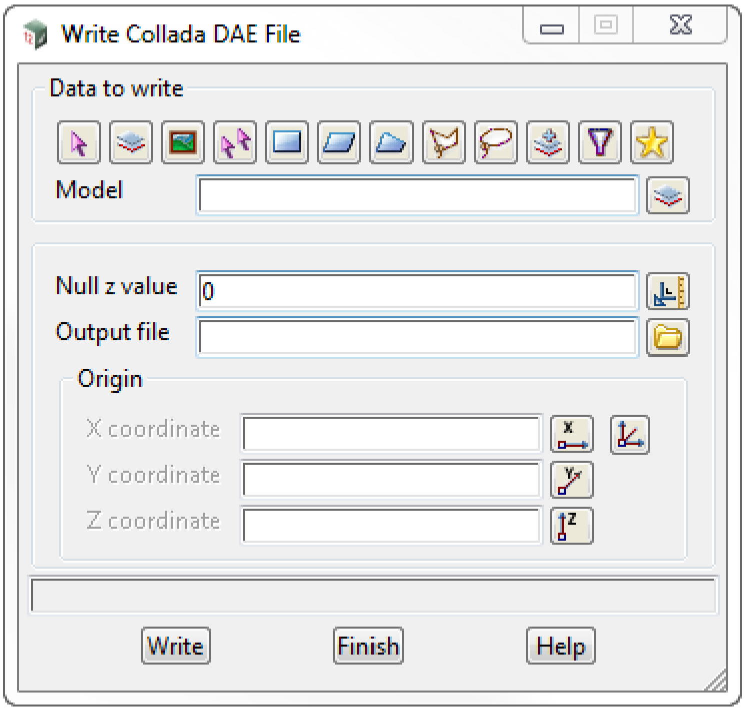
8.2.16 Export DAE

Position of option on menu: **File I/O =>Data output => DAE**

The Collada Digital Asset Exchange (DAE) file format is a published format for writing out 3d shapes for interchange between various graphics packages.

Trimeshes, extrusions, pipes and drainage strings can be written to a DAE file.

Selecting **DAE** brings up the **Write Collada DAE File** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to be written out to a DAE file.

Null z value	real box	0	measures menu

value to use in place of any null z values.

Output file	file box		folder browse

name of the file to write the DAE information to.

Origin	point select box		

.

Write	button		

write out the DAE file.

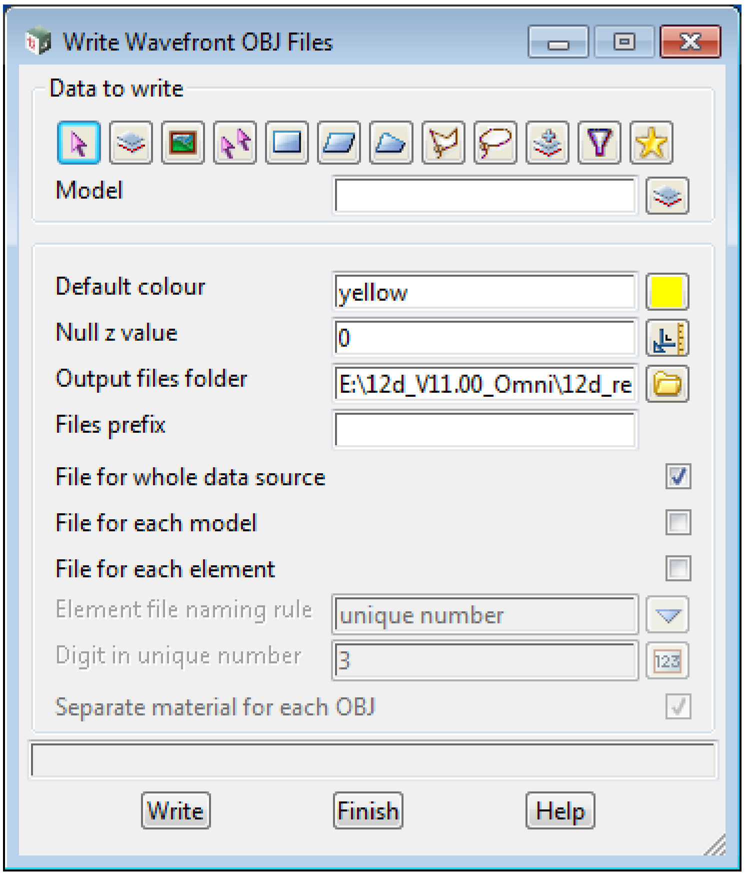
8.2.17 Export OBJ

Position of option on menu: **File I/O =>Data output => OBJ**

The OBJ file is a published format from Wavefront for writing out 3d shapes.

Trimeshes, extrusions, pipes and drainage strings can be written to the one OBJ file, or separate OBJ files.

Selecting **OBJ** brings up the **Write Wavefront OBJ Files** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
data selection type - for a full description go to 4.19.3 Data Source.			
Data source	input		
source of data to be written out to a file.			
Default colour	colour box		
default colour for the OBJ objects.			
Null z value	real box	0	measures menu
value to use in place of any null z values.			
Output files folder	folder box		folder browse
name of the folder to write the obj files to.			

Files prefix text box

prefix to use in front of any names for the obj files.

File for whole data source tick box

*if **ticked**, all the 3d shapes in the data source are written out as the one obj. The name of the file is* **File prefix.**

File for each model tick box

*if **ticked**, an obj file is written out for each model, and all the 3d shapes in the one model are written out as the one obj. The name of the file is the model name prefixed by* **File prefix.**

File for each model tick box

*if **ticked**, a separate obj file is written out for each model, and all the 3d shapes in the one model are written out as the one obj.*

File for each element tick box

*if **ticked**, a separate obj file is written out for 3d shapes in the data source.*

Element naming rule choice box unique number
name followed by unique number
model name followed by unique number

*if **unique number**, the* **File prefix** *followed by a unique number for each shape, is used for the name of each obj file.*

*If **name followed by unique number**, the* **File prefix** *followed by the string name of the 3d shape, followed by a unique number when two string names are the same, is used for the name of each obj file.*

*If **model name followed by unique number**, the* **File prefix** *followed by the name of the model that the 3d shape is in, followed by a unique number for each shape in the model, is used for the name of each obj file.*

Digits in unique number integer box

number of digits in the unique number. The number will be 0 filled if it has less than this number of digits.

Write button

write out the data in OBJ format.

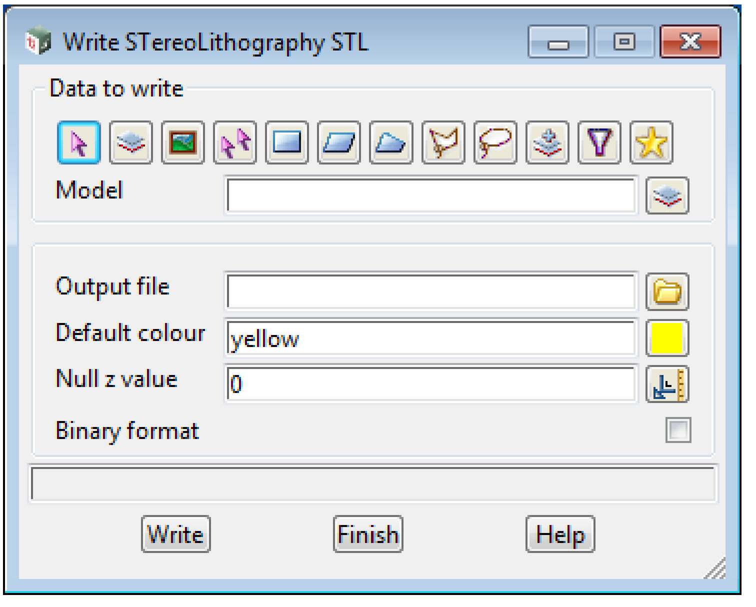
8.2.18 Export STL

Position of option on menu: **File I/O =>Data output =>STL**

The STL file is a format for driving 3D printers for stereolithography. The STL format only accepts solid shapes.

Trimeshes, extrusions, pipes and drainage strings can be written to an STL file.

Selecting **Export STL** brings up the **Write StereoLithography STL** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
data selection type - for a full description go to 4.19.3 Data Source.			
Data source	input		
source of data to be written out to an STL file.			
Output file	folder box		*.stl files
name of the file for the STL information to be written out to.			
Null z value	real box	0	measures menu
value to use in place of any null z values.			
Binary format	tick box		
*if **ticked**, the binary STL format is written out.* *If **not ticked**, the ASCII STL format is used.*			
Default colour	colour box		
colour for the STL objects.			
Write	button		
write out the STL file.			

8.2.19 IFC Output

Position of menu: **File I/O =>Data output =>IFC**

Recommended related reading: 7.6.10 Tags.

The **IFC Output** options write out ***12d Model*** data in the IFC STEP format, version **IFC 2x3**.

The **Industry Foundation Classes** (IFC) data model is intended to describe building and construction industry data.

It is a platform neutral, open file format specification that is not controlled by a single vendor or group of vendors.

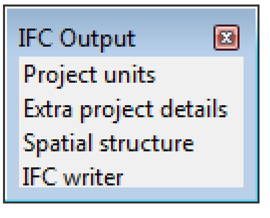
It is an object-based file format with a data model developed by **buildingSMART** (formerly the International Alliance for Interoperability, IAI) to facilitate interoperability in the architecture, engineering and construction (AEC) industry, and is a commonly used collaboration format in **Building Information Modeling** (BIM) based projects.

For more information on BIMs, see 33 BIM and http://www.buildingsmart-tech.org

For more information on IFC's, see 8.2.19.1 IFCs.

The data in ***12d Model*** that can be written out to IFC's includes super strings, TINs, drainage strings and trimeshes.

The **IFC Output** walk-right menu is



For the options:

Project units	8.2.19.2 Project Units
Extra project details	8.2.19.3 Extra Project Details
Special tag structure	8.2.19.4 Defining and Assigning Spatial Structures
IFC Writer	8.2.19.5 IFC 2x3 Writer

For general information on IFCs, see 8.2.19.1 IFCs.

For information on what ***12d Model*** objects are written out to IFCs, and how they are written, see 8.2.19.1.3 Representation of 12d Objects as IFCs.

8.2.19.1 IFCs

The **IFC Output** options write out ***12d Model*** data in the IFC STEP format where IFC stands for **Industry Foundation Classes**.

The IFC data model is intended to describe building and construction industry data, and to date, only covers buildings although there are committees currently looking at extending it to other infrastructure areas such as bridges, roads, railways.

It is a platform neutral, open file format specification that is not controlled by a single vendor or group of vendors.

It is an object-based file format with a data model developed by **buildingSMART** (formerly the International Alliance for Interoperability, IAI) to facilitate interoperability in the architecture, engineering and construction (AEC) industry, and is a commonly used collaboration format in **Building Information Modeling** (BIM) based projects. See http://www.buildingsmart-tech.org.

The IFC model specification is open and available. It is registered by **ISO** and is an official International Standard ISO 16739:2013. See http://www.iso.org/iso/catalogue_detail.htm?csnumber=51622 and http://www.buildingsmart-tech.org/specifications/ifc-releases/summary.

It should be noted that from the ISO site, the following are outside the scope of ISO 16739:2013:

- exchange format definitions outside of the domain of construction and facility maintenance;
- project structure and component breakdown structures **outside of building engineering**;
- behavioural aspects of components and other information items.

Before trying to write out an IFC file, ***12d Model*** Users must be aware of how the IFC data model is structured so that the data to be written out is correct. And how this data is to be structured may vary from client to client wanting their data in an IFC file.

For a general overview of IFC's, see http://en.wikipedia.org/wiki/Industry_Foundation_Classes

The IFC data model is very rich, as you would expect it to be to cover every aspect of a building, but we will only be using a small subset of its capabilities.

All the information and data is contained in **ifcProject** and there is only one of these.

All the data in a ***12d Model*** project can only go out to the one **ifcProject**.

We will mainly be using **ifcProduct** which represents occurrences in space such as physical building elements and spatial locations.

ifcProduct is the **base class** for all physical objects and is subdivided into:

(a) spatial items

Spatial items include ifcSite, ifcBuilding, ifcBuildingStorey and ifcSpace.

The spatial structure elements are linked together, and to the *IfcProject*, by using the objectified relationships *IfcRelContainedInSpatialStructure* and *IfcRelAggregates*.

(b) physical elements

Physical building elements include ifcWall, ifcBeam, ifcDoor, ifcWindow, ifcStair *etc*.

(c) structural analysis items

(d) other concepts.

Products may have associated materials, shape representations, and placements in space.

For more information, wee:

8.2.19.1.1 Spatial Structures

Within the **ifcProject**, an overall Spatial Structure is defined which has a strict hierarchical structure.

At the top level is the **Project**.

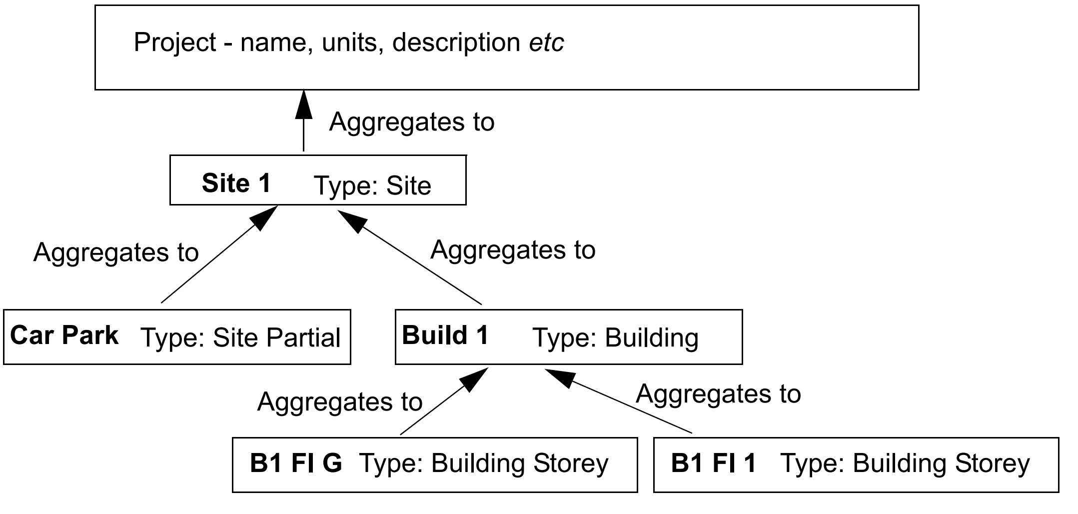
Then within this **Project** are **Sites**, and each **instance** of a **Site** has a **unique name**.

A Site can contain other Sites (called Site Partials) or Buildings, or Building Storeys or Spaces or Products.

A Building can contain Building Storeys, Spaces or Products.

Each instance of Site, Site Partial, Building, Building Storey, Space or Product has a unique name and is directly contained in only one other spatial structure.

The hierarchy of the overall Spatial Structure is specified by defining when each spatial structure **B** is directly contained in another spatial structure **A**. It is expresses as the spatial structure **B** **aggregates to** the spatial structure **A**.



So we only need to refer to a spatial structure by name and all the spatial structures contained beneath it are also uniquely specified.

In ***12d Model*** the Spatial Structure is constructed by the option

File =>Data output =>IFC => Spatial structure

which brings up the panel **IFC Spatial Structure**.

The spatial structures for the project, including the ***Aggregates to***, are defined in the **Define** tab of the panel, and are stored as project attributes. See 8.2.19.4 Defining and Assigning Spatial Structures.

An IFC element is assigned to a spatial structure. Basic types of IFC elements are

(a) building element

(b) opening element

(c) furnishing element

(d) distribution element (including heating, ventilation, air conditioning, electrical and equipment elements)

(e) transportation element

12d Model data that is to be written out to an IFC file are written as **physical** elements and as such must belong to one spatial structure.

12d Model data is assigned a spatial structure by either defined a spatial structure for a whole model and/or for individual strings or trimeshes. The spatial structure for tins is taken to be that of the spatial structure of the model that the tin is in.

The **IFC Writer** panel writes out all the data of a user given spatial structure to a file. See 8.2.19.5 IFC 2x3 Writer.

Continue to the next section 8.2.19.1.2 Some IFC 2x3 Definitions or return to 8.2.19.1 IFCs or 8.2.19 IFC Output.

8.2.19.1.2 Some IFC 2x3 Definitions

For some information on definitions of some of the IFC 2x3 items used when writing the IFC file, see:

8.2.19.1.2.1 ifcProject
8.2.19.1.2.2 ifcSite
8.2.19.1.2.3 ifcElement
8.2.19.1.2.4 ifcSpatialStructureElement
8.2.19.1.2.5 ifcBuildingElement
8.2.19.1.2.6 ifcBuildingElementProxy
8.2.19.1.2.7 ifcFlowStorageDevice
8.2.19.1.2.8 ifcFlowStorageDeviceType
8.2.19.1.2.9 ifcFlowSegment
8.2.19.1.2.10 ifcFlowSegmentType
8.2.19.1.2.11 ifcRelContainedInSpatialStructure
8.2.19.1.2.12 ifcRelAggregates
8.2.19.1.2.13 ifcProduct

Do not be alarmed if the definitions need to be read a number of times to get your head around them. Remember they are only an extract of part of the definition and there are many more definitions that make up IFC's.

For the complete information on IFC's, see http://www.buildingsmart-tech.org/specifications

Or continue to the section 8.2.19.1.3 Representation of 12d Objects as IFCs or return to 8.2.19.1 IFCs or 8.2.19 IFC Output.

8.2.19.1.2.1 ifcProject

Definition from IAI: *The undertaking of some design, engineering, construction, or maintenance activities leading towards a product. The project establishes the context for information to be exchanged or shared, and it may represent a construction project but does not have to.*

All the information and data is contained in **ifcProject** and there is only one of these.

The **ifcProject** has information such as

(a) the default units used

For setting the **ifcProject** units in ***12d Model***, see 8.2.19.2 Project Units.

(b) descriptive information about the project

For setting the **ifcProject** information in ***12d Model***, see 8.2.19.3 Extra Project Details.

Within the **ifcProject**, a spatial structure is defined and it is a strict hierarchical structure. See 8.2.19.1.1 Spatial Structures.

Continue to 8.2.19.1.2.2 ifcSite or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.2 ifcSite

Definition from ISO 6707-1:1989: *Area where construction works are undertaken.*

Definition from IAI: *A defined area of land, possibly covered with water, on which the project construction is to be completed. A site may be used to erect building(s) or other AEC products.*

The geometrical placement of the site, defined by the *IfcLocalPlacement*, shall be always relative to the spatial structure element, in which this site is included, or absolute, i.e. to the world coordinate system, as established by the geometric representation context of the project. The world coordinate system, established at the *IfcProject.RepresentationContexts*, may include a definition of the true north within the XY plane of the world coordinate system.

An IFC project may span over several connected or disconnected sites. Therefore **site complex** provides for a collection of sites included in a project.

A site can also be decomposed in parts, where each part defines a **site section**.

Whether it is a site, site complex or site section is defined by the Composition Type attribute of the supertype ***IfcSpatialStructureElement*** which is interpreted as follow:

If the attribute value is **COMPLEX** then it is a **site complex**

If the attribute value is **ELEMENT** then it is a **site**

If the attribute value is **PARTIAL** then it is a **site section** (**site partial)**.

Note that in ***12d Model***, you can currently only have a **site** and **site partial**.

Continue to 8.2.19.1.2.3 ifcElement or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.3 ifcElement

Definition from IAI: *Generalization of all components that make up an AEC product. Those elements can be logically contained by a spatial structure element that constitutes a certain level within a project structure hierarchy (e.g., site, building, storey or space). This is done by using the IfcRelContainedInSpatialStructure relationship*.

Elements are physically existent objects, although they might be void elements, such as holes.

EXAMPLEs of elements in a building construction context are walls, floors, windows and recesses.

There are various type of Elements derived from ifcElement including ifcBuildingElment, idfFurnishingElment, ifcElelectricalElment and ifcBuildingElmentProxy (see 8.2.19.1.2.6 ifcBuildingElementProxy).

Note that in ***12d Model***, most data is written to the IFC file as *ifcBuildingElmentProxy*.

Continue to 8.2.19.1.2.4 ifcSpatialStructureElement or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.4 ifcSpatialStructureElement

Definition from IAI: *A spatial structure element (**IfcSpatialStructureElement**) is the generalization of all spatial elements that might be used to define a spatial structure. That spatial structure is often used to provide a project structure to organize a building project*.

A spatial project structure might define as many levels of decomposition as necessary for the building project. Elements within the spatial project structure are:

(a) site as *IfcSite*

(b) building as *IfcBuilding*

(c) storey as *IfcBuildingStorey*

(d) space as *IfcSpace*

or

(e) aggregations or parts thereof.

The Composition Type declares an element to be either an element itself, or an aggregation (complex) or a decomposition (part). The interpretation of these types is given at each subtype of *IfcSpatialStructureElement*. For example see 8.2.19.1.2.2 ifcSite.

The *IfcRelAggregates* is defined as an 1-to-many relationship and used to establish the relationship between exactly two levels within the spatial project structure.

Finally the highest level of the spatial structure is assigned to *IfcProject* using the *IfcRelAggregates*. See 8.2.19.1.2.12 ifcRelAggregates.

Continue to 8.2.19.1.2.5 ifcBuildingElement or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.5 ifcBuildingElement

Definition from ISO 6707-1:1989: *Major functional part of a building, examples are foundation, floor, roof, wall*.

Definition from IAI: *The building element comprises all elements that are primarily part of the construction of a building, i.e., its structural and space separating system*.

EXAMPLEs of building elements are walls, beams, or doors, they are all physically existent and tangible things.

Continue to 8.2.19.1.2.6 ifcBuildingElementProxy or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.6 ifcBuildingElementProxy

Definition from IAI: *The **IfcBuildingElementProxy** is a proxy definition that provides the same functionality as an **IfcBuildingElement**, but without having a defined meaning of the special type* *of building element, it represents.*

NOTE1 The *IfcBuildingElementProxy* should be used to exchange special types of building elements for which the current IFC Release does not yet provide a semantic definition.

NOTE2 The *IfcBuildingElementProxy* can also be used to represent building elements for which the participating applications can not provide additional semantic classification.

Continue to 8.2.19.1.2.7 ifcFlowStorageDevice or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.7 ifcFlowStorageDevice

The distribution flow element **IfcFlowStorageDevice** defines the occurrence of a device that participates in a distribution system and is used for temporary storage of a fluid such as a liquid or a gas (e.g., tank) or the voltage potential induced by the induced electron flow (such as a battery).

Its type is defined by ***IfcFlowStorageDeviceType*** or its subtypes. See 8.2.19.1.2.8 ifcFlowStorageDeviceType.

Continue to 8.2.19.1.2.8 ifcFlowStorageDeviceType or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.8 ifcFlowStorageDeviceType

The element type **IfcFlowStorageDeviceType** defines a list of commonly shared property set definitions of a flow storage device and an optional set of product representations. It is used to define a flow storage device specification (the specific product information that is common to all occurrences of that product type).

A flow storage device is a device used for the temporary storage of a fluid (such as a tank) or the voltage potential induced by the induced electron flow (such as a battery). Flow storage types (or the instantiable subtypes) may be exchanged without being already assigned to occurrences.

Continue to 8.2.19.1.2.9 ifcFlowSegment or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.9 ifcFlowSegment

The distribution flow element ***IfcFlowSegment*** defines the occurrence of a segment of a flow distribution system.

The ***IfcFlowSegment*** defines a particular occurrence of a segment inserted in the spatial context of a project. The parameters defining the type of the segment and/or its shape are defined by the ***IfcFlowSegmentType.***

IFC2x4 CHANGE This entity has been deprecated for instantiation and will become ABSTRACT in a future release; new subtypes should now be used instead.

Material Use Definition

The material of the ***IfcFlowSegment*** is defined using one of the following entities:

IfcMaterialProfileSetUsage: for parametric segments, this defines the cross section and alignment to the 'Axis' representation, from which the 'Body' representation may be generated.

IfcMaterialProfileSet: for non-parametric segments (having fixed length or path), this may define the cross section for analysis purposes, however the 'Body' representation is independently generated.

IfcMaterialConstituentSet: for elements containing multiple materials where profiles are not applicable, this indicates materials at named parts.

IfcMaterial: for elements comprised of a single material where profiles are not applicable, this indicates the material.

The material is attached by the RelatingMaterial attribute on the IfcRelAssociatesMaterial relationship. It is accessible by the HasAssociations inverse attribute. Material information can also be given at the IfcFlowSegmentType, defining the common attribute data for all occurrences of the same type. Standard names and material types are defined at subtypes.

Geometry Use Definition

Standard representations are defined at the supertype ***IfcDistrubutionFlowElement***. For parametric flow segments where IfcMaterialProfileSetUsage is defined and an 'Axis' representation is defined, then the 'Body' representation may be generated using the 'SweptSolid' or 'AdvancedSweptSolid' representation types by sweeping the profile(s) along the axis.

Continue to 8.2.19.1.2.10 ifcFlowSegmentType or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.10 ifcFlowSegmentType

The element type ***IfcFlowSegmentType*** defines a list of commonly shared property set definitions of a flow segment and an optional set of product representations.

It is used to define a flow segment specification (the specific product information, that is common to all occurrences of that product type).

A *flow segment type* is used to define the common properties of a flow segment that may be applied to many occurrences of that type. A flow segment is a section of a distribution system, such as a duct, pipe, or conduit, that typically has only two ports. Flow segment types (or the instantiable subtypes) may be exchanged without being already assigned to occurrences.

Material Use Definition

The material of the *IfcDistributionFlowSegmentType* is defined using one of the following entities:

IfcMaterialProfileSet: This defines the material cross section which may be used to generate the 'Body' representation at occurrences (for parametric definitions not having representation), or for analysis purposes.

IfcMaterialConstituentSet: For elements containing multiple materials where profiles are not applicable, this indicates materials at named aspects.

IfcMaterial: For elements comprised of a single material where profiles are not applicable, this indicates the material.

Continue to 8.2.19.1.2.11 ifcRelContainedInSpatialStructure or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.11 ifcRelContainedInSpatialStructure

Definition from IAI: *This objectified relationship, **IfcRelContainedInSpatialStructure**, is used to assign elements to a certain level of the spatial project structure. Any element can only be assigned once to a certain level of the spatial structure. The question, which level is relevant for which type of element, can only be answered within the context of a particular project and might vary within the various regions*.

EXAMPLE A multi-storey space is contained (or belongs to) the building storey at which its ground level is, but it is referenced by all the other building storeys, in which it spans. A lift shaft might be contained by the basement, but referenced by all storeys, through which it spans.

The **containment relationship** of an element within a spatial structure has to be a hierarchical relationship, **an element can only be contained within a single spatial structure element**.

The **reference relationship** between an element and the spatial structure may not be hierarchical, i.e. an element can reference many spatial structure elements.

NOTE The reference relationship is expressed by *IfcRelReferencedInSpatialStructure*.

Predefined spatial structure elements to which elements can be assigned are

(a) site as *IfcSite* . See 8.2.19.1.2.2 ifcSite.

(b) building as *IfcBuilding*

(c) storey as *IfcBuildingStorey*

(d) space as *IfcSpace*

Continue to 8.2.19.1.2.12 ifcRelAggregates or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.12 ifcRelAggregates

Definition from IAI: *The aggregation relationship **IfcRelAggregates** is a special type of the general composition/decomposition (or whole/part) relationship IfcRelDecomposes. The aggregation relationship can be applied to all subtypes of object.*

Some further specializations of decomposition may imply additional constraints and meanings, such as the requirement of aggregates to represent physical containment. In cases of physical containment the representation (within the same representation context) of the whole can be taken from the sum of the representations of the parts.

EXAMPLE: A roof is the aggregation of the roof elements, such as roof slabs, rafters, purlins, *etc*. Within the same representation context, e.g. the detailed geometric representation, the shape representation of the roof is given by the shape representation of its parts

Decompositions imply a dependency, i.e. the definition of the whole depends on the definition of the parts and the parts depend on the existence of the whole. The behaviour that is implied from the dependency has to be established inside the applications.

Continue to 8.2.19.1.2.13 ifcProduct or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.13 ifcProduct

Definition from IAI: *Any object, or any aid to define, organize and annotate an object, that relates to a geometric or spatial context. Subtypes of IfcProduct usually hold a shape representation and a local placement within the project structure*.

This includes manufactured, supplied or created objects (referred to as **elements**) for incorporation into an AEC/FM project. This also includes objects that are created indirectly by other products, as spaces are defined by bounding elements. Products can be designated for permanent use or temporary use, an example for the latter is formwork. Products are defined by their properties and representations.

In addition to **physical products** (covered by the subtype 8.2.19.1.2.3 ifcElement) and **spatial items** (covered by the subtype 8.2.19.1.2.4 ifcSpatialStructureElement) the *IfcProduct* also includes non-physical items, that relate to a geometric or spatial contexts, such as grid, port, annotation, structural actions, *etc*.

Continue to 8.2.19.1.2.14 ifcPropertySet or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.14 ifcPropertySet

Definition from IAI: *The IfcPropertySet defines all dynamically extensible properties. The* *property set is a container class that holds properties within a property tree. These properties are interpreted according to their name attribute.*

Property sets, defining a particular type of object, can be assigned an object type (*IfcTypeObject*). Property sets are assigned to objects (*IfcObject*) through an objectified relationship (*IfcRelDefinedByProperties*). If the same set of properties applies to more than one object, it should be assigned by a single instance of *IfcRelDefinedByProperties* to a set of related objects. Those property sets are referred to as shared property sets.

Use Definition

Instances of *IfcPropertySet* are used to assign named sets of individual properties (complex or single properties). Each individual property has a significant name string. Some property sets have predefined instructions on assigning those significant name. The naming convention "Pset_Xxx" applies to those property sets and shall be used as the value to the *Name* attribute.

In addition any user defined property set can be captured, those property sets shall have a *Name* value not including the **Pset_** prefix.

Continue to 8.2.19.1.2.15 IfcPropertySingleValue or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.15 IfcPropertySingleValue

Definition from IAI: A property with a single value (*IfcPropertySingleValue*) defines a property object which has a single (numeric or descriptive) value assigned. It defines a property - single value combination for which the property name, the value with measure type (and optionally the unit) is given.

The unit is handled by the *Unit* attribute:

If the *Unit* attribute is not given, then the unit is already implied by the type of *IfcMeasureValue* or *IfcDerivedMeasureValue*. The associated unit can be found at the *IfcUnitAssignment* globally defined at the project level (*IfcProject.UnitsInContext*).

If the *Unit* attribute is given, then the unit assigned by the *Unit* attribute overrides the globally assigned unit.

Continue to 8.2.19.1.2.18 IfcCircleHollowProfileDef or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.16 IfcShapeRepresentation

Definition from ISO/CD 10303-42:1992: The shape representation is a specific kind of representation that represents a shape.

Definition from IAI: The ***IfcShapeRepresentation*** represents the concept of a particular geometric representation of a product or a product component within a specific geometric representation context.

The inherited attribute ***RepresentationType*** is used to define the geometric model used for the shape representation, the inherited attribute ***RepresentationIdentifier*** is used to denote the part of the representation captured by the ***IfcShapeRepresentation*** (e.g. Axis, Body, *etc*.).

Several representation types for shape representation are included as predefined types:

Curve2D 2 dimensional curves

GeometricSet points, curves, surfaces (2 or 3 dimensional)

GeometricCurveSet points, curves (2 or 3 dimensional)

Annotation2D points, curves (2 or 3 dimensional), hatches and text (2 dimensional)

BoundingBox simplistic 3D representation by a bounding box

SectionedSpine cross section based representation of a spine curve and planar cross sections. It can represent a surface or a solid and the interpolations of the between the cross sections is not defined

MappedRepresentation representation based on mapped item(s), referring to a representation map. Note: it can be seen as an inserted block reference. The shape representation of the mapped item has a representation type declaring the type of its representation items.

SurfaceModel face based and shell based surface model

SolidModel including swept solid, Boolean results and Brep bodies. More specific types are:

SweptSolid swept area solids, by extrusion and revolution

Brep faceted Brep's with and without voids

CSG Boolean results of operations between solid models, half spaces and Boolean results

Clipping Boolean differences between swept area solids, half spaces and Boolean results

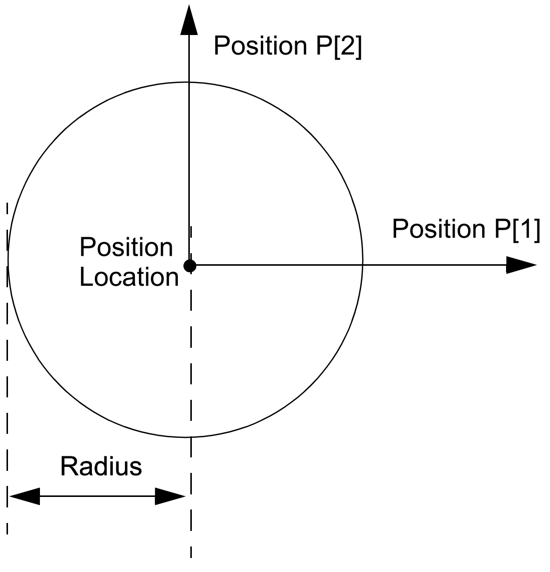
AdvancedSweptSolid swept area solids created by sweeping a profile along a directrix

NOTE The definition of this entity relates to the STEP entity shape_representation. Please refer to ISO/IS 10303-41:1994 for the final definition of the formal standard.

Continue to 8.2.19.1.2.17 IfcCircleProfileDef or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.17 IfcCircleProfileDef

Definition from IAI: The ***IfcCircleProfileDef*** defines a circle as the profile definition used by the swept surface geometry or by the swept area solid. It is given by its ***Radius*** attribute and placed within the 2D position coordinate system, established by the ***Position*** attribute.



Position
The parameterized profile defines its own position coordinate system. The underlying coordinate system is defined by the swept surface or swept area solid that uses the profile definition. It is the xy plane of either:

IfcSweptSurface.Position

IfcSweptAreaSolid.Position

or in case of sectioned spines the xy plane of each list member of IfcSectionedSpine.CrossSectionPositions.

By using offsets of the position location, the parameterized profile can be positioned centric (using x,y offsets = 0.), or at any position relative to the profile. Explicit coordinate offsets are used to define cardinal points (e.g. upper-left bound).

Parameter
The ***Position*** attribute defines the 2D position coordinate system of the circle.

The ***Radius*** attribute defines the radius of the circle.

ifc Attribute Definitions:

Radius: The radius of the circle.

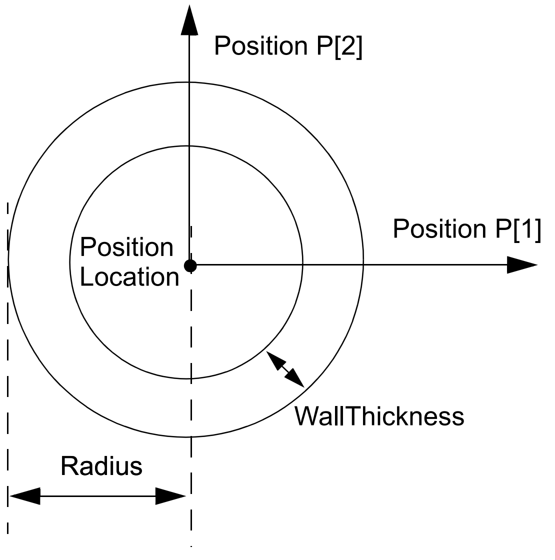
Continue to 8.2.19.1.2.18 IfcCircleHollowProfileDef or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.18 IfcCircleHollowProfileDef

Definition from IAI: The ***IfcCircleHollowProfileDef*** defines a section profile that provides the defining parameters of a circular hollow section (tube) to be used by the swept area solid.

Its parameters and orientation relative to the position coordinate system are according to the following illustration.

The centre of the position coordinate system is in the profile's centre of the bounding box (for symmetric profiles identical with the centre of gravity).



Position
The parameterized profile defines its own position coordinate system. The underlying coordinate system is defined by the swept area solid that uses the profile definition. It is the xy plane of:

IfcSweptAreaSolid.Position

by using offsets of the position location, the parameterized profile can be positioned centric (using x,y offsets = 0), or at any position relative to the profile. Explicit coordinate offsets are used to define cardinal points (e.g. upper-left bound).

Parameter
The parameterized profile is defined by a set of parameter attributes, see attribute definition below.

ifc Attribute Definitions:

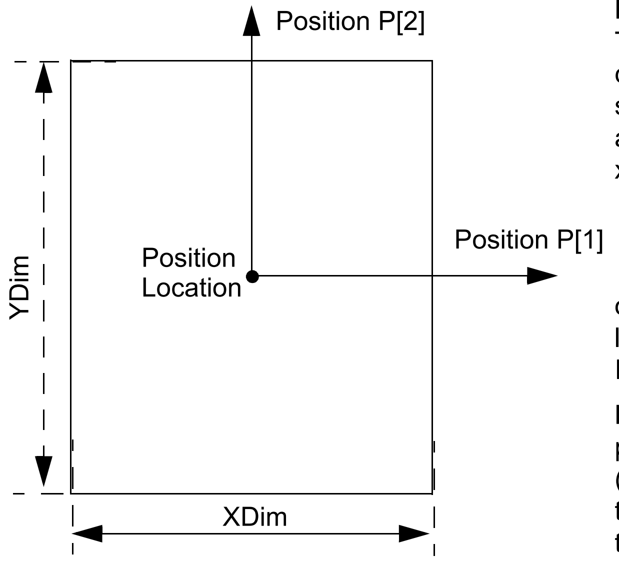
WallThickness: Thickness of the material. It is the difference between the outer and inner radius.

The wall thickness must be smaller than the radius

Continue to 8.2.19.1.2.19 IfcRectangleProfileDef or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.19 IfcRectangleProfileDef

Definition from IAI: The ***IfcRectangleProfileDef*** defines a rectangle as the profile definition used by the swept surface geometry or the swept area solid. It is given by its X extent and its Y extent, and placed within the 2D position coordinate system, established by the Position attribute. It is placed centric within the position coordinate system.



Position
The parameterized profile defines its own position coordinate system. The underlying coordinate system is defined by the swept surface or swept area solid that uses the profile definition. It is the xy plane of either:

IfcSweptSurface.Position

IfcSweptAreaSolid.Position

or in case of sectioned spines the xy plane of each list member of IfcSectionedSpine.CrossSectionPositions.

By using offsets of the position location, the parameterized profile can be positioned centric (using x,y offsets = 0.), or at any position relative to the profile. Explicit coordinate offsets are used to define cardinal points (e.g. upper-left bound).

Parameter
The ***IfcRectangleProfileDef*** is defined within the position coordinate system, where the **XDim** defines the length measure for the length of the rectangle (half along the positive x-axis) and the **YDim** defines the length measure for the width of the rectangle (half along the positive y-axis).

ifc Attribute Definitions:

XDim: The extent of the rectangle in the direction of the x-axis.

YDim: The extent of the rectangle in the direction of the y-axis.

Continue to the next section 8.2.19.1.2.20 IfcRectangleHollowProfileDef or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.2.20 IfcRectangleHollowProfileDef

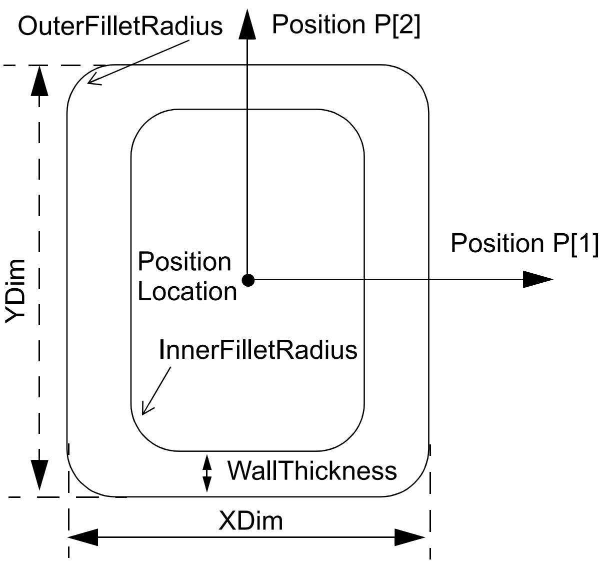
Definition from IAI: The ***IfcRectangleHollowProfileDef*** defines a section profile that provides the defining parameters of a rectangular (or square) hollow section to be used by the swept surface geometry or the swept area solid.

Its parameters and orientation relative to the position coordinate system are according to the following illustration.

A square hollow section can be defined by equal values for h and b.

The centre of the position coordinate system is in the profiles centre of the bounding box (for symmetric profiles identical with the centre of gravity).

Normally, the longer sides are parallel to the y-axis, the shorter sides parallel to the x-axis.



Position
The parameterized profile defines its own position coordinate system. The underlying coordinate system is defined by the swept area solid that uses the profile definition. It is the xy plane of:

IfcSweptAreaSolid.Position

by using offsets of the position location, the parameterized profile can be positioned centric (using x,y offsets = 0), or at any position relative to the profile. Explicit coordinate offsets are used to define cardinal points (e.g. upper-left bound).

Parameter
The parameterized profile is defined by a set of parameter attributes, see attribute definition below

ifc Attribute Definitions:

WallThickness: Thickness of the material. The wall thickness shall be smaller than the X and Y dimension of the rectangle.

InnerFilletRadius: Radius of the circular arcs, by which all four corners of the outer contour of rectangle are equally rounded. If not given, zero (= no rounding arcs) applies.

The inner fillet radius (if given) shall be smaller than or equal to the X and Y dimension of the rectangle minus the wall thickness.

OuterFilletRadius: Radius of the circular arcs, by which all four corners of the outer contour of rectangle are equally rounded. If not given, zero (= no rounding arcs) applies.

The outer fillet radius (if given) shall be smaller than or equal to the X and Y dimension of the rectangle

Continue to the next section 8.2.19.1.2.21 IfcArbitaryClosedProfileDef or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

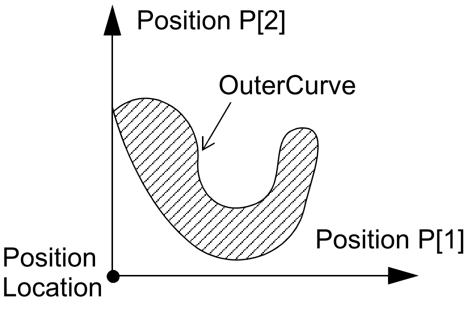
8.2.19.1.2.21 IfcArbitaryClosedProfileDef

Definition from IAI: The closed profile ***IfcArbitraryClosedProfileDef*** defines an arbitrary two-dimensional profile for the use within the swept surface geometry, the swept area solid or a sectioned spine. It is given by an outer boundary from which the surface or solid can be constructed.

Informal proposition:

1.The **OuterCurve** has to be a closed curve.

2.The **OuterCurve** shall not intersect.



Position
The ***OuterCurve*** is defined in the underlying coordinate system. The underlying coordinate system is defined by the swept surface or swept area solid that uses the profile definition. It is the xy plane of either:

IfcSweptSurface.Position

IfcSweptAreaSolid.Position

or in case of sectioned spines the xy plane of each list member of *IfcSectionedSpine.CrossSectionPositions.*

By using offsets of the position location, the parameterized profile can be positioned centric (using x,y offsets = 0.), or at any position relative to the profile. Explicit coordinate offsets are used to define cardinal points (e.g. upper-left bound).

Parameter
The ***OuterCurve*** attribute defines a two dimensional closed bounded curve.

ifc Attribute Definitions:

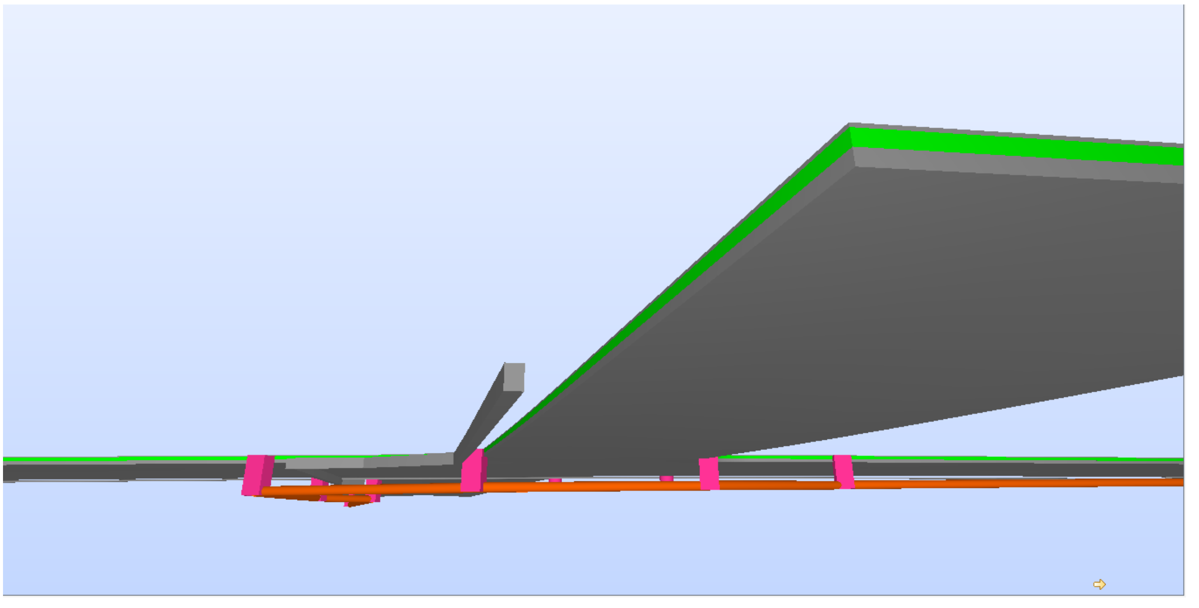
OuterCurve: Bounded curve, defining the outer boundaries of the arbitrary profile.

Continue to the next section 8.2.19.1.3 Representation of 12d Objects as IFCs or return to 8.2.19.1.2 Some IFC 2x3 Definitions or 8.2.19.1 IFCs.

8.2.19.1.3 Representation of 12d Objects as IFCs

Currently IFCs do not support road elements such a alignments or the spatial structures that match a road or rail design but it is still possible to get most of the shape data in***12d Model*** output in ways that will fit in with the IFC schema.

For example, in the image below, a drainage network with circular and rectangular pipes and pits, with thicknesses, a tin and trimeshes for the pavement layers have been written out from ***12d Model*** as an IFC and then read into **Solibri** and displayed.



See

8.2.19.1.3.1 Super Alignment
8.2.19.1.3.2 Super String
8.2.19.1.3.3 Drainage String
8.2.19.1.3.4 Sewer String
8.2.19.1.3.5 Tin
8.2.19.1.3.6 Trimesh

Old string types:
8.2.19.1.3.7 Alignment

8.2.19.1.3.1 Super Alignment

A **Super Alignment** is written out as an **IFCBUILDINGELEMENTPROXY** element.

The string attributes can be written out as an ifcPropertySet.

Continue to the 8.2.19.1.3.1 Super Alignment or return to 8.2.19.1.3 Representation of 12d Objects as IFCs or 8.2.19.1 IFCs.

8.2.19.1.3.2 Super String

A super string with a **rectangular pipe** is written out as an **IfcRectangleProfileDef** element.

A super string with a **circular pipe** is written out as an **IfcCircleRectangleProfileDef** element.

For a circular pit, the shape representation is ***ifcCircleHollowProfileDef***. See 8.2.19.1.2.18

IfcCircleHollowProfileDef.

For a rectangular pit, the shape representation is ***ifcRectangleHollowProfileDef***. Note however that this has only one wall thickness so when writing the pit out, the outer shape is correct but the maximum value of the top, bottom, left and right thicknesses is used for the wall thickness. So if the top, bottom, left and right thickness are not all the same value then the inner rectangle is smaller than it actually is. See 8.2.19.1.2.20 IfcRectangleHollowProfileDef.

Each **Pipe** is written out as an **IFCFLOWSEGMENTS** element.

For a circular pipe, the shape representation is ***ifcCircleHollowProfileDef***. 8.2.19.1.2.18 IfcCircleHollowProfileDef.

For a rectangular pipe, the shape representation is ***ifcRectangleHollowProfileDef***. Note however that this has only one wall thickness so when writing the pipe out, the outer shape is correct but the maximum value of the top, bottom, left and right thicknesses is used for the wall thickness. So if the top, bottom, left and right thickness are not all the same value then the inner rectangle is smaller than it actually is.

Continue to the 8.2.19.1.3.4 Sewer String or return to 8.2.19.1.3 Representation of 12d Objects as IFCs or 8.2.19.1 IFCs.

8.2.19.1.3.3 Drainage String

Each **Pit** is written out as an **IFCFLOWSTORAGEDEVICE** element.

For a circular pit, the shape representation is ***ifcCircleHollowProfileDef***. See 8.2.19.1.2.18 IfcCircleHollowProfileDef.

For a rectangular pit, the shape representation is ***ifcRectangleHollowProfileDef***. Note however that this has only one wall thickness so when writing the pit out, the outer shape is correct but the maximum value of the top, bottom, left and right thicknesses is used for the wall thickness. So if the top, bottom, left and right thickness are not all the same value then the inner rectangle is smaller than it actually is. See 8.2.19.1.2.20 IfcRectangleHollowProfileDef.

Each **Pipe** is written out as an **IFCFLOWSEGMENTS** element.

For a circular pipe, the shape representation is ***ifcCircleHollowProfileDef***. 8.2.19.1.2.18 IfcCircleHollowProfileDef.

For a rectangular pipe, the shape representation is ***ifcRectangleHollowProfileDef***. Note however that this has only one wall thickness so when writing the pipe out, the outer shape is correct but the maximum value of the top, bottom, left and right thicknesses is used for the wall thickness. So if the top, bottom, left and right thickness are not all the same value then the inner rectangle is smaller than it actually is.

Continue to the 8.2.19.1.3.4 Sewer String or return to 8.2.19.1.3 Representation of 12d Objects as IFCs or 8.2.19.1 IFCs.

8.2.19.1.3.4 Sewer String

Each **Maintenance hole** is written out as **IFCFLOWSTORAGEDEVICE** element.

For a circular maintenance hole, the shape representation is ***ifcCircleHollowProfileDef***. 8.2.19.1.2.18 IfcCircleHollowProfileDef.

For a rectangular maintenance hole, the shape representation is

ifcRectangleHollowProfileDef. Note however that this has only one wall thickness so when writing the maintenance hole out, the outer shape is correct but the maximum value of the top, bottom, left and right thicknesses is used for the wall thickness. This may mean that the inner rectangle may be smaller than it actually is.

Each **Pipe** is written out as an **IFCFLOWSEGMENT** element.

For a circular pipe, the shape representation is ***ifcCircleHollowProfileDef***. 8.2.19.1.2.18 IfcCircleHollowProfileDef.

For a rectangular pipe, the shape representation is ***ifcRectangleHollowProfileDef***. Note however that this has only one wall thickness so when writing the pipe out, the outer shape is correct but the maximum value of the top, bottom, left and right thicknesses is used for the wall thickness. So if the top, bottom, left and right thickness are not all the same value then the inner rectangle is smaller than it actually is.

Continue to the 8.2.19.1.3.5 Tin or return to 8.2.19.1.3 Representation of 12d Objects as IFCs or 8.2.19.1 IFCs.

8.2.19.1.3.5 Tin

A **Tin** is written out as an **IFCBUILDINGELEMENTPROXY** element.

The tin attributes can be written out as an ifcPropertySet.

Continue to the 8.2.19.1.3.6 Trimesh or return to 8.2.19.1.3 Representation of 12d Objects as IFCs or 8.2.19.1 IFCs.

8.2.19.1.3.6 Trimesh

A **Trimesh** is written out as an **IFCBUILDINGELEMENTPROXY** element.

The Trimesh attributes can be written out as an ifcPropertySet.

Return to 8.2.19.1.3 Representation of 12d Objects as IFCs or 8.2.19.1 IFCs.

8.2.19.1.3.7 Alignment

An **Alignment** is written out as an **IFCBUILDINGELEMENTPROXY** element.

The string attributes can be written out as an ifcPropertySet.

Continue to the 8.2.19.1.3.3 Drainage String or return to 8.2.19.1.3 Representation of 12d Objects as IFCs or 8.2.19.1 IFCs.

8.2.19.2 Project Units

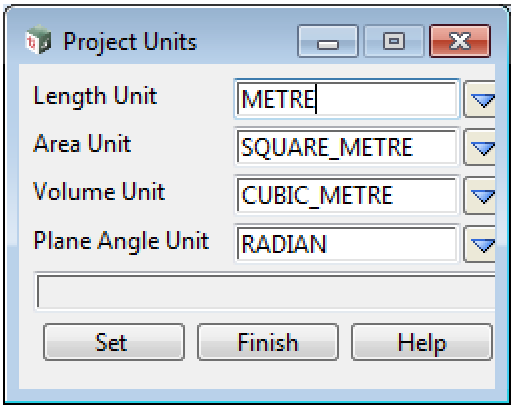
Position of option on menu: **File I/O =>Data output =>IFC => Project units**

This option creates the Project attributes group ***ifc_attributes/ifc_project_units*** and the values of the attributes are written out when an IFC STEP file (IFC file) is created.

Note that this does not change the data stored inside ***12d Model*** or written out to the IFC file.

The user must set the **IFC Units** to match what units they are been using inside ***12d Model***. And these by default are METRE, SQUARE_METRE, CUBIC_METRE and RADIAN.

Selecting **Project units** brings up the **Project Units** panel:



and if the Project attributes group ***ifc_attributes/ifc_project_units*** exists, the values are displayed in the panel. If the Project attributes group ***ifc_attributes/ifc_project_units*** does not exist, then it is created when the **Set** button is pressed.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Length Unit	choice box	as per Project Attributes	MILLIMETRE METRE, KILOMETRE

*length units used globally in the IFC file. Defined as SI units. This must match what you units data is in within **12d Model**.*

Area Unit	choice box	as per Project Attributes	SQUARE)MILLIMETRE, SQUARE_METRE, SQUARE_KILOMETRE

*area units used globally in the IFC file. Defined as SI units. This must match what you units data is in within **12d Model***

Volume Unit	choice box	as per Project Attributes	CUBIC_MILLIMETRE, CUBIC_METRE, CUBIC_KILOMETRE

*volume units used globally in the IFC file. Defined as SI units. This must match what you units data is in within **12d Model***

Plane Angle Unit	choice box	as per Project Attributes	RADIAN, DEGREES

plane angle units used globally in the IFC file. Defined as SI units.

Set	button		

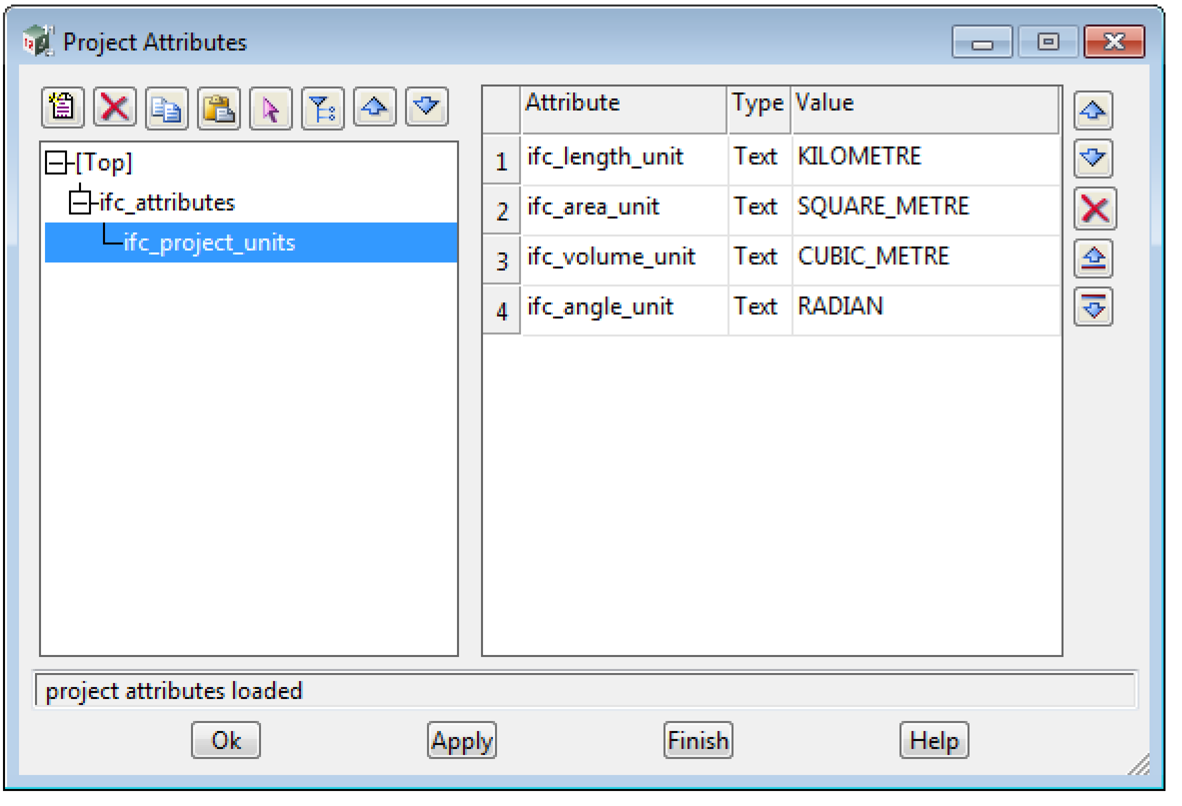
*updates/creates the Project attribute group **ifc_attributes/ifc_project_units** with the values in the* *panel.*

Note

The attributes can be displayed (and modified) using the option

Project =>Utilities =>Attributes

which brings up panel **Project Attributes**.



Warning:

Be careful making any changes using **Project Attributes**. The attribute name can't be and the attribute values must be valid IFC values.

Continue to next section 8.2.19.3 Extra Project Details or go back to 8.2.19 IFC Output.

8.2.19.3 Extra Project Details

Position of option on menu: **File I/O =>Data output =>IFC => Extra project details**

This option

(a) defines the path name of the ***Spatial Schema File*** that defines the types of IFC spatial elements that 12d elements can be tagged as, and the relationship between the allowed IFC spatial elements.

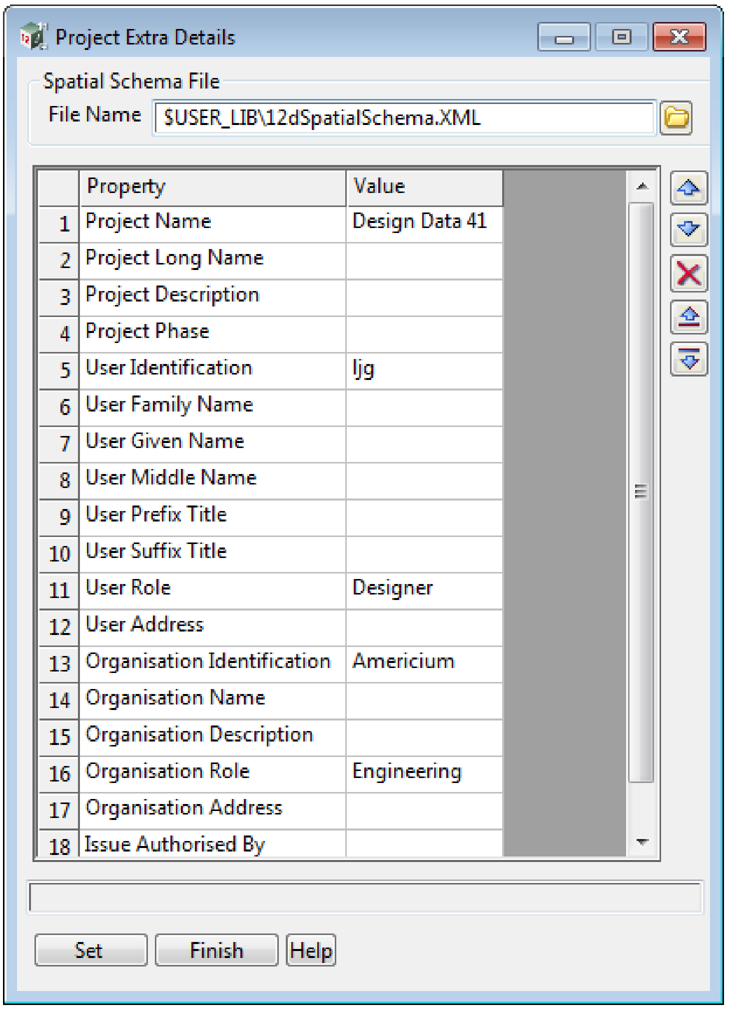
and

(b) creates and updates the **Project Attributes** group

ProjectExtraDetails.

that collects information to be written out as part of ***ifcProject***.

Selecting **Extra project details** displays the panel **Project Extra Details:**



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Spatial Schema File

File Name	file box		available *.xml files

name of the XML file which will be used by the **Spatial tag structure** *option (the* **Spatial Tag**

Aggregation *panel (the next step before using the IFC Writer to create an IFC file). For more information on when and how this file is created, see* 8.2.19.3.1 Spatial Schema File.

Grid

Property/Value

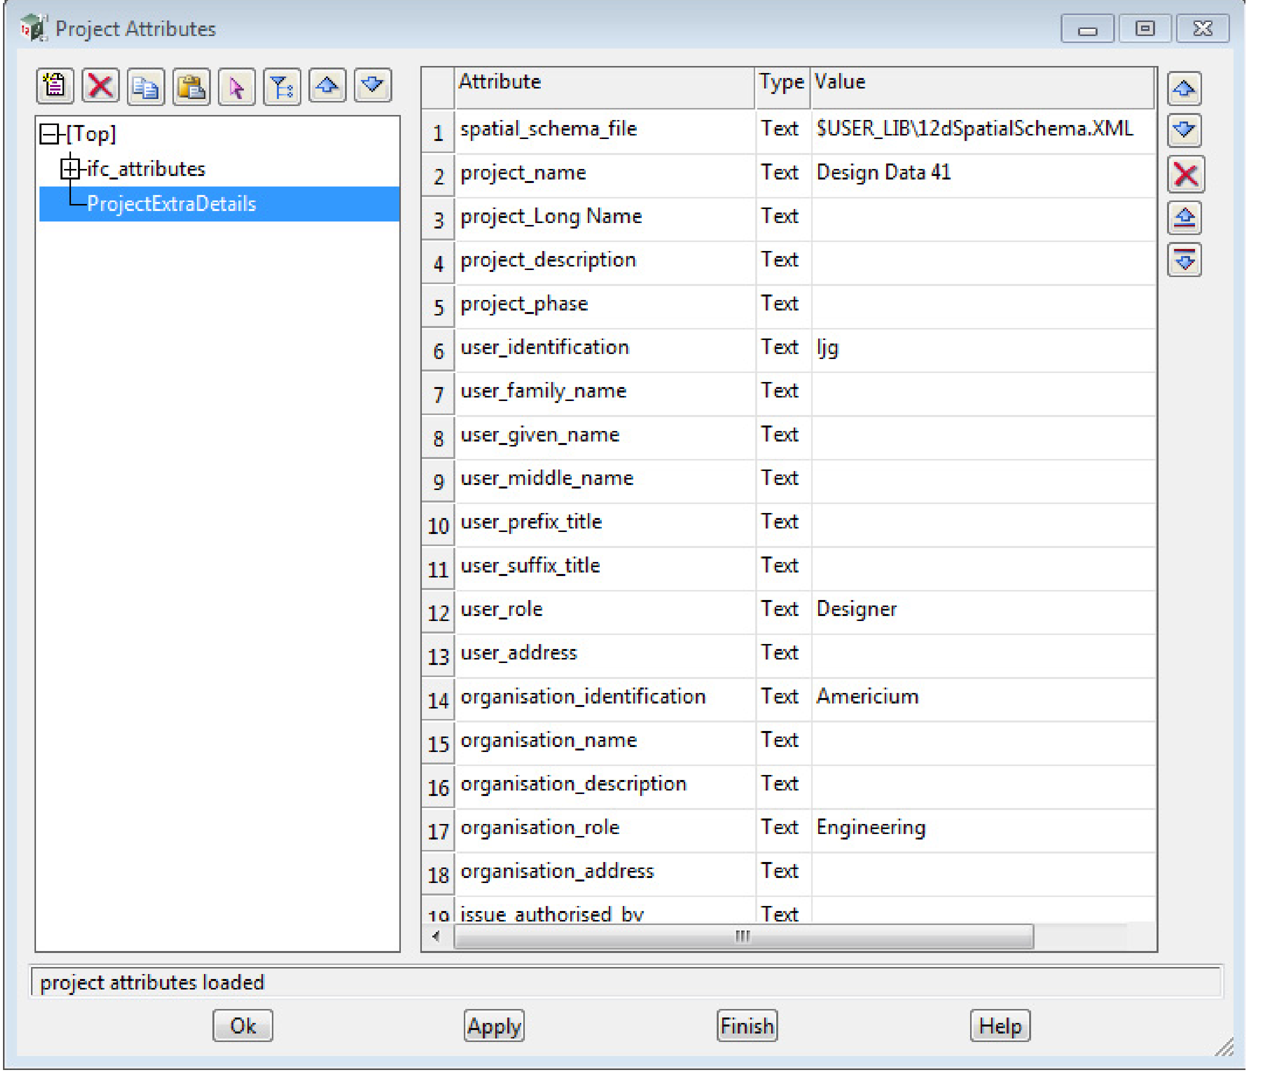
this grid allows the user to enter extra details about the IFC project and the information is stored as Project attributes in the group ***ProjectExtraDetails****. The values of these attributes are written out to the IFC file as part of the* ***ifcProject*** *element.*

Buttons at bottom

Set button

set the value of the attribute ***spatial_schema_file*** *in the* ***ProjectExtraDetails*** *group to the name given in the* **File name** *field.*

Then use the values in the **Property/Value Grid** *to create/update the values of the attributes in the Project attributes group* ***ProjectExtraDetails.*** *Note that these attributes are written out to the ifcProject element in any IFC file that is created by the* **IFC writer** *option (see* 8.2.19.5 IFC 2x3 Writer*).*



Continue to the next sub-section 8.2.19.3.1 Spatial Schema File or the next section 8.2.19.4 Defining and Assigning Spatial Structures, or return to 8.2.19 IFC Output.

8.2.19.3.1 Spatial Schema File

The **Spatial Schema File** is an XML file which is used by the **Spatial tag structure** option (the **Spatial Tag Aggregation** panel to define defines types of IFC spatial elements, and the allowed hierarchical relationship between the types.

For example, the type **Site** (ifcSite) is allowed as a standalone entity.

The type **Site Partial** (ifcBuilding) can't be standalone but must be associated with a specific **Site** and only a **Site**. Whereas **Building** (ifcBuilding) also can't stand alone but it can be associated with a specific **Site** or a specific **Site Partial.** (See 8.2.19.1.1 Spatial Structures).

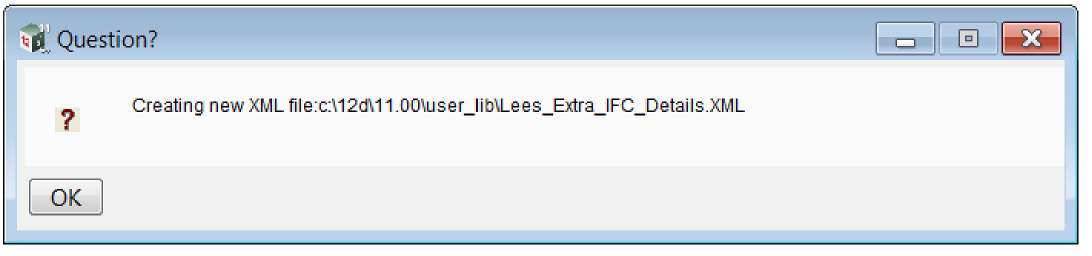
When **Extra project details** is selected the Project attribute:

ProjectExtraDetails/spatial_schema_file

is searched for and

(a) if the **attribute exists** then a file of the name of the value of the attribute is searched for.

If the file does not exist, then a **Question?** panel comes up:

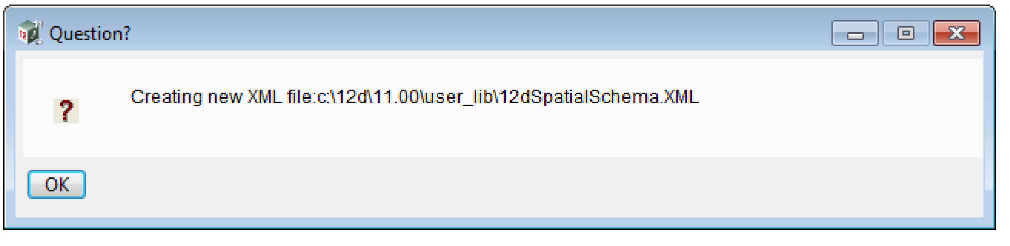


If **OK** is pressed then a file of the given name is created and a default spatial schema written to the file.

OR

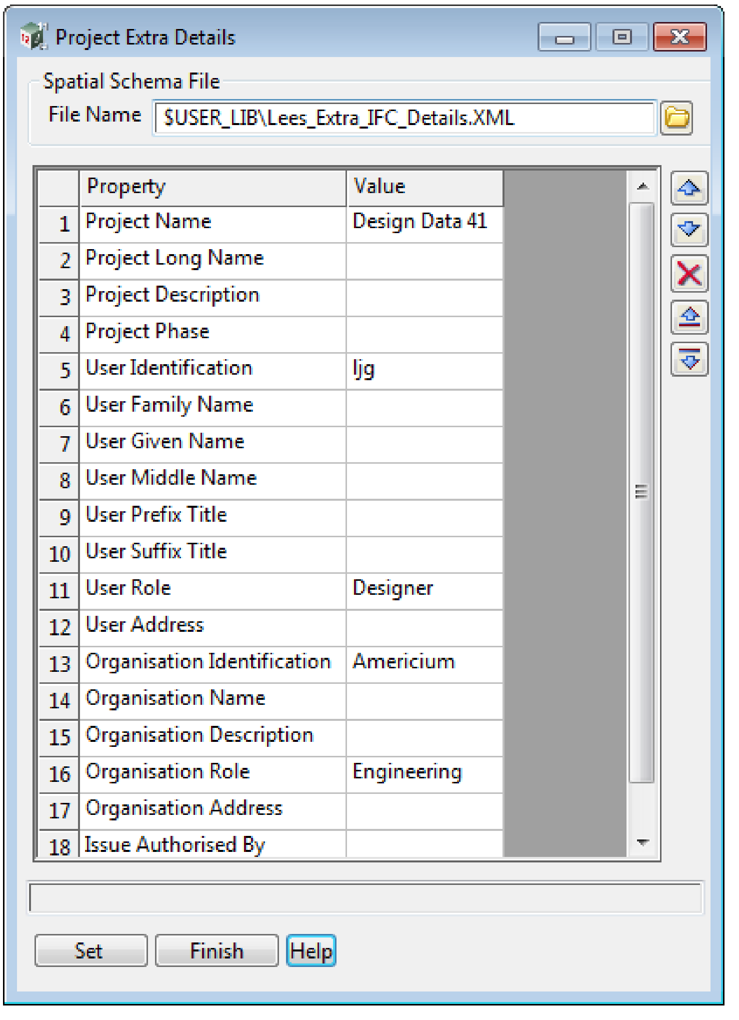
(b) if the **attribute doesn't exit** then a file of the name called *12dSpatialSchema.XML* is searched for in $USER_LIB.

If the file does not exist, then a **Question?** panel comes up:



If **OK** is pressed then the file $USER_LIB*12dSpatialSchema.XML*is created and a default spatial schema written to the file.

The panel **Project Extra Details** is then brought up displaying name of the *Spatial Schema File*, and also the grid of parameters that are stored in the Project attribute group *ProjectExtraDetails* for writing out to the ***ifcProject*** element in the IFC file.



Continue to next section 8.2.19.4 Defining and Assigning Spatial Structures or return to 8.2.19 IFC Output.

8.2.19.4 Defining and Assigning Spatial Structures

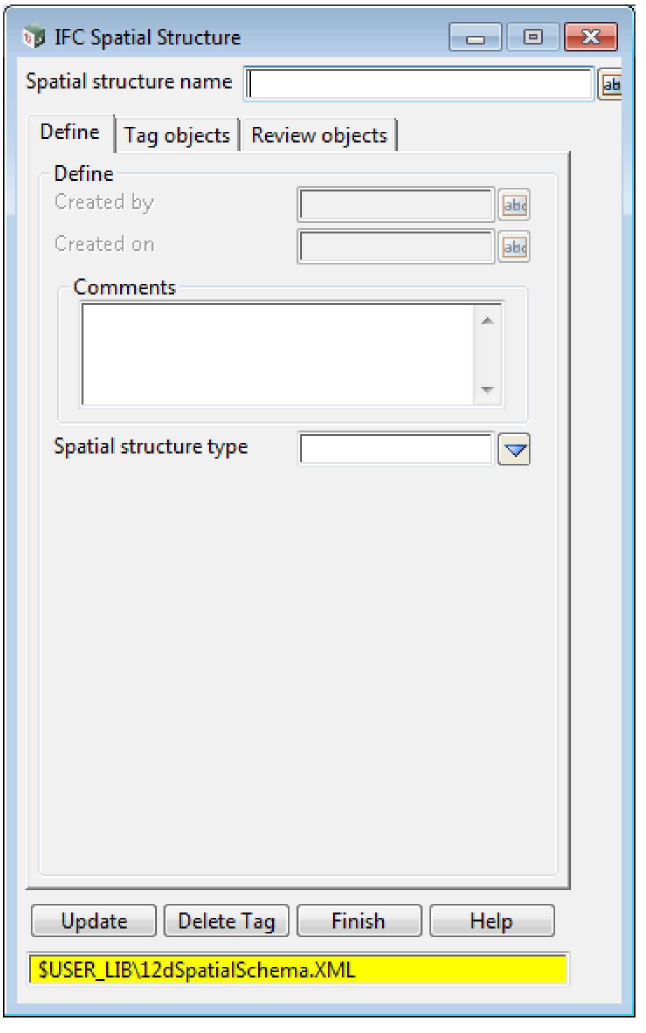
Position of option on menu: **File I/O =>Data output =>IFC => Spatial structures**

This option actually has three functions:

1. It creates the named structures as tags using the *Spatial Schema File* referred to by the attribute ***spatial_schema_file*** in the Project attribute group ***ProjectExtraDetails*** (see 8.2.19.3 Extra Project Details).
2. it tags models and/or strings with a spatial structure defined in 1.
3. it select all items of given spatial structure and optionally remove the spatial structure tag from any of them.

See 8.2.19.1.1 Spatial Structures for more information on Spatial Structures.

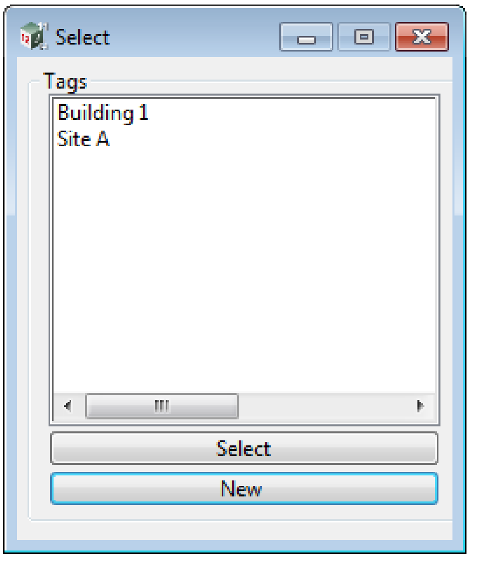
Selecting **Spatial structure** brings up the **IFC Spatial Structure** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Spatial structure name	input		Select/New Spatial structures

*clicking LB **inside** the text entry field bring up the* **Select Spatial Structure** *panel will bring up the New Spatial Structure panel is no spatial structures have been defined (*8.2.19.4.1 Create New Spatial Structure*), or if spatial structures have already been defined, a* **Select** *panel with the choices* *of existing spatial structures:*



If ***New*** *is selected then* **Create Spatial Structure** *panel is brought up to. See* 8.2.19.4.1 Create New Spatial Structure.

If a Spatial Structure is double clicked on in the list, or a Spatial Structure highlighted in the list and ***Select*** *pressed, then the rest of the panel is filled with the information for the selected Spatial Structure. the information can then be edited and then updated by clicking on the Update button.*

For information on each Tab and the Buttons at the bottom, see:
Define Tab
Tag Objects Tab
Review Objects Tab
Buttons at Bottom

Define Tab

this tab is used when a new Spatial Structure is being created or an existing one edited.

Created by output from selected Spatial Structure

cannot be edited from this tab.

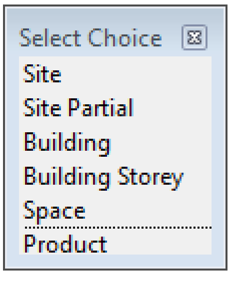
Created on output from selected Spatial Structure

cannot be edited from this tab.

Comments input/output from selected Spatial Structure

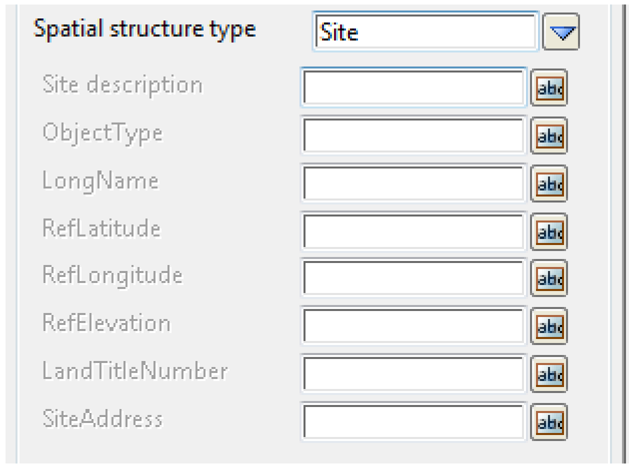
displays the existing comments which can be edited and extra comments added.

Spatial structure type choice box from selected Spatial Structure



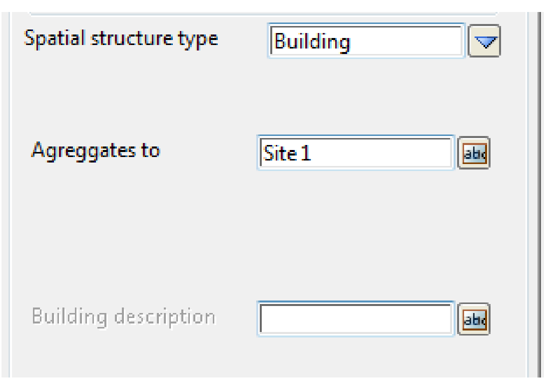
displays the spatial structure types for the selected Spatial Structure. This can be changed and the *choices are defined in the spatial schema file. See* 8.2.19.3.1 Spatial Schema File.

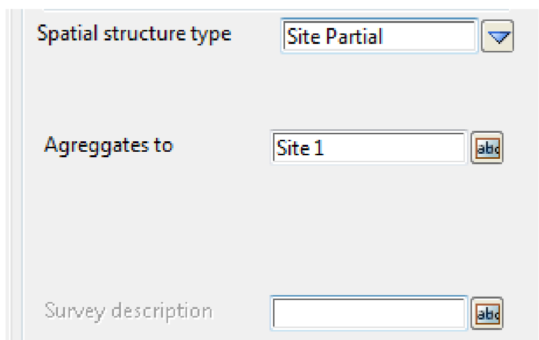
if ***Spatial structure*** *type is set to* ***Site****, the following fields are displayed.*



The fields and names on the left had side of the panel are populated from the Spatial Schema File (see 8.2.19.3.1 Spatial Schema File*). The values for the fields can be created/edited and when the* **Update** *button is pressed, the values are stored as a subgroup of the Tags group of the Project attributes. The subgroup has the name of the Site.*

If the ***Spatial structure*** *type is set to anything other than Site, only the* **Aggregates to** *and fields that are defined the Spatial Schema File (see* 8.2.19.3.1 Spatial Schema File*).*



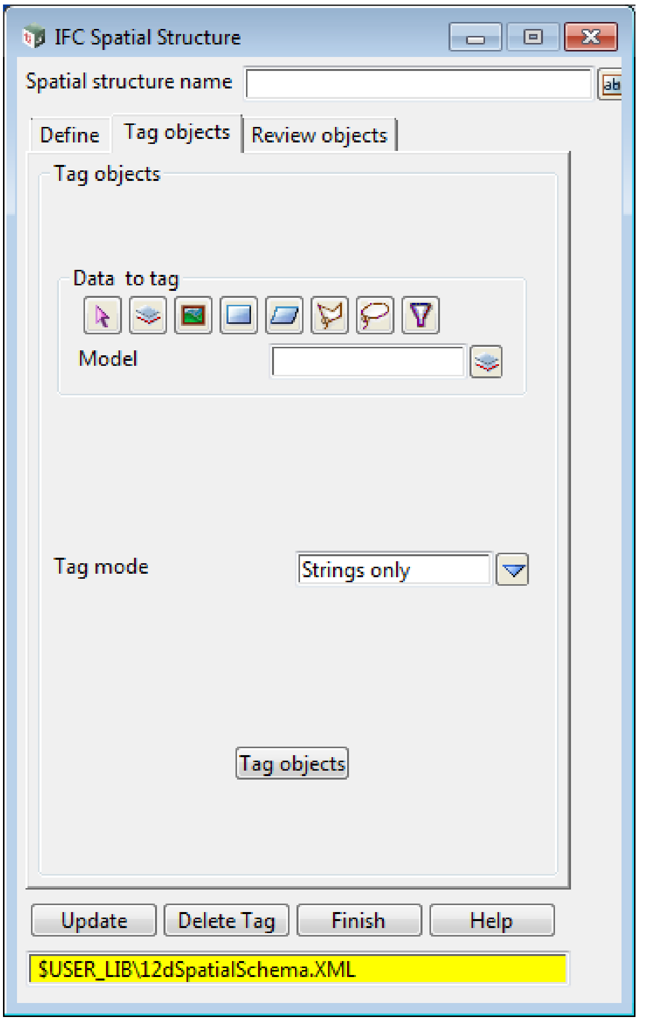


Clicking in the ***Aggregates to*** *field brings up a list of Spatial Structures that have already been created. The existing Spatial Structure that this new spatial structure is in is selected. See* 8.2.19.1.1 Spatial Structures.

The values for the other fields can be created/edited and when the **Update** *button is pressed, the values are stored as a subgroup of the Tags group of the Project attributes. The subgroup has the name of the Spatial Structure.*

Tag Objects Tab

this tab is used to tag data are being in a given Spatial Structure.



Data to tag Model

data selection type - for a full description go to 4.19.3 Data Source.

Data source input

source of data is to be selected for tagging.

Tag mode choice box Models only, Strings only, Strings and models

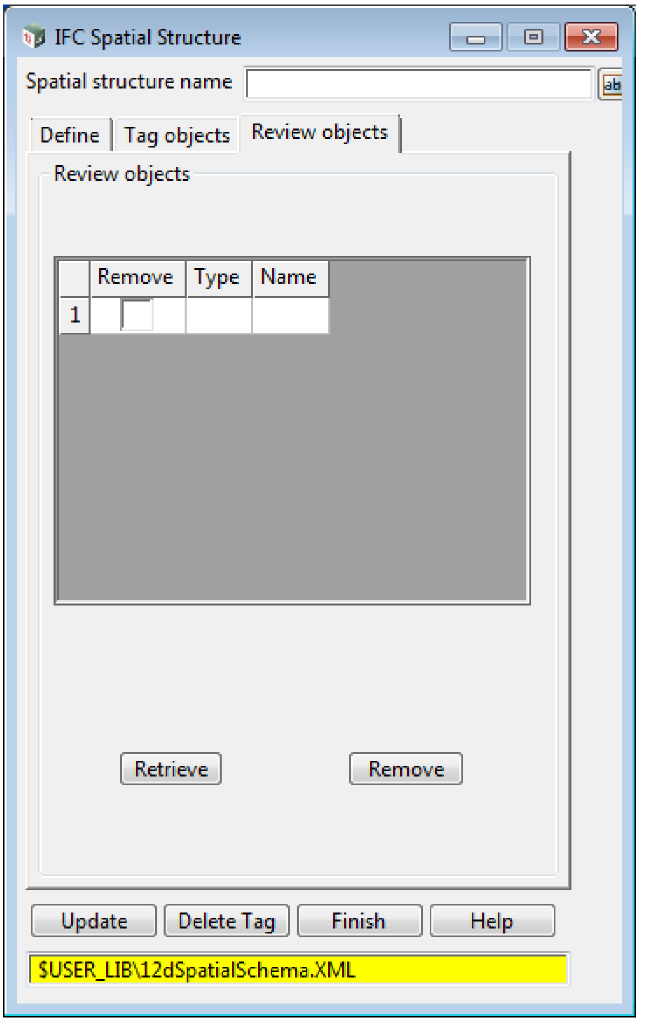
creates attributes on the selected strings and/or models to indicate which spatial structure the strings and/or models belong to.

Tag objects button

tags the selected strings and models with attributes so it is known that they belong to a spatial structure, and which structure it is.

Review Objects Tab

this tab selects data with a given Spatial Structure and can also remove selected items from the spatial structure.



Review Objects Grid

Remove tick box

if ticked, the string or model in that row will be removed when the **Remove** *button is clicked.*

Whether strings, models, or both are available is dependent on Tag mode selected in Tag objects tab.

Type output String, Model or Trimesh

the type of the object - string, model or trimesh.

Name output

the name of the object.

Retrieve button

adds a selected string or model.

Remove button

when pressed the data for the given Spatial Container is listed in the grid.

Buttons at Bottom

Update

*applies each change. Hit **Update** after every change.*

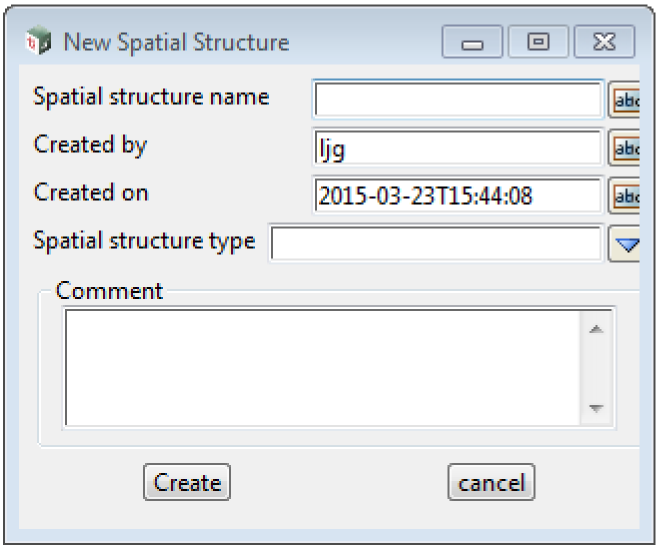
Delete Tag

deletes all objects with the selected tag.

Continue to next section 8.2.19.5 IFC 2x3 Writer or return to 8.2.19 IFC Output.

8.2.19.4.1 Create New Spatial Structure

Selecting **New** brings up the **Create Spatial Structure** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Spatial structure name	input		

the name of the new spatial structure

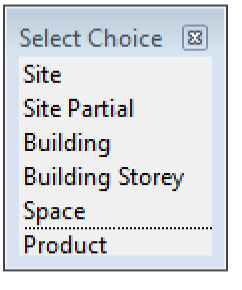
Created by	input	user name	

can be edited to show a different user name if need be

Created on	input	current date and time	

can be edited to show a different date and time

Spatial structure type	choice box	as per the spatial schema file.	



spatial structure types that are defined in the spatial schema file. See 8.2.19.3.1 Spatial Schema File.

Comments	input		as per New Container panel

allows user comments to be entered.

Create	button		

create the new Spatial Structure.

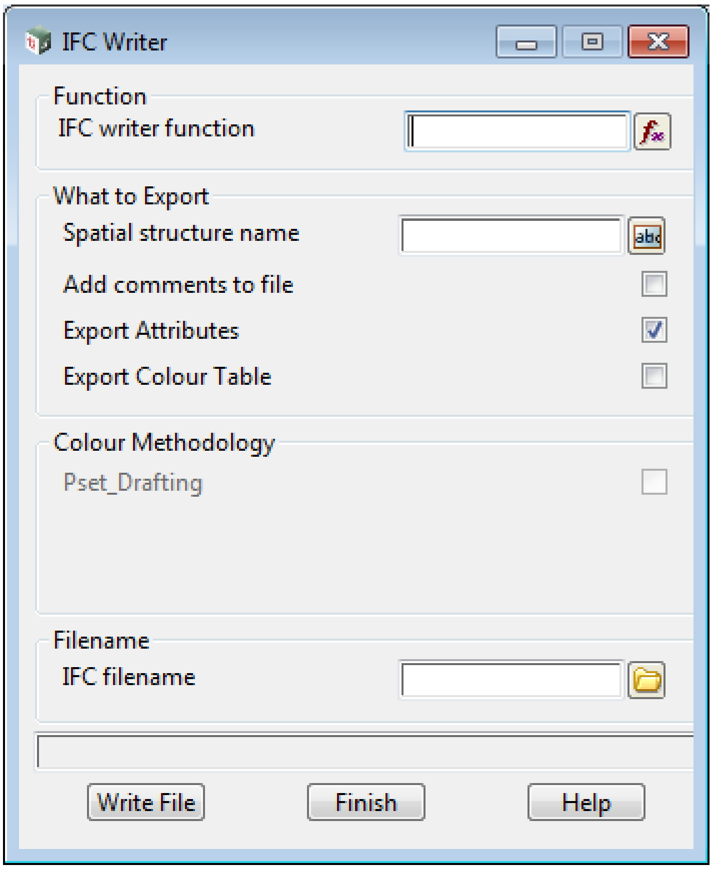
Return to 8.2.19.4 Defining and Assigning Spatial Structures.

8.2.19.5 IFC 2x3 Writer

Position of option on menu: **File I/O =>Data output =>IFC => IFC Writer**

The **IFC Writer** option writes out data with a given tag to a file in the IFC 2x3 format (see 8.2.19.1.2 Some IFC 2x3 Definitions).

Selecting **IFC Writer** brings up the **IFC Writer** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Function

IFC writer function	function box		available IFC functions

the name for the IFC Writer Function. Note that the IFC Writer is a function so that it can remember the settings in the panel and can be easily recalced as a function at any time.

What to Export

Spatial structure name	defined spatial structures		available spatial structures

All data with that has been tagged with this IFC spatial structure name, or has been tagged with an IFC spatial structure name that is in the Spatial Structure hierarchy under this spatial structure, is written out to the IFC file. See 8.2.19.1.1 Spatial Structures *and* 8.2.19.4 Defining and Assigning Spatial Structures*).*

So only the name of one spatial structure is required and all the data in that spatial structure and the data in all those spatial structures under it are selected for writing out.

Add comments to file	tick box	not ticked	

*if **ticked**, comments are added to the IFC file denoting what each group of data is in the IFC file. For example, IFC MODEl INFORMAITON, PROJECT INFORMATION and ELEMENTS CONTAINED IN SPATIAL STRUCTURES.*

Export attributes tick box ticked

*if **ticked**, the 12d Project Attributes will be exported to the IFC file to the ifcProject. For 12d Objects that are represented as ifcBuildingElementProxy elements, the string/tin/trimesh attributes are exported as an ifcPropertySet.*

Export colour table tick box not ticked

*if **ticked**, the Colour Table will be exported to the IFC file.*

Colour Methodology

Pset_Drafting tick box ticked (if Export Colour Table is ticked)

if **Export colour table** *is ticked then this is automatically ticked on.*

Filename

IFC Filename file box available *.ifc files

the name of the IFC file to write all data tagged with the given Spatial Structure.

Buttons at bottom

Write File button

write the IFC 2x3 file.

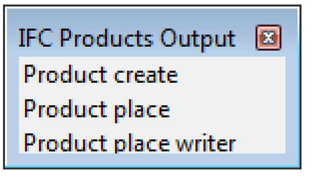
Return to 8.2.19 IFC Output.

8.2.19.6 Products

Position of option on menu: **File I/O =>Data output =>IFC => Products**

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Products** brings up the **Products** menu.



For the options see;

Product create 8.2.19.6.1 Writing 12d Solutions 12da Data with Place Nodes
Product place 8.2.19.6.2 Product Place
Product place writer 8.2.19.6.3 Product Place Writer

8.2.19.6.1 Writing 12d Solutions 12da Data with Place Nodes

Position of option on menu: **File I/O =>Data output =>IFC => Products =>Product create**

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Product create** brings up the **Write 12d Solutions Ascii Data with Place Nodes** panel.

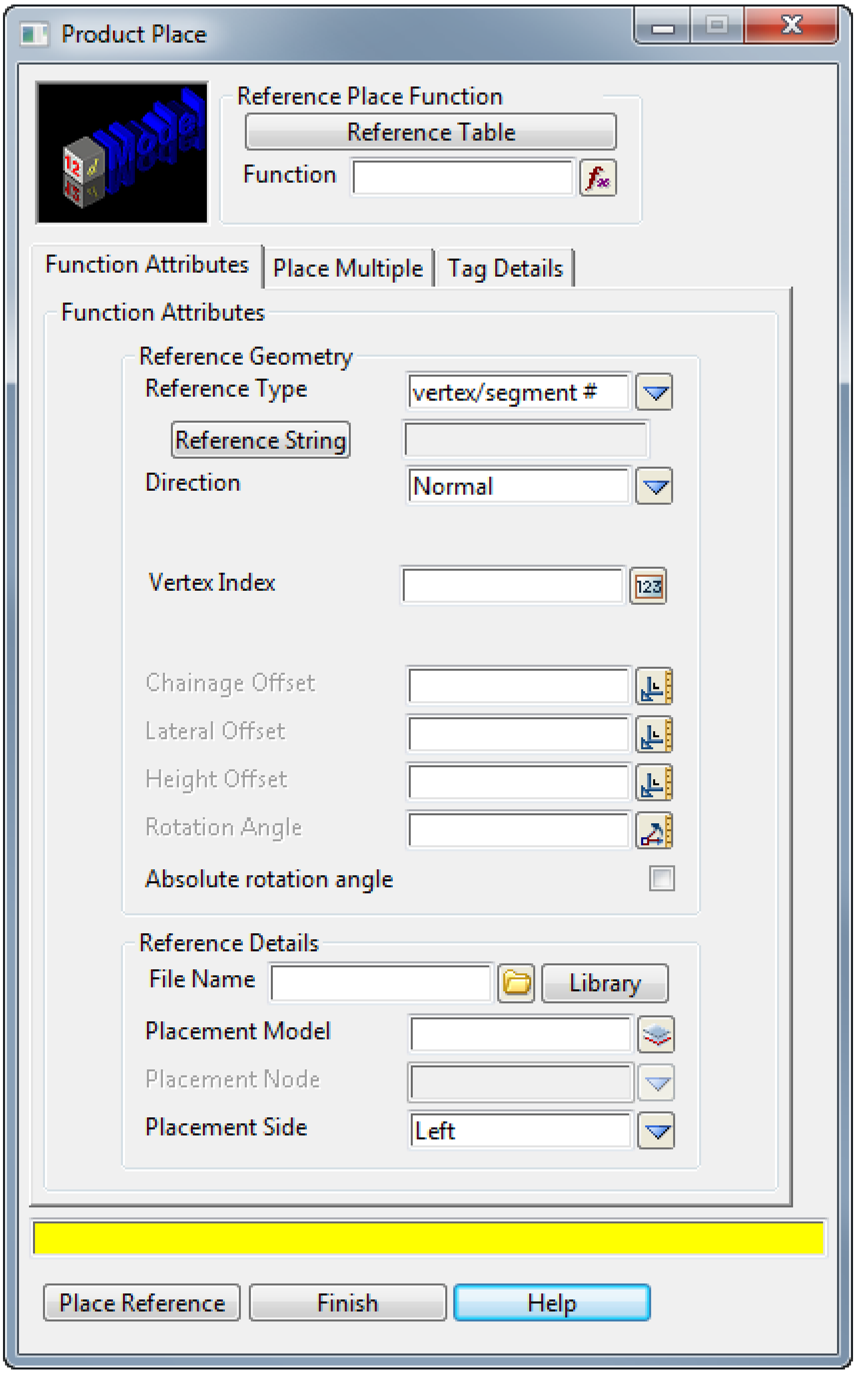
Continue to next section 8.2.19.6.2 Product Place or go back to 8.2.19.6.6 Products.

8.2.19.6.2 Product Place

Position of option on menu: **File I/O =>Data output =>IFC => Products =>Product place**

This section of documentation is a work in progress and will be updated in subsequent releases.

Selecting **Product place** brings up the **Product Place** panel.



Continue to next section 8.2.19.6.3 Product Place Writer or go back to 8.2.19.6 Products.

8.2.19.6.3 Product Place Writer

Position of option on menu: **File I/O =>Data output =>IFC => Products =>Product place writer**

This section of documentation is a work in progress and will be updated in subsequent releases.

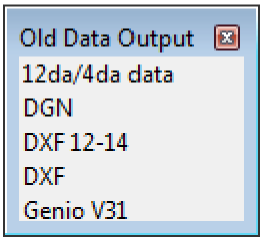
Selecting **Product place writer** brings up the **CSV Tag File Writer** panel.

Go back to 8.2.19.6 Products or go back to 8.2.19 IFC Output.

8.2.20 Old Outputs

Position of menu: **File I/O =>Data output =>Old**

The **Old** menu contains superseded options. The **Old** walk-right menu is



For the option *12da/4da data, go to*

DGN	
DXF 12-14	8.2.20.1 DXF 12-14 Output
DXF	8.2.20.2 DXF Output
Genio V31	8.2.20.3 Genio V3.1 Output

8.2.20.1 DXF 12-14 Output

Position of option on menu: **File I/O =>Data output =>Old =>DXF 12-14**

SUPERSEDED OPTION

The DXF 12-14 output format is for writing data out in a format compatible with AutoCAD. The DXF file produced **does not** have a full DXF header with the required line types, text styles, fonts already defined. Hence the DXF file needs to be loaded into an **existing** Autocad drawing.

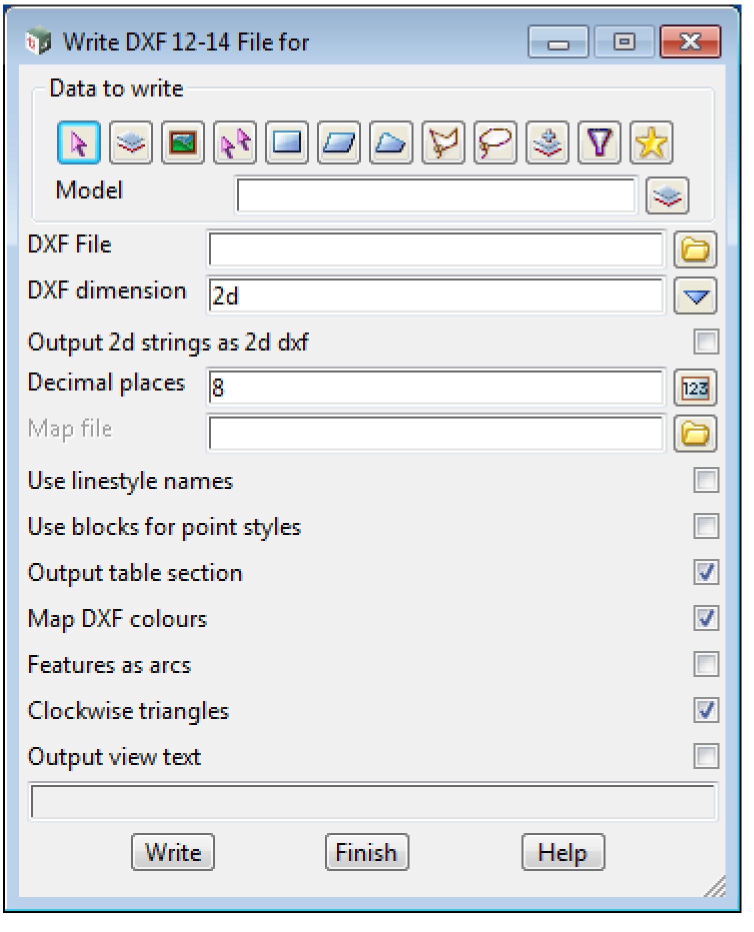
AutoCAD Release 10 introduced binary DXF files as a means of addressing the problems of large file sizes, slow processing and limited accuracy that occur when using the ASCII DXF format. 12d Model can write binary DXF files. See the **Precision** field below.

12d Model line strings are output as POLYLINEs, point strings as a series of AutoCAD POINTs and triangles as 3DFACEs.

By default, the string or triangle colour is used in the Autocad colour record. The DXF layer used is the items model name with any spaces in the model name replaced by a minus (-). However, a DXF output map file with matches on string name can be used to give DXF layers, colours and line type (see next section).

At this stage, 4d, interface and alignment strings are only output as Autocad POLYLINES.

On selecting the **DXF 12-14** output option, the **Write DXF 12-14 File for** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source input

source of data is to be written out to a file.

DXF File input *.dxf files

name of the file for the information to be written out to. If the file already exists, the data will be appended to the file.

DXF Dimension input 2d 2d, 3d

*if **3d**, strings will be written out as three dimensional DXF polylines. Alignment strings and arcs will be approximated by short lines.*
*If **2d**, the z-value of all the data is set to zero and arcs and curves in alignment strings are written out as dxf polylines with bulges for the arcs.*

Decimal places input 8

the number of decimal places to be used for co-ordinates etc. in the DXF file.
*If this number is **negative**, a binary DXF file will be written. The actual number specified becomes irrelevant in this case, since full precision is preserved in a binary DXF file.*

Map file input *.mf files

if non-blank, the name of a file to be used as a 12d *Model to DXF output map file. See* 8.2.20.1.1 DXF Output Map File.

Use linestyle names tick box

*if **ticked**, a* 12d *Model string's linestyle name is used as the DXF element's line type ("1" goes to CONTINUOUS).*
*if **not ticked**, all DXF line types are CONTINUOUS.*

Use blocks for point styles tick box

*if **ticked**, for each* ***12d Model*** *point string, an AutoCAD block of the same name as the* ***12d Model*** *string's linestyle is places at each point.*

Output table section tick box tick

*if **ticked**, an AutoCAD table section is written out at the top of the DXF file.*

Map DXF colours tick box tick

*if **ticked**, a mapping is made between the first seven default* ***12d Model*** *colours and the corresponding DXF colours. The other* ***12d Model*** *colours are mapped to the DXF colour of the same colour number.*
*If **not ticked**, the nth* ***12d Model*** *colour is mapped to the nth DXF colour.*

Features as arcs tick box

*if **ticked**, feature strings output as arcs in DXF.*
*if not **ticked**, the centre of the feature string is output as a point.*

Output view text tick box

*if **ticked**, any view text turned on (point numbers, z-values etc.) are output as text in DXF.*
*if not **ticked**, view text is not output.*

Write button

write out, in DXF format, the data in the model/view given in the model/view field, to the file given in the file field.

8.2.20.1.1 DXF Output Map File

When using the output options to write out a DXF file, an output map file can be used, with 12d Model string names as the entity-name to match the key, so that the user can specify AutoCAD colour and style. BYLAYER can be used with colour and style.

The key can have wild cards (*) and wild characters (?) as for the input map files.The fields in the DXF output map file are (ACD = AutoCAD):

field 1	key - string name	can include wild cards * and wild characters ?
field 2	new name	not output to DXF
field 3	ACD layer	* for ***12d Model*** name
field 4	ACD colour	number between 0 and 256, * for ***12d Model*** colour mapped to ACD, BYLAYER for ACD BYLAYER
field 5	ACD line type	* for ***12d Model*** linestyle, BYLAYER for ACD BYLAYER
field 6	ACD text style	not yet used, * for ***12d Model*** text style

The DXF file produced needs to be loaded into an existing Autocad drawing which has the ACD layers and linestyles defined.

An example of an DXF output map file is.

```
//      1       2       3          4          5             6
//      key     name    layer      colour     linetype      textstyle

        cont*   CONT    CONTOURS   1          1             *
        EB*     TOP     ROAD       2          CONTINUOUS    *
        103     TOP     *          3          *             *
        fe*     TOP     FENCE      *          BYLAYER       *
        SURV*   TOP     SURVEY     BYLAYER    DASH          *
```

8.2.20.2 DXF Output

Position of option on menu: **File I/O =>Data output =>Old =>DXF**

SUPERSEDED OPTION

The DXF output format is for writing data out in a format compatible with AutoCAD version 15. The DXF file produced **does not** have a full DXF header with the required line types, text styles, fonts already defined. Hence the DXF file needs to be loaded into an existing Autocad drawing.

This option is the one used in 12d Model V3.1. It is now superseded by the **DWG/DXF** output option.

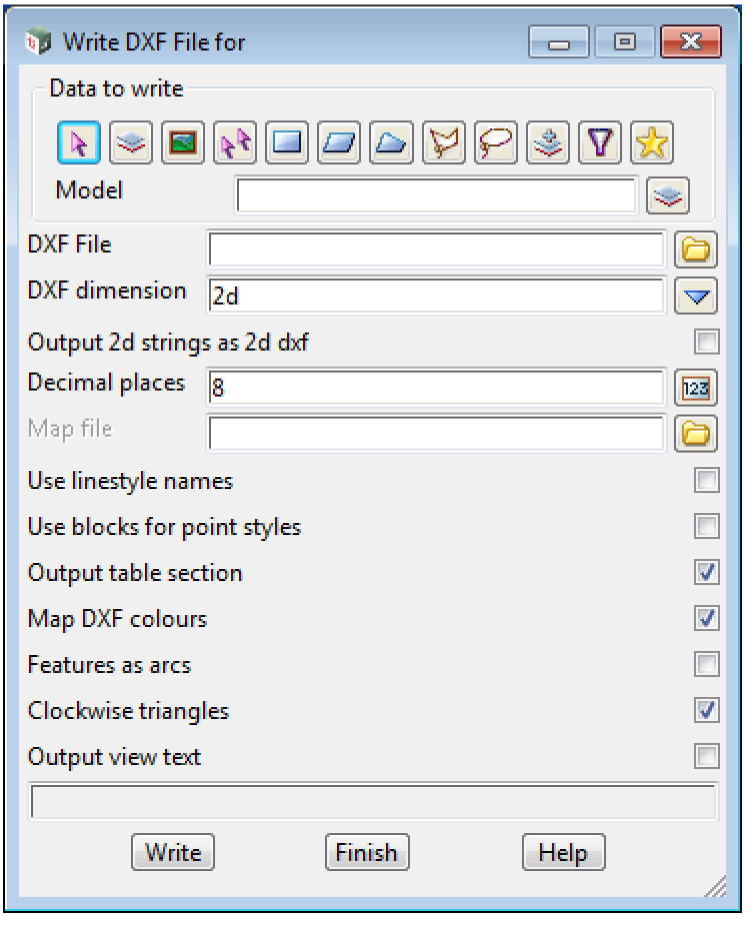
AutoCAD Release 10 introduced binary DXF files as a means of addressing the problems of large file sizes, slow processing and limited accuracy that occur when using the ASCII DXF format. 12d Model can write binary DXF files. See the **Precision** field below.

12d Model line strings are output as POLYLINEs, point strings as a series of AutoCAD POINTs and triangles as 3DFACEs.

By default, the string or triangle colour is used in the Autocad colour record. The DXF layer used is the items model name with any spaces in the model name replaced by a minus (-). However, a DXF output map file with matches on string name can be used to give DXF layers, colours and line type (see next section).

At this stage, 4d, interface and alignment strings are only output as Autocad POLYLINES.

On selecting the **DXF** output option, the **Write DXF file for** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data is to be written out to a file.

DXF File	input		*.dxf files

name of the file for the information to be written out to. If the file already exists, the data will be appended to the file.

DXF Dimension	input	3d	2d, 3d

if 3d, strings will be written out as three dimensional DXF polylines. Alignment strings and arcs will be approximated by short lines.
*If **2d**, the z-value of all the data is set to zero and arcs and curves in alignment strings are written out as dxf polylines with bulges for the arcs.*

Decimal places	input	8	

the number of decimal places to be used for co-ordinates etc. in the DXF file.
*If this number is **negative**, a binary DXF file will be written. The actual number specified becomes irrelevant in this case, since full precision is preserved in a binary DXF file.*

Map file	input		*.mf files

if non-blank, the name of a file to be used as a 12d Model to DXF output map file. See 8.2.20.1.1 DXF Output Map File.

Use linestyle names	tick box		

*if **ticked**, a 12d Model string's linestyle name is used as the DXF element's line type ("1" goes to CONTINUOUS).*
*if **not ticked**, all DXF line types are CONTINUOUS.*

Use blocks for point styles	tick box		

*if **ticked**, for each* ***12d Model*** *point string, an AutoCAD block of the same name as the* ***12d Model*** *string's linestyle is places at each point.*

Output table section	tick box	tick	

*if **ticked**, an AutoCAD table section is placed at the beginning of the DXF file.*

Map DXF colours	tick box	tick	

*if **ticked**, a mapping is made between the first seven default 12d Model colours and the corresponding DXF colours. The other* ***12d Model*** *colours are mapped to the DXF colour of the same colour number.*
*If **not ticked**, the nth* ***12d Model*** *colour is mapped to the nth DXF colour.*

Features as arcs	tick box		

*if **ticked**, feature strings output as arcs in DXF.*
*if not **ticked**, the centre of the feature string is output as a point.*

Output view text	tick box		

*if **ticked**, any view text turned on (point numbers, z-values etc.) are output as text in DXF.*
*if not **ticked**, view text is not output.*

Write	button		

write out, in DXF format, the data in the model/view given in the model/view field, to the file given in the file field.

8.2.20.3 Genio V3.1 Output

Position of option on menu: **File I/O =>Data output =>Old =>Genio V31**

SUPERSEDED OPTION

Genio i/o is a separate chargeable module.

This is the genio output module from 12d Model V3.1. This module has been replaced by the new genio module but the genio v3.1 will be left in V4.0 in case there a any problems with the new module.

The **genio v3.1 output** option uses a non-default format to write out the strings in a model or on a view, to a genio file. A genio 001 option is used to specify the record format.

The first thirty two characters of the model name are converted to upper case and used as the Moss model name.

In Moss, string labels can have a maximum of four characters. Since 12d Model places no restrictions on string name length, the following rules are used to produce genio string labels.

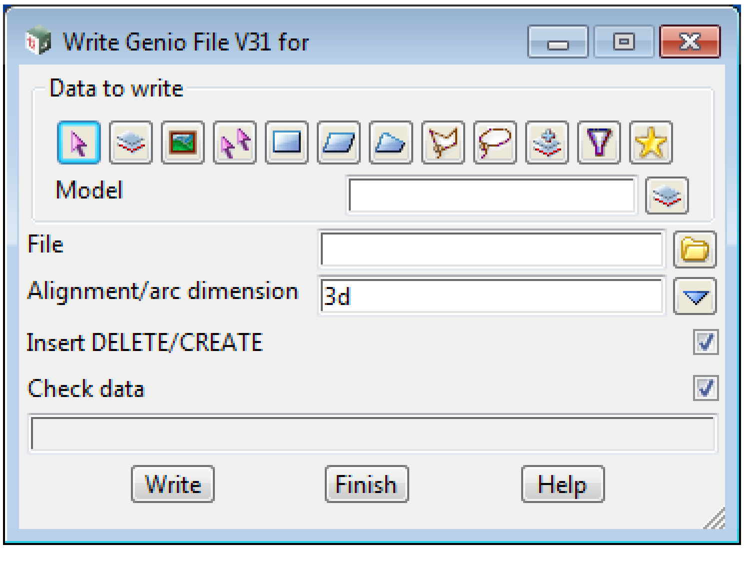
For a line-string, the first four characters of its string name are used as the genio string label. The four characters are mapped to upper case.

Similarly for point-strings whose names start with **P**. Otherwise the genio string label is **P** plus the first three letters of the point-string name. The three letters are mapped to upper case.

The name of a Moss text string must start with a * so 12d Model uses * and the first three characters of the text string's name.

An alignment string can be written out as either a moss 3d, 6d or 12 string.

On selecting the **Genio V31** output option, the **Write Genio File V31 for** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
data selection type - for a full description go to 4.19.3 Data Source.			
Data source	input		
source of data is to be written out to a file.			
File	input		*.mos files

name of the file the model/view is to be written out to. If the file already exists, the data will be appended to the bottom of the file.

Alignment dimension	input	3d	3d,6d,12d

if 3d is selected, alignment strings as written out as a 3d string as a series of straight lines.
If 6d is selected, alignment strings are written out as Moss 6d strings.
If 12d is selected, alignment strings are written out as Moss geometry strings. This is the only way that full horizontal and vertical geometry can be transferred to Moss.

Insert DELETE/CREATE	tick box	tick

if ticked, the genio commands DELETE and CREATE are written at the top of the file to correctly define the moss models for the data.

Write	button

write out in genio format the data in the model/view given in the **model/view** *field, to the file given in the* **file** *field. If the file already exist, the data will be appended to the file.*

8.2.20.4 Eagle Output

Position of option on menu: **File I/O =>Data output =>Old =>Eagle**

Eagle is a 3D CAD package used throughout Australia, Asia and Europe.

Using the **Eagle output** option, 12d Model produces an Eagle command file which is used by Eagle to create an Eagle model. Since Eagle supports 3D faces, the triangles created in 12d Model can be transferred to Eagle for use in shaded models and walk-throughs.

Instead of colours, Eagle uses pens, dash styles, line thicknesses and frags. To allow the user to map 12d Model colours to appropriate Eagle settings, an **Eagle map file** setting out the ***12d Model*** and Eagle relationships can be provided.

The eagle map file is a user created file consisting of a list of 12d Model colours and the Eagle pen, dash style, pen thickness and frag to be used for the colour.

The map file is set out with one ***12d Model*** colour per line. The line begins with the ***12d Model*** colour followed by the Eagle pen number, dash style, thickness and frag to be used for the ***12d Model*** colour. Each item is separated by one or more spaces.

For example, if the ***12d Model*** colour **red** is to be mapped to Eagle pen 3, dash style 4, thickness 2 and frag 1, then the line in the eagle map file would be

```
red        3          4          2          1
```

If a map file is used, as each string is written out, the map file is searched sequentially until a colour match is made.

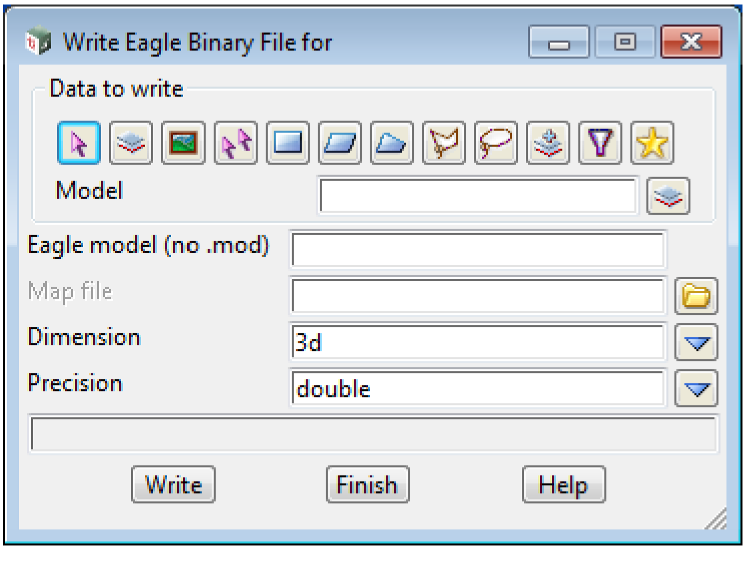
If no match is found, the colour of the string is used as a pen number and default values used for dash, thickness and frag.

Comments can be included in the map file by preceding the comment with a double forward slash (i.e. //). Anything on the line following the // will be ignored.

For example,

// 12d colour	pen	dash	thick	frag
red	3	4	2	1
green	4	1	1	2

On selecting the **Eagle** option, the **Write Eagle Command File for** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source input

source of data is to be written out to a file.

Eagle Command File input *.cmd files

*name of the Eagle command file to write the model/view out to. If the file already exists, the data will be appended to the bottom of it. To be consistent with the Eagle file naming convention, the file name should end in **.cmd***

Eagle model input

*name of the Eagle model to be used for the data. Only the characters A-Z, a-z, 0-9 and - are allowed in an Eagle model name. Do not include a **.mod** in the name.*

Map file input *.emf files

if non-blank, the name of the map file to be used for all string colours. If blank, no map file is used.

Write button

write out the data from the model/view given in the **model/view** *field to the file given in the* **eagle command file** *field. The Eagle model has the name given in the **Eagle model** field. If the file already exists, the data is appended to the file.*

8.2.20.5 Eagle Binary Output

Position of option on menu: **File I/O =>Data output =>Old =>Eagle Binary**

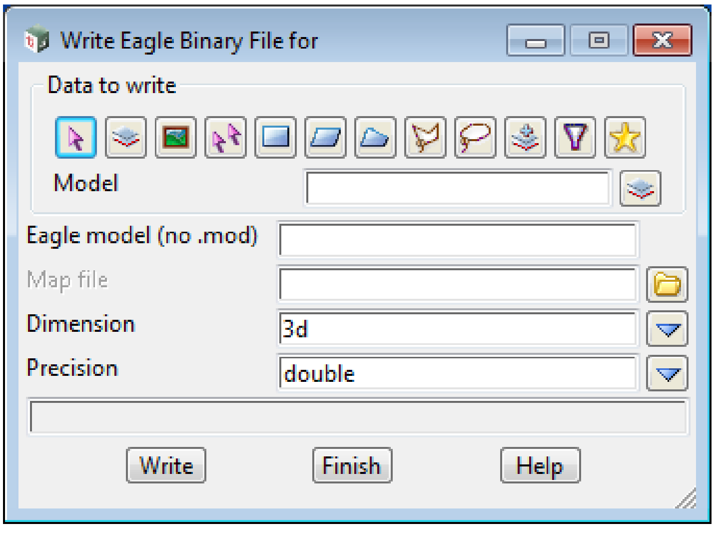
Eagle binary i/o is a separate chargeable module.

Using the **Eagle binary output** option, 12d Model produces Eagle binary models. Since Eagle supports 3D faces, the triangles created in 12d Model can be transferred to Eagle for use in shaded models and walk-throughs.

Since Eagle uses pens, dash styles, line thicknesses and frags rather than colours, an **eagle map file** is used to define the relationships between ***12d Model*** colours and Eagle pens, dash styles, thickness and frags. The map file is the same as described in the **eagle** output option.

The ***12d Model*** string name is written to the second attribute of the corresponding eagle item.

On selecting the **Eagle binary** option, the **Write Eagle Binary File for** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data is to be written out to a file.

Eagle model	input		

stem of the name of the eagle model to write the model/view data out to. Because an eagle model has a maximum size, more than one model may be created. The eagle model names will have a sequence number appended to the name stem given in the **eagle model** *field.*

Map file	input		*.emf files

if non-blank, the name of the map file to be used for all string colours. If blank, no map file is used.

Dimension	input	3d	2d/3d

if 3d, strings will be written out as three dimensional eagle lines. The alignment strings and arcs will be approximated by short lines.

If 2d, the z-value of all the data is set to zero and arcs and curves in alignment strings are written out as eagle plan arcs.

Precision	input	double	single/double

the precision of the eagle models.

Write button

write out the data from the model/view given in the **Model/view** *field to the file given in the* **eagle model** *field.*

8.3 Layouts

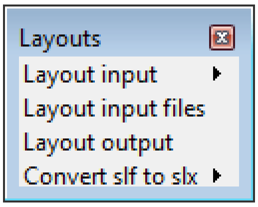
Position of menu: **File I/O =>Layouts**

The options under **Layouts** read and write screen layout files.

The screen layout format to use is the slx format (an XML format) introduced in ***12d Model 10.***

There is also an option to convert the older format, slf, to slx.

The **Layouts** walk-right menu is



read in layout files from working folder, Lib or User Lib
read in one of more layout files
write out a screen layout file
convert a pre V10 layout file (slf) to a V11 layout file (slx)

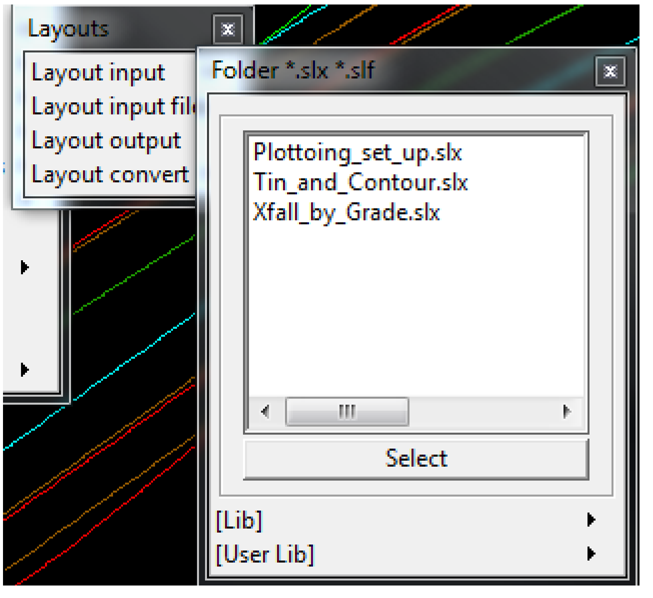
See

Layout input	8.3.1 Layout Input
Layout input files	8.3.2 Layout Input Files
Layout output	8.3.3 Layout Output
Convert slf to slx	8.3.4 Convert slf to slx Format

8.3.1 Layout Input

Position of option on menu: **File I/O =>Layouts =>Layout input**

Walking right on **Layout input** lists all screen layout files (files ending in .slx or .slf) in the working folder, or by further walking right on the [Lib] or [User lib], all screen layout files in [Lib] or [User lib] will be listed.



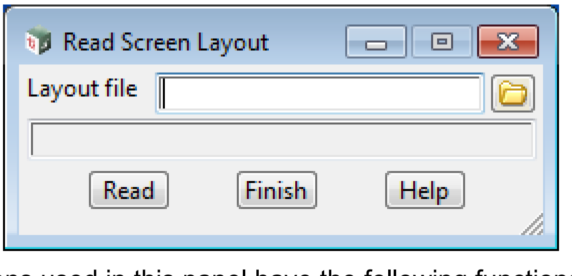
Clicking on a file in a one of the list runs the selected screen layout file and places on the screen, the menus and panels recorded in the screen layout file.

If Clicking on reads in a screen layout file (*.slf) which can create most menus and panels and place them on the screen.

The screen layout file can be created by the **layout output** option, the Menu/Panel Dump option, or by any text editor.

Note

If the *File I/O* menu or the Layouts menu, is pinned, clicking LB on **Layout input** brings up the **Read Screen Layout** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layout file	input		*.slx and *.slf

the name of the screen layout file to read the screen layout information from.

Read	button		

after selecting this button, the screen layout file will be read in.

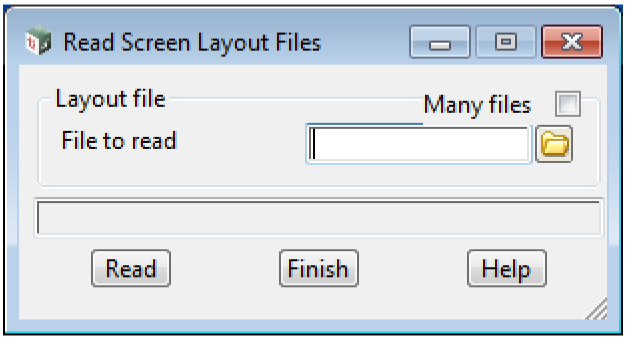
8.3.2 Layout Input Files

Position of option on menu: **File I/O =>Layouts =>Layout input files**

The **layout input files** option reads in one or more screen layout files (files ending in .slx or .slf) which can create most menus and panels and place them on the screen.

The screen layout file can be created by the **Layout output** option or by any editor.

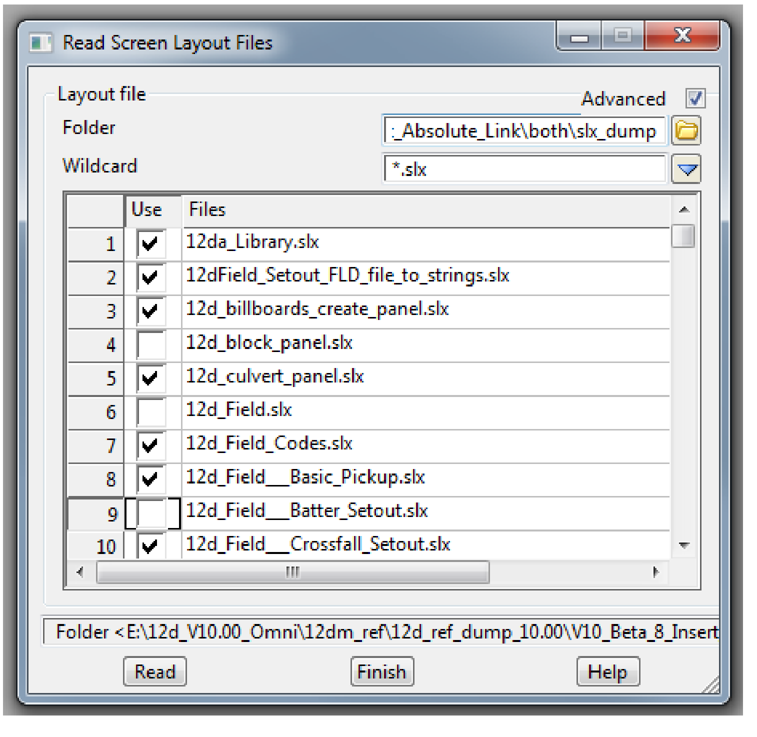
On selecting the **Layout input files** option, the **Read Screen Layout Files** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Advanced	tick box	not ticked	

if ticked, a folder containing slx/slf files can be selected, an optional Wildcard given, and all the slx/slf files satisfying the Wildcard are displayed in a grid. Files in the grid can be selected/not selected.



When **Read** *is pressed, all the selected files are read.*

Layout file	input		*.slx and *.slf

the name of the file to read the screen layout information from.

Read	button		

after selecting this button, the screen layout file will be read in.

8.3.3 Layout Output

Position of option on menu: **File I/O =>Layouts =>Layout Output**

The **layout output** option writes out information on almost all the objects on the screen, and for views, their sizes, into what is called a ***screen layout file***.

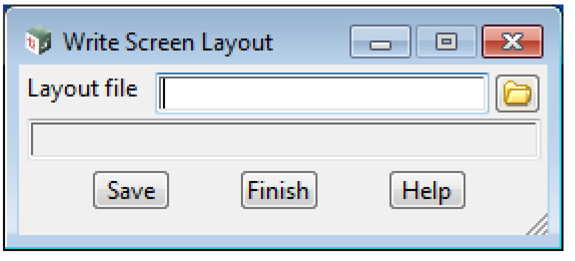
For any menus, its screen position is recorded, and for panels, its position and all the information set for the panel is also recorded.

The screen layout file can then be read back in by options such as **layout input** and **Layout input files**, to recreate on the screen the menus and panels recorded in the screen layout file (but not the views).

Since the screen layout file is editable, users can create their own special layout files.

The view size information is helpful in building up a set_up_file to define the initial screen layout.

On selecting the **Layout output** option, the **Write Screen Layout** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Layout file	input		*.slf

the name of the file to print the screen layout information to.

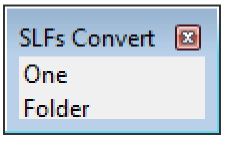
Save	button		

after selecting this button, the screen layout information will be printed out.

8.3.4 Convert slf to slx Format

Position of option on menu: **File I/O =>Layouts =>Layout Convert**

The options on the **Layout Convert** walk-right menu convert the older screen layout format (*.slf) to the new xml format (*.slx) introduced in ***12d Model 9***.
Layout Convert walk-right menu containing these options is:



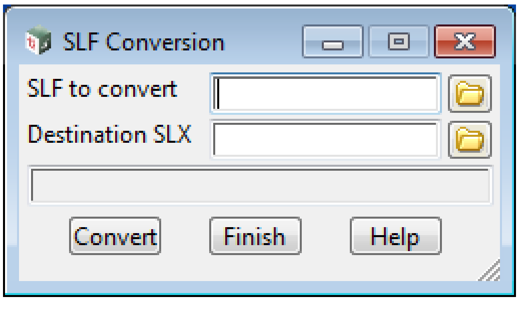
For the option *One*, go to 8.3.4.1 SLF Conversion
Folder 8.3.4.2 Convert a Folder of Screen Layout Files

8.3.4.1 SLF Conversion

Position of option on menu: **File I/O =>Layouts =>Layout Convert=> One**

The **One** option is for converting a single slf to a slx file.

Selecting **One** brings up the **SLF Conversion** panel**.**



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Slf to convert	file box		*.slf

the name of the pre v9 format screen layout file to convert to a XML screen layout file.

When a slf file is selected from the pop-up list, or types in and <enter> hit, then the slf file name, with the slf replaced by slx, is written to the **Destination slx** *field.*

Field Description	Type	Defaults	Pop-Up
Destination slx	file box		*.slx

the slf file is converted to an XML screen layout file and given the name in **Destination slx**.

Field Description	Type	Defaults	Pop-Up
Convert	button		

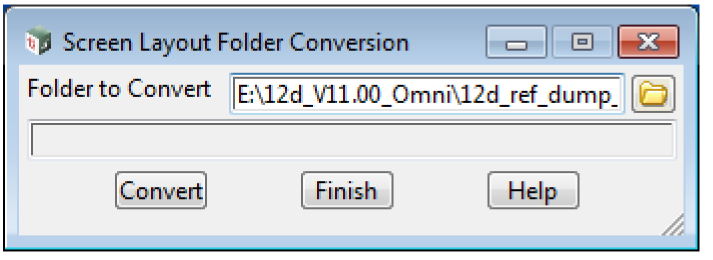
after selecting this button, the slf file will be converted to a slx file

8.3.4.2 Convert a Folder of Screen Layout Files

Position of option on menu: **File I/O =>Layouts =>Layout Convert=> Folder**

The **Folder** option is for converting a folder of slf files to a slx files.

Selecting **Folder** brings up the **Screen Layout Folder Conversion** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder to convert	input		*.slf

the folder containing all the slf files to convert to slx files

Convert	button		

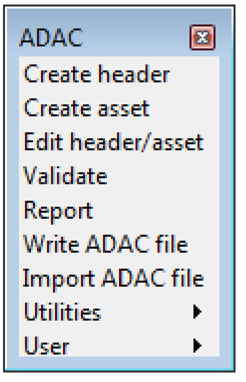
after selecting this button, the all the slf files in the folder **Folder to convert** *are converted to slx files. The converted files are given the same name as the slf files except the slf is replaced by slx.*

8.4 ADAC

Position of menu: **File I/O =>ADAC**

The options under **ADAC** enable use of the new ADAC functionality.

The **ADAC** walk-right menu is



For information on the ADAC menus, see 10.4 12d ADAC Menu

8.5 Digitizer

Position of menu: **File I/O =>Digitizer**

The **Digitizer** option is used with a digitizing table to create 12d Model strings from existing maps or plans.

Contours (2d strings), feature strings (3d strings), spot heights (points strings), 4d strings, circles, arcs and text can all be digitized with this option.

The digitized data can be added to a new or existing 12d Model project.

The digitizing process consists of a number of steps.

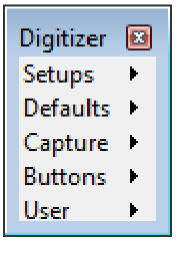
- providing a digitizer definition file
- selecting the type of digitizer to be used
- registering a new plan or map on the digitizer, or continuing with a previously registered plan (resuming).
- selecting a default digitizing tolerance, default model, colour and name for digitized strings.
- digitizing the information

These steps are described totally in the next five sections and are then summarized.

A summary of the step is given in section 8.5.6 Summary.

The digitizer can be set up using WinTab which is preferred method, or by using a definition in the 12d digitizer definitions file, digitize.4d. A quick description of the digitizer definition file is given in the section 8.5.1 Digitizer Definitions. The format for the digitizers_definitions file is given in the section 8.5.7 Digitizer Definitions File.

The **Digitizer** walk-right menu is laid out to reflect the standard sequence of digitizer operations.



define digitizers and plans
default tolerance, model, colour *etc*.
digitize strings
some digitizer button operations

For the option

Setups, go to	8.5.2 Setups
Defaults	8.5.3 Defaults
Capture	8.5.4 Capture
Buttons	8.5.5 Buttons

8.5.1 Digitizer Definitions

Most digitizers now support the WinTab definition for communicating with Windows and that is the preferred method to be used with 12d Model.

If the digitizer supports WinTab then the WinTab drivers need to be installed before the digitizer can be used by 12d Model. The WinTab drivers are supplied with the digitizer, not by 12d Solutions.

Once the WinTab drivers are installed, no further information is required by 12d Model and the rest of this section can be ignored.

Unfortunately if WinTab is not supported, each brand of digitizer has its own method of communicating with a computer and a software package.

To allow for a variety of digitizers not supported by WinTab, 12d Solutions has its own text format for defining the important features of a particular digitizer. The digitizer definitions file is also used to tailor digitizer button usage at a particular site.

For example, the **digitizer file** defines which buttons on the digitizer puck are used to:

digitize new (add) points	**add** button
end the digitizing of a string	**end** button
turn tolerance on/off	**tolerance** button
delete the last digitized point	**delete point** button

When 12d Model starts up, it checks to see if an environment variable called DIGITIZERS_4D exists and if it does, then the file it points to is used to provide the definitions for the digitizers.

If the environment variable is not set, then 12d Model searches for a file called **digitize.4d** in the standard 12d Model search sequence for set up files.

Only digitizers that have been defined in the digitizers definitions file can be selected for use from within 12d Model.

The format for the digitizers definitions file is given in the section 8.5.7 Digitizer Definitions File**.**

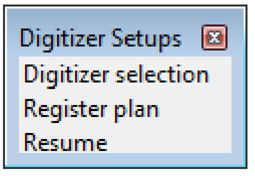
Return to 8.5 Digitizer or look at 8.5.6 Summary.

8.5.2 Setups

Position of menu: **File I/O =>Digitizer =>Setups**

The **setups** menu contains options to select the digitizer to be used, register the co-ordinate system on a new plan or map sheet and for resuming the registration for a plan or map sheet already registered.

The **setups** walk-right menu is



define which digitizer is being used
register a new plan
resume an existing registration

Each options will now be described in detail.

For the option

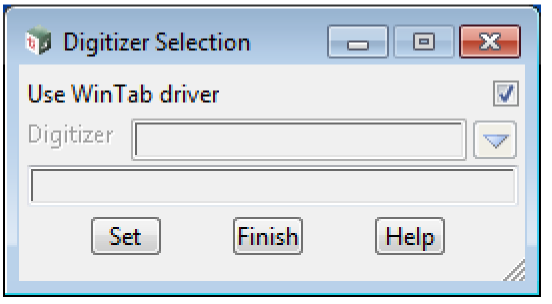
Digitizer selection go to 8.5.2.1 Digitizer Selection
Register plan 8.5.2.2 Register Plan
Resume 8.5.2.3 Resume Plan

For a summary on using the digitizer go to 8.5.6 Summary**.**

8.5.2.1 Digitizer Selection

Position of option on menu: **File I/O=>Digitizer=>Setups=>Digitizer selection**

On selecting the **digitizer selection** option, the **digitizer selection** panel is displayed.



This panel displays the current digitizer selected and allows a different one to be selected from those defined in the digitizers definitions file.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Use Wintab drive	tick box		

if ticked then user WinTab drivers.
If not ticked, then the Digitizer field is enabled and must have a digitizer selected.

Digitizer	input	current digitizer	available digitizers

the name of the current digitizer is displayed in this field. The current digitizer is changed by selecting a different name from the pop-up for the **digitizer** *field and then selecting the* **Set** *button.*

This field is only used if ***Use WinTab driver*** *is not ticked.*

Set button

if ***Use Wintab driver*** *is set to tick and the Wintab drivers exist, then the* **Wintab Monitor** *panel is placed on the screen. The WinTab Monitor displays the digitizer co-ordinates and the digitizer button being used. The information describing the use of the digitizer buttons is written to the Output Window (see below). Do not close the Wintab Monitor panel or the digitizer will stop being read.*

If ***Use Wintab driver*** *is set to tick and the Wintab drivers* ***don't*** *exist, an error message is displayed.*

If ***Use Wintab driver*** *is not set to tick, then after selecting this button, the digitizer given in the* **digitizer** *field will be used as the current digitizer.*

Typical Message to Output Window if WinTab Drivers are Installed

Interface: Wintab 32-bit Digitizer Services.

Continue to the next section 8.5.2.2 Register Plan or return to 8.5.2 Setups.

8.5.2.2 Register Plan

Position of option on menu: **File I/O =>Digitizer =>Setups=> Register plan**

Before the information on a plan or map can be digitized, the relationship between the co-ordinate system of the plan and the digitizer must be determined.

In 12d Model, this relationship is given by specifying the plan co- ordinates and then the position on the digitizer of three or more points. These special points are known as control points.

The affine transformation for the control points is then calculated and if accepted by the user, is used to convert digitizer co-ordinates to plan co-ordinates.

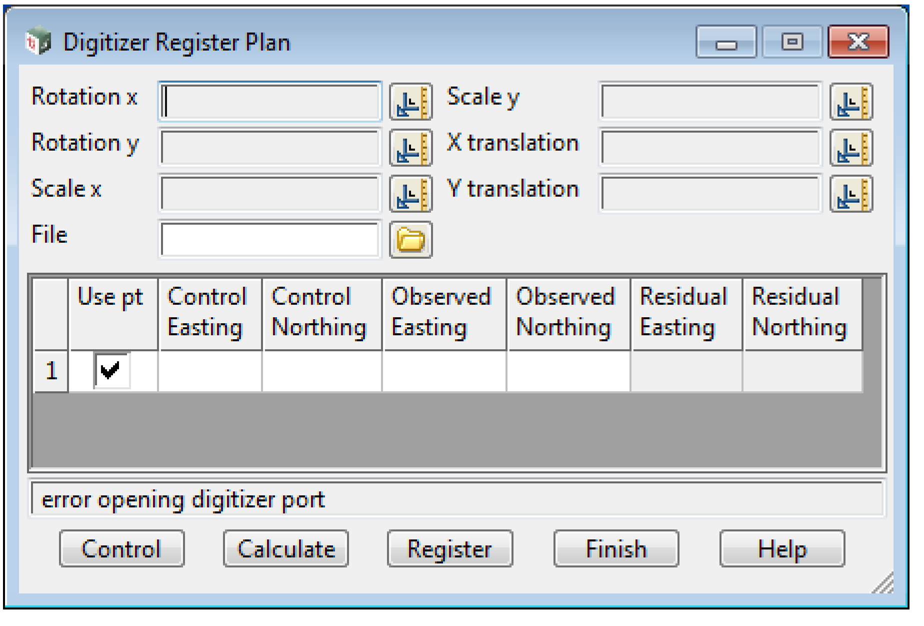
This process is called "registering a plan".

Once a plan has been registered, the information is saved to a file. This file can be used in the **resume plan** option to register the plan without having to re-enter the control points.

Warning

If the plan is moved on the digitizer, it must be re-registered since the current affine transformation will be invalid.

After selecting the **register plan** option, the **digitizer register plan** panel is displayed.



The main purpose of this panel is to display and register the affine transformation parameters. The fields and buttons used in the **digitizer register plan** panel will be discussed after the selection of the control points.

After selecting the **register plan** option, the **digitizer register plan** panel is placed on the screen and the option sits waiting for the user to enter the information for each control point.

This is achieved by

- selecting the control point with the mouse if it already exists in 12d Model, or by typing in its plan co-ordinates (easting northing)

and then

- selecting the control point's position on the digitizer tablet using the digitizers **add point** button. Alternatively, if the control points already exist in 12d Model, they can be selected rather than using typed input

This process is repeated for each control point and is terminated by selecting **cancel** from the **pick ops** pop-up menu instead of selecting a new control point.

The **calculate** button calculates the affine transformation for all the control points in the grid with the Use pt ticked on.

The affine parameters are

- the rotation of the x axis of the plan co-ordinates with respect to the digitizer x axis
- the rotation of the y axis of the plan co-ordinates with respect to the digitizer y axis
- the x and y scale factors for the plan co-ordinates with respect to the digitizer coordinates
- the x and y translations for the plan co-ordinates with respect to the digitizer coordinates

Once calculated, these values are displayed in the **digitizer register plan** panel.

If further control points are required, selecting the **control** button on the **digitizer register plan** panel will restart the control point picking mechanism. Each new control point will be added to the grid.

The new affine transformation can be calculated by selecting the **calculate** button on the **digitizer register plan** panel.

Finally, once the user is satisfied with the affine transformation, it can be **registered** and stored in an text file for future use by entering a filename into the **file** field of the **digitizer register plan** panel and then selecting the **register** button from that panel.

Summarising, the fields and buttons in the **digitizer register plan** panel have the following functions

Field Description	Type	Defaults	Pop-Up
Rotation x/y	output		

the rotation of the x/y axis of the plan co-ordinates with respect to the digitizer x/y axis

Scale x/y	output		

the x/y scale factor for the plan co-ordinates with respect to the digitizer coordinates

Translation x/y	output		

the x/y translation for the plan co-ordinates with respect to the digitizer coordinates

File	input	*.aff	

the name of the file to record the affine parameters.

Control	button		

restarts the selection process for choosing more control points.

Calculate	button		

calculates the affine parameters based on the control point selection.

Register	button		

write the affine transformation to the file given in the **file** *field and register the affine transformation as the current one to be used for the digitising session.*

Finish	button		

remove the panel from the screen.

Warning

The affine transformation must be registered using the **register** button before the **finish** button is selected or it will be lost.

Continue to the next section 8.5.2.3 Resume Plan or return to 8.5.2 Setups.

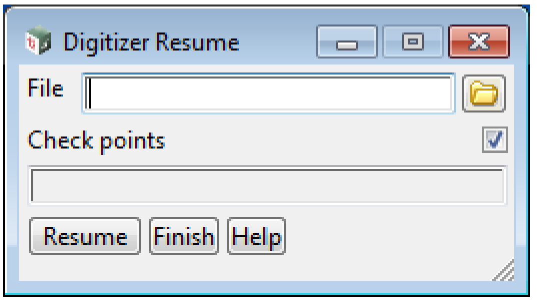
8.5.2.3 Resume Plan

Position of option on menu: **File I/O =>Digitizer =>Setups =>Resume**

When digitising a large plan, it is often necessary to spread the digitising over more than one session in 12d Model.

If the plan has not been moved on the digitizer since it was registered, the affine transformation can be restored with the **resume plan** option rather than having to register the plan again.

On selecting the **resume plan** option, the **digitizer resume** panel is displayed.



To resume digitizing with an affine transformation recorded during an earlier registration session, simply enter the name of the affine file into the **file** field on the **digitizer resume** panel and then select the **resume** button.

Warning

If the plan is moved on the digitizer, it must be re-registered since the current affine transformation will be invalid.

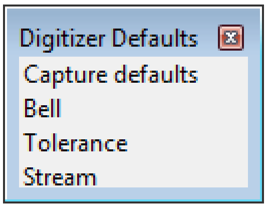
Return to 8.5.2 Setups.

8.5.3 Defaults

Position of menu: **File I/O =>Digitizer =>Defaults**

The **defaults** menu sets default model, colour *etc*. and tolerance which are used when digitizing.

The **defaults** walk-right menu is



default model, colour *etc*.
not yet used
minimum distance between points
set digitizer to stream mode

For the option

Capture defaults, go to	8.5.3.1 Capture Defaults
Bell	8.5.3.2 Bell
Tolerance	8.5.3.3 Tolerance
Stream	8.5.3.4 Stream

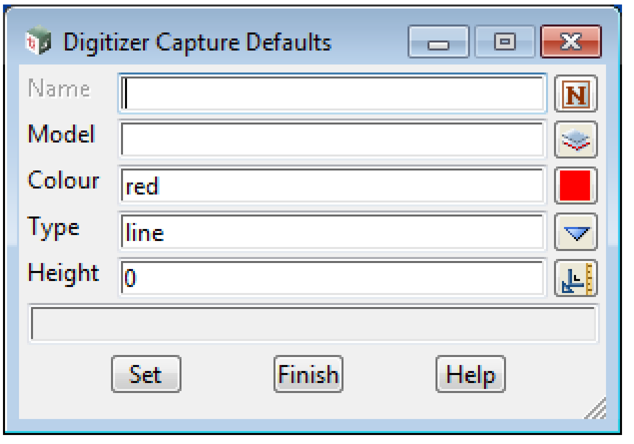
For a summary on using the digitizer go to 8.5.6 Summary**.**

8.5.3.1 Capture Defaults

Position of option on menu: **File I/O =>Digitizer =>Defaults =>Capture defaults**

For any new string a name, model, colour, breakline type and default height are needed. When digitizing, the same values are often required for a large number of the strings. The **capture defaults** panel is used to set default values for digitized strings.

On selecting the **capture defaults** option, the **digitizer capture defaults** panel is displayed.

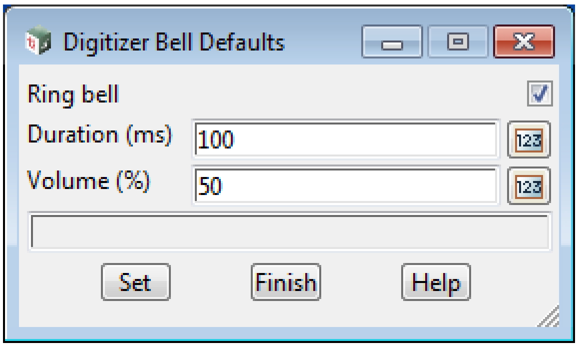


In the digitizing **capture** options, whenever a new string is selected, the values for name, model, colour, breakline type and height are taken from the **digitizer capture defaults** panel.

Continue to the next section 8.5.3.2 Bell or return to 8.5.3 Defaults.

8.5.3.2 Bell

Not yet implemented



Continue to the next section 8.5.3.3 Tolerance or return to 8.5.3 Defaults.

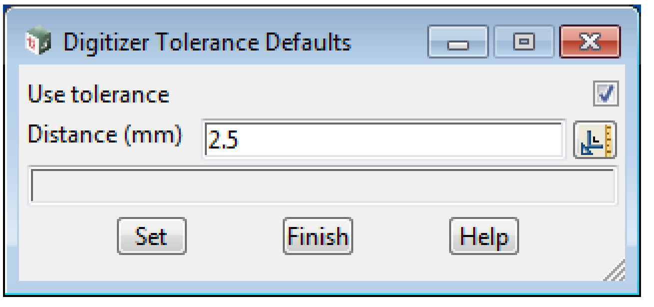
8.5.3.3 Tolerance

Position of option on menu: **File I/O =>Digitizer =>Defaults =>Bell**

When points are being digitized, a new point is often only required when it is a certain distance from the previous point on the digitizer. This is especially important for steam digitizing when hundreds of points per second may be captured.

The **tolerance** option allows the user to specify the minimum plan distance (in millimetres) between successive digitized points in a string.

On selecting the **tolerance** option, the **digitizer tolerance defaults** panel is displayed.



The fields and buttons used in this panel have the following meanings.

Field Description	Type	Defaults	Pop-Up
Use tolerance	tick box	tick	

*if **tick**, a new point taken from the digitizer is only accepted if it is at least the distance given in the* **distance** *field away from the previous recorded point in the string.*

Distance (mm)	input	2.5	

the minimum separation distance, in millimetres, between successive digitized points in a string.

Set	button		

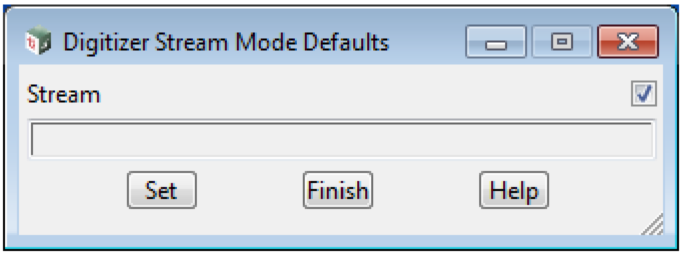
set the **use tolerance** *and* **distance** *values.*

Continue to the next section 8.5.3.4 Stream or return to 8.5.3 Defaults.

8.5.3.4 Stream

Position of option on menu: **File I/O =>Digitizer =>Defaults =>Stream**

Not yet documented.



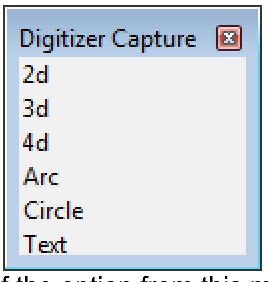
Return to 8.5.3 Defaults.

8.5.4 Capture

Position of menu: **File I/O =>Digitizer =>Capture**

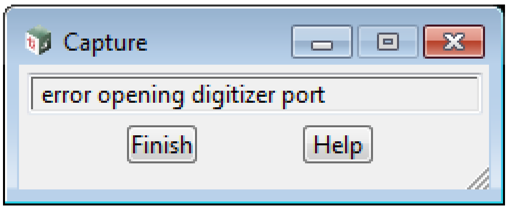
The **capture** menu is for digitizing strings into 12d Model.

The **capture** walk-right menu is



digitize 2d strings
digitize 3d strings
digitize 4d strings
digitize arcs
digitize circles
digitize text

The first time any of the option from this menu is selected, the **capture** panel is placed on the screen.

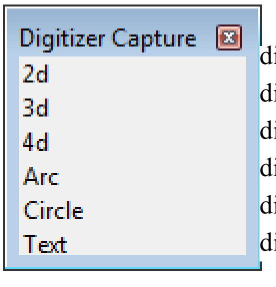


This panel is used to display the transformed co-ordinates for each digitized point that passes the tolerance test, and some special digitizer messages (for example, tolerance on/off).

To **change** the type of string being captured, simply select the new type from the **digitize capture** panel. This is normally only done at the end of capturing a string, not part way through.

To **terminate the digitizing session**, select **finish** on the **capture** panel.

Each of the methods for capturing data available in the **digitizer capture** menu will now be described.



digitize 2d strings
digitize 3d strings
digitize 4d strings
digitize arcs
digitize circles
digitize text

For the option

2d, go to	8.5.4.1 2d
3d	8.5.4.2 3d
4d	8.5.4.3 4d
Arc	8.5.4.4 Arc
Circle	8.5.4.5 Circle
Text	8.5.4.6 Text

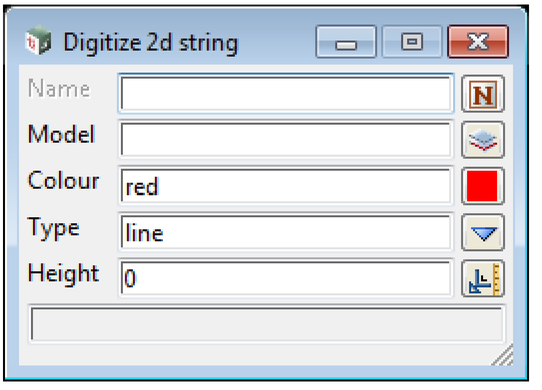
For a summary on using the digitizer go to 8.5.6 Summary.

8.5.4.1 2d

Position of option on menu: **File I/O=>Digitizer=>Capture=>2d**

This option is used to digitize 2d strings.

On selecting the **2d** option, the **Digitize 2d string** panel is displayed.



The fields and buttons in the **digitize 2d string** panel have the following meanings.

Field Description	Type	Defaults	Pop-Up
Name	input	name of new string	name from capture defaults
Model	input	capture defaults model	available models
model for the new string			
Colour	input	capture def colour	available colours
colour of the new string			
Type	input	capture def type	point, line
breakline type of the new string.			
Height	input	capture def height	
height of the 2d string.			

If the **digitize 2d string** panel is created by the **2d** option, the values in the name, model, colour, type and height fields are taken from the **digitizer capture defaults** panel.

Any of the values in the **digitize 2d string** can be modified before digitizing the 2d string begins.

Digitizing begins by pressing the **add** button on the digitizer puck when the puck is above the first point of the new string.

The co-ordinates of the selected point are then displayed in the **capture** panel and the **digitize 2d string** panel removed from the screen.

Further points are digitized by either pressing the **add** button again or if stream mode is on, holding the **add** button down and moving along the string being digitized.

The 2d string is terminated when the **end** button is pressed on the digitizer puck.

After selecting the **end** button, the **digitize 2d string** panel is again placed on the screen with the filed values the same as the 2d string just digitized.

The digitizing process is repeated for the new 2d string.

Continue to the next section 8.5.4.2 3d or return to 8.5.4 Capture.

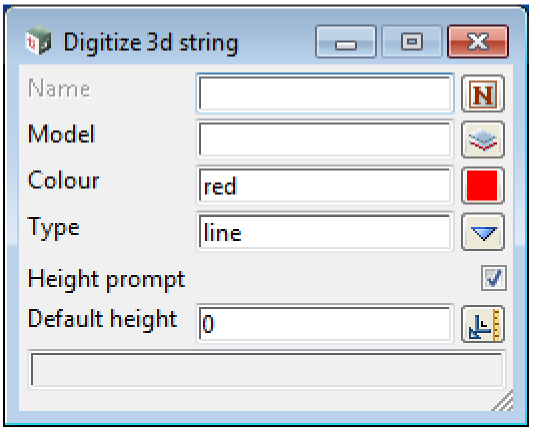
8.5.4.2 3d

Position of option on menu: **File I/O=>Digitizer=>Capture=>3d**

This option is used to digitize 3d strings.

Digitizing 3d strings is similar to 2d strings except that different z-values can exist at each of the digitized points.

On selecting the **3d** option, the **Digitize 3d string** panel is displayed.



The fields and buttons in the **digitize 3d string** panel are similar to the **digitize 2d string** panel except for the fields

Field Description	Type	Defaults	Pop-Up
Height prompt	tick box	tick	

*if **tick**, after each point is digitized, an* enter height *box is placed on the screen. The height of the digitized point is typed into the box.*
*If **not tick**, the* **default height** *is used as the z-value for the digitized point.*

Field Description	Type	Defaults	Pop-Up
Default height	input	capture default height	

height of the point if the height prompt is set to no.

If the **digitize 3d string** panel is created by the **3d** option, the values in the name, model, colour, type and height fields are taken from the **digitizer capture defaults** panel.

As for digitizing 2d strings, any of the values in the **digitize 3d string** can be modified before digitizing begins.

Digitizing begins by pressing the **add** button on the digitizer puck when the puck is above the first point of the new string.

The co-ordinates of the selected point are displayed in the **capture** panel and the **digitize 3d string** panel removed from the screen.

If the **height prompt** field is set to **tick**, an enter height box is placed on the screen with the previous typed height in it. The height for the digitized point in typed into the box, terminated by a <return>. The enter height box then disappears.

Further points are digitized by either pressing the **add** button again or if stream mode is on, holding the **add** button down and moving along the string being digitized.

Again, if the **height prompt** is set to **yes**, the enter height box will appear after each digitized point.

The 3d string is terminated when the **end** button is pressed on the digitizer puck.

After selecting the **end** button, the **digitize 3d string** panel is again placed on the screen with the field values the same as the 3d string just digitized.

The digitizing process is repeated for the new 3d string.

Warning

If stream digitizing is used for the 3d string, the **height prompt** should be set to **not tick**.

Continue to the next section 8.5.4.3 4d or return to 8.5.4 Capture.

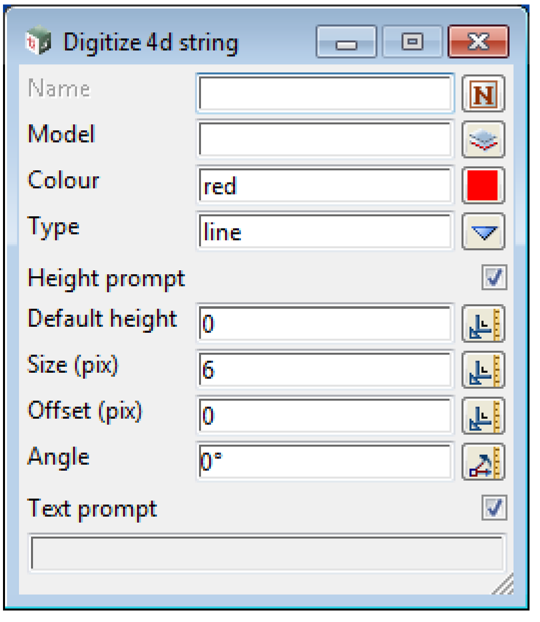
8.5.4.3 4d

Position of option on menu: **File I/O=>Digitizer=>Capture=>4d**

This option is used to digitize 4d strings.

Digitizing 4d strings is similar to 3d strings except that as well as a different z-value at each point, a text string also exits at each of the digitized points.

On selecting the **4d** option, the **Digitize 4d string** panel is displayed.



The fields and buttons in the **digitize 4d string** panel are similar to the **digitize 3d string** panel except for the fields

Field Description	Type	Defaults	Pop-Up
Text prompt	input	yes	yes, no

*if **tick**, after each point is digitized, an* enter text *box is placed on the screen. The text for the digitized point is typed into the box.*
*If **not tick**, no text is used at the digitized point.*

Size (pix)	input	default text size

height (in pixels) of the text at each point.

Angle	input	0

angle of the text at each point.

Offset (pix)	input	0

offset (in pixels) of the text from the digitized point.

If the **digitize 4d string** panel is created by the **4d** option, the values in the name, model, colour, type and height fields are taken from the **digitizer capture defaults** panel.

As for digitizing 3d strings, any of the values in the **digitize 4d string** can be modified before digitizing begins.

Digitizing begins by pressing the **add** button on the digitizer puck when the puck is above the first point of the new string.

The co-ordinates of the selected point are displayed in the **capture** panel and the **digitize 4d string** panel removed from the screen.

If the **height prompt** field is set to **tick**, an enter height box is placed on the screen with the previous typed height in it. The height for the digitized point in typed into the box, terminated by a <return>. The enter height box then disappears.

If the **text prompt** field is set to **tick**, an enter text box is placed on the screen. The text for the digitized point is typed into the box, terminated by a <return>. The enter text box then disappears.

Further points are digitized by either pressing the **add** button again or if stream mode is on, holding the **add** button down and moving along the string being digitized.

Again, the enter height and enter text boxes will appear after each digitized point if the **height prompt** and **text prompts** are set to **tick**.

The 4d string is terminated when the **end** button is pressed on the digitizer puck.

After selecting the **end** button, the **digitize 4d string** panel is again placed on the screen with the values in the fields from the 4d string just digitized.

The digitizing process is repeated for the new 4d string.

Warning

If stream digitizing is used for the 4d string, the **height prompt** and text prompt should be set to **not tick.**

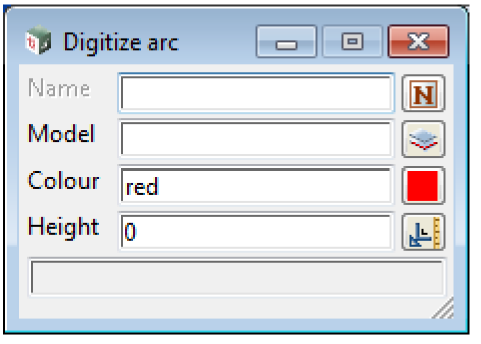
Continue to the next section 8.5.4.4 Arc or return to 8.5.4 Capture.

8.5.4.4 Arc

Position of option on menu: **File I/O =>Digitizer =>Capture =>Arc**

This option is used to digitize arcs by digitizing three points on the arc - the arc start point, a point on the arc and the arc end point.

On selecting the **arc** option, the **Digitize arc** panel is displayed.



The fields and buttons in the **digitize arc** panel are similar to the **digitize 3d string** panel except for the field

Field Description	Type	Defaults
Height	input	capture default height

height given to the two end points of the arc.

If the **digitize arc** panel is created by the **arc** option, the values in the name, model, colour and height fields are taken from the **digitizer capture defaults** panel.

As for digitizing 3d strings, any of the values in the **digitize arc** panel can be modified before digitizing an arc begins.

Digitizing begins by pressing the **add** button on the digitizer puck when the puck is above the first point of the new arc.

The co-ordinates of the selected point are displayed in the **capture** panel and the **digitize arc** panel removed from the screen.

Next a point on the arc between the arc end points is digitized followed by the arc end point.

After the end point is digitized, the arc is automatically created and the **digitize arc** panel again placed on the screen with the field values the same as the arc just digitized.

The digitizing process is repeated for the new arc.

Warning

Stream digitizing should not be used for arcs.

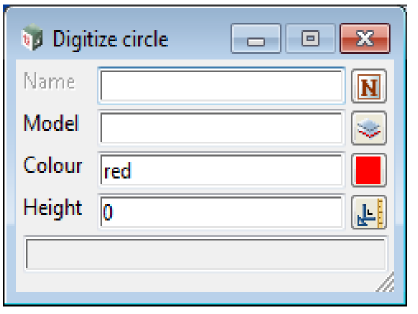
Continue to the next section 8.5.4.5 Circle or return to 8.5.4 Capture.

8.5.4.5 Circle

Position of option on menu: **File I/O =>Digitizer =>Capture =>Circle**

The **circle** option is used to digitize circles by digitizing the centre point and one point on the circle.

On selecting the **circle** option, the **Digitize circle** panel is displayed.



The fields and buttons in the **digitize circle** panel are the same as the **digitize arc** panel.

If the **digitize circle** panel is created by the **circle** option, the values in the name, model, colour and height fields are taken from the **digitizer capture defaults** panel.

As for digitizing arcs, any of the values in the **digitize circle** panel can be modified before digitizing of the circle begins.

Digitizing begins by pressing the **add** button on the digitizer puck when the puck is above the circle point of the new circle.

The co-ordinates of the selected point are displayed in the **capture** panel and the **digitize circle** panel removed from the screen.

Next a point on the circle is digitized. The circle is then fully defined and automatically created.

The **digitize circle** panel is again placed on the screen with the field values the same as the circle just digitized.

The digitizing process is repeated for the new circle.

Warning

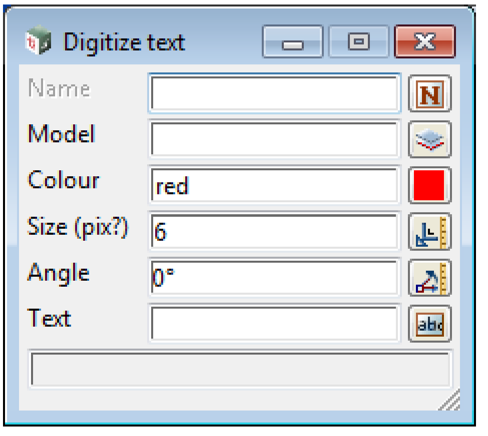
Stream digitizing should **not** be used for circles.

Continue to the next section 8.5.4.6 Text or return to 8.5.4 Capture.

8.5.4.6 Text

Position of option on menu: **File I/O =>Digitizer =>Capture =>Text**

Not yet implemented



Return to 8.5.4 Capture.

For a summary on using the digitizer go to 8.5.6 Summary.

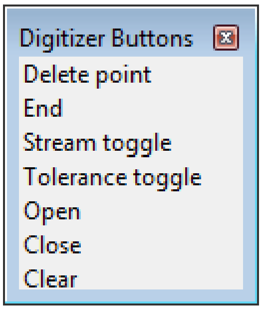
8.5.5 Buttons

Position of menu: **File I/O =>Digitizer =>Buttons**

The various options on the **Buttons** menu can be used instead of pushing buttons on the digitizer puck.

The main use for this is when the digitizer puck has only a small number of buttons.

The **Buttons** walk-right menu is



delete last point
end string
turn stream on/off
turn tolerance on/off
open string
close string
delete all points in string

Return to 8.5 Digitizer.

For a summary on using the digitizer go to 8.5.6 Summary.

8.5.6 Summary

The steps for digitizing are

1. Point to digitizers definitions file

   The file containing the definitions of the digitizers is created and either called **digitize.4d**, or the environment variable DIGITIZERS_4D is set to point to the file.

2. Select a digitizer

   Use the menu item **File I/O =>Digitizer=> Setups=> Digitizer selection**

3. Register a new plan or resume an old plan

   To register a new plan, use menu item **File I/O =>Digitizer => Setups =>Register plan**

   After selecting the option, the software is waiting for the user to give the co-ordinates and position of control points on the digitizer.

   Control Point Loop

   (a) type in easting northing of the control point

   (b) pick point on the digitizer

   The loop is terminated by getting up the **Pick Ops** menu with the mouse and picking **Cancel**

   Then select **calculate** from the **digitizer control point table** panel and check the calculated affine parameters in the **digitizer register plan** panel.

   Once happy with the affine parameters, save them away by typing a filename (ending in **.aff**) into the **file** field of the **digitizer register plan** panel and then select the **register** button.

   Alternatively, to resume digitizing a previously registered plan that has not moved on the digitizing tablet, use menu item **File I/O =>Digitizer =>Setups=> Resume plan**

   Type the affine file name into the **file** field of the **digitizer resume** panel and select **resume**.

4. Set the capture defaults

   Menu items under **Digitizer =>Defaults**

5. Digitize a bounding polygon for the area to be digitized

   Use the menu item **Digitizer =>Capture =>2d**

   This step is not strictly necessary, however, the polygon can be used to easily **fit** the digitized data onto a view.

6. Digitize the data

   Use the menu items under **Digitizer =>Capture**

Return to 8.5 Digitizer.

8.5.7 Digitizer Definitions File

Unfortunately, each brand of Digitizer has its own method of communicating with a computer and a software package.

To allow for a variety of digitizers, 4D Solutions has its own text format for defining the important features of a particular digitizer.

When 12d Model starts up, it checks to see if an environment variable called DIGITIZERS_4D exists and if it does, then the file it points to is used to provide the definitions for the digitizers.

DIGITIZERS_4D filename

If the environment variable is not set, then 12d Model searches for a file called **digitize.4d** in the standard 12d Model search sequence for set up files.

Only digitizers that have been defined in the digitizer definitions file can be selected for use from within 12d Model.

The digitizers definition file format is a simple text format and consists of one or more digitizer definitions. Each digitizer definition in the file begins with the key word **digitizer** followed by the digitizer name and then appropriate digitizer commands enclosed within curly braces **{ }**.

8.5.7.1 Available Digitizer Commands

Commands to define communication with the digitizer:

port	text
baud	300 | 600 | 1200 | 2400 | 4800 | 9600 | 19200| 38400
charbits	5 | 6 | 7 | 8
parity	none | even | odd
stopbits	1 | 2

Commands to define the size of the digitizing area:

xdimension	integer	// length of digitizer area in mm
ydimension	integer	// height of digitizer area in mm
resolution	real	// resolution in mm

Commands to define contents of the text string returned when digitizing:

stringlength	integer	// length of the text string returned
buttonstart	integer	// position in text for button id
buttonend	integer	
xstart	integer	// position for x value
xend	integer	
ystart	integer	// position for y value
yend	integer	

Command to define sequences to send to digitizer:

startup	text	// digitizer start up sequence
finishup	text	// digitizer finish up sequence
pointmode	text	// text to put digitizer into point mode
streammode	text	// text to put into stream mode (track mode)

Commands to define the meaning of the button values returned from the digitizer:

These commands may occur more than once since some digitizers have more than one return value for the same thing.

addpoint	text	// digitize a point
end	text	// end the string being digitized
delpoint	text	// delete the last point digitized
toggletol	text	// toggle tolerance
togglestream	text	// toggle stream mode
clearstr	text	// clear all points in the current string
openstr	text	// open the current string
closestr	text	// closes the current string

Notes

1. spaces in text - any text string that includes spaces or only numbers, must be enclosed in double quotes **“**.
2. comments - anything after // until the end of the line is ignored.
3. blank lines - blank lines are ignored

Return to 8.5 Digitizer.

For a summary on using the digitizer go to 8.5.6 Summary**.**

8.6 GIS

Position of menu: **File I/O =>GIS**

The **FDO (Feature Data Objects**) is used to communicate with external servers such as **GIS** packages and external databases, including **SQL Server**, **Oracle** and **MySQL**.

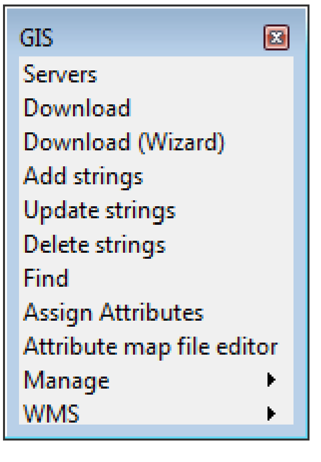
Depending on the services provided by the external data source, vector data may be downloaded, updated or new data inserted. Raster images may also be dynamically downloaded and displayed via the W**MS (Web Mapping Service).**

The list of services ***12d Model*** currently supports includes:

- WFS (Web Feature Service)
- ArcSDE
- Oracle databases
- SQL Server databases
- MySQL databases
- Basic ODBC (Open Database Connectivity), such as Excel and Access
- PostGreSQL
- SQLite
- PostGIS
- Shape files
- SDF files
- OGR formats (see http://www.gdal.org/ogr/ogr_formats.html)
- WMS (Web Mapping Service) for Raster downloads

Some server types may not be available if you do not have the required third party components, as installed with the third party software. You may need to contact the vendors of the data source if you experience difficulty.

The **GIS** walk-right menu containing these options is:

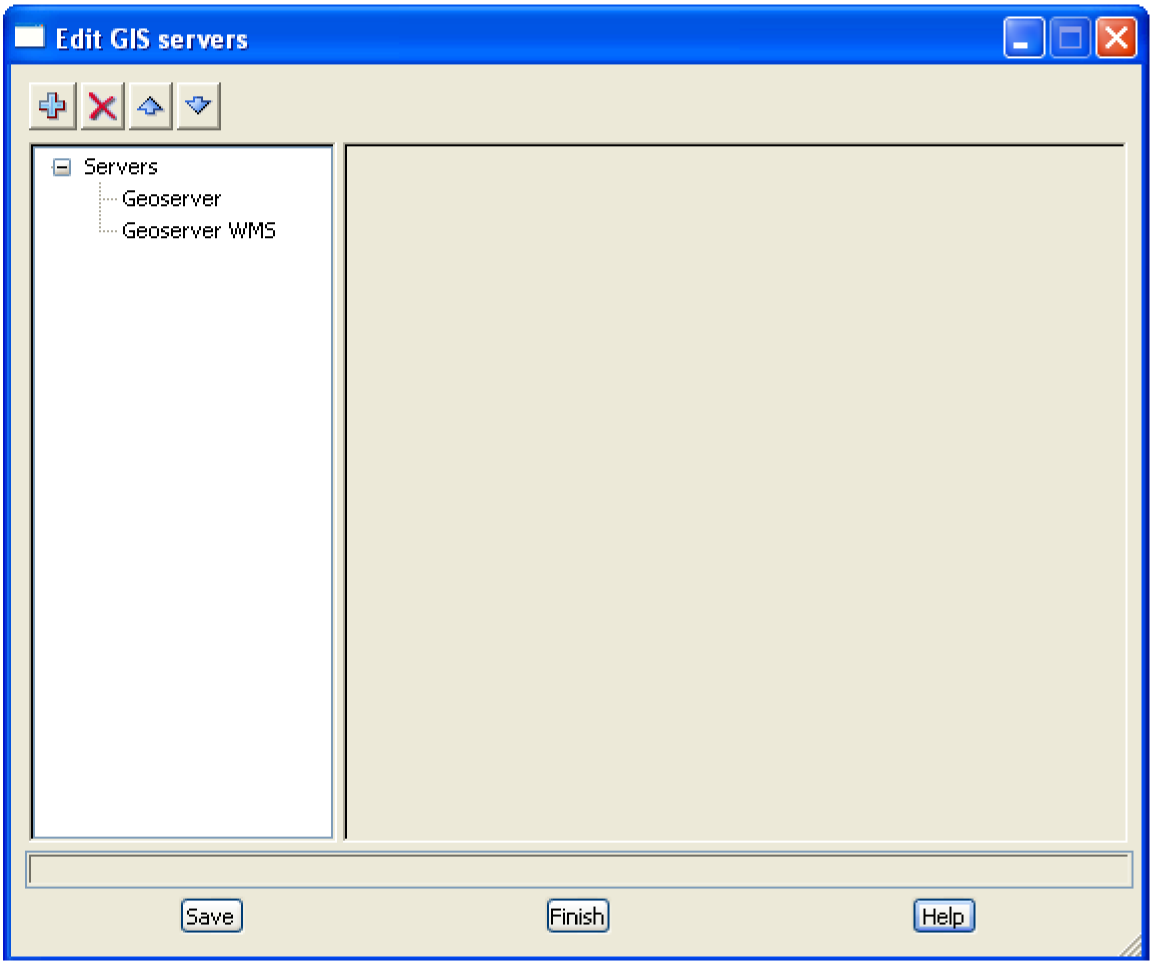


For the option Servers, go to	8.6.1 Edit GIS Servers
Download	8.6.7 GIS Download
Download (Wizard)	8.6.10 GIS Download Wizard
Add strings	8.6.14 GIS Add Strings
Update strings	8.6.15 GIS Update Strings

8.6.1 Edit GIS Servers

Position of option on menu: **File I/O =>GIS =>Servers**

Selecting **Servers** brings up the **Edit FDO servers** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Insert	button		
Delete	button		
Up	button		
Down	button		
Save	button		

Insert — button

Adds a new server

Delete — button

Deletes the selected server

Up — button

Moves the server up in the list

Down — button

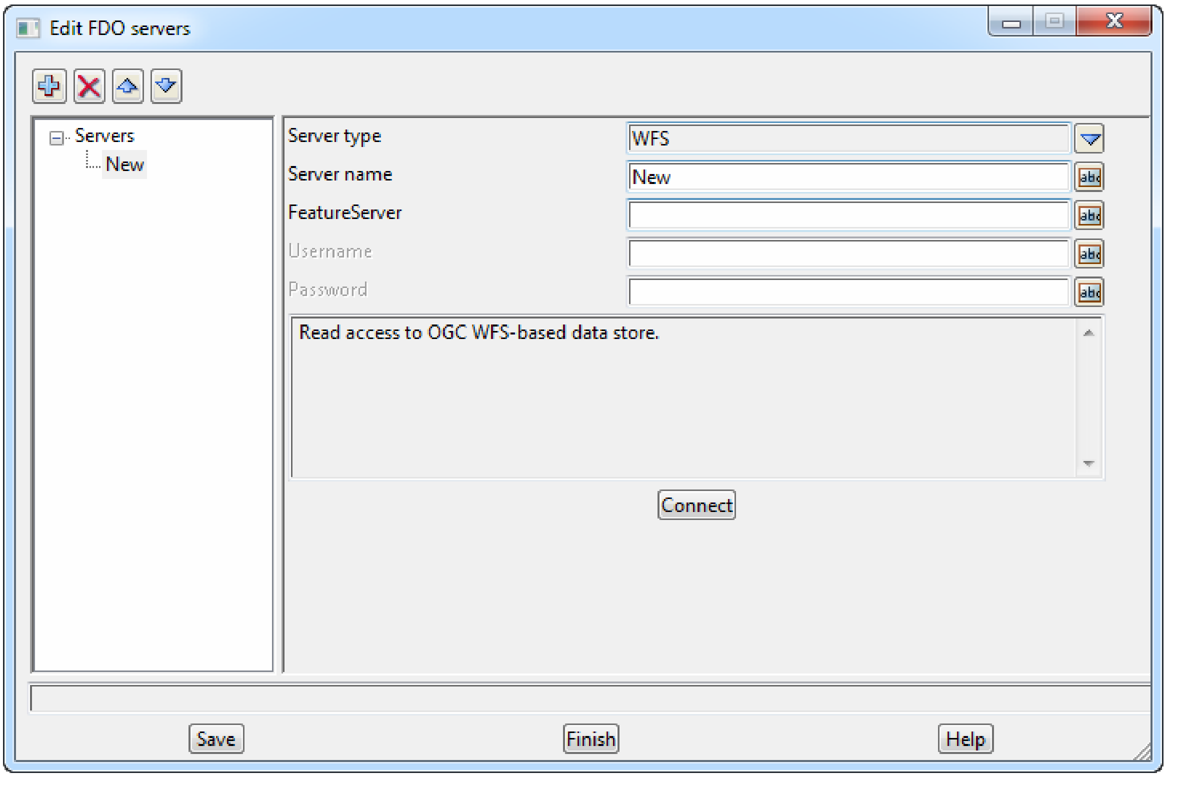
Moves the server down in the list

Save — button

Saves the list of servers.

8.6.2 WFS Server Setup

This panel provides access to edit the required information for connection to a **WFS (Web Feature Service)** server.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Server type	choice box		

the type of server

Server name

the name by which you will refer to the server

FeatureServer

the HTTP address of the server

Username

an optional username

Password

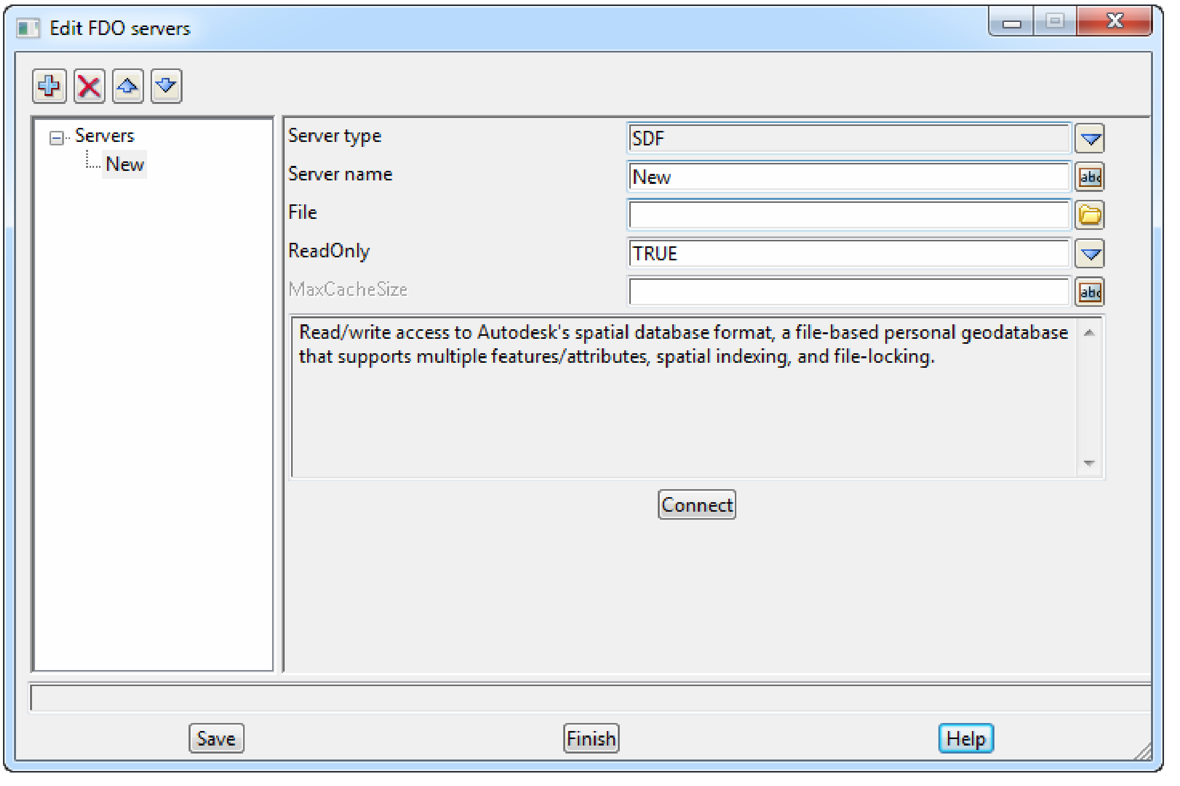
an optional password

Connect button

Tests the connection to the server

8.6.3 SDF Server Setup

This provides access to edit the required information for connection to a file in **AutoDesk's SDF format (spatial database format)**.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Server type	choice box		

the type of server

Server name

the name by which you will refer to the server

File	file		

the file to read / write

ReadOnly	choice box		True, False

whether or not to access the file in a read only fashion

MaxCacheSize

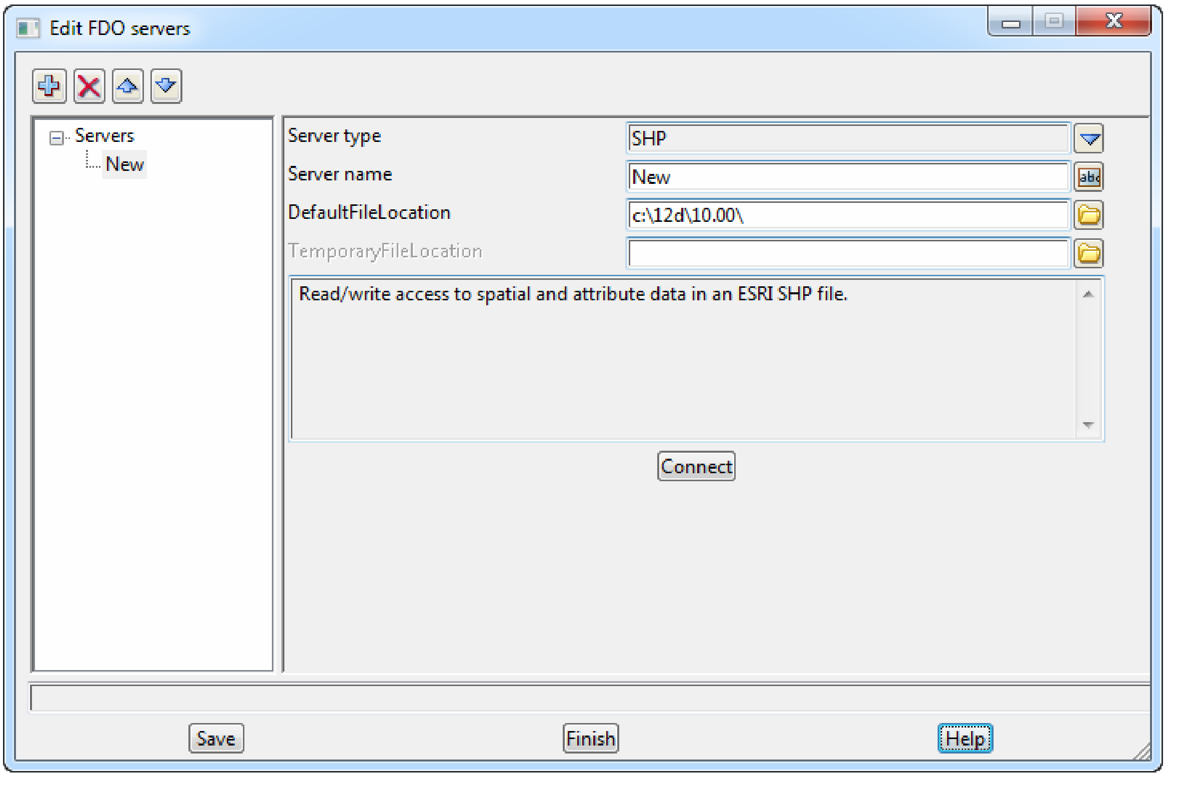
an optional setting to determine the maximum cache size used in ***SDF*** *operations*

Connect	button		

Tests the connection to the file

8.6.4 SHP Server Setup

This provides access to edit the required information for connection to a file or set of files in **ESRI's SHP** file format.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Server type	choice box		

the type of server

Server name

the name by which you will refer to the server

DefaultFileLocation file

where the SHP file(s) to read/write reside

TemporaryFileLocation file

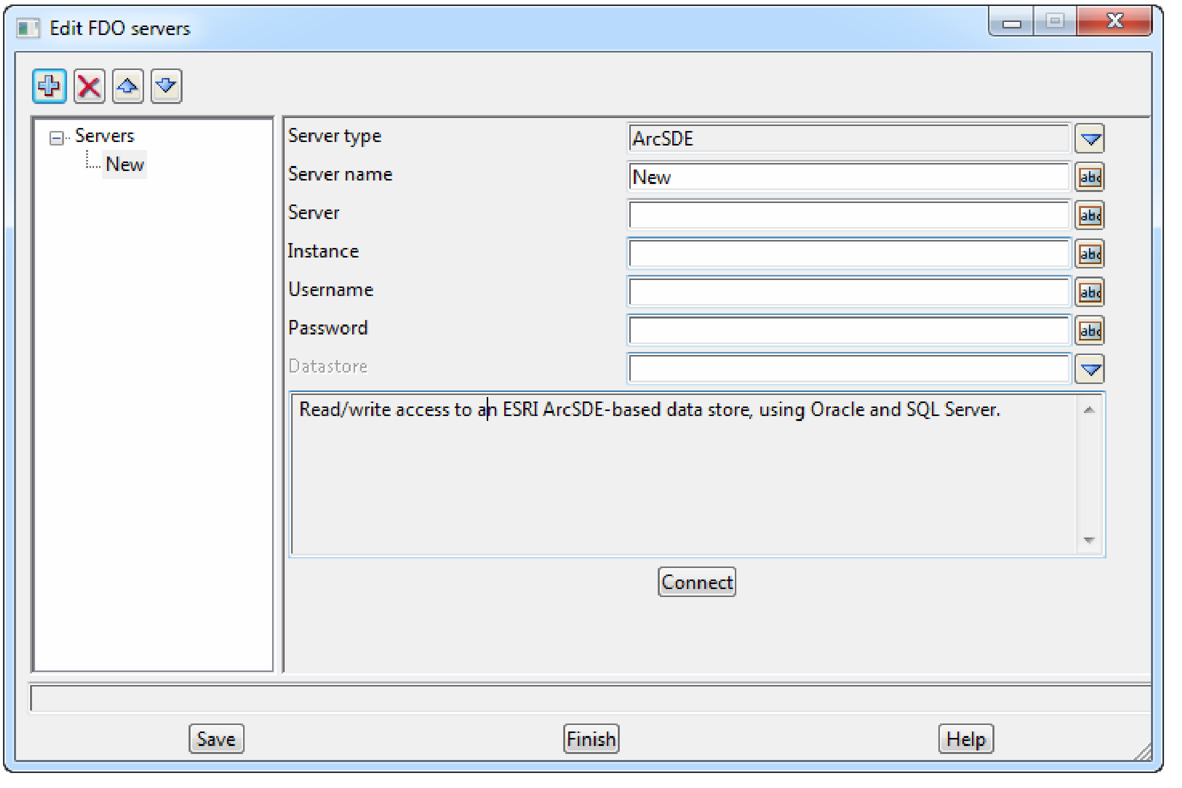
*an optional field to specify where the **FDO** should write any required temporary files*

Connect button

Tests the connection settings

8.6.5 ArcSDE Server Setup

This provides access to edit the required information for connection to an **ArcSDE** server. If you do not know the data store name, you may need to connect to the server once to retrieve the list of names.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Server type	choice box		

the type of server

Server name

the name by which you will refer to the server

Server

the address of the remote ArcSDE server

Instance

the instance name or port number

Username

the username under which you will connect to the server

Password

the required password for connecting to the server

Datastore

*if a datastore is required, you must enter it here. If you do not know the name of the datastore, click **Connect** and the list of datastores will be retrieved*

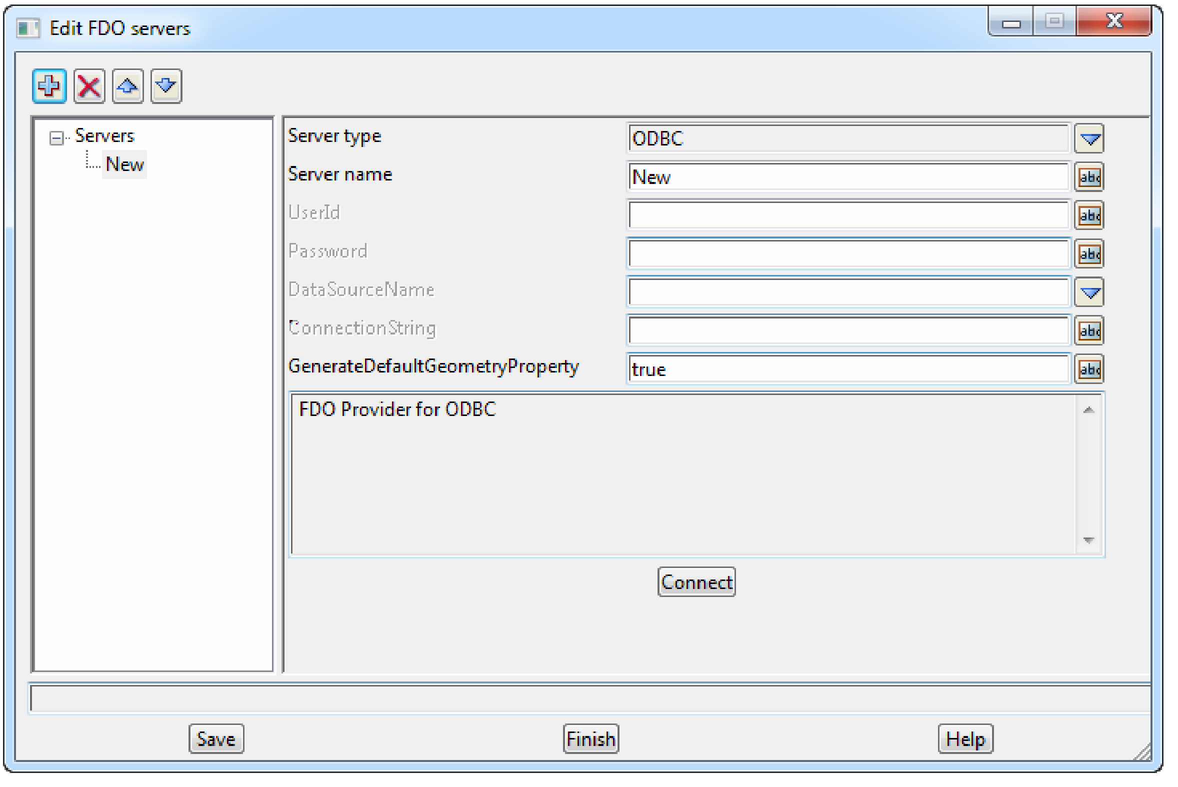
Connect button

Tests the connection to the server and retrieves the list of datastores

8.6.6 ODBC Server Setup

This provides access to setup a connection to a generic **ODBC (Open Database Connectivity)** data source, such as **Microsoft Excel** or **Microsoft Access**.

Because this is a generic connection type, you will be required to know the necessary combination of settings including DSN or Connection String. This may involve knowing the specific driver required to connect to the data source.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Server type	choice box		

the type of server

Server name

the name by which you will refer to the server

UserId

an optional user id for the connection

Password

an optional password for the connection

DataSourceName

an optional data source name (or DSN)

ConnectionString

an optional connection string

GenerateDefaultGeometryProperty

whether or not to generate the default geometry property if one does not exist

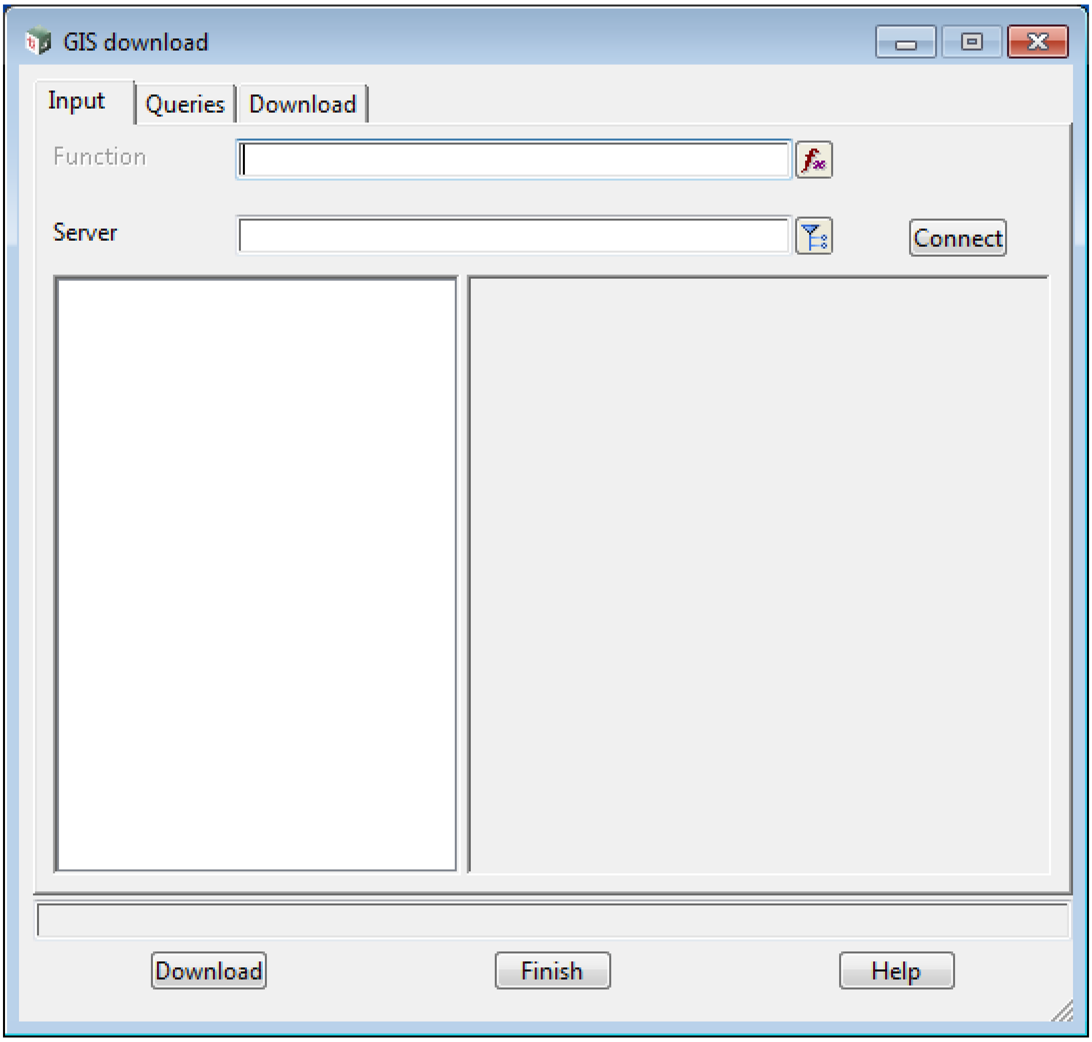
Connect button

Tests connection to the data source

8.6.7 GIS Download

Position of option on menu: **File I/O =>GIS =>Download**

Selecting **Download** brings up the **GIS download** panel.



For a description of the *Input* tab, see Input tab

For a description of the *Queries* tab, see Queries tab

For a description of the *Download* tab, see Download tab

For a description of the *Download* button, see Download button

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Input tab

Function	function box		available GIS functions

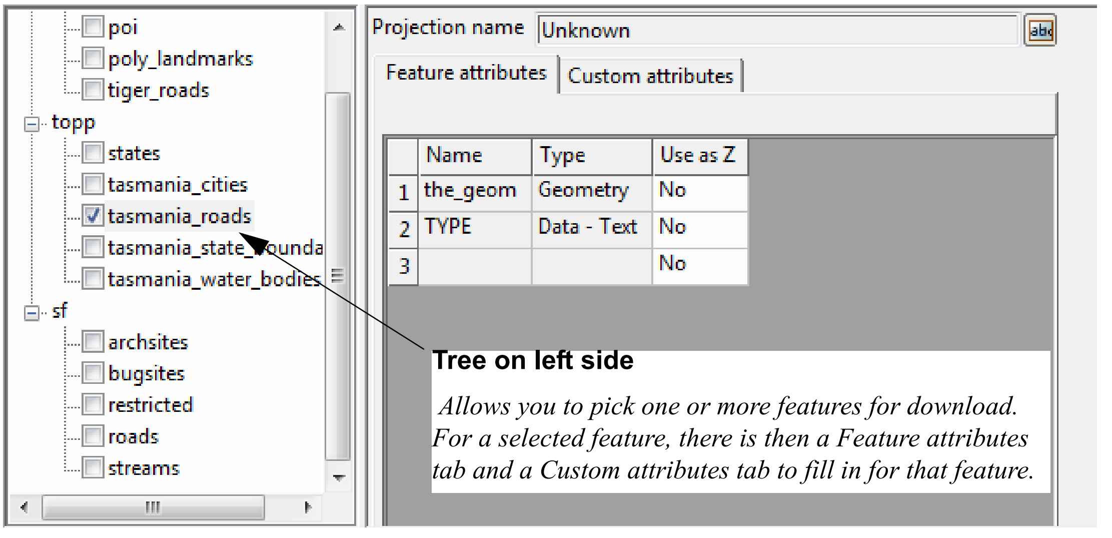
an optional function. A function is required for edits and inserts

Server

the server you wish to connect to

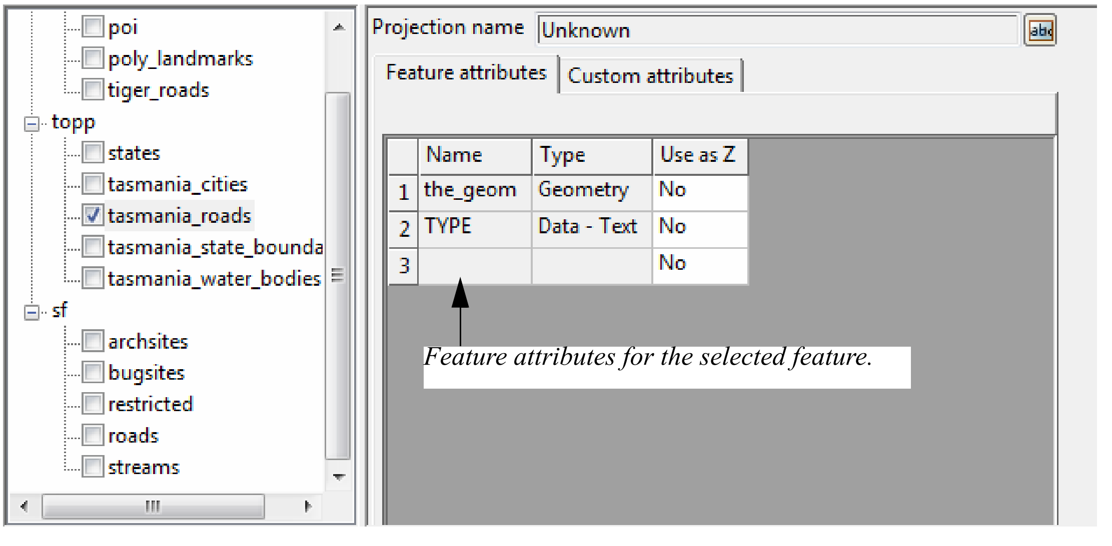
Connect button

connects to the server and retrieves the list of features available for download. The list of features is displayed as a tree control on the left hand side of the panel.



Input tab: Feature Attributes Tab

The Feature attributes grid displays the set of attributes to be downloaded as part of the selected feature.



Name

the name of the downloaded feature attribute

Type

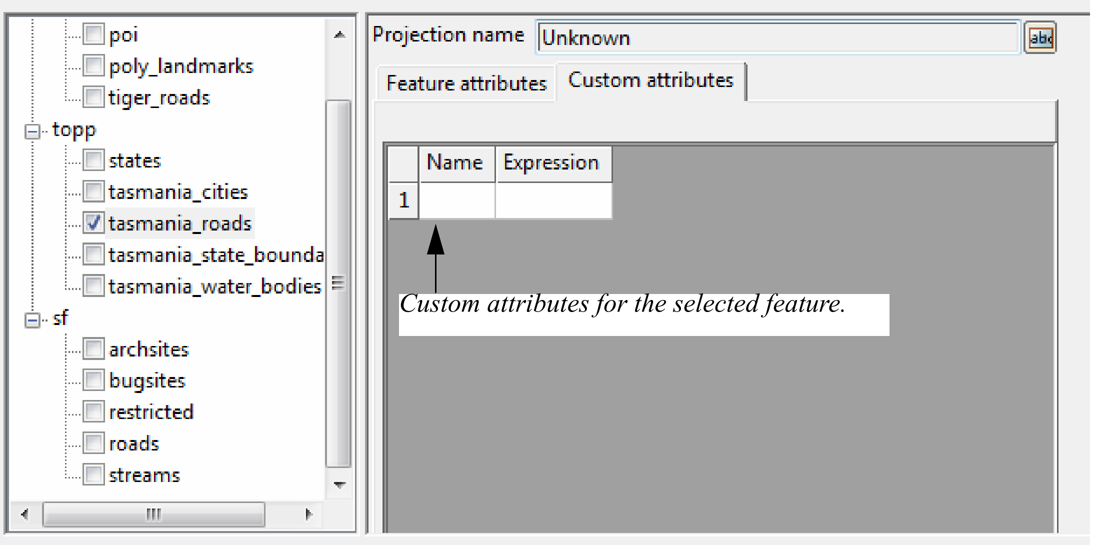
the type of the downloaded feature

Use as Z

whether or not this attribute should be used as a Z level on strings

Input tab: Custom Attributes tab

The Custom attributes grid defines the set of attributes to be downloaded as part of the selected feature.



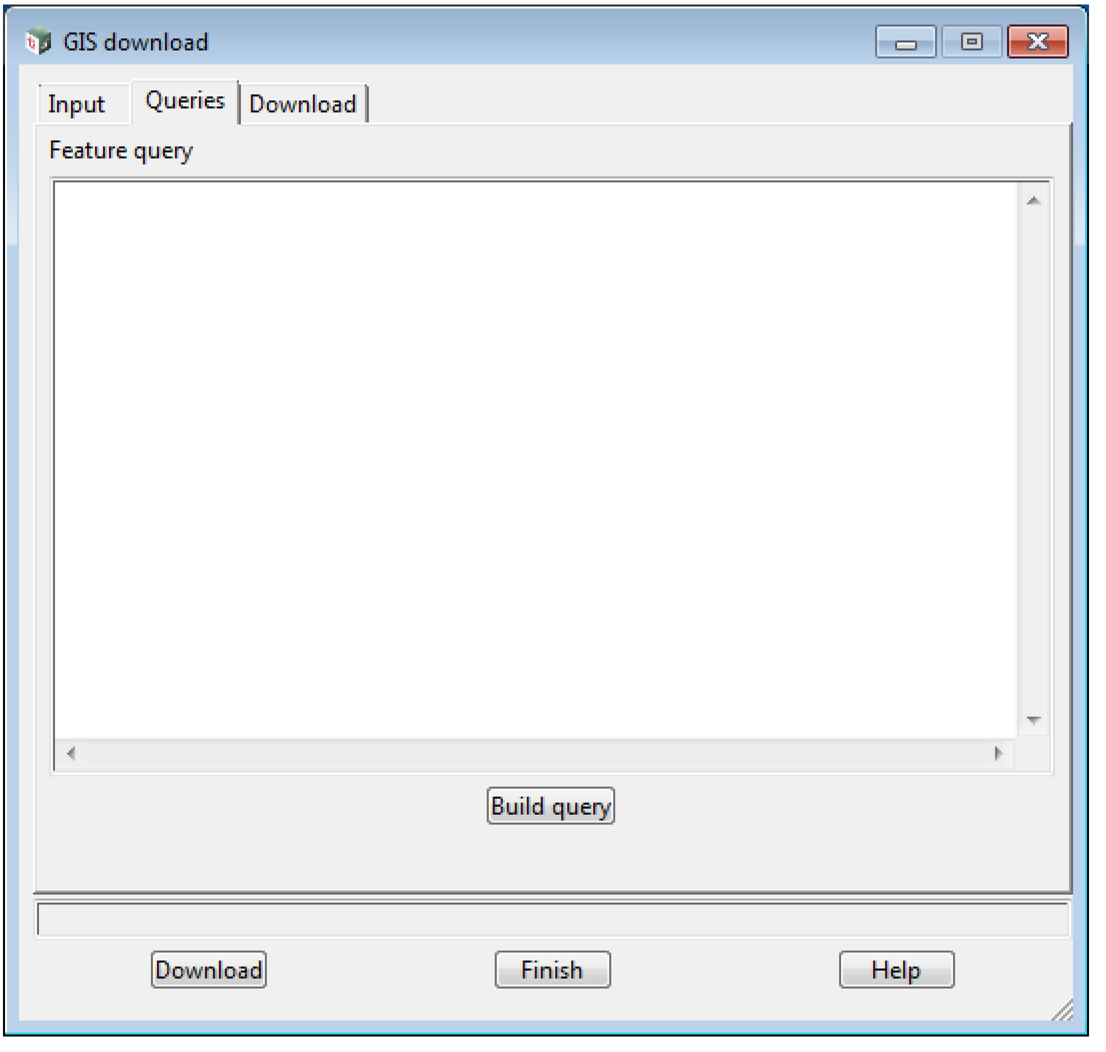
Name

the name of the attribute to be downloaded

Expression

the expression to calculate the attribute (see 8.6.8 Query Building*)*

Queries tab



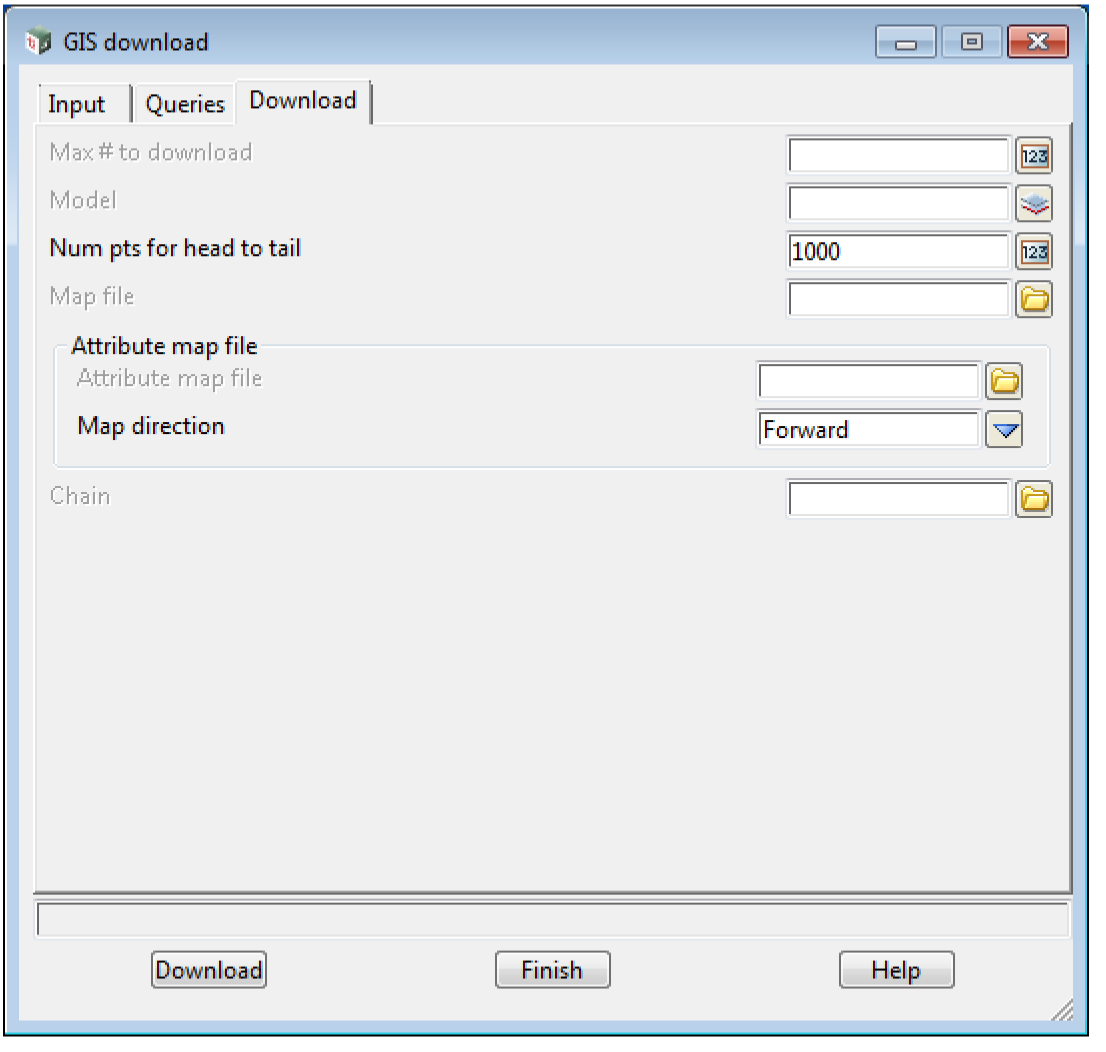
Feature Query

an optional query to send to the server for downloads

Build Query button

shows a helper panel for building queries (see 8.6.8 Query Building*)*

Download tab



Max # to download

the maximum number of strings to download

Model model box

an optional model to download into

Num pts for head to tail

an optional number of points for head to tailing point strings

Map file

an optional map file to apply to downloaded strings

Attribute map file

an optional attribute map file to apply to attributes

Map direction choice box Forward, Backward

the direction to apply to the attribute map file

Chain file box available *.chain files

an optional chain to run after the download completes. This is only available if not run in a function.

Download **button**

downloads the requested features from the server

8.6.8 Query Building

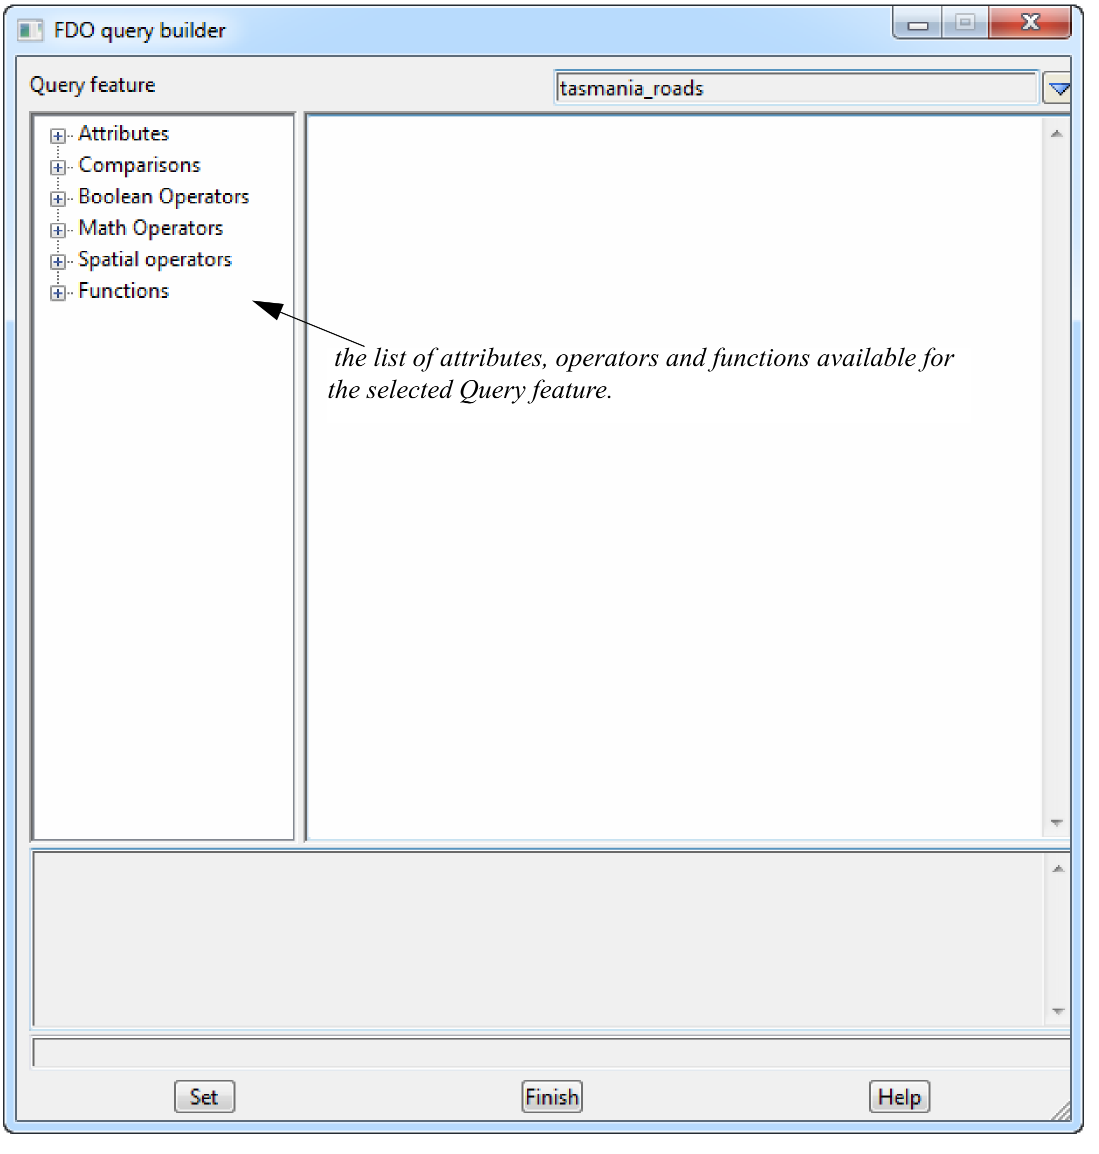
This panel helps build queries for constraining feature downloads.

Note that the features, attributes and queries available are determined by the server you are connecting to and will not be documented here.

If the server publishes help information about the query operation, then it will be listed at the bottom of the panel.

Select **Build query** 

to bring up the FDO query builder panel



Query feature

the feature to build a query for

Left side

the list of attributes, operators and functions available

Right side

the current query

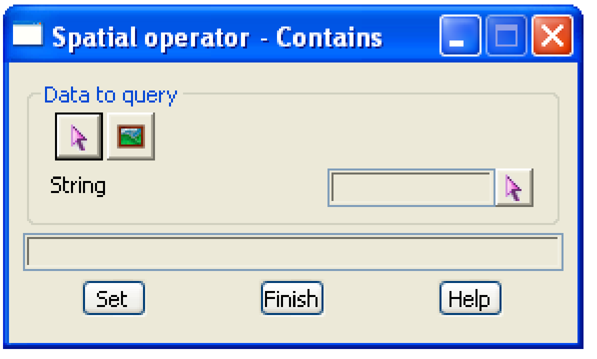
Bottom

any description of the operator

8.6.9 Spatial Operators

Spatial operators are special operators that allow you to refer to an operation against existing geometry. Examples may include whether or not the geometry attribute contains, crosses, intersects or touches another piece of geometry.

For these operators, a panel in the following style will be presented.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Data to query

the data to operate against

Set

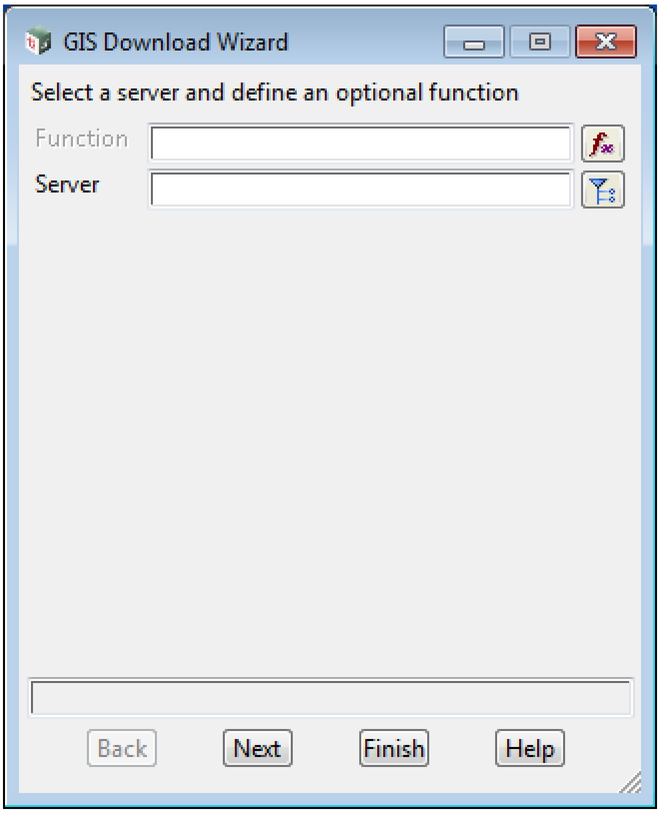
Sets the data for the query

8.6.10 GIS Download Wizard

Position of option on menu: **File I/O =>GIS =>Download (Wizard)**

This is a wizard style interface to assist in setting up an GIS download.

Selecting **Download (Wizard)** brings up the **FDO Download Wizard** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Throughout the wizard, the following buttons **Back** and **Next** will be available

Back

Takes you back to the last step

Next

Takes you to the next step

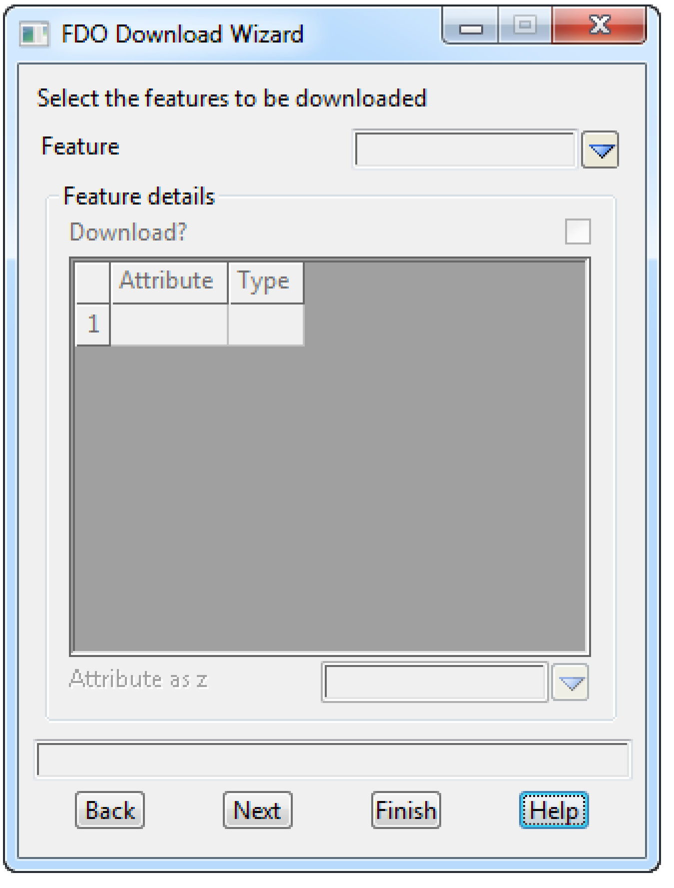
Function

an optional function to create for this FDO download

Server

the server to connect to

8.6.11 Feature Selection Step



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Feature choice box

the feature to view settings for

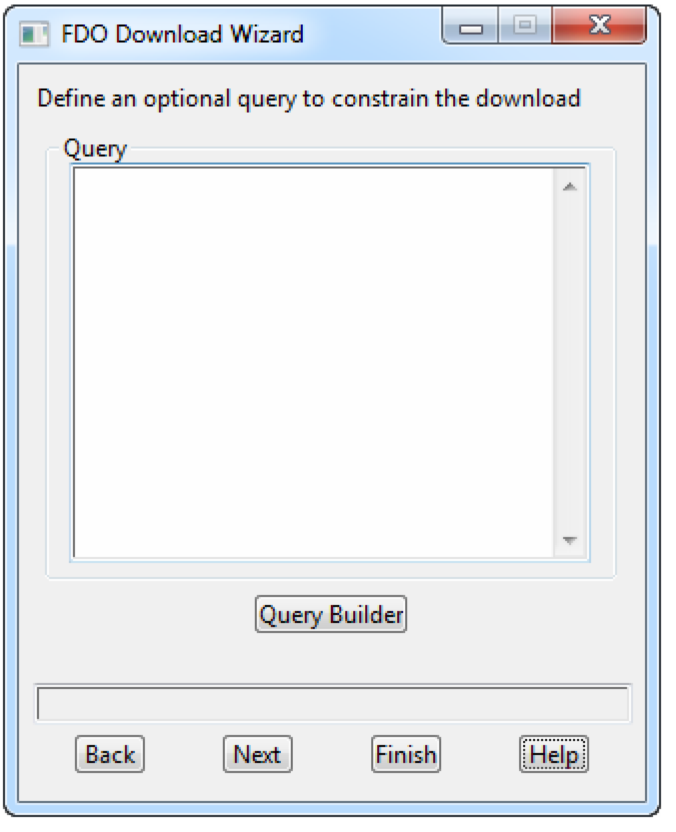
Download? tick box

whether or not to download this feature

Attribute as z

which attribute, if any, to use as the z level for strings

8.6.12 Query Step



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

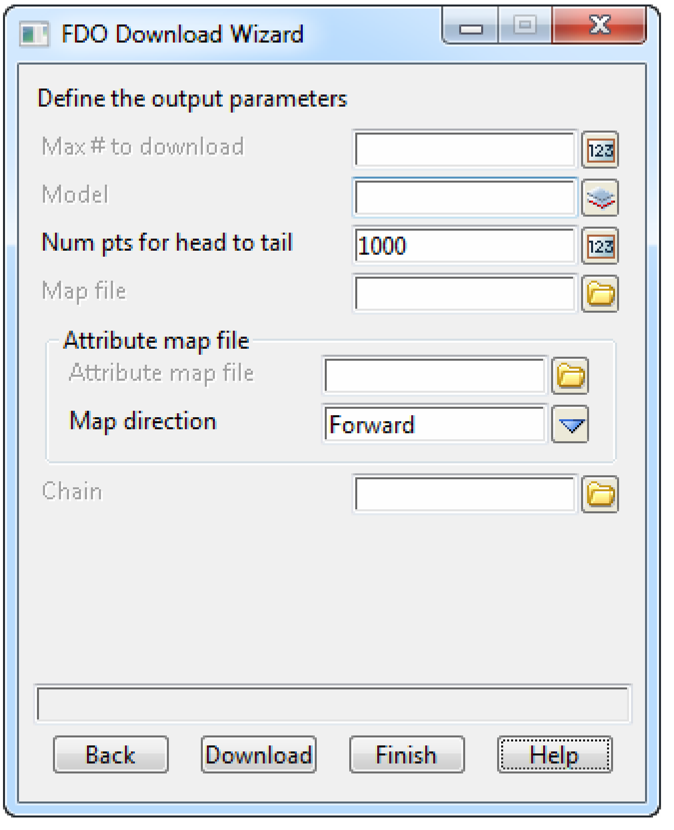
Query

the query to send to the server to constrain features

Query Builder

opens the **FDO Query builder** *panel. See the section on* 8.6.8 Query Building

8.6.13 Output Parameters Step



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Define the Output parameters

Max # to download

the maximum number of strings to download

Model model box

an optional model to download into

Num pts for head to tail

an optional number of points for head to tailing point strings

Map file file

an optional map file to apply to downloaded strings

Attribute map file

Attribute map file file

an optional attribute map file to apply to attributes

Map direction choice box Forward, Backward

the direction to apply to the attribute map file

Chain file

an optional chain to run after the download completes. This is only available if not run in a function.

Download button

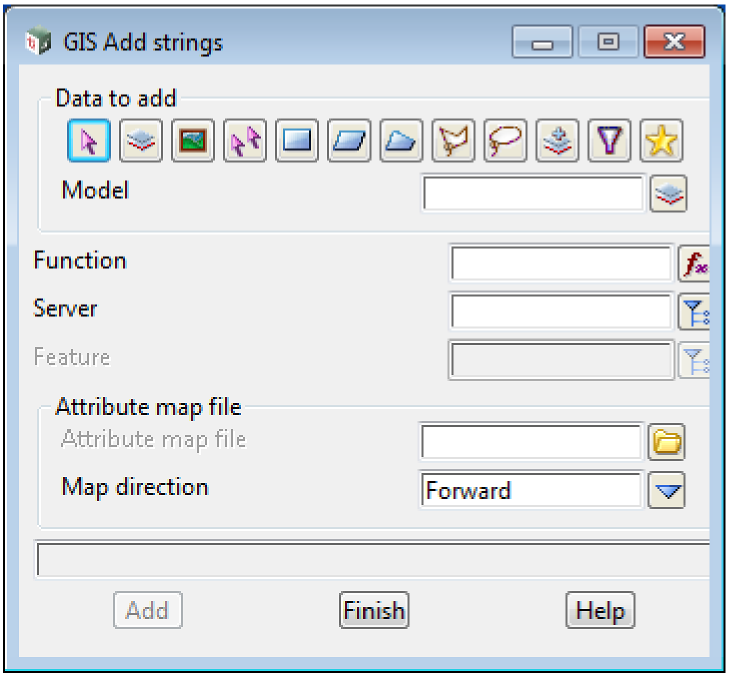
downloads the requested features from the server

8.6.14 GIS Add Strings

Position of option on menu: **File I/O =>GIS =>Add strings**

This allows a user to add strings to a known server. This is only allowed if the server permits the operation.

Selecting **Add strings** brings up the **GIS Add Strings** panel.



The fields and buttons used in this panel have the following functions.

Field Description   Type   Defaults   Pop-Up

Data to add

the data set to add to the server

Function

the existing FDO function to which strings will be added

Server

the server to connect to

Feature

the feature to add strings to

Attribute map file

Attribute map file

an attribute map file to apply to any strings to be uploaded

Map direction   choice box   Forward, Backward

the direction of mapping

Add   button

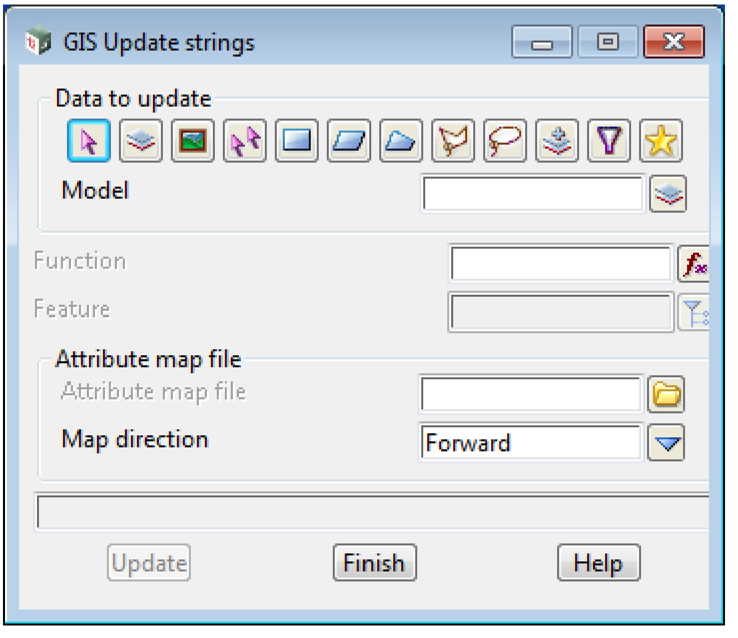
uploads the new strings to the server. Disabled until the function and server are set.

8.6.15 GIS Update Strings

Position of option on menu: **File I/O =>GIS =>Update strings**

This panel allows a user to upload / update strings on the remote server, if the server permits the operation.

Selecting **Update strings** brings up the **GIS Update Strings** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Data to update

the data set of strings to update on the server

Function

the existing FDO function containing strings to be updated

Feature

the feature to update

Attribute map file

Attribute map file	file		

the attribute map file to apply

Map direction	choice box		Forward, Backward

the attribute map file direction to apply to the attribute map file

Update	button		

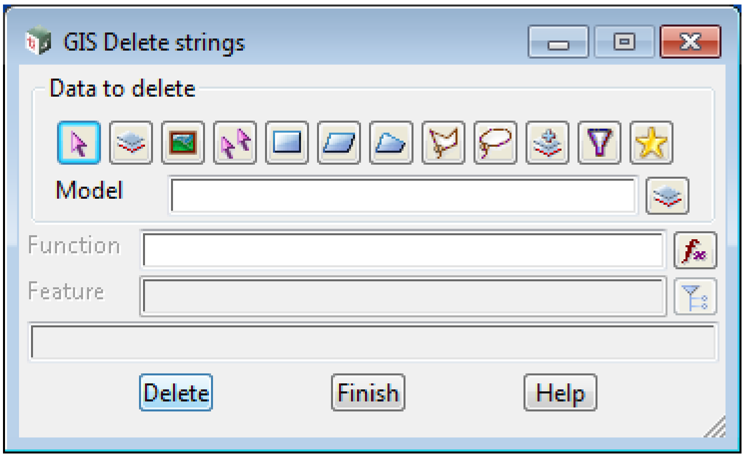
Connects to the server and sends the strings to be updated

8.6.16 GIS Delete Strings

Position of option on menu: **File I/O =>GIS =>Delete strings**

This panel allows a user to delete strings from the FDO server, if the server permits the operation.

Selecting **Delete strings** brings up the **GIS Delete Strings** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Data to delete

the data set to delete from the server

Function

the existing FDO function containing the strings to be deleted

Feature

the feature from which the strings will be deleted

Delete button

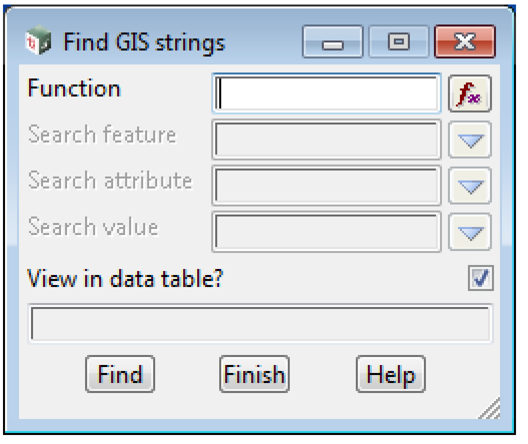
Connects to the server and deletes the specified strings

8.6.17 Find GIS Strings

Position of option on menu: **File I/O =>GIS =>Find**

This allows a user to find downloaded strings by a feature and an optional attribute / value pair.

Selecting **Find** brings up the **Find GIS Strings** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Function

the FDO function containing the strings. Once entered, the list of features will become available

Search feature

the feature to search through

Search attribute

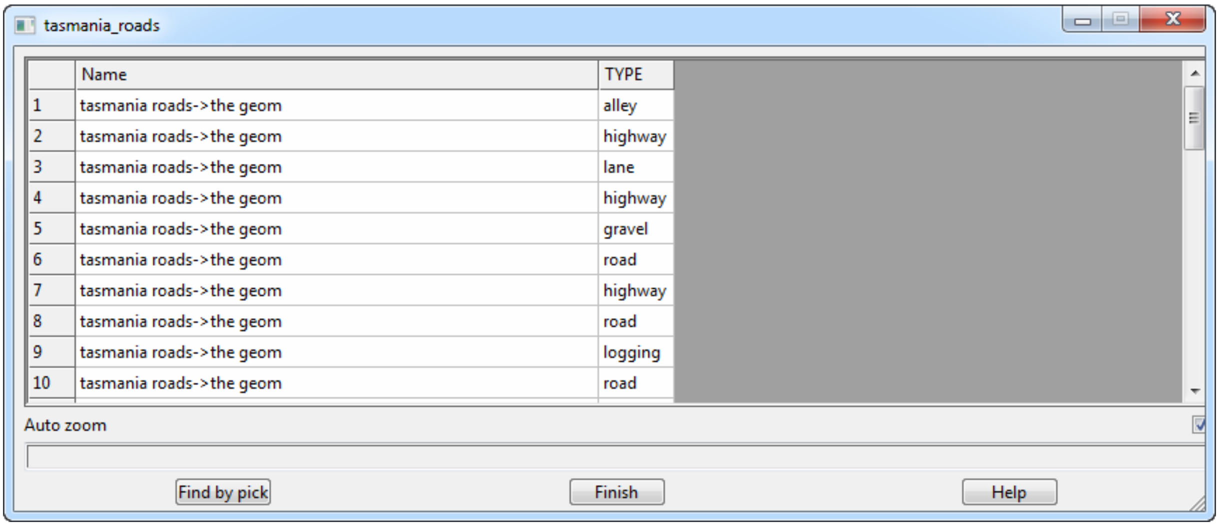
an optional attribute to search for. If not set, all strings in the feature will be found

Search value

the value of the attribute to search for

View in data table? tick box

whether or not to view in a separate data table or in the output window. The data table, below, will pan when the row is selected.



Auto zoom tick box

whether or not to zoom to the selected feature

Find by pick

finds a row based on a string selection

Find button

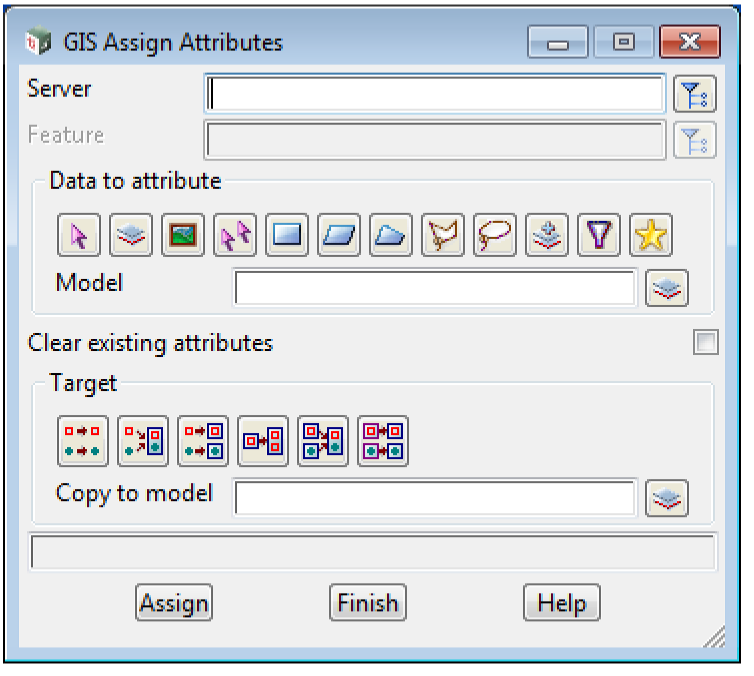
Finds the strings

8.6.18 GIS Assign Attributes

Position of option on menu: **File I/O =>GIS =>Assign Attributes**

This panel allows you to take the schema from a server and feature and create attributes with default values to a data set.

Selecting **Assign Attributes** brings up the **GIS Assign Attributes** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Server

the server to connect to

Feature

the feature to use the schema from

Data to attribute

the data set to apply feature attributes to

Clear existing attributes tick box

whether or not to clear existing attributes from the data set

Target

the target data set

Assign button

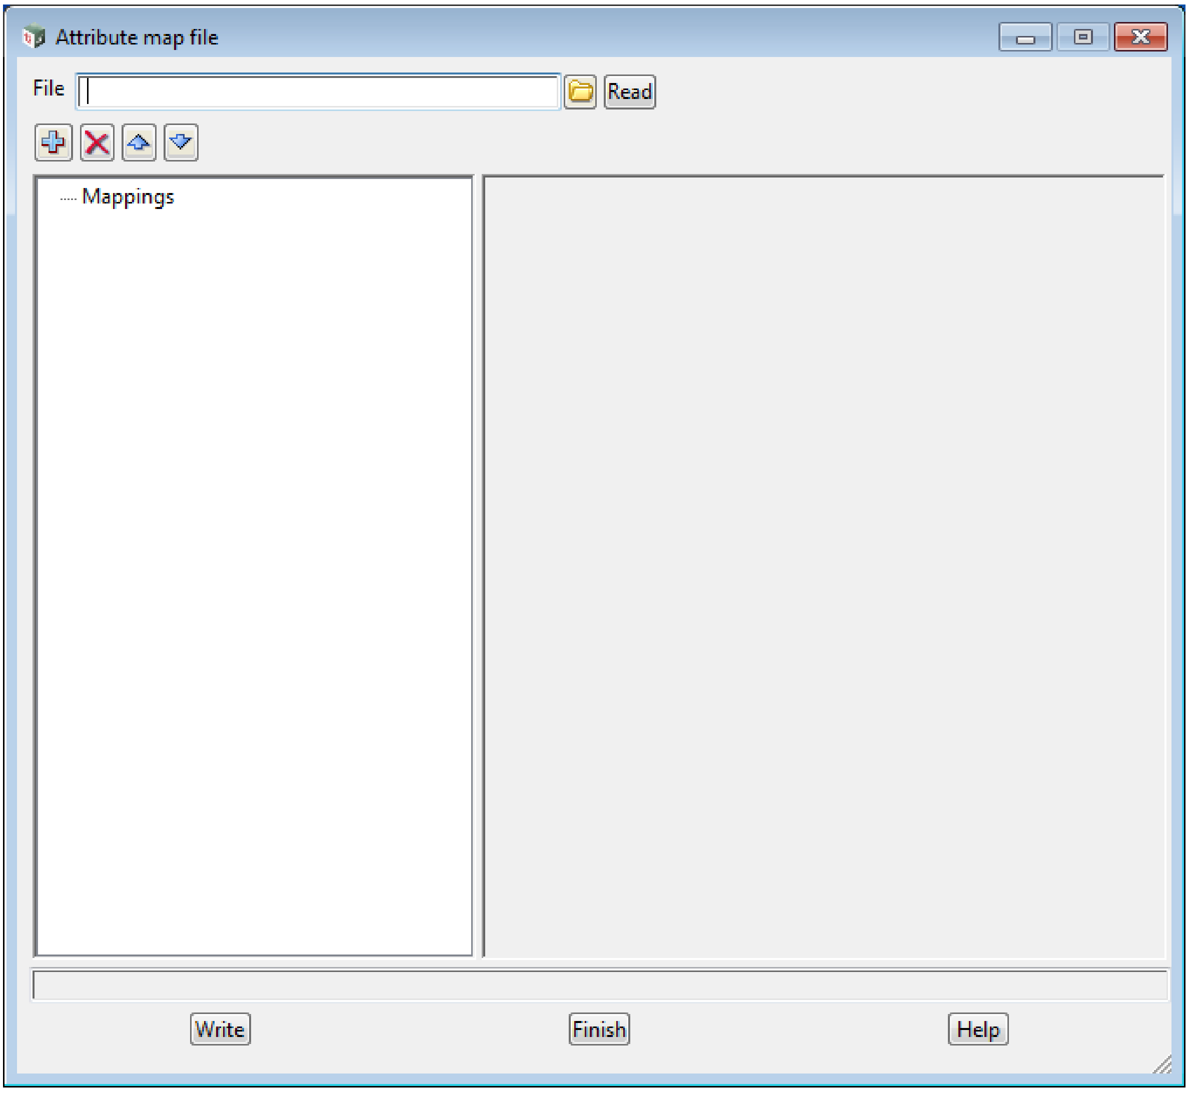
assigns the feature attributes to the data source / target set

8.6.19 Attribute Map File

Position of option on menu: **File I/O =>GIS =>Attribute map file editor**

This panel allows you to define a mapping from one attribute format to another. This allows you to map from attributes defined by an external data source to meet your attribute schema requirements, or vice versa.

Selecting **Attribute map file editor** brings up the **Attribute map file** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

File

the attribute mapping file to edit

Read button

reads the file

Insert

adds a new mapping

Delete

deletes the select mapping

Up

Moves the mapping up in the list

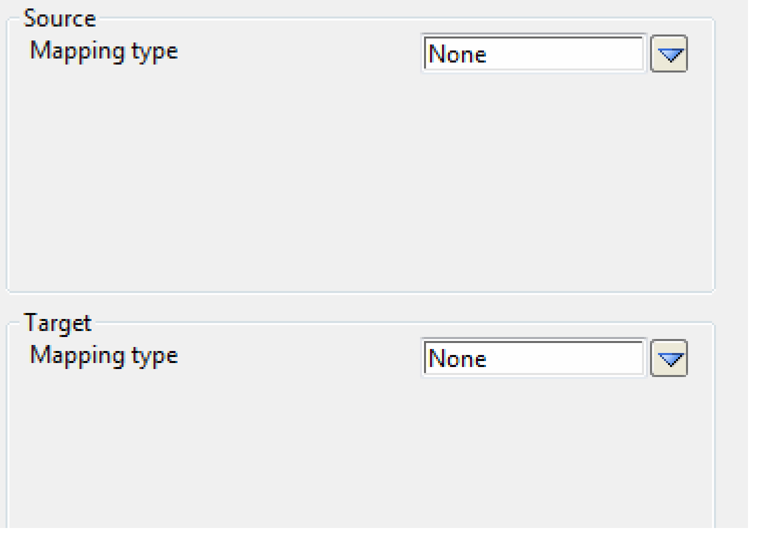
Down

Moves the mapping down in the list

Write button

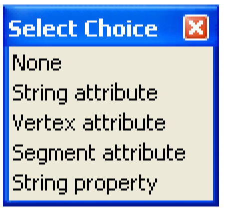
writes the mapping

After selecting **insert** the **Source Mapping Type** choice box and **Target Mapping Type** choice box appear on the screen.



Source Mapping Type choice box

the type of attribute to map from



For String attribute see String/Vertex/Segment attribute

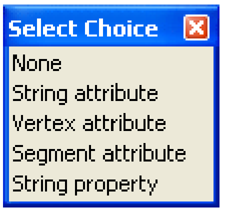
Vertex attribute see String/Vertex/Segment attribute

Segment attribute see String/Vertex/Segment attribute

String property see String Property attribute

Target Mapping Type choice box

the type of attribute to map to



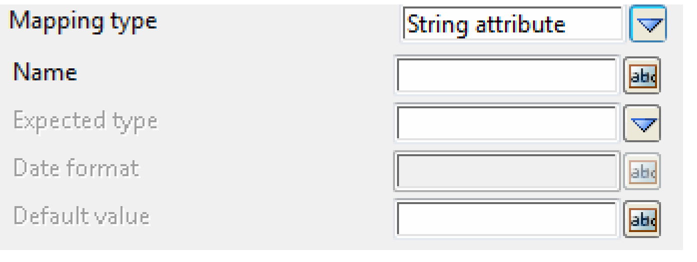
For String attribute see String/Vertex/Segment attribute

Vertex attribute see String/Vertex/Segment attribute

Segment attribute see String/Vertex/Segment attribute

String property see String Property attribute

String/Vertex/Segment attribute



Name

the name of the attribute

Expected type choice box

the type of attribute to be expected

Date format

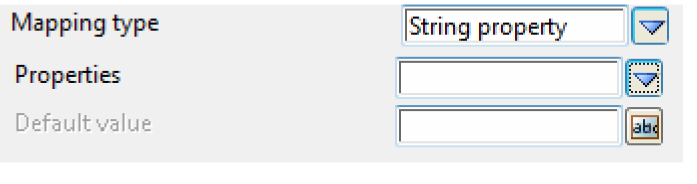
an optional date format (to convert to/from a date string)

Default value

an optional default value to use if the attribute is not found

String Property attribute

Maps to / from a property on a string, such as colour, name, height, weight *etc*.



Properties choice box

the property to map to / from

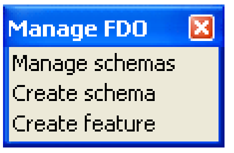
Default value

an optional default value to use if the value is not found

8.6.20 Manage FDO

Position of option on menu: **File I/O =>GIS =>Manage**

The **Manage FDO** walk-right menu containing these options is:



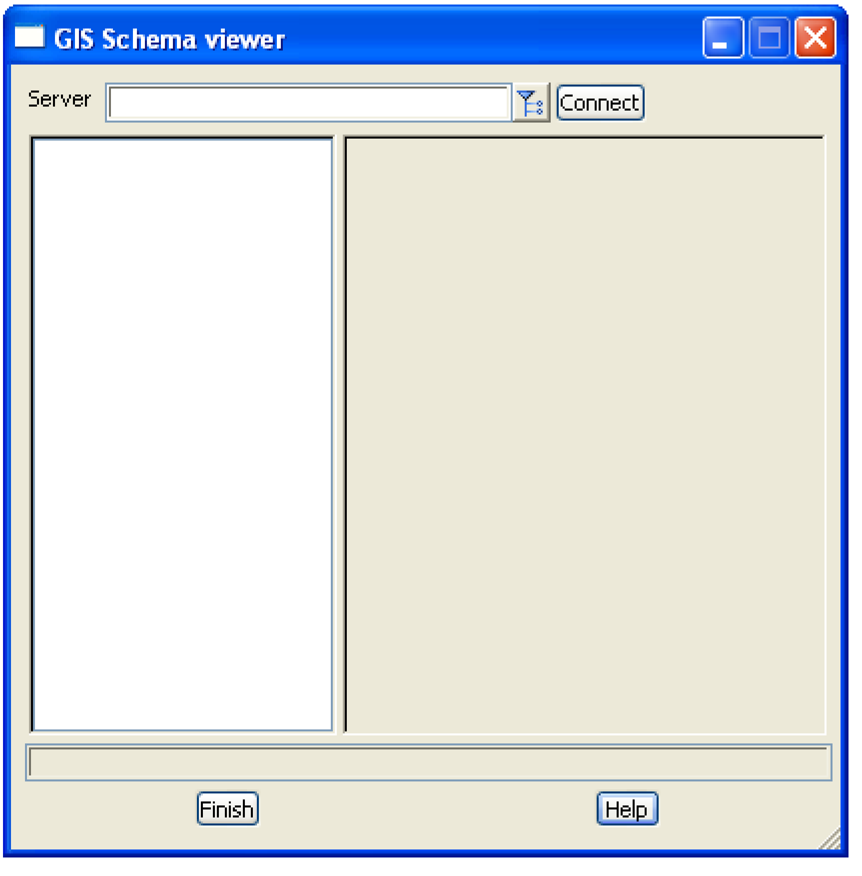
For the option Manage Schemas go to 8.6.20.1 GIS Schema Viewer
Create Schema 8.6.20.2 Create FDO Schema
Create Feature 8.6.20.3 Create GIS Feature

8.6.20.1 GIS Schema Viewer

Position of option on menu: **File I/O =>GIS =>Manage => Manage Schemas**

This panel allows you to view and edit schemas, if editing is permitted by the server.

Selecting **Manage Schemas** brings up the **GIS Schema Viewer** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

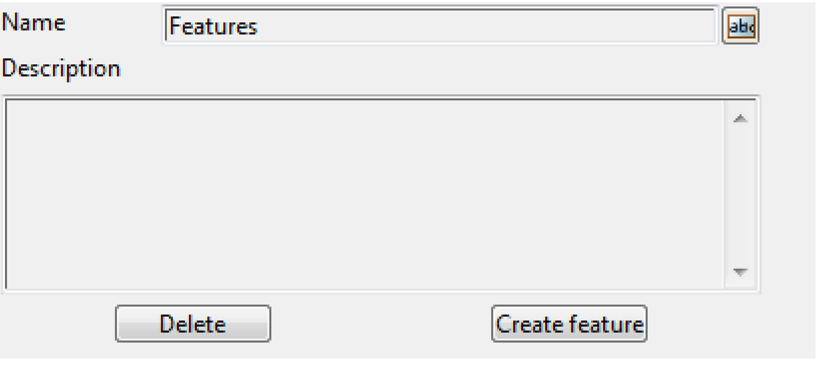
Server

the server to view schemas for

Connect button

connects to the server and downloads all schema information available

When a schema is selected, the right side of the panel will display:



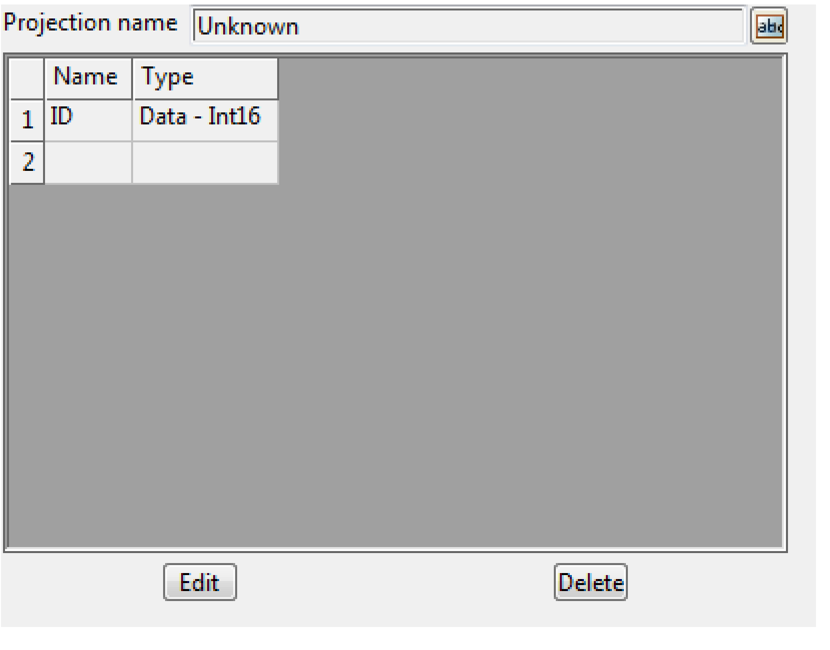
Delete button

deletes the selected schema - only available if permitted by the server

Create feature button

creates a new feature in this schema - only available if permitted by the server

When a feature is selected, the right side of the panel will display the list of attributes and their types.



Edit

edits the selected feature see 8.6.20.3 Create GIS Feature*- only available if permitted by the server*

Delete

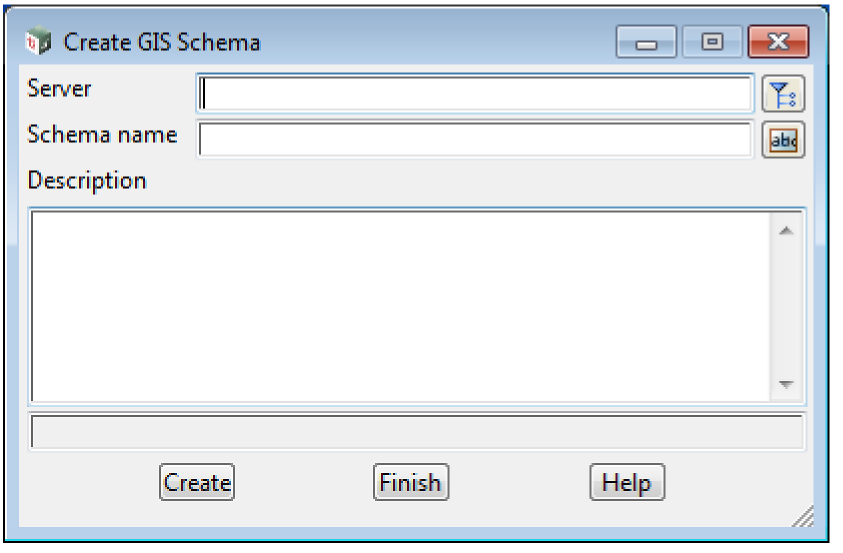
deletes the current feature - only available if permitted by the server

8.6.20.2 Create FDO Schema

Position of option on menu: **File I/O =>GIS =>Manage => Create Schema**

This panel creates a new schema on a remote server, if the operation is permitted by the server.

Selecting **Create Schema** brings up the **Create GIS Schema** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Server

the name of the server to create a schema on

Schema name

the name of the schema

Description

an optional description about the schema

Create button

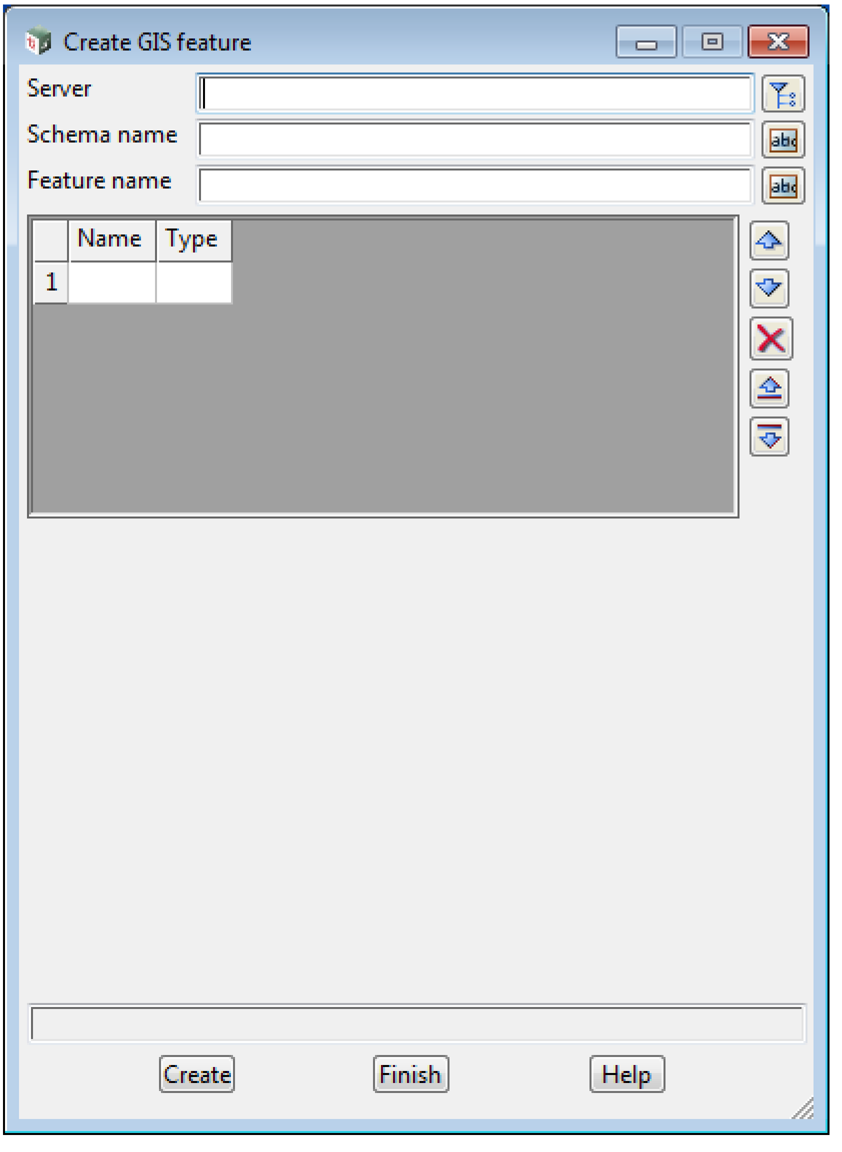
attempts to create the new schema on the remote server

8.6.20.3 Create GIS Feature

Position of option on menu: **File I/O =>GIS =>Manage => Create feature**

This panel creates a new feature in a schema, if the remote server permits the operation.

Selecting **Create feature** brings up the **Create GIS Feature** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Server

the name of the server to create the feature

Schema

the name of the schema to create a feature in

Feature name

the name of the feature to create

Grid Column Name

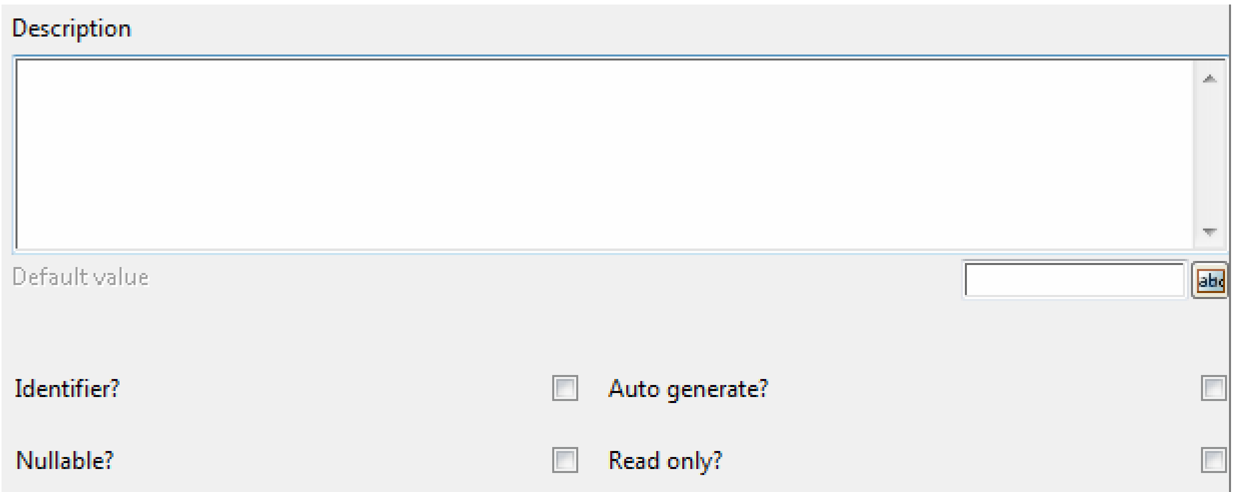
the name of the attribute to create

Grid Column Type

the type of attribute to make

Each row in the grid has a number of additional parameters to fill in.

The standard set of fields are:



Description

a description of the attribute

Default value

an optional default value

Identifier? tick box

whether or not this attribute is an identifier attribute

Nullable? tick box

whether or not this attribute is nullable (can have a null value)

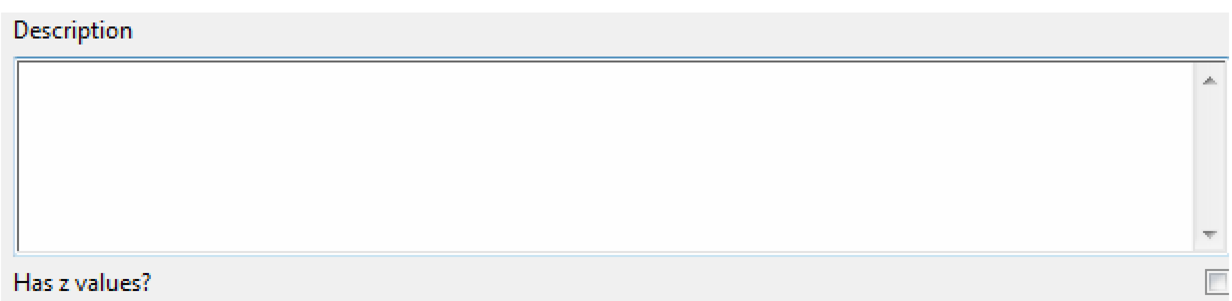
Auto generate? tick box

whether or not the server should auto generate the value of the attribute

Read only? tick box

whether or not the attribute is a read only attribute

Geometry attributes have the following fields:



Description

a description of the attribute

Has z values? tick box

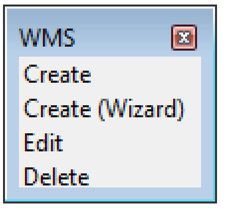
whether or not the geometry contains z values

8.6.21 WMS

Position of option on menu: **File I/O =>GIS =>WMS**

Position of option on menu: **Strings =>WMS**

The **WMS** walk-right menu containing these options is:



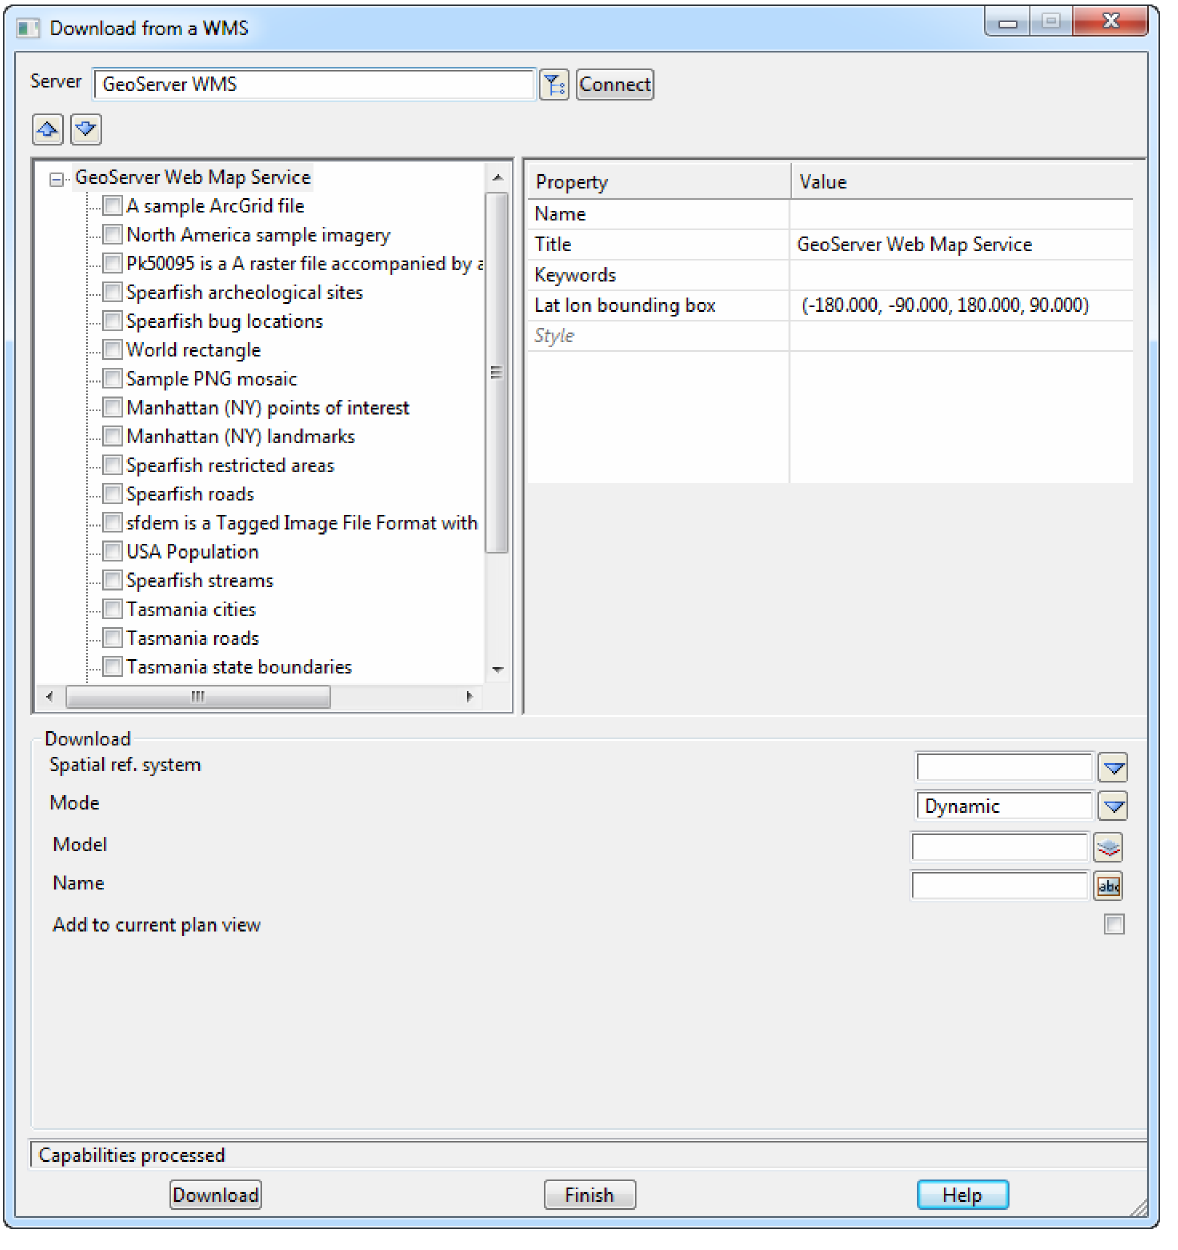
For the option Create go to	8.6.21.1 Download from a WMS
Create (Wizard)	8.6.21.2 WMS Wizard
Edit	8.6.22.1 Edit a WMS Image
Delete	8.6.22.2 Delete a WMS Image

8.6.21.1 Download from a WMS

Position of option on menu: **File I/O =>GIS =>WMS =>Create**

This panel allows you to set up an image to be downloaded from a **WMS (Web Mapping Server)**, either dynamically or as a once off download.

Selecting **Create** brings up the **Download from a WMS** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Server

the WMS server to download from

Connect button

connects to the server and downloads the schema

Up arrow

moves the layer up in order in which they will be downloaded.

Down arrow

moves the layer down in order in which they will be downloaded.

Spatial ref system

the spatial reference system to use when downloading

Mode choice box Dynamic, Save as file

Dynamic (update as you pan around), or Save as file

Model model box

the model to add a dynamic WMS image to

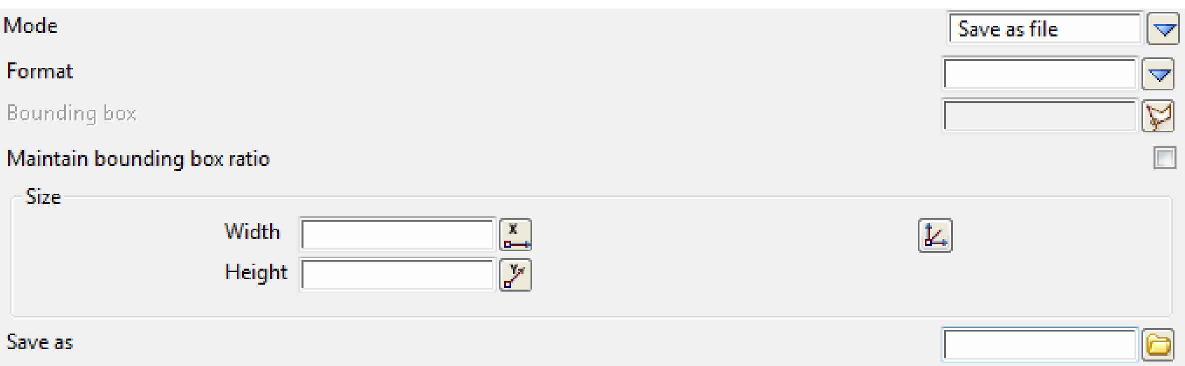
Name

the name of the image

Add to current plan view tick box

Whether or not to add to the current plan view

If the mode is **Save as file**, the following fields will be displayed.:



Format

the format of the image to download

Bounding box

whether or not to define a bounding box

Maintain bounding box ratio

whether or not to maintain the ratio of the bounding box on the server

Size

defines the width and height of the image file

Save as

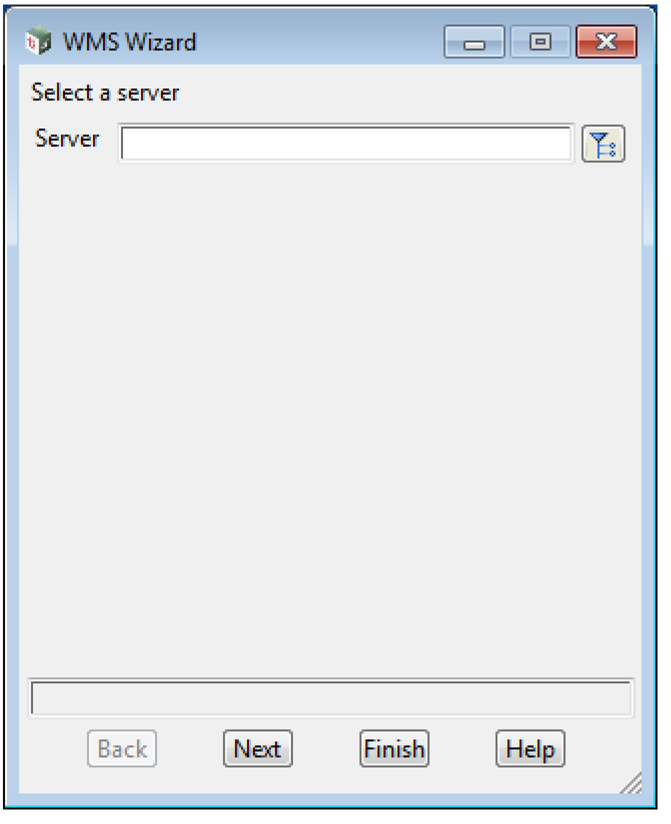
the target file for the image

8.6.21.2 WMS Wizard

Position of option on menu: **File I/O =>GIS =>WMS =>Create (Wizard)**

This panel allows you to set up an image to be downloaded from a **WMS (Web Mapping Server)**, either dynamically or as a once off download, via a wizard like interface.

Selecting **Create (Wizard)** brings up the **WMS Wizard** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Throughout the wizard, the following buttons will be available:

Server

the server to download from

Back

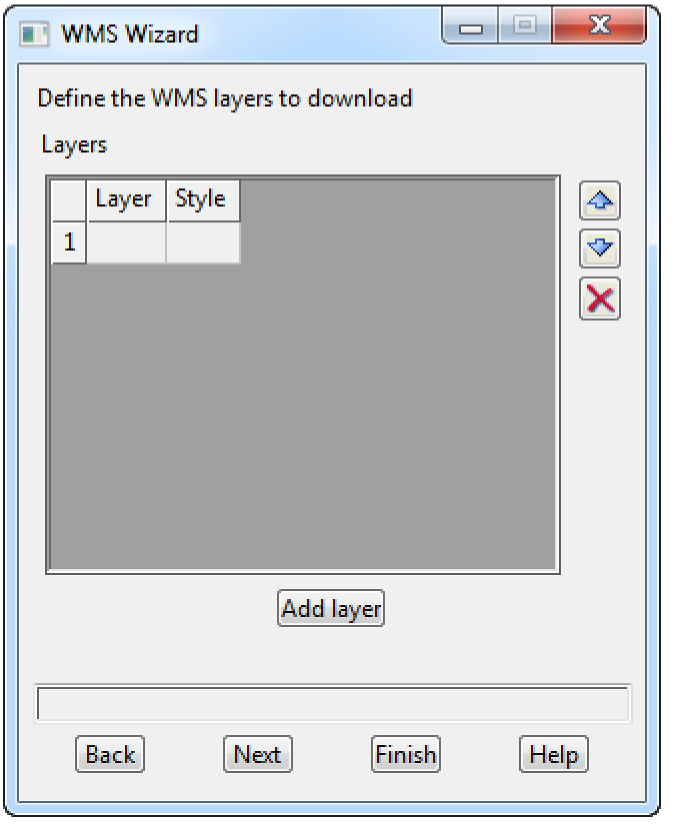
Takes you back to the last step

Next

Takes you to the next step

8.6.22 Layer Selection Step

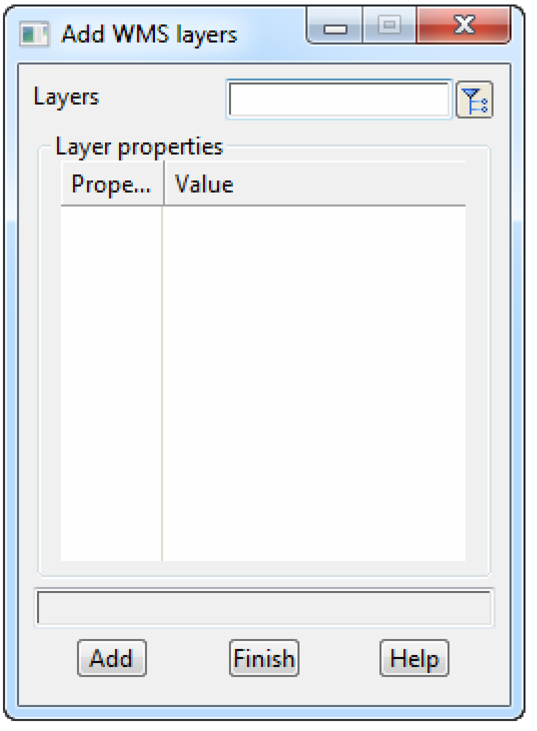
This panel allows you to select the layers to be downloaded



Add layers button

shows the list of layers to be downloaded
*Selecting **Add layers** bring up the **Add WMS layers** panel*

Add WMS layers

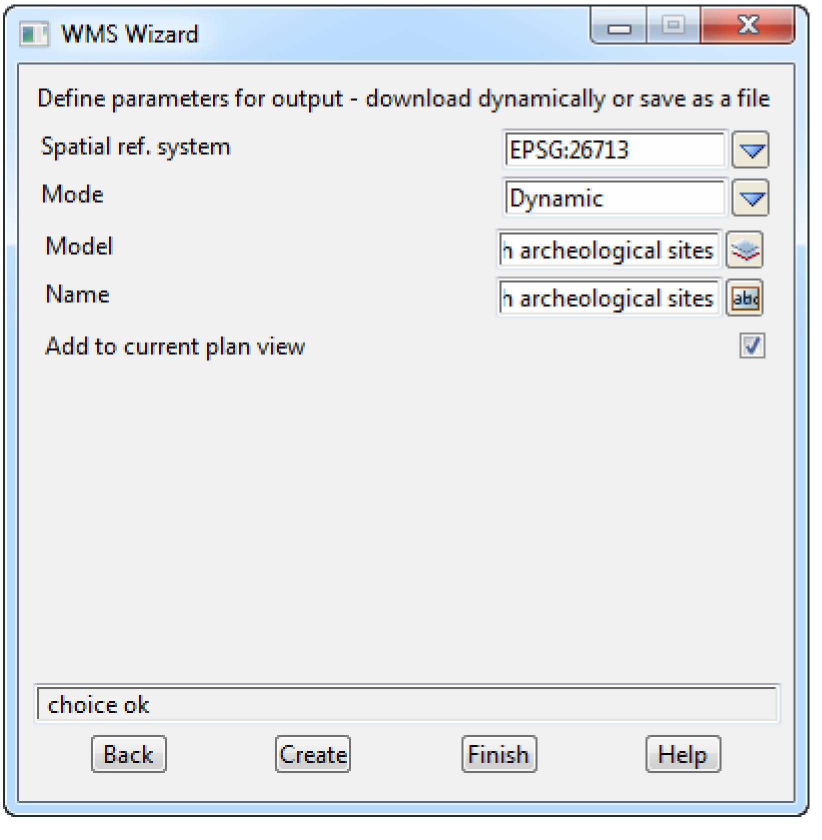


Layers

the layer to add or view properties

Add

adds the layer



Spatial ref. system

the spatial reference system to use when downloading

Mode

Dynamic (update as you pan around), or Save as file

Model model box

the model to add a dynamic WMS image to

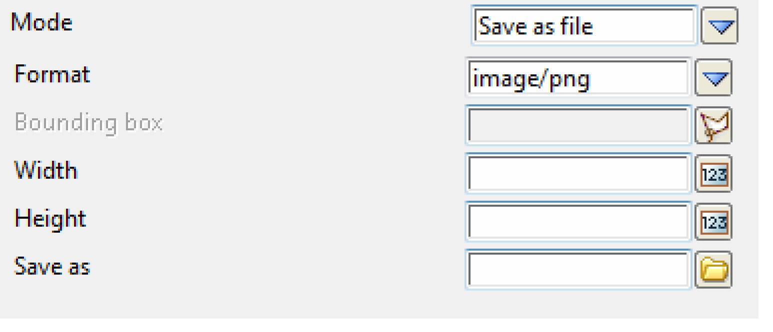
Name

the name of the image

Add to current plan view tick box

Whether or not to add to the current plan view

If the mode is set to '**Save as file**', the following fields will be displayed:



Format choice box

the format of the image to download

Bounding box

whether or not to define a bounding box

Width

the width of the image

Height

the height of the image

Save as

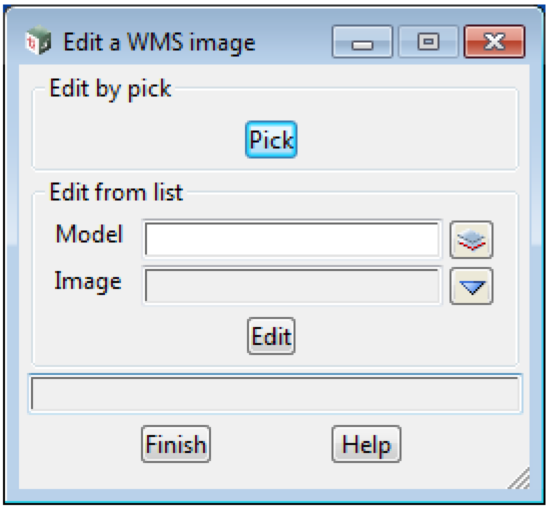
the target file for the image

8.6.22.1 Edit a WMS Image

Position of option on menu: **File I/O =>GIS =>WMS =>Edit**

Edits a **WMS** image, as selected by picking or by specifying by model and image name.

Selecting **Edit** brings up the **Edit a WMS Image** panel.



The fields and buttons used in this panel have the following functions.

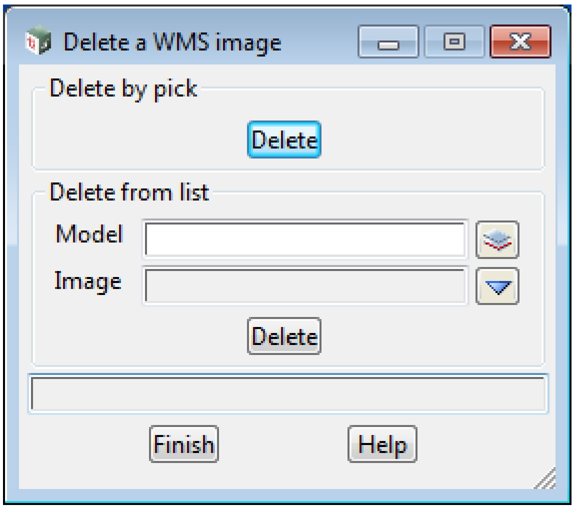
Field Description	Type	Defaults	Pop-Up
Edit by Pick			
Pick	button		
pick the WMS image to string, by picking its extent			
Edit from list			
Model	model box		
the model to look for WMS images in			
Image			
the WMS image within the model to edit			
Edit	button		
edits the selected WMS image			

8.6.22.2 Delete a WMS Image

Position of option on menu: **File I/O =>GIS =>WMS =>Delete**

Deletes a **WMS** image, as selected by picking or by specifying by model and image name.

Selecting **Delete** brings up the **Delete a WMS Image** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Delete by pick

Delete button

pick the WMS image to string, by picking its extent

Delete from list

Model model box

the model to look for WMS images in

Image

the WMS image within the model to delete

Delete

delete the selected WMS image

8.7 Label Map Files

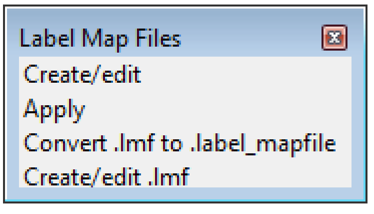
Position of menu: **File I/O =>Label Map files**

The option Create/edit creates and edits ***Label Map*** files which are then used in the Label Map File ***Apply*** option.

From ***12d Model 10***, the Label Map file had an XML format (the file ends in .label_mapfile). Before ***12d Model 10*** there was a format with files ending in .lmt so there is an option to convert from the older format, .lmf, to the newer .label_mapfile format.

Note: if the ***Create/edit*** option is used on an old format file, it is automatically converted to the new format.

The **Map files** walk-right menu is



create/edit a label mapfile
apply a label map file to data
convert pre-V10 label map file format to XML format label map files
create/edit a pre-V10 label map file

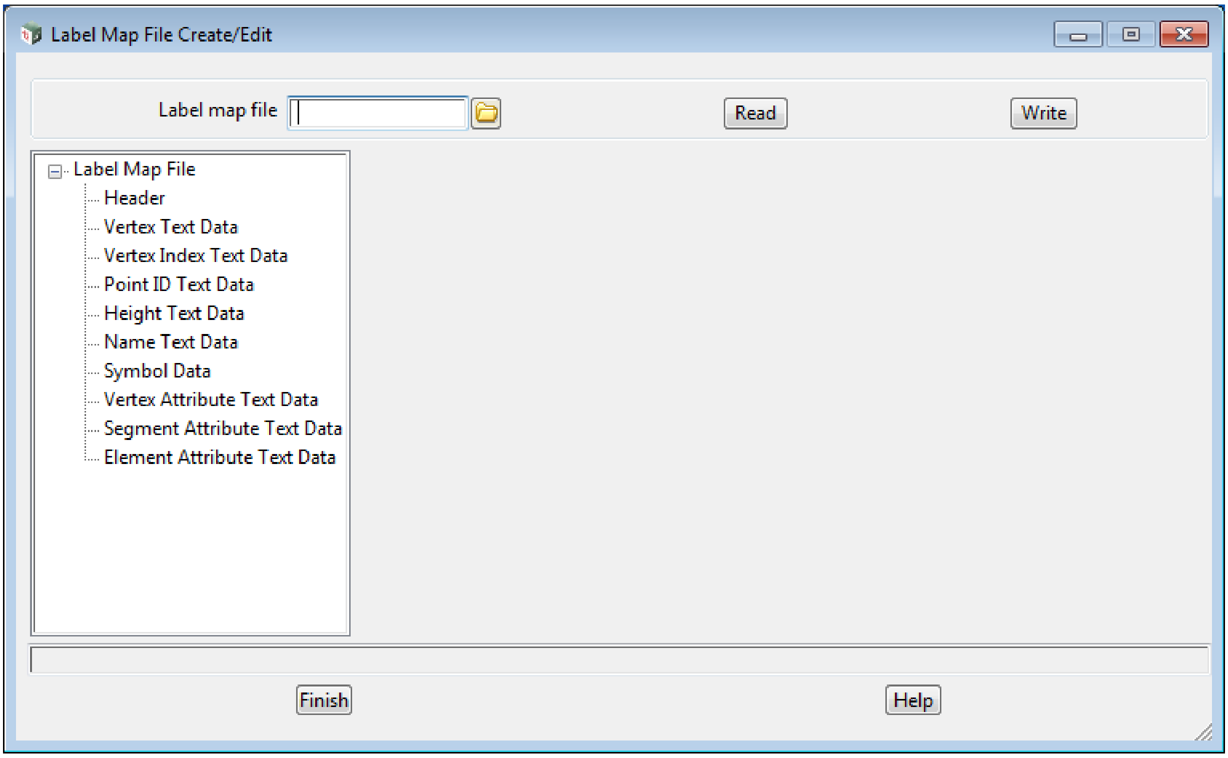
For *Create/edit*, go to 8.7.1 Create/Edit Label Map File
Apply 8.7.2 Apply a Label Map File
Convert .lmf to .label_mapfile 8.7.3 Convert .lmf Files to .label_mapfile
Create/edit .lmf 8.7.4 Create/Edit Pre-V10 Label Map File

8.7.1 Create/Edit Label Map File

Position of option on menu: **File I/O =>Label Map files =>Create/edit**

The **label map file** option **creates** or **edits** the label map files which is used in the ***Apply Label Map File*** option to create various labels at string vertices and segments.

Selecting **Create/edit** brings up the **Label Map File Create/Edit** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Label map file	input		*.label_mapfile and *.lmf

name of the label map file to be created or edited.

If it is a .lmf file, it is automatically converted to the new xml format and written out as a .label_mapfile file.

Bottom buttons

Read button

read in the label map file given in the **Label map file** *field and load the data into the fields of the table. If the file doesn't exist, an error message is given.*

Write button

write out the data in the table to the file name given in the **Label map file** *field. If the file already exists, a Replace-Cancel panel checks to see if the existing file is to be over written - if no or cancel is selected, nothing is written out.*

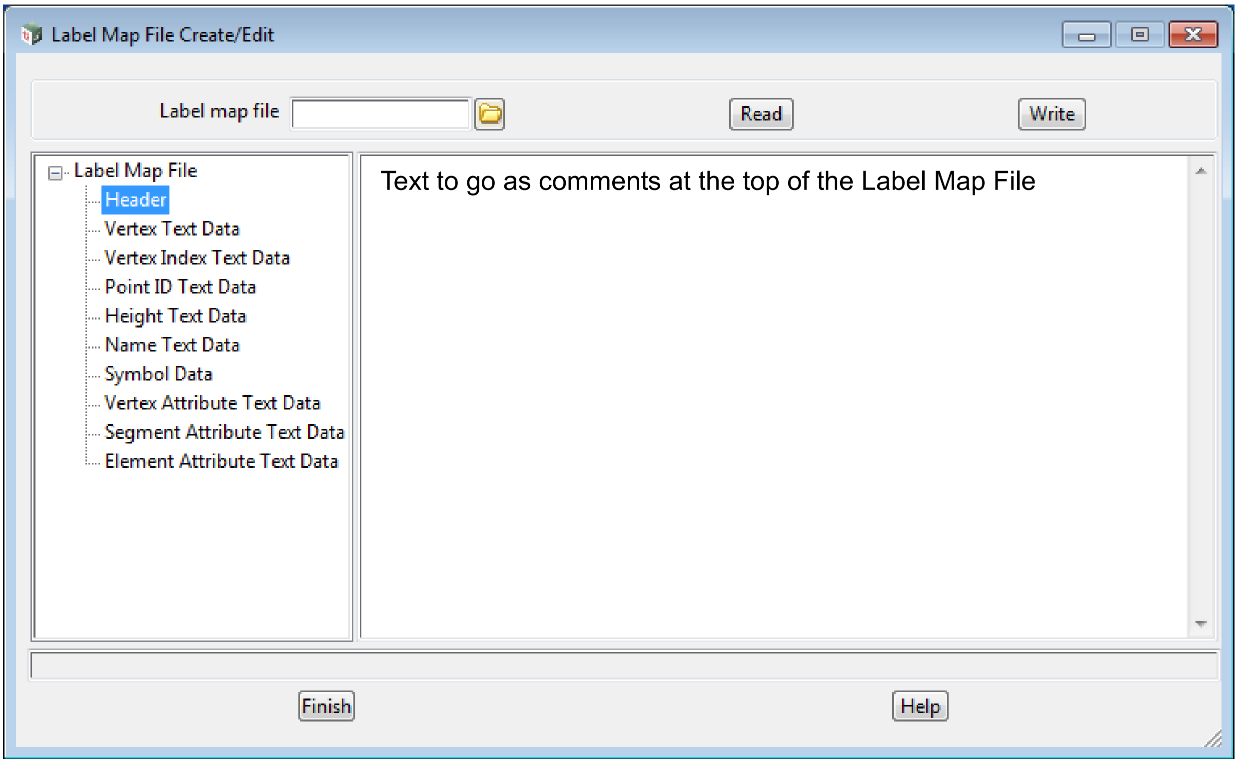
8.7.1.1 Header

Header just has lines of comment text. A common use is to document which client the file is to be used for, or the revision history.

The text written in the right hand side of the panel is written out as comments at the top of the Label Map file.



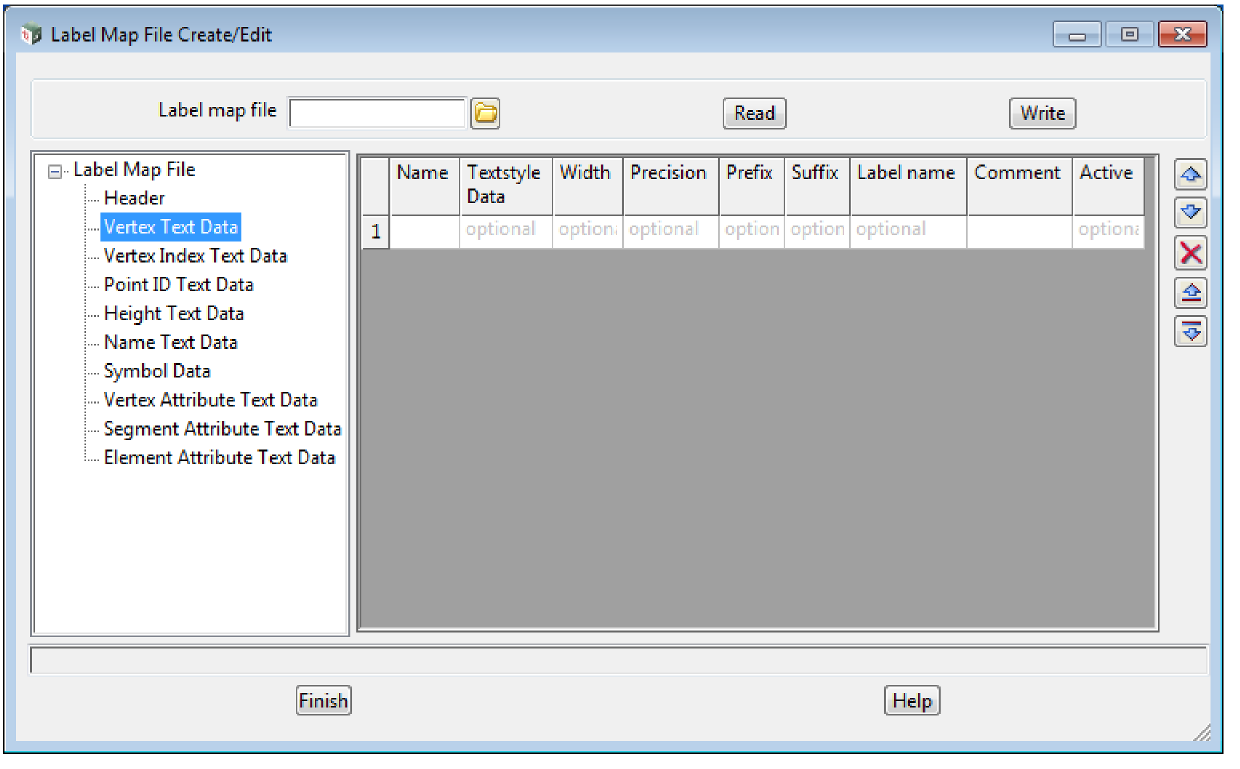
Go to the next section 8.7.1.2 Vertex Text Data or return to 8.7.1 Create/Edit Label Map File.

8.7.1.2 Vertex Text Data

Super strings can have text at ***each*** vertex of the super string. **Vertex Text Data** creates labels from the vertex text at each vertex.

The ***Vertex Text Data*** grid specifies ***which strings are selected*** and how a label containing the ***vertex text*** for each vertex of the selected strings is created.

For each selected string, a new super string is created with vertices at the same position as the vertices of the selected string, and with the labels created as vertex text at the appropriate vertices of the new super string.



Name **select name** menu for fields

for the selected strings, labels are created from the vertex text at each vertex. See Selecting Strings using Name:

For each selected string, a new super string is created with vertices at the same position as the vertices of the selected string, and with the labels created as vertex text at the appropriate vertices of the new super string.

Selecting Strings using Name:

The text in the **Name** *column is the name of the strings to be selected.* **Name** *can include wild cards* ***** *and wild characters* ***?*** *to allow matching of multiple strings.*

For each string, the string name is compared to the text in the **Name** *column for this line and if there is a match then the string is selected to label using the parameters in this line of the Label Map file.*

If a match occurs for a line, then this line of the Label Map file grid is used and no other lines are tested against.

If no match occurs, then this line of the Label Map file grid is ignored and a test for a match is made against the next line of the grid.

Hence the order of the text in the **Names** *column in the grid is important, especially when wild cards and wild characters are used.*

Textstyle data **select textstyle data** menu for fields

textstyle data for labels. This controls the units, size, colour, border etc for the created text

Width

if non blank, the minimum number of number of characters that is allowed for the vertex text before applying the prefix and suffix.

If the number of characters in the vertex text is less than **Width** *characters, then additional spaces are added to the left of the vertex text so that there are* **Width** *characters.*

If the number of characters in the vertex text is greater than **Width***, then* **Width** *is ignored. Hence the vertex text is not truncated.*

For example if **Width** *is set to 20 and the vertex text has only ten characters, then an extra 10 spaces are added to the left of the vertex text before applying the Prefix/Suffix.*

if blank, the vertex text is used with no space padding.

Precision

not applicable

Prefix/Suffix

prefix/suffix for the text

Label name

the created super strings are given this name

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

Go to the next section 8.7.1.3 Vertex Index Text Data or return to 8.7.1 Create/Edit Label Map File.

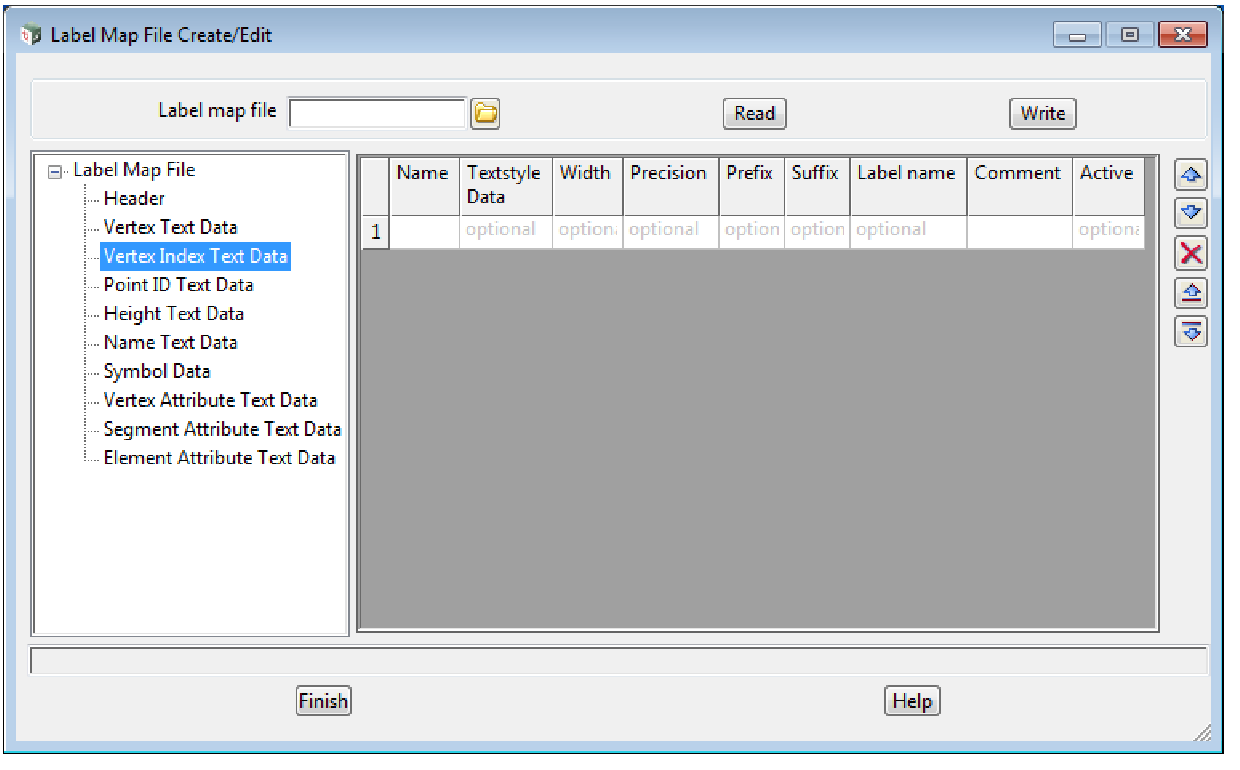
8.7.1.3 Vertex Index Text Data

Vertex Index Text Data labels the vertex index at each vertex.

The ***Vertex Index Text Data*** grid specifies ***which strings are selected*** and how a label containing the ***vertex index*** for each vertex of the selected strings is created.

For each selected string, a new super string is created with vertices at the same position as the vertices of the selected string, and with the labels created as vertex text at the appropriate vertices of the new super string.

Note: the vertex index is the position of the vertex in the string. For example if the vertex is the tenth vertex in the string, then the vertex index is 10.



Name **select name** menu for fields

for the selected strings, labels are created from the vertex index of each vertex. See Selecting Strings using Name:

For each selected string, a new super string is created with vertices at the same position as the vertices of the selected string, and with the labels created as vertex text at the appropriate vertices of the new super string.

Textstyle data **select textstyle data** menu for fields

textstyle data for labels. This controls the units, size, colour, border etc for the created text

Width

if non blank, the minimum number of characters allowed for the vertex index (including **Precision***) before applying the prefix and suffix.*

If the number of digits in the vertex index (including **Precision***) is less than* **Width** *characters, then additional spaces are added to the left of the text so that there are* **Width** *characters.*

If the number of digits in the vertex index (including **Precision***) is greater than* **Width***, then* **Width** *is ignored. Hence the vertex index value is not truncated.*

As an example, if **Width** *is set to 10 and the vertex index is 23 and* **Precision** *is 3, then the label is "   023". That is, an extra seven spaces is added to the left of the vertex index value.*

if blank, the vertex text is used with no modification.

Precision

if the number of digits in the vertex index is less than the absolute value of **Precision***, then left 0 padding is used to bring the number of digits in the text up to the absolute value of* **Precision***.*

As an example, if **Width** *is set to 10 and the vertex index is 23 and* **Precision** *is 3, then the label is " 023". That is, an extra seven spaces is added to the left of the vertex index value.*

Prefix/Suffix

prefix/suffix for the text

Label name

the created super strings are given this name

Comment and Active

prefix/suffix for the text

Label name

the created super strings are given this name

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

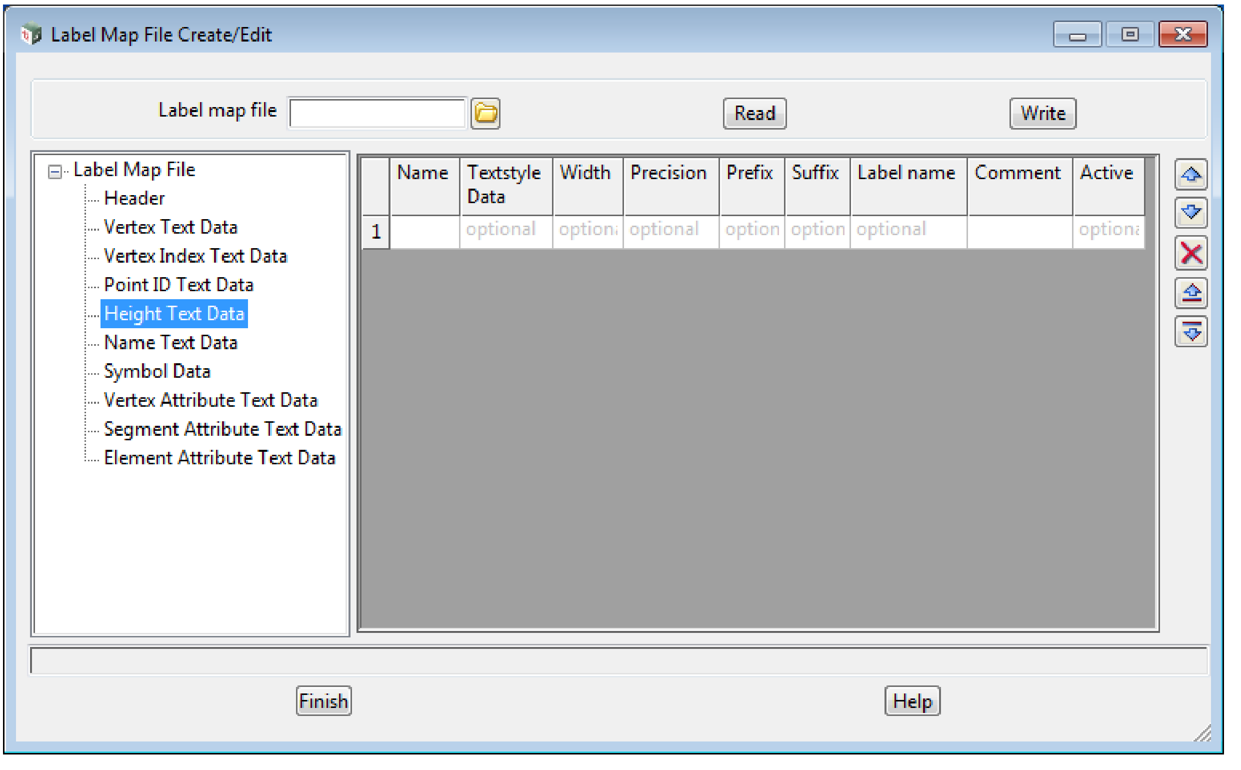
Go to the next section 8.7.1.5 Height Text Data or return to 8.7.1 Create/Edit Label Map File.

8.7.1.5 Height Text Data

Height Text Data labels the height at each vertex.

The ***Height Text Data*** grid specifies ***which strings are selected*** and how a label containing the ***height (z-value)*** for each vertex of the selected strings is created.

For each selected string, a new super string is created with vertices at the same position as the vertices of the selected string, and with the labels created as vertex text at the appropriate vertices of the new super string.



Name — **select name** menu for fields

for the selected strings, labels are created from the height (z-value) of each vertex. See Selecting Strings using Name:

For each selected string, a new super string is created with vertices at the same position as the vertices of the selected string, and with the labels created as vertex text at the appropriate vertices of the new super string.

Textstyle data — **select textstyle data** menu for fields

textstyle data for labels. This controls the units, size, colour, border etc for the created text

Width

if non blank, the minimum number of characters allowed for the z-value (including **Precision***) before applying the prefix and suffix.*

If the number of digits in the z-value (including **Precision***) is less than* **Width** *characters, then additional spaces are added to the left of the text so that there are* **Width** *characters.*

If the number of digits in the z-value (including **Precision***) is greater than* **Width***, then* **Width** *is ignored. Hence the z-value is not truncated (other than by* **Precision***).*

As an example, if **Width** *is set to 10 and the z-value is 23.2 and* **Precision** *is 3, then the label is " 23.200". That is, an extra four spaces is added to the left of the z-value.*

if blank, the z-value with **Precision** *is used with no further modification.*

Precision

if positive, the number of decimal places after the decimal point.

if negative, the absolute number is the number of decimal places to first calculate the text of the z-value for but then any trailing zeros after the decimal place are removed.

Important Note: *this use of positive and negative for not eliminating/eliminating trailing zeros after the decimal place is the opposite to plot parameters.*

Prefix/Suffix

prefix/suffix for the text

Label name

the created super strings are given this name

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

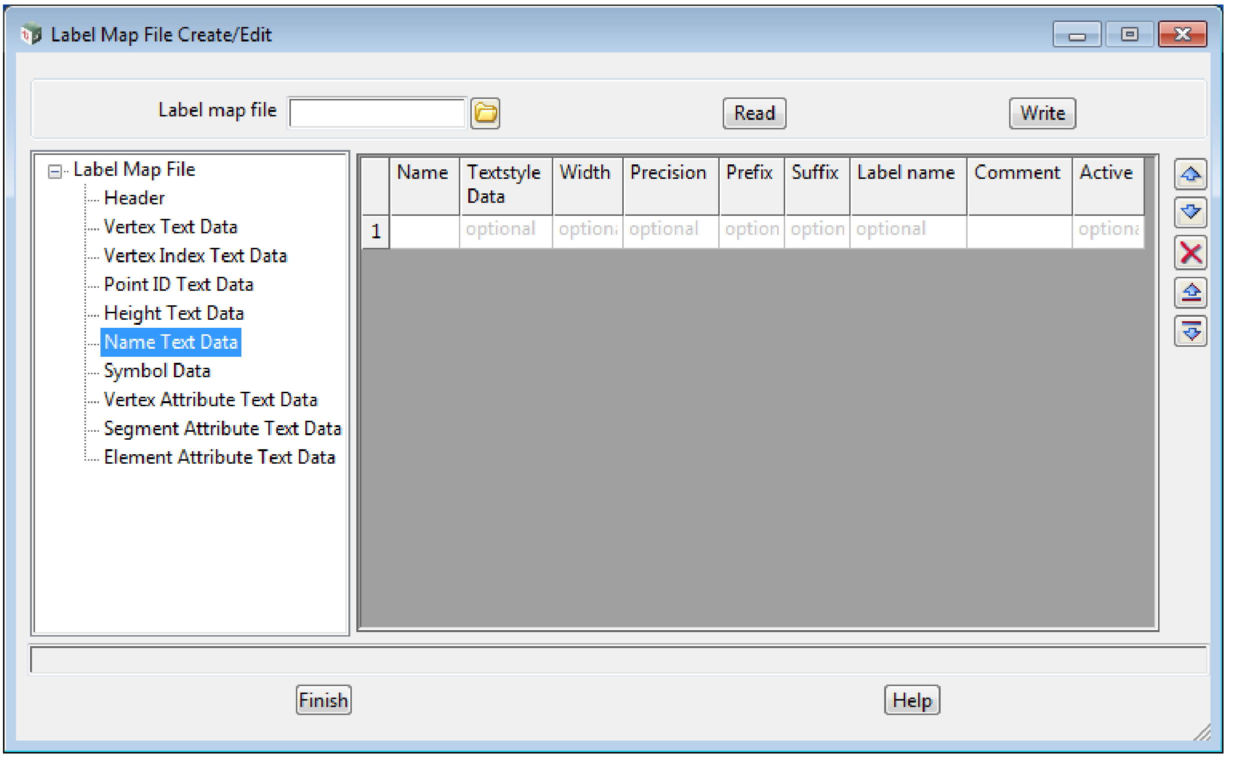
Go to the next section 8.7.1.6 Name Text Data or return to 8.7.1 Create/Edit Label Map File.

8.7.1.6 Name Text Data

Name Text Data labels the string name at each vertex.

The ***Name Text Data*** grid specifies ***which strings are selected*** and how a label containing the ***string name*** (often referred to as string ***Code*** by Surveyors) for each vertex of the selected strings is created.

For each selected string, a new super string is created with vertices at the same position as the vertices of the selected string, and with the labels created as vertex text at the appropriate vertices of the new super string.



Name **select name** menu for fields

for the selected strings, labels are created from the string name. See Selecting Strings using Name:

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

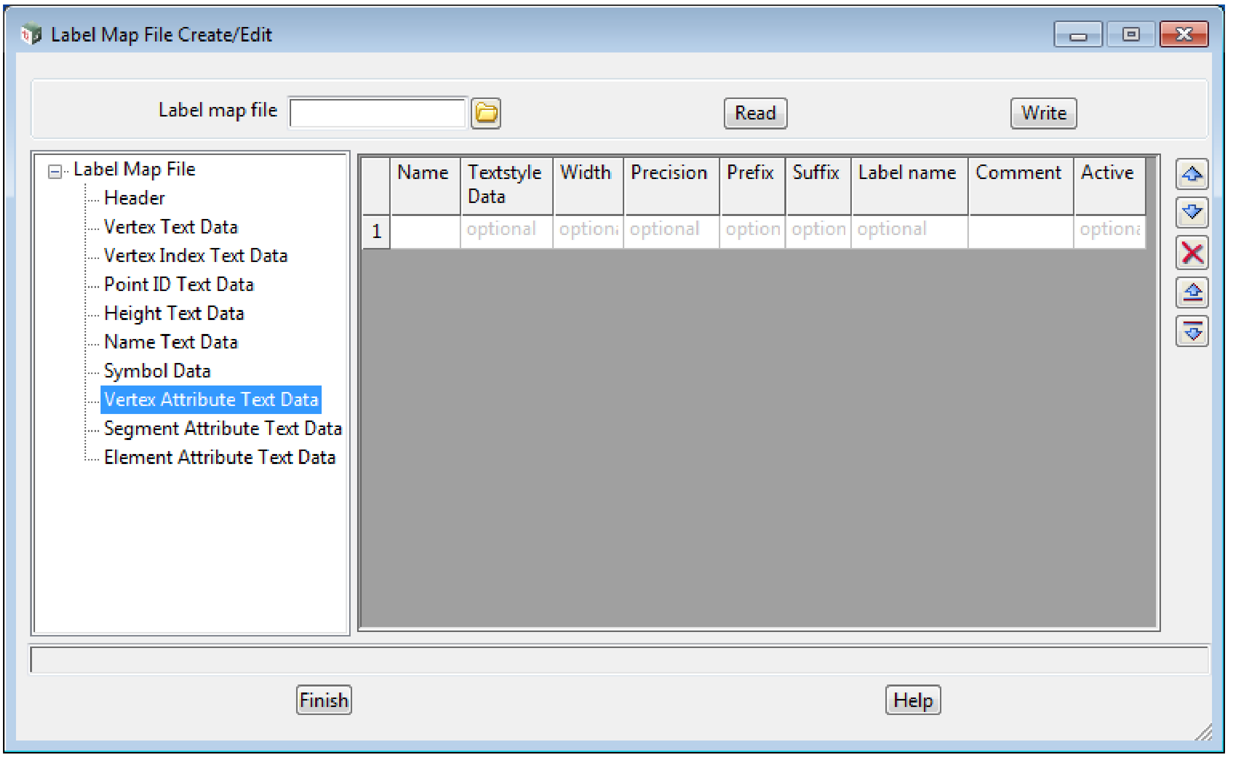
Go to the next section 8.7.1.8 Vertex Attribute Text Data or return to 8.7.1 Create/Edit Label Map File.

8.7.1.8 Vertex Attribute Text Data

Super strings can have attributes at ***each vertex*** of the super string. **Vertex Attribute Text Data** labels the ***value*** of vertex attributes at each vertex.

The ***Vertex Attribute Text Data*** grid specifies ***which strings** and **which vertex attributes are selected*** and how a label containing the ***value of the vertex attribute*** is created for each vertex of the selected strings.

For each selected string, a new super string is created with vertices at the same position as the selected vertices of the selected string, and with the labels created as vertex text at the appropriate vertices of the new super string.



Name **select name** menu for fields

*for the selected strings and the selected **vertex attributes** of those strings, a label is created from the **value** of the vertex attribute using the parameters in this line of the Label Map file. See* Selecting Strings and Attributes Using Name:.

For each selected string, a new super string is created with vertices at the same position as the selected vertices of the selected string, and with the labels created as vertex text at the appropriate vertices of the new super string.

Selecting Strings and Attributes Using Name:

The text in the **Name** *column is made up of the name of the string to be selected, followed by / and then the path name of the attribute (see* Attribute Pathname*) to be selected.* **Name** *can include wild cards* *** *and wild characters* **?** *to allow matching on multiple strings and/or multiple attributes.*

For each string, the string name and attribute path is compared to the text in the **Name** *column for this line and if there is a match then the label from the selected attribute is created using the parameters in this line of the Label Map file.*

For example

Drain/Adac/Pit/*   would search any string with the name starting with "Drain" and gets matches for any third level attribute in the second level attribute group "Adac/Pit".*

***Note** that it is the **name** of the attribute used for **selection** but it is the **values** of the selected attribute that are used in the **labels**.*

If a match occurs for a line, then this line of the Label Map file grid is used and no other lines are tested against.

If no match occurs, then this line of the Label Map file grid is ignored and a test for a match is made against the next line of the grid.

Hence the order of the text in the **Name** *column in the grid is important, especially when wild cards and wild characters are used.*

Textstyle data **select textstyle data** menu for fields

textstyle data for labels. This controls the units, size, colour, border etc for the created text

Width

*If the attribute is type **text**:*

if non blank, the minimum number of characters that is allowed for the attribute text before applying the prefix and suffix.

If the number of characters in the attribute text is less than **Width** *characters, then additional spaces are added to the left of the attribute text so that there are* **Width** *characters.*

If the number of characters in the attribute text is greater than **Width***, then* **Width** *is ignored. Hence the attribute text is not truncated.*

For example if **Width** *is set to 20 and the attribute text has only ten characters, then an extra 10 spaces are added to the left of the attribute text before applying the Prefix/Suffix.*

if blank, the attribute text is used with no space padding.

*If the attribute is type **real**:*

if non blank, the minimum number of characters allowed for the attribute real value (including **Precision***) before applying the prefix and suffix.*

If the number of digits in the attribute real value (including **Precision***) is less than* **Width** *characters, then additional spaces are added to the left of the text so that there are* **Width** *characters.*

If the number of digits in the attribute real value (including **Precision***) is greater than* **Width***, then* **Width** *is ignored. Hence the attribute real value is not truncated (other than by* **Precision***).*

As an example, if **Width** *is set to 10 and the attribute real value is 23.2 and* **Precision** *is 3, then the label is "   23.200". That is, an extra four spaces is added to the left of the vertex index value.*

if blank, the attribute real value with **Precision** *is used with no further modification.*

*If the attribute is type **integer**:*

if non blank, the minimum number of characters allowed for the attribute integer value (including **Precision***) before applying the prefix and suffix.*

If the number of digits in the attribute integer value (including **Precision***) is less than* **Width** *characters, then additional spaces are added to the left of the text so that there are* **Width** *characters.*

If the number of digits in the attribute integer value (including **Precision***) is greater than* **Width***, then* **Width** *is ignored. Hence the attribute integer value is not truncated.*

As an example, if **Width** *is set to 10 and the attribute integer value is 23 and* **Precision** *is 3, then the label is "   023". That is, an extra seven spaces is added to the left of the attribute integer value.*

if blank, the attribute integer value text is used with no modification.

Precision

*If the attribute is type **text** then not applicable.*

*If the attribute is type **real**:*

if positive, the number of decimal places after the decimal point.

if negative, the absolute number is the number of decimal places to first calculate the text of the attribute real value for but then any trailing zeros after the decimal place are removed.

***Important Note:** this use of positive and negative for not eliminating/eliminating trailing zeros* *after the decimal place is the opposite to plot parameters.*

*If the attribute is type **integer**:*

if the number of digits in the attribute integer value is less than the absolute value of **Precision**, *then left 0 padding is used to bring the number of digits in the text up to the absolute value of* **Precision**.

As an example, if **Width** *is set to 10 and the attribute integer value is 23 and* **Precision** *is 3, then the label is "   023". That is, an extra seven spaces is added to the left of the attribute integer value.*

See 8.8.2 Comment and Active Column in Grids.

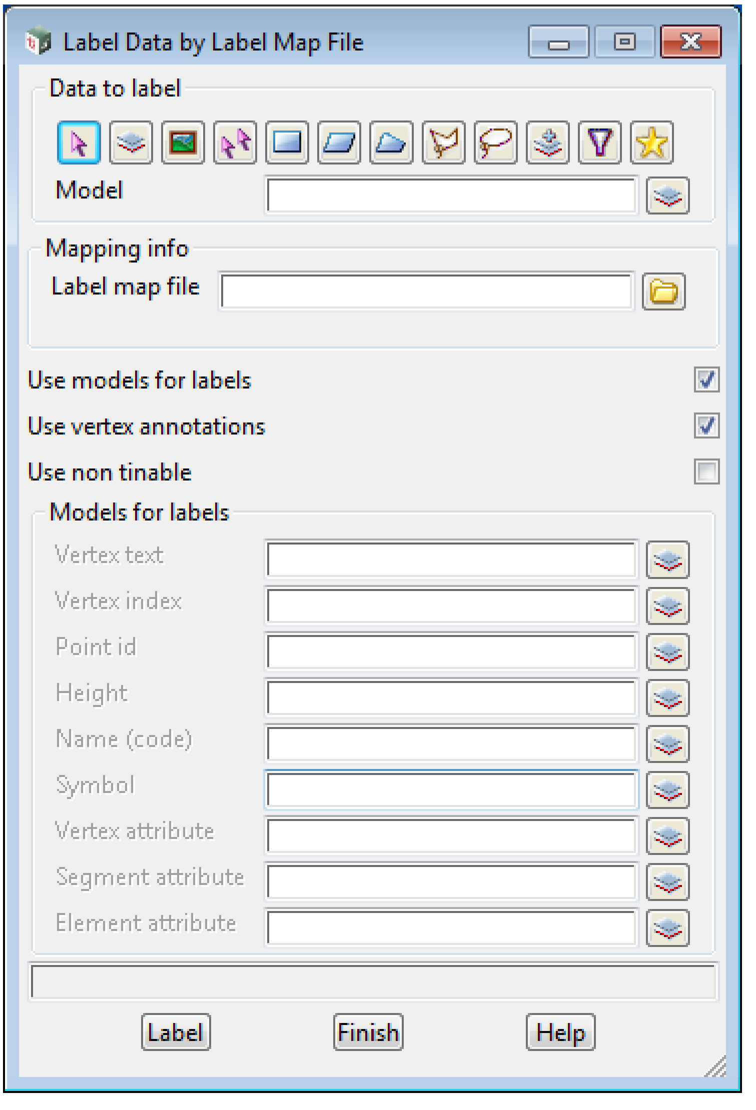
Go to the next section 8.7.2 Apply a Label Map File or return to 8.7.1 Create/Edit Label Map File.

8.7.2 Apply a Label Map File

Position of option on menu: **File I/O =>Label Map files =>Apply**

Use a *Label Map File* to create text labels for all strings in the selected data source and that match the criteria in the sections of the *Label Map File*.

Selecting **Apply** brings up the **Label Data by Label Map File** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data is to be selected and processed by the Label Map File.

Label map file	input		*.lmf

name of the Label Map File to process the selected data.

Use models for labels	tick box	tick	

*if **ticked**, the **Models for labels** section is displayed and labels are only created for the type of data that has a non blank model name in the "Model for labels" area. The created labels go into that model.*

*If **ticked**, then the* **Vertex text** *field is the model for the text.*

*If **not ticked**, then the model for the created text is the original data source model name with the text in the* **Vertex text** *field used as pre*post text for the model name.*

For example, Vertex text labels will only be created if the **Vertex text** *field is not blank.*

*If **not ticked**, the **Pre*Post for models** section is displayed and labels are only created for the type of data that has a non blank Pre*post field. When it is non blank the created text goes into a model of the same name as the original data source, but with a prefix/-postfix given by the pre*post field.*

Use vertex annotations tick box tick

Vertex text, Vertex index, Point id, Height, Name (code), Symbol, Vertex attribute, Segment attribute, Element attribute

*If **Use models for labels** is **ticked**, the above panel fields are models for the created data.*
*If **Use models for labels** is **not ticked**, the above panel fields are used as **Pre*Post** text in conjunction with the original data source model name to create model names.*

If the fields are blank, then no text is created by the Label Map File for that type of text.

Label button

process the selected strings and label them.

8.7.3 Convert .lmf Files to .label_mapfile

Position of option on menu: **File I/O =>Label Map files =>Convert .lmf to .label_mapfile**

The **Label map file convert** option converts a label map file in the pre-V9 format to the XML label map file format introduced in ***12d Model 10***.

Selecting **Convert .lmf to .label_mapfile** displays the **Label Map File Convert .lmf to .label_mapfile** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File to convert from	file box		*.lmf

name of the pre-V10 label map file to be converted to the new label map file format

File to convert to	file box		*.label_mapfile

name of the new converted label map file

Convert	button		

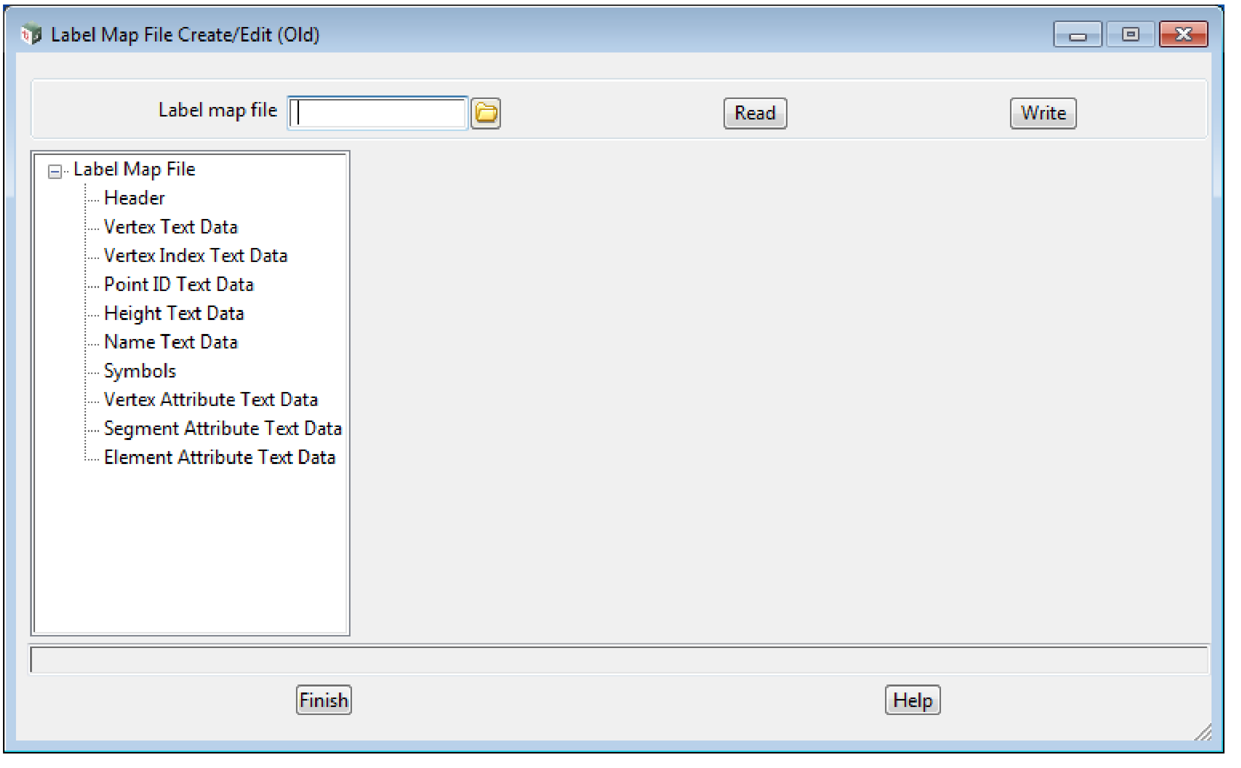
convert a file in the pre-V10 label map file format to the new label map file format.

8.7.4 Create/Edit Pre-V10 Label Map File

Position of option on menu: **File I/O =>Label Map files =>Create/edit .lmf**

This option is for editing the superseded label map file format and should not be used.

Please use the new Label Map File format Created/edit option (8.7.1 Create/Edit Label Map File).



8.8 Map Files

Position of menu: **File I/O =>Map files**

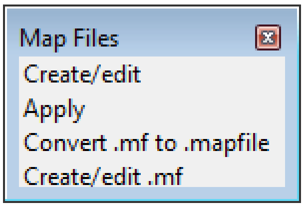
The main options under **Map files** is **Create/edit** which creates and edits ***12d Map Files*** which are used in many ***12d Model*** panels

The Map File format uses is the *.mapfile* format (an XML format) introduced in ***12d Model 10.***

There is also an option to convert the older format, .mf, to the XML .mapfile.

Note: if the ***Create/edit*** option is used on an old format file, it is automatically converted to the new format.

The **Map files** walk-right menu is



create/edit a Map File
apply a Map File
convert pre-V9 Map File format to XML format Map Files
create/edit a pre-V9 Map File

For *Create/edit*, go to 8.8.1 Create/Edit a Map File
Apply 8.8.5 Apply Map File
Convert .mf to .mapfile 8.8.6 Convert .mf Files to .mapfile
Create/edit .mf 8.8.7 Create/Edit .mf File

8.8.1 Create/Edit a Map File

Position of option on menu: **File I/O =>Map files =>Map File**

The **Map file** option is used to **create** or **edit** ***12d Map Files*** which are used in many 12d Model options for reading in data, reducing surveys, mapping existing data *etc*.

A *12d Map file* consists of sections of tables or grids of keys or entity-masks which are used to select specific data to set many string properties such as string name, colours, linestyles, symbols, models, extrusions and tinability for the strings that are being created and/or modified by the ***12d Model*** option.

For example, the 8.1.5.1 X Y Z S Input options reads in an XYS file and creates strings of (x,y,z) data with string names for the lines strings. A ***12d Map File*** can be used in option to give the strings other properties such as colour, linestyle, colour fills, pipe diameters *etc*.

The Map File consists of sections such as Basic, Fills and Pipes, which are displayed as a tree. The strings are processed by each section of the tree, going in order from the top to the bottom of the Map File tree.

Each section of the Map File uses matching of specific string information against a **Key** to select strings and/or vertices and/or segments for processing by that section of the Map File.

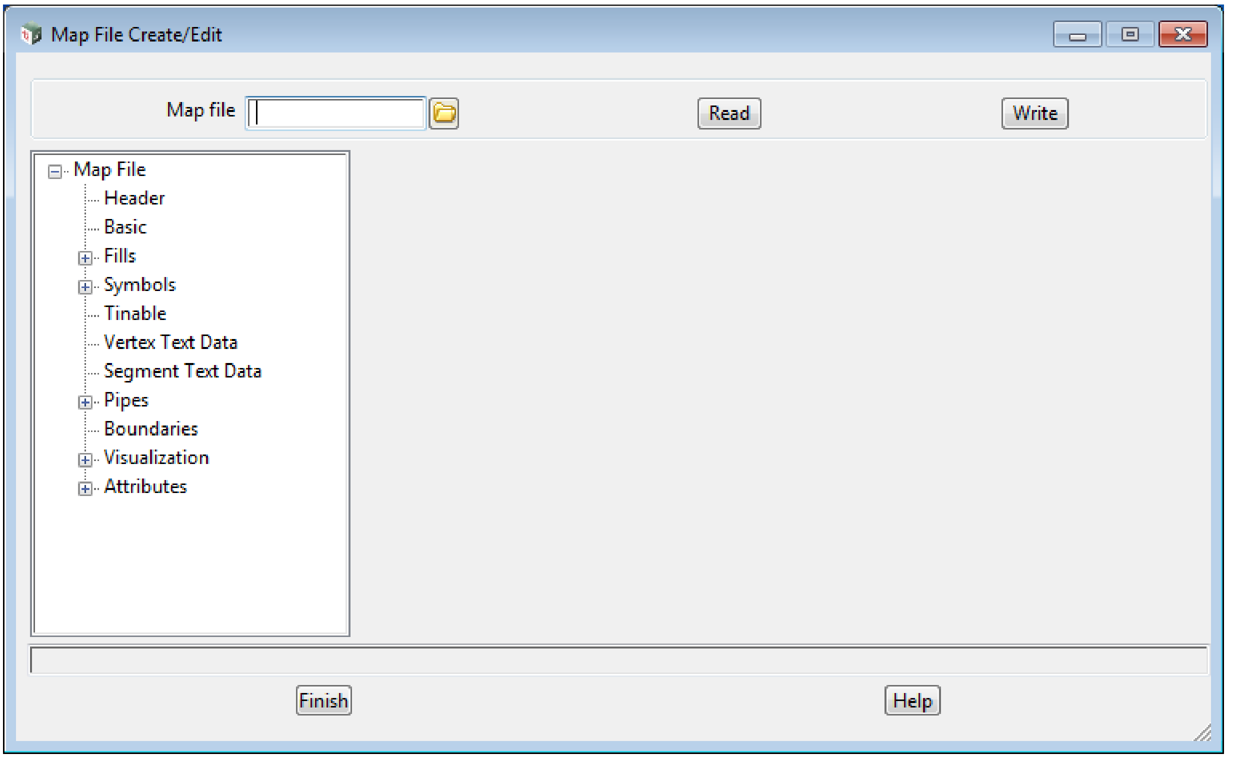
The **Basic** section is the first section used and takes the data that had been created by the option and uses the Entity Name and string attributes created by the option to set string properties such as string name, colour, point-line type, linestyle, weight and model. What the Entity Name actually is depends on the particular option that the Map File is being used in.

For example, the Survey Data Reduction option uses the ***field code*** as the entity-name, the xyzs reader uses the ***string name*** in the xyzs file as the entity-name but in the DWG reader, no entity name exists and the ***AutoCAD layer*** can be used as the entity-name. For the DGN reader, a combination of Level, Colour, Linestyle and Weight can be the entity name.

After the **Basic** section is applied, the string has a definite string name that is used as part of the matching key in all the other sections of the Map File.

In the other sections of the Map File, the ***Key*** is a combination of string names, and/or string attribute values **Att key**, and/or vertex attribute values **Vertex Att key** and/or segment attribute values **Segment Att key**

Selecting **Map file** brings up the **Map File Create/Edit** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Map file	input		*.mapfile, *.mf

name of the map file to be created or edited.

If it is a .mf file, it is automatically converted to the new xml format and written out as a .mapfile.

Read button

read in the map file given in the **map file** *field and load the data into the fields of the table. If the file doesn't exist, an error message is given.*

Write button

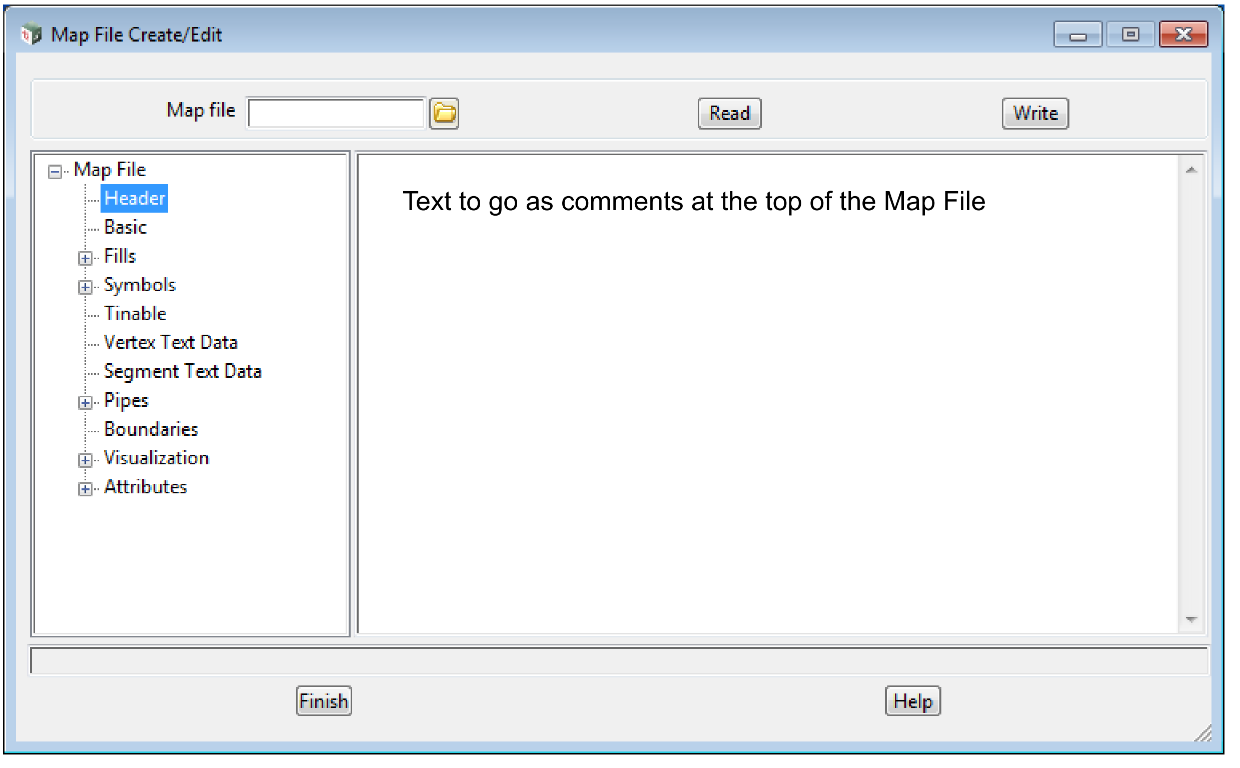
write out the data in the table to the file name given in the **Map file** *field. If the file already exists, a replace-cancel panel checks to see if the existing file is to be over written - if cancel is selected, nothing is written out.*

For more information on *Header*, go to 8.8.1.1 Header
Basic 8.8.1.2 Basic
Fills 8.8.1.3 Fills
Symbols 8.8.1.4 Symbols
Tinable 8.8.1.5 Tinable
Vertex Text Data 8.8.1.6 Vertex Text Data
Segment Text Data 8.8.1.7 Segment Text Data
Pipes 8.8.1.8 Pipes
Boundaries 8.8.1.9 Boundaries
Visualization 8.8.1.10 Visualization
Attributes 8.8.1.11 Attributes

8.8.1.1 Header

Header just has lines of comment text. A common use is to document which client the file is to be used for, or the revision history.

The text written in the right hand side of the panel is written out as comments at the top of the Map file.

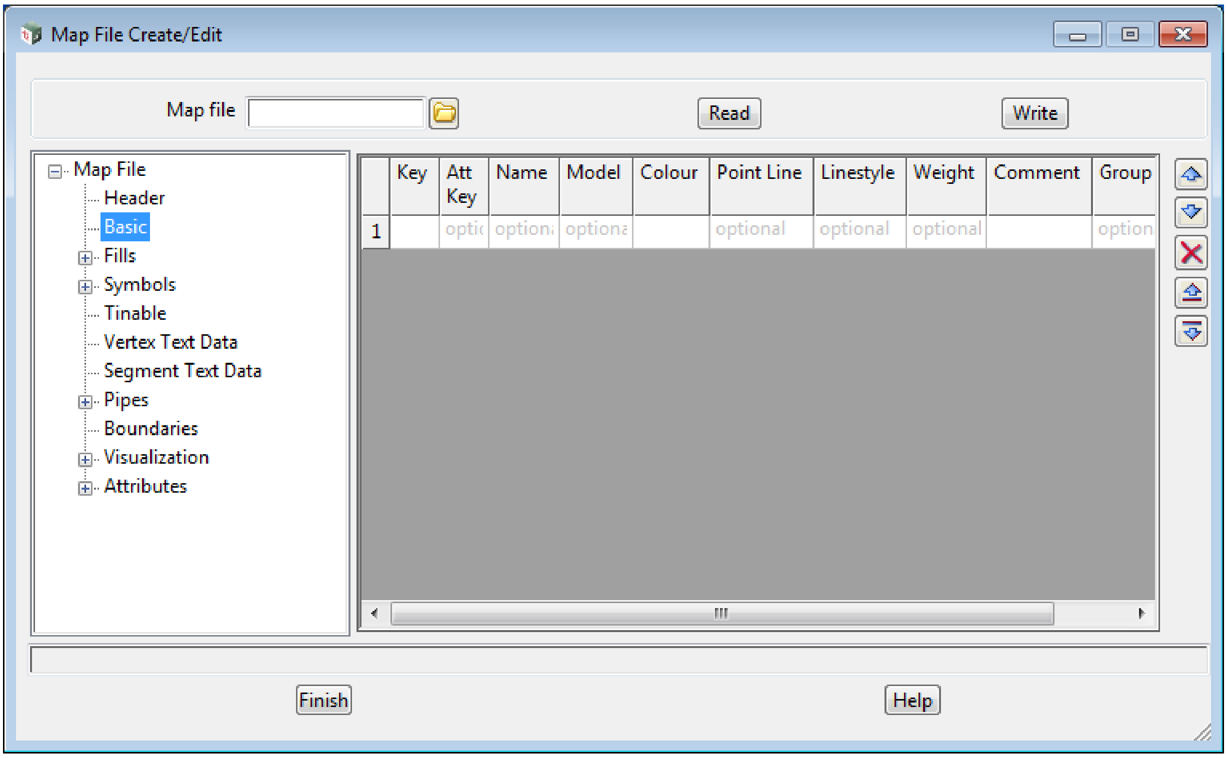


Go to the next section 8.8.1.2 Basic or return to 8.8.1 Create/Edit a Map File.

8.8.1.2 Basic

The **Basic** grid selects data using the **Key** and **Att Key** and sets the name, model, colour, linestyle, point-line type, and weight for the created strings.

Note: the **final string name** is the **Name** set by the ***Basic*** grid, or if none is set in the *Basic* grid, then it is the **Entity Name**.



Field Description Type Defaults Pop-Up

Processing Using Key and Att Key for Basic Node

when an Entity finds a first match with **Key** *and* **Att Key** *in the grid (see* Matching Using Key and Att Key:*), the created string is given the properties as defined in the parameters of the matching line.*

Key and Att Key **select colour pop-up**

Key *is a Text grid cell and the text entered into* **Key** *can include wild cards* *** *and wild characters* ***?***.
The ***Entity Name*** *is matched against* **Key**.
Att Key *is an Attribute Data grid cell which contains the definition of the attributes and their values that are to be matched against. There can be more than one attribute in the Attribute Data but they must have unique names.*
The ***Entity Attributes*** *are matched against the attribute details in* **Att Key.**
To access ***Att Key****, click LB on the* ***Att Key*** *field to highlight the field, then click LB again to bring up the* **Attribute Data** *panel. To enter data see* Attribute Data Panel.

Matching Using Key and Att Key:

The Entity being mapped needs an Entity Name (which may be blank) and can also have Entity Attributes. The Entity may even have some other properties such as colour, linestyle etc.
Starting with the first line of the grid, matching and processing occurs as follows
If **Key** *and* **Att Key** *are not blank, and a match of the Entity Name occurs with* **Key** *and a match of the Entity Attributes occurs with* **Att Key**, *then the rest of the fields for this line of the Map File grid are used on the created string.*
If **Key** *in not blank and* **Att Key** *is blank, and a match of the Entity Name occurs with* **Key**, *then the rest of the fields for this line of the Map File grid are used on the created string.*

If **Key** *in blank then no match occurs and this line of the Map File grid is ignored.*

If a ***match occurs****, then no tests for matches against* **Key** *and* **Att Key** *further down in the grid are made.*

If ***no match occurs****, then this line of the map file grid is ignored and a test for a match is made against the next line of the grid.*

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See 8.8.3 Map File Substitution by Attributes.

Name **select name pop-up**

if non-blank, the created string is given this **Name**.
if blank, the original Entity Name (which matched against **key***) is used as the string name.*

Important Note*: the resulting string name is used for matching in all the subsequent Map File nodes (e.g. Fills, Symbols, Pipes, Visualisation etc).*

Model **select model pop-up**

if non-blank, the model to be used for all strings produced by this line of the map file grid.
if blank, the string's model is not modified. Note: some options may allow **Model** *to be ignored.*

Colour **select colour pop-up**

if non-blank, the colour to be used for all strings produced by this line of the map file grid.
if blank, the string's colour is not modified.

Point Line **select choice point, line**

if non-blank, the breakline type to be used for all strings produced by this line of the map file grid.
if blank, the string's point-line type is not modified. If data is coming from a field file, then the data may be coded as a line or point string.

Linestyle **select linestyles pop-up**

if non-blank, the linestyle to be used for all strings produced by this line of the map file grid.
if blank, the string's linestyle is not modified.

NOTE: *If the point-line type is point then the linestyle is used as a symbol at each vertex of the string. The size of the symbol at each point is given in the linesytle definition. If a symbol at each point is required whose size, colour and rotation may need to be modified at each point, then the* ***Symbol*** *section must be used to place a symbol at each vertex and a world style must be used in the symbol name field in the* ***Symbol*** *tab. See* 8.8.1.4 Symbols.

Weight

if non-blank, the weight to be used for all strings produced by this line of the map file grid.
if blank, the string's weight is not modified.

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

Group

the optional **Group** *column is not used in the* ***Map File*** *but is used in the* ***Names.4d*** *file which has the same XML structure.*

If you ***don't*** *want the* ***Group Column*** *to be used in any grid then you have to set the environment variable* ***USE_TREE_NAME_BOX_4D*** *to* ***0****. By default is has the value* ***1****.*

IMPORTANT NOTE:

Regardless of the group/subgroup structure, the search order for **finding a match** with the key in the ***Basic*** node of the ***Map File*** is still the order that the rows occur in the ***Basic*** grid.

Currently the Group Column will only be visible if you have the environment variable **USE_TREE_NAME_BOX_4D** set to **1**.

To assist is debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Go to the next section 8.8.1.3 Fills or return to 8.8.1 Create/Edit a Map File.

8.8.1.3 Fills

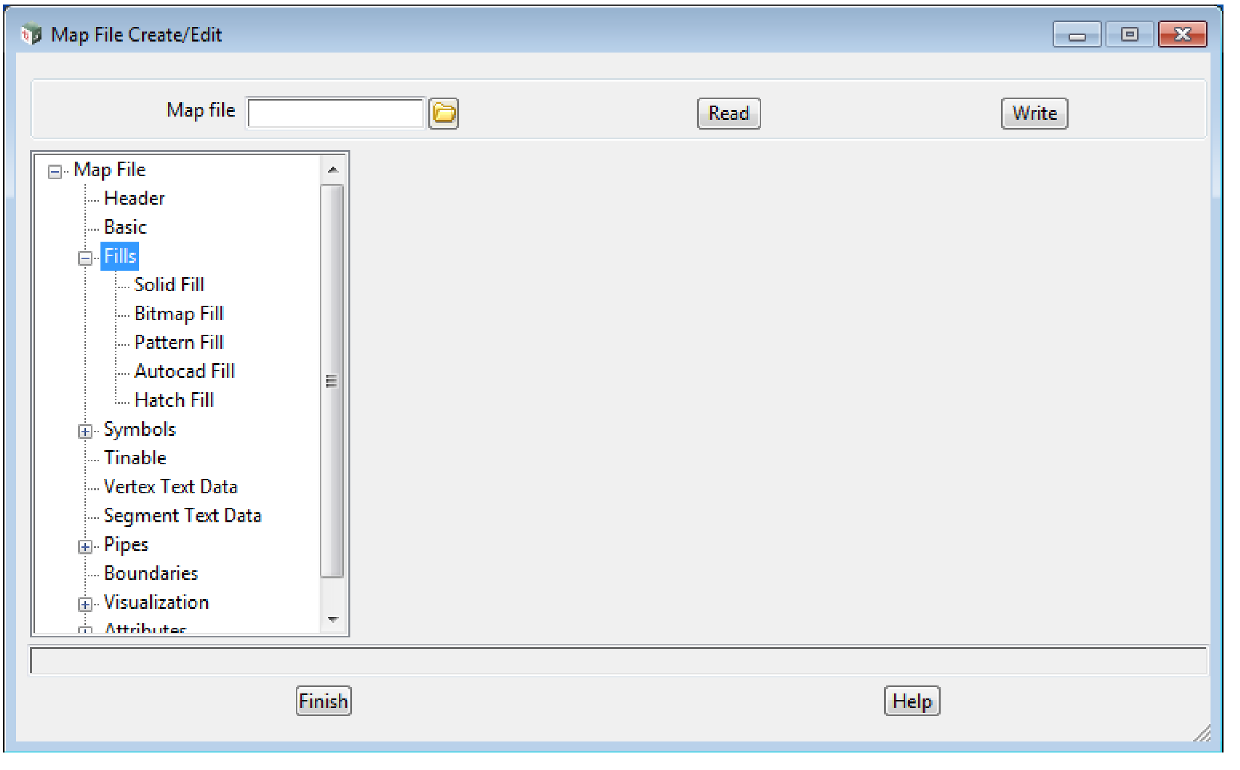
Fills creates fills for the selected super strings (closed and non-closed).

Super strings can support more than one fill type per string. For example, a super string can have a solid fill, and an I Acad fill at the same time.

The order of drawing the fill types is: solid, bitmap, pattern, hatch, acad.

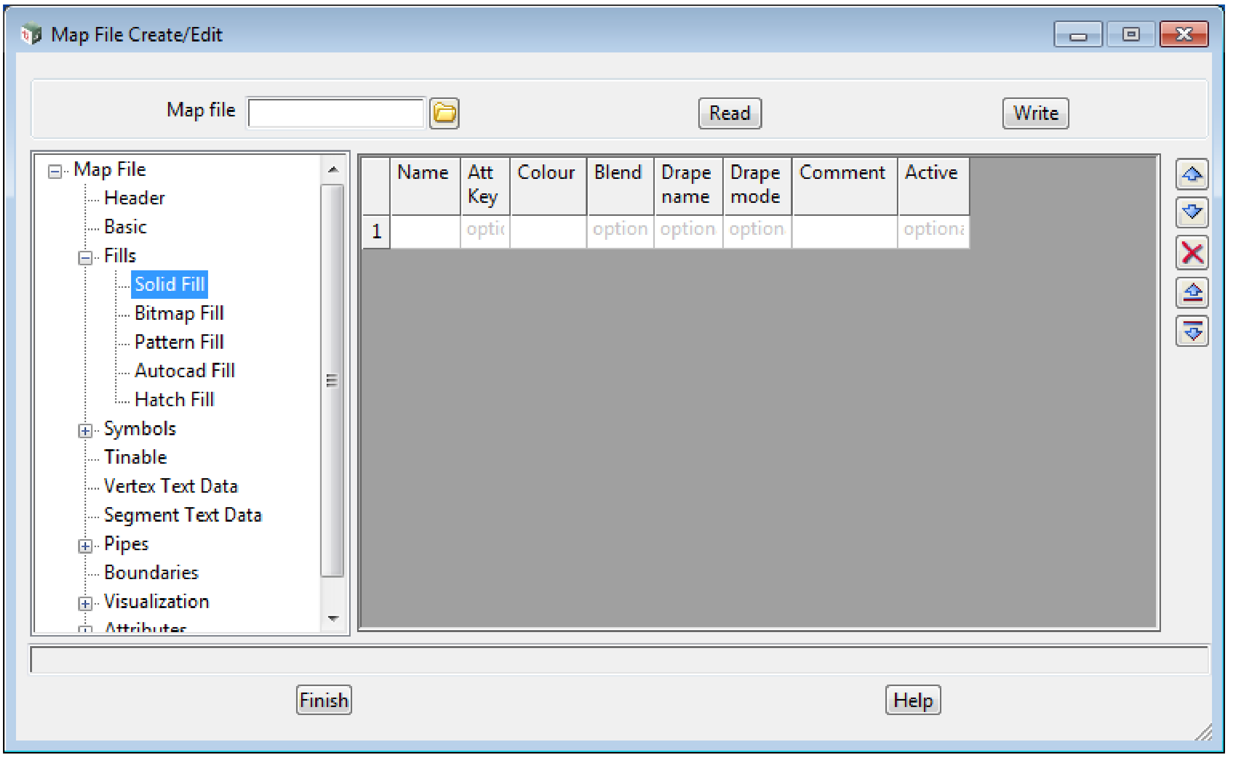
For more information on *Solid Fill*, go to 8.8.1.3.1 Fills >Solid Fill
Bitmap Fill 8.8.1.3.2 Fills >Bitmap Fill
Pattern Fill 8.8.1.3.3 Fills >Pattern Fill
Autocad Fill 8.8.1.3.4 Fills >Autocad Fill
Hatch Fill 8.8.1.3.5 Fills >Hatch Fill
Multiple Fills 8.8.1.3.6 Multiple Fills

Note: there are settings for Plan Views that determines how fills are drawn on plan views (see 9.1.1.4 Face Flags for View).



8.8.1.3.1 Fills >Solid Fill

Solid Fill sets whether super strings (closed and non-closed) are filled with a "solid" colour, and optionally with some level of blending (transparency).



Field Description Type Defaults Pop-Up

Processing Using Name and Att Key for Fills>Solid Fill Node

when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* Matching Using Name and Att Key:*), the string is given a Solid Fill as defined in the parameters of the matching line.*

Name and Att Key

Name *is at Text grid and the text entered into* **Name** *can include wild cards* * *and wild characters* ?*.*
The string name is matched against **Name**.
Att Key *is an Attribute Data grid cell which contains the definition of the attributes and their values that are to be matched against. There can be more than one attribute in the Attribute Data but they must have unique names.*
The ***string*** *attributes are matched against the attribute details in* **Att Key.**
To access ***Att Key*** *data, click LB on the* ***Att Key*** *field to highlight the field, then click LB again to bring up the* **Attribute Data** *panel. To enter data, see* Attribute Data Panel.

Matching Using Name and Att Key:

Strings are first created via the ***Basic*** *node and given a string name of either the Entity Name or the text given in the Name column of the Basic Map File grid.*
Starting with the first line of the grid, matching and processing occurs as follows
If **Name** *and* **Att Key** *are not blank, and a match of the string name occurs with* **Name** *and a match of the string attributes occurs with* **Att Key***, then the rest of the fields for this line of the Map File grid are used on the string.*
If **Name** *in not blank and* **Att Key** *is blank, and a match of the string name occurs with* **Name***, then the rest of the fields for this line of the Map File grid are used on the string.*
If **Name** *in blank then no match occurs and this line of the Map File grid is ignored.*
If a ***match occurs****, then no tests for matches against* **Name** *and* **Att Key** *further down in the grid are*

made.

*If **no match occurs**, then this line of the map file grid is ignored and a test for a match is made against the next line of the grid.*

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See 8.8.3 Map File Substitution by Attributes.

Colour **select colour pop-up**

colour to use to fill the super string with. If the super string is not closed, the fill will apply as if the super string was closed.

This field can not be blank.

Blend measures box **At Point, Point to Point, String from Point, String to Point)**

*if **not blank**, the blend value to use for the solid fill.This value is between 0.0 and 1.0 and controls the amount of transparency of the fill.*

*if **blank** the blend value of 1.0 is assumed.*

TODO: measures box makes no sense....

Drape name

*if **not blank**, the string is given this as a Drape name. That is, a name that is used to specify which strings are draped as the solid filled super string onto a tin.*

*This allows the plan shape of a polygon to be drawn on top of a tin. A good example would be a polygon defining the shape of a "left turn arrow" which the user wants drawn on top of the road design tin. If the user adds the road design tin (and the tin has a **Plan polygon drape name** set to the* **Drape name** *set here), then the model containing the polygon onto an OpenGL perspective view, the "left turn arrow" will be drawn after the tin and draped onto the tin.*

*If **blank**, no drape name is given to the string.*

To access the render settings panel use **View=>Visualisation=>Tin Render Settings** *(see* 12.13.1 Tin Render Settings*). To see the effect of the drape requires the visualisation module.*

Drape mode choice box Colour, Colour to texture

*if **Drape name** is blank this field is not used.*

if non blank, and the value is

Colour, *the solid fill colour of the super string is used to draw onto the surface of the tin.*

Colour to texture, *the value of the solid fill colour is mapped via the **Texture mapping** field of the* **Tin Render Settings** *panel and a texture drawn inside the polygon draped onto the tin.*

***Drape mode** cannot be blank if **Drape name** is present.*

To access the render settings panel use **View=>Visualisation=>Tin Render Settings** *(see* 12.13.1 Tin Render Settings*). To see the effect of the drape requires the visualisation module.*

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

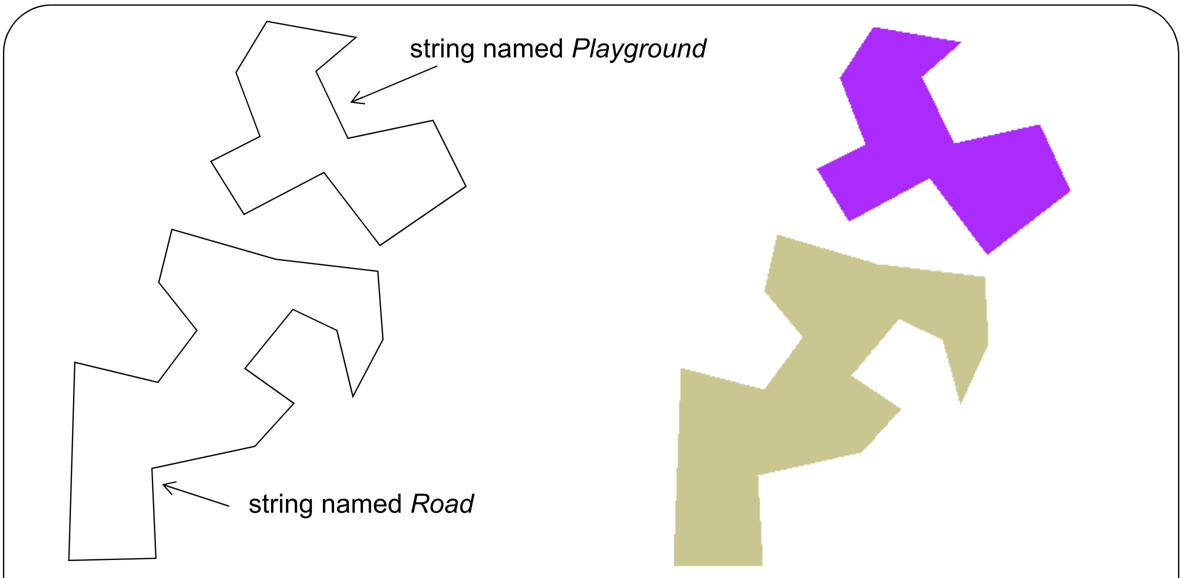
To assist is debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Example of Solid Fill

Applying the following **Solid Fill** entries to polygons called *Road* and *Playground*:

	Name	Att Key	Colour	Blend	Drape name	Drape mode	Comment
1	Road*		concrete1	1	drape	Colour to texture	
2	Playground		purple	1	drape	Colour	

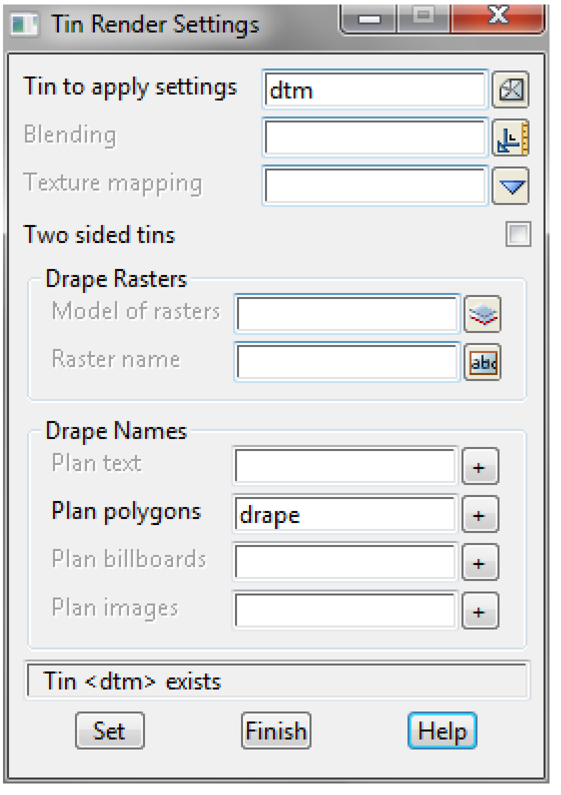
produces the solid filled polygons



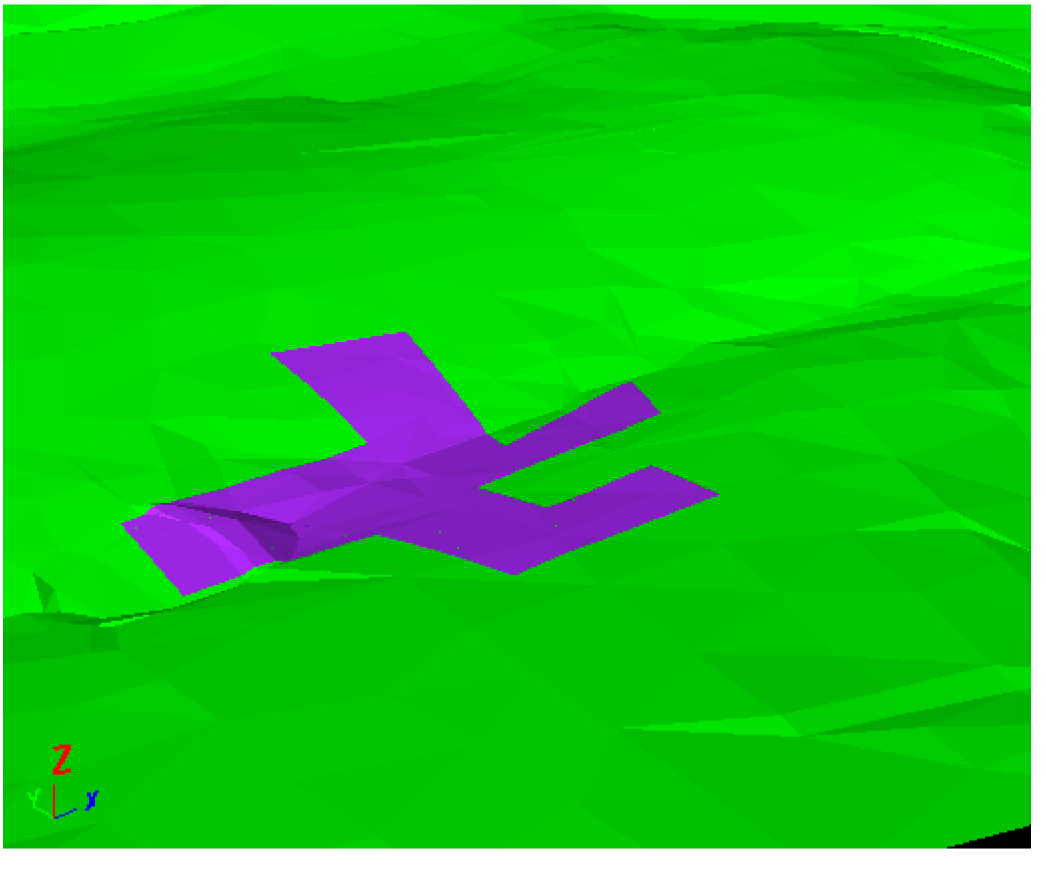
Polygons Before Applying Map File

Polygons After Applying Map File

If the above solid fill details have been applied to a closed super string, and using the **Tin Render Settings** panel to set **Plan polygon** field to "drape" for the tin called "dtm"



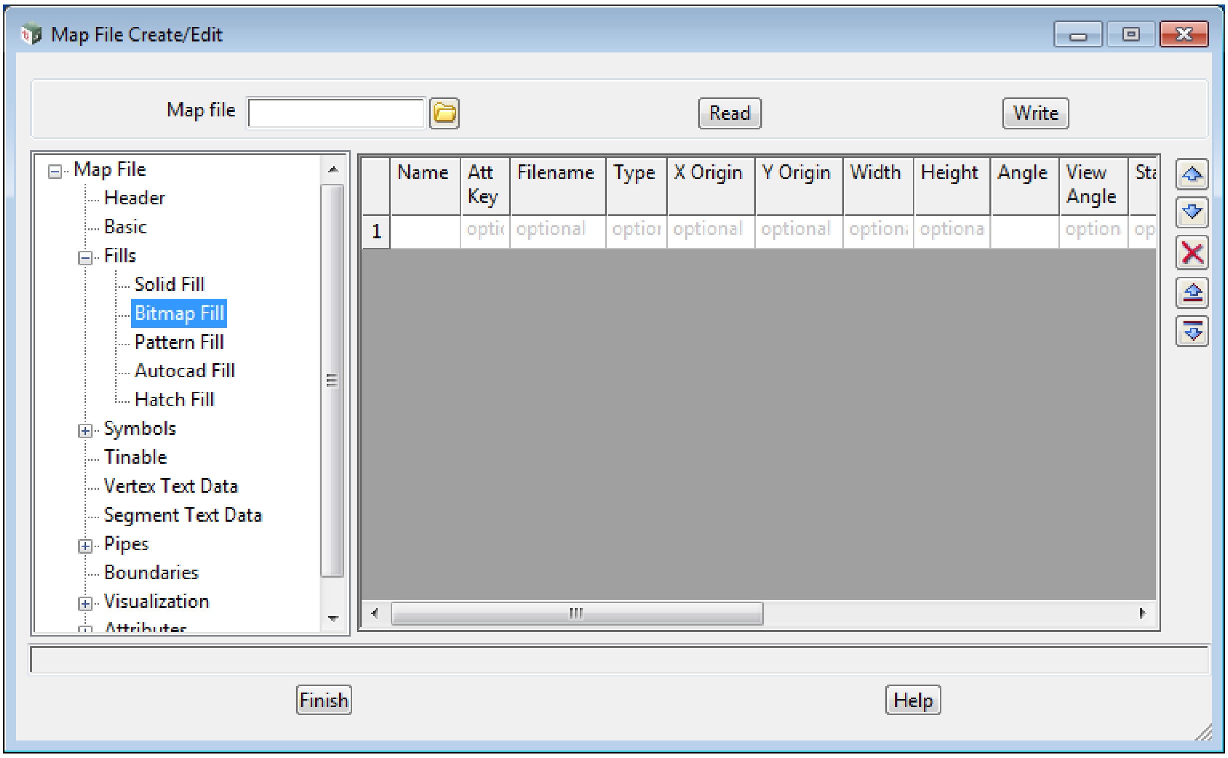
the result will be



Go to the next section 8.8.1.3.2 Fills >Bitmap Fill or return to 8.8.1.3 Fills or 8.8.1 Create/Edit a Map File.

8.8.1.3.2 Fills >Bitmap Fill

Bitmap Fill sets whether super strings (closed and non-closed) are filled with a bitmap pattern.



Processing Using Name and Att Key for Fills>Bitmap Fill Node

when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* Matching Using Name and Att Key:*), the string is given a Bitmap Fill as defined in the parameters of the matching line.*

Name and Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key***, and how to access* **Att Key***, see* Name and Att Key.

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See 8.8.3 Map File Substitution by Attributes.

Filename file .*bmp

The bitmap file to be used for filling. Only BMP files are currently supported.

Type choice box **paper, world, device, screen (device), pixels (device)**

The units of size.This means the bitmap can be drawn with either world size, paper size (mm) or device size.

X/Y Origin measures box **At Point, Point to Point, String= from Point, String to Point)**

The x/y co-ordinate of the origin point of the repeated pattern.

Width/Height measures box **At Point, Point to Point, String= from Point, String to Point)**

The width/height of the bitmap in the selected units.

Angle measures box **At Point, Point to Point, String= from Point, String to Point)**

The orientation of the bitmap pattern relative to the x axis measured in the anti-clockwise direction. The units are dms (degrees minutes and seconds) and typed in using 4.17.1 HP Notation.

View Angle choice box yes, no

if not blank, this field controls whether **Angle** *is relative to the x axis or to the plotting x axis.*

If **yes** *and we are plotting,* **Angle** *is measured relative to the x axis of the plot rotation.*

If **no**, **Angle** *is measured absolute to the world x axis*

If blank, **Angle** *is measured absolute to the world x axis.*

Stagger measures box **At Point, Point to Point, String= from Point, String to Point)**

if not blank, this field allows each alternate row of bitmaps to be staggered (offset) by the specified value. **Stagger** *is measured in the selected units along the x axis in the rotated system.*

If blank, a **Stagger** *of 0.0 is assumed.*

Space X/Y measures box **At Point, Point to Point, String= from Point, String to Point)**

The distance in the selected units along the x/y axis in the rotated system between each instance of the bitmap.

Transparent **select colour pop-up**

The transparency colour within the bitmap.This means any pixel of this colour within the bitmap is not drawn.

Solid Colour **select colour pop-up**

if not blank, when the bitmaps become too small to be legible, instead of drawing the bitmaps, the super string is solid filled with colour ***Solid colour***.

Solid Blend measures box **At Point, Point to Point, String= from Point, String to Point)**

if not blank, and **Solid Colour** *is specified, the solid fill is drawn with blend value* **Solid Blend**. *The blend value is between 0.0 and 1.0.*

If blank, **Solid Blend** *is assumed to be 1.0.*

Drape Name

reserved for future use

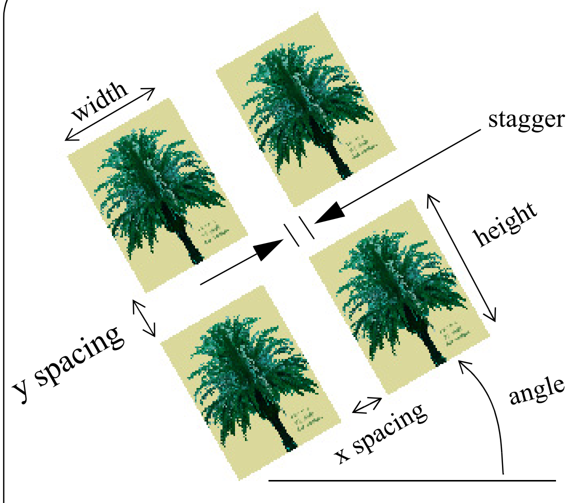
Comment and Active

See 8.8.2 Comment and Active Column in Grids.

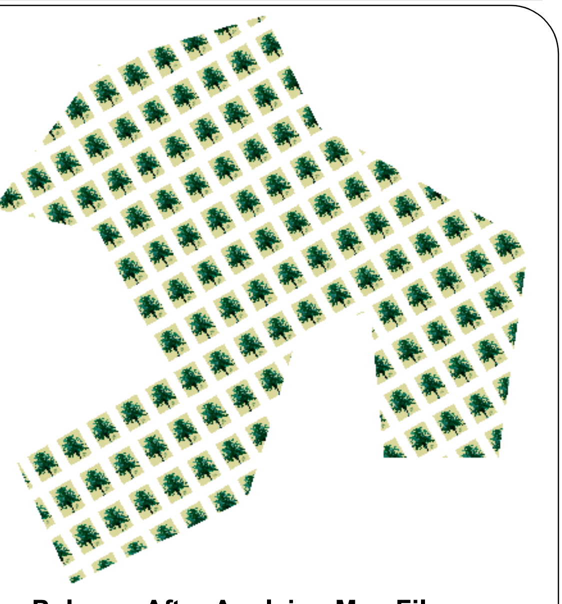
To assist is debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Examples of Bitmap Fill

	Name	Att Key	Filename	Type	X Origin	Y Origin	Width	Height	Angle	View Angle	Stagger	Space X	Space Y	Transparent	Solid Colour	Solid Blend	Drape name	Comment
1	bfl06		$LIB\12D_palm 1.bmp	world	100	100	9	12	30		1	4	4		off yellow	0.5		



Definitions for Bitmap Fill

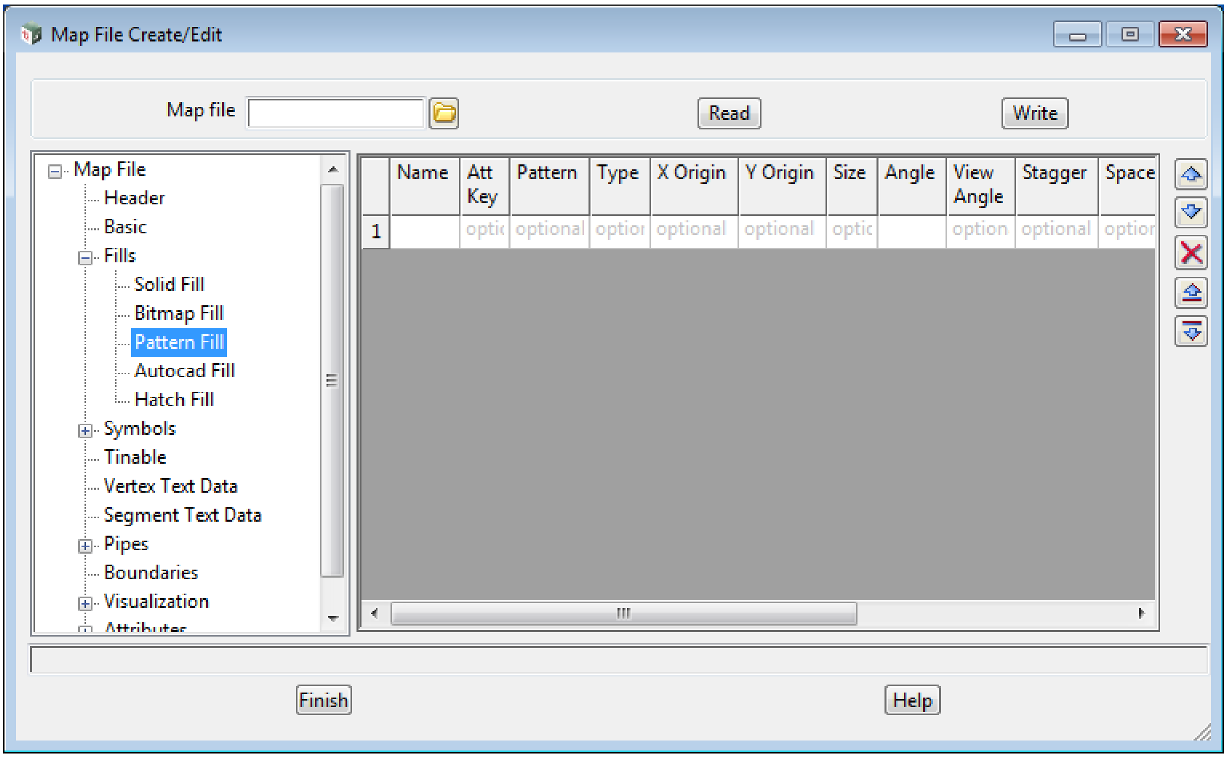


Polygon After Applying Map File

Go to the next section 8.8.1.3.3 Fills >Pattern Fill or return to 8.8.1.3 Fills or 8.8.1 Create/Edit a Map File.

8.8.1.3.3 Fills >Pattern Fill

Pattern Fill uses a pattern from the ***12d Model*** pattern file, *12d.patttern*, to fill the selected super strings.



Processing Using Name and Att Key for Fills>Pattern Fill Node

when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* Matching Using Name and Att Key:*), the string is given a 12d Pattern Fill as defined in the parameters of the matching line.*

Name and Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key**, *and how to access* **Att Key**, *see* Name and Att Key.

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See 8.8.3 Map File Substitution by Attributes.

Pattern **select Pattern pop-up**

The pattern name to be applied.These patterns are defined in the file ***patterns.12d***

For more information on the 12d pattern definition please go to the section 42.2.5 12d Patterns File.

Type choice box paper, world, device

The units of size.This means the pattern can be drawn with either world size, paper size (mm) or device size.

X/Y Origin measures box **At Point, Point to Point, String= from Point, String to Point)**

The x/y co-ordinate of the origin point of the repeated pattern.

Size measures box **At Point, Point to Point, String=**

from Point, String to Point)

The size of the pattern in the selected units given in **Type**.

Angle	measures box	**At Point, Point to Point, String= from Point, String to Point)**

The orientation of the pattern relative to the x axis measured in the anti-clockwise direction. The units are dms (degrees minutes and seconds) and typed in using 4.17.1 HP Notation.

View Angle	choice box	yes, no

if not blank, this field controls whether **Angle** *is relative to the x axis or to the plotting x axis.*

If **yes** *and we are plotting,* **Angle** *is measured relative to the x axis of the plot rotation.*

If **no**, **Angle** *is measured absolute to the world x axis*

If blank, **Angle** *is measured absolute to the world x axis.*

Stagger	measures box	**At Point, Point to Point, String= from Point, String to Point)**

if not blank, this field allows each alternate row of patterns to be staggered (offset) by the specified value. **Stagger** *is measured in the selected units along the x axis in the rotated system.*

If blank, a **Stagger** *of 0.0 is assumed.*

Space X/Y	measures box	**At Point, Point to Point, String= from Point, String to Point)**

The distance in the selected units along the x/y axis in the rotated system between each instance of the pattern.

Solid Colour		**select colour pop-up**

if not blank, when the pattern become too small to be legible, instead of drawing the pattern, the super string is solid filled with colour ***Solid colour***.

Solid Blend	measures box	**At Point, Point to Point, String= from Point, String to Point)**

if not blank, and **Solid Colour** *is specified, the solid fill is drawn with blend value* **Solid Blend**. *The blend value is between 0.0 and 1.0.*

If blank, **Solid Blend** *is assumed to be 1.0.*

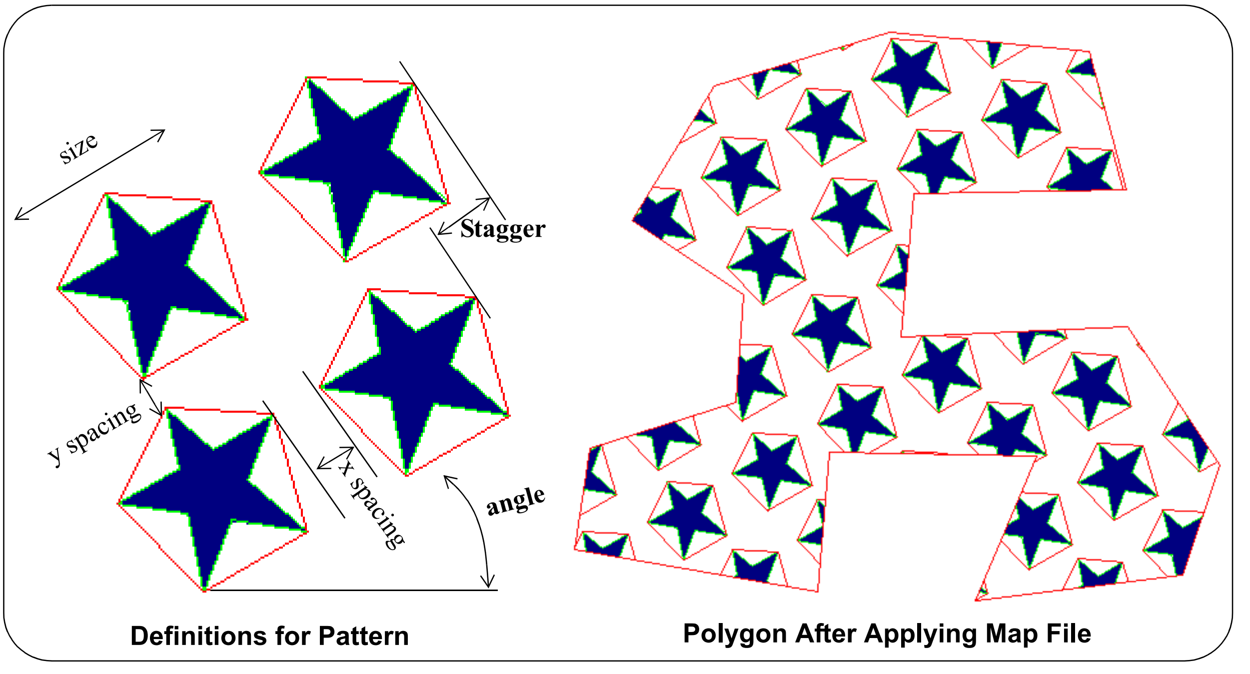
Comment and Active

See 8.8.2 Comment and Active Column in Grids.

To assist is debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Examples of Pattern Fill

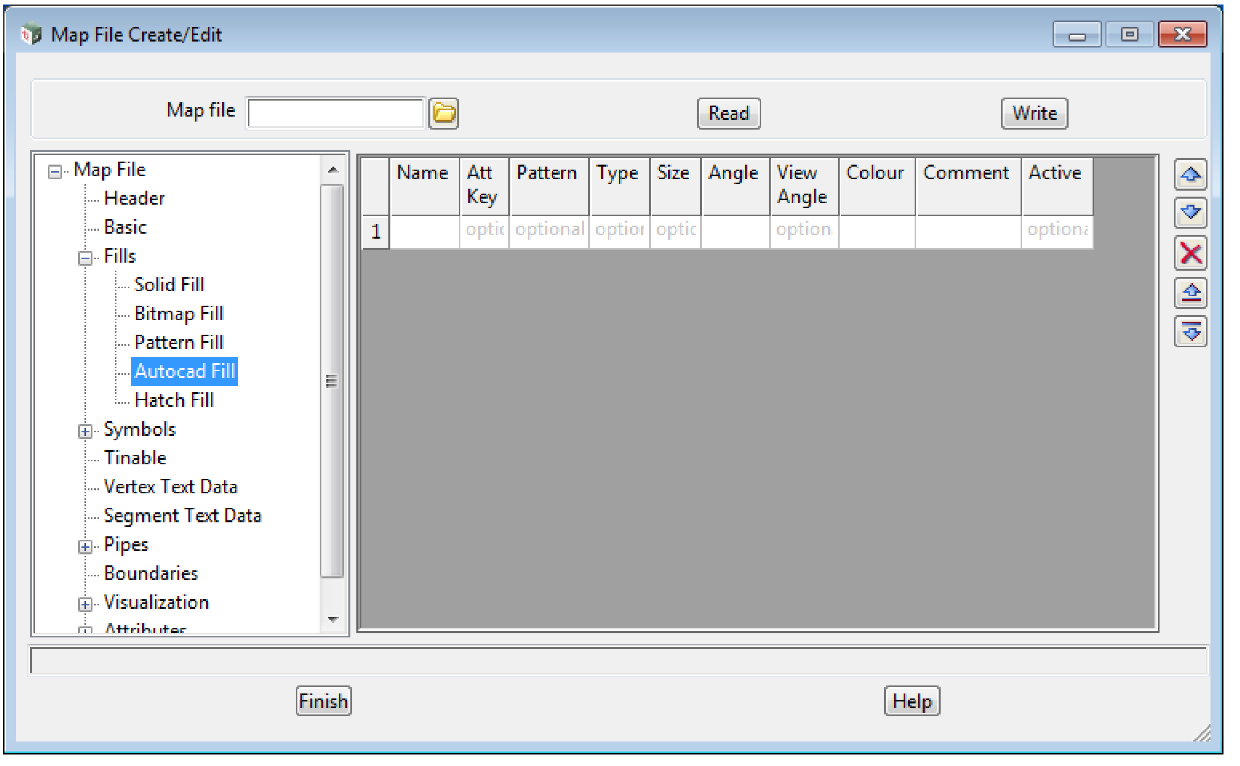
	Name	Att Key	Pattern	Type	X Origin	Y Origin	Size	Angle	View Angle	Stagger	Space X	Space Y	Solid Colour	Solid Blend	Comment
1	pf46		star with bitmap dots	world	0	0	20	30	no	6	6	4			



Go to the next section 8.8.1.3.4 Fills >Autocad Fill or return to 8.8.1.3 Fills or 8.8.1 Create/Edit a Map File.

8.8.1.3.4 Fills >Autocad Fill

AutoCad Fill uses a pattern from the **AutoCAD pattern** file to fill the selected super strings.



Processing Using Name and Att Key for Fills>AutoCAD Fill Node

when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* Matching Using Name and Att Key:*), the string is given an AutoCAD Pattern Fill as defined in the parameters of the matching line.*

Name and Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key***, and how to access* **Att Key***, see* Name and Att Key.

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See 8.8.3 Map File Substitution by Attributes.

Pattern select autocad pattern

The autocad pattern name to be applied.These patterns are defined via acad.pat.

This is an autocad file.

Type

The units of size.This means the pattern can be drawn with either world size, paper size (mm) or device size.

Size

The size of the pattern in the units given by **Type.**

Angle measures box **At Point, Point to Point, String= from Point, String to Point)**

The orientation of the pattern relative to the x axis measured in the anti-clockwise direction. The units are dms (degrees minutes and seconds) and typed in using 4.17.1 HP Notation.

View Angle choice box yes, no

if not blank, this field controls whether **Angle** *is relative to the x axis or to the plotting x axis.*

If **yes** *and we are plotting,* **Angle** *is measured relative to the x axis of the plot rotation.*

If **no**, **Angle** *is measured absolute to the world x axis*

If blank, **Angle** *is measured absolute to the world x axis.*

This is an extension.

Colour

The colour of the pattern.

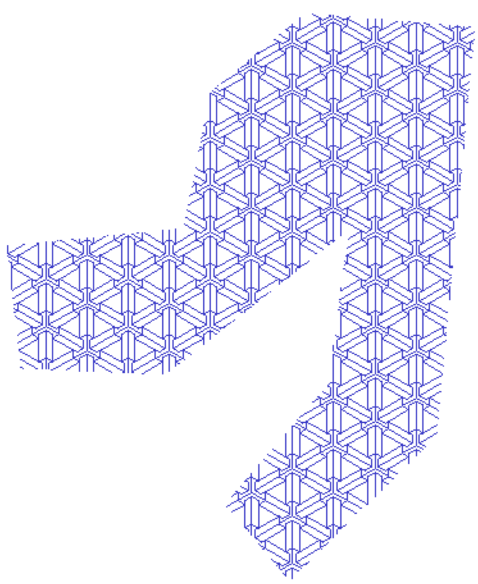
Comment and Active

See 8.8.2 Comment and Active Column in Grids.

To assist is debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Example of AutoCAD Fill

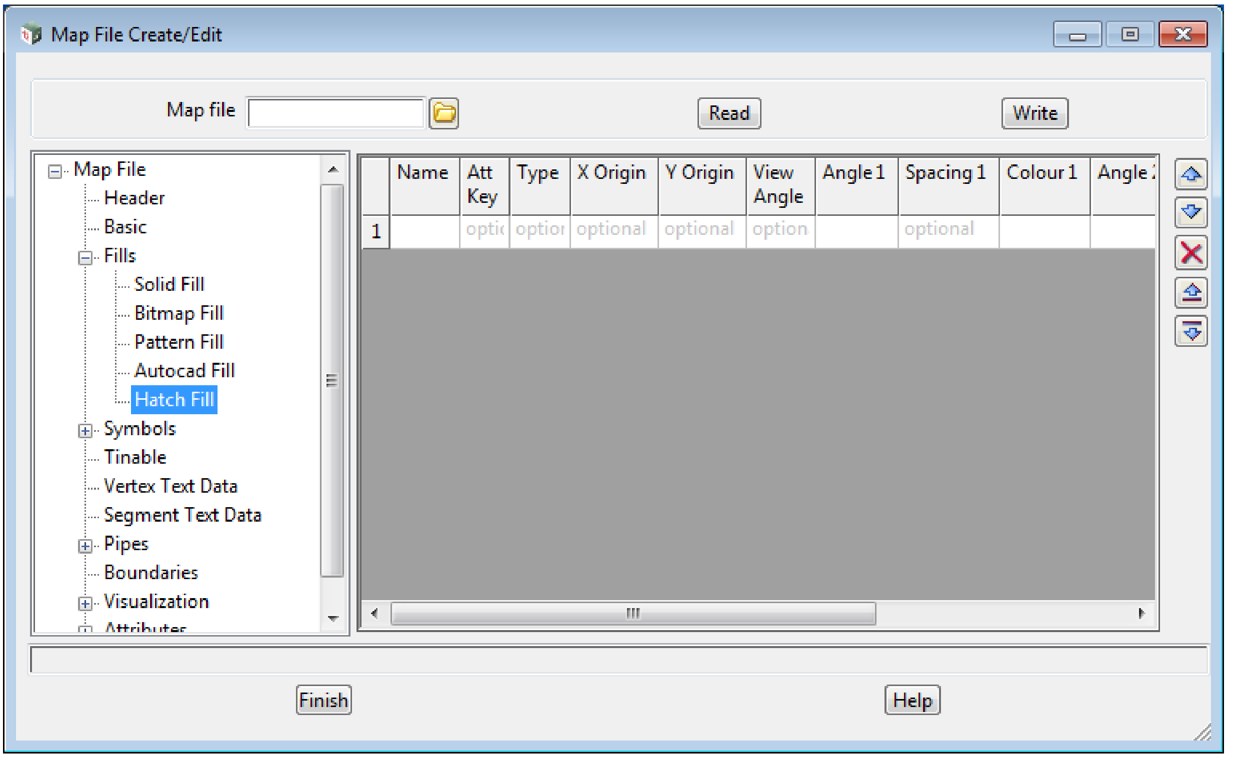
	Name	Att Key	Pattern	Type	Size	Angle	View Angle	Colour	Comment
1	pl04		ESCHER	world	10	30	no	dark blue	



Go to the next section 8.8.1.3.5 Fills >Hatch Fill or return to 8.8.1.3 Fills or 8.8.1 Create/Edit a Map File.

8.8.1.3.5 Fills >Hatch Fill

Hatch Fill sets whether super strings (closed and non-closed) are filled with a hatch pattern. The hatch pattern consists of one or two sets of lines drawn at specified angles.



Processing Using Name and Att Key for Fills>Hatch Fill Node

when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* Matching Using Name and Att Key:*), the string is given a Hatch Pattern Fill as defined in the parameters of the matching line.*

Name and Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key***, and how to access* **Att Key***, see* Name and Att Key.

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See 8.8.3 Map File Substitution by Attributes.

Type select choice box

The units of **Spacing 1** *and* **Spacing 2***. This means the pattern can be drawn with either world size, paper size (mm) or device size.*

X/Y Origin

The x/y co-ordinate of the anchor point of the repeated pattern.

View Angle choice box yes, no

if not blank, this field controls whether **Angle 1** *and* **Angle 2** *are relative to the x axis or to the plotting x axis.*

If **yes** *and we are plotting,* **Angle 1** *and* **Angle 2** *are measured relative to the x axis of the plot rotation.*

If **no**, **Angle 1** *and* **Angle 2** *are measured absolute to the world x axis*

If blank, **Angle 1** *and* **Angle 2** *are measured absolute to the world x axis.*

Angle 1 measures box **At Point, Point to Point, String= from Point, String to Point)**

The orientation of the first set of lines relative to the x axis measured in the anti-clockwise direction. The units are dms (degrees minutes and seconds) and typed in using 4.17.1 HP Notation.

Spacing 1

The distance between the first set of lines (drawn at an angle **Angle 1***) in the units selected in the* **Type** *column.*

Colour 1

The colour of the first set of lines.

Angle 2 measures box **At Point, Point to Point, String= from Point, String to Point)**

The orientation of the second set of lines relative to the x axis measured in the anti-clockwise direction. The units are dms (degrees minutes and seconds) and typed in using 4.17.1 HP Notation.

Spacing 2

The distance between the second set of lines (drawn at an angle **Angle 2***) in the units selected in the* **Type** *column.*

Colour 2

The colour of the second set of lines.

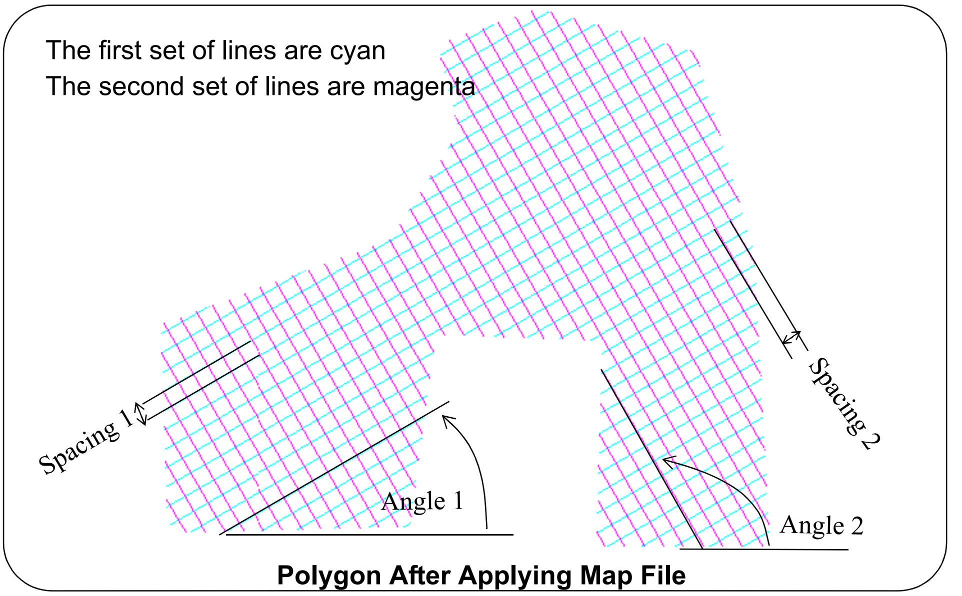
Comment and Active

See 8.8.2 Comment and Active Column in Grids.

To assist is debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Example of Hatch Fill

	Name	Att Key	Type	X Origin	Y Origin	View Angle	Angle 1	Spacing 1	Colour 1	Angle 2	Spacing 2	Colour 2	Comment
1	ht07		world	0	0		30	10	cyan	120	10	magenta	



Polygon After Applying Map File

Go to the next section 8.8.1.3.6 Multiple Fills or return to 8.8.1.3 Fills or 8.8.1 Create/Edit a Map File.

8.8.1.3.6 Multiple Fills

Super strings support more than one fill type per string. For example, a super string can have a solid fill, and an I Acad fill at the same time.

The order of drawing the fill types is: solid, bitmap, pattern, hatch, acad.

Go to the next section 8.8.1.4 Symbols or return to 8.8.1.3 Fills or 8.8.1 Create/Edit a Map File.

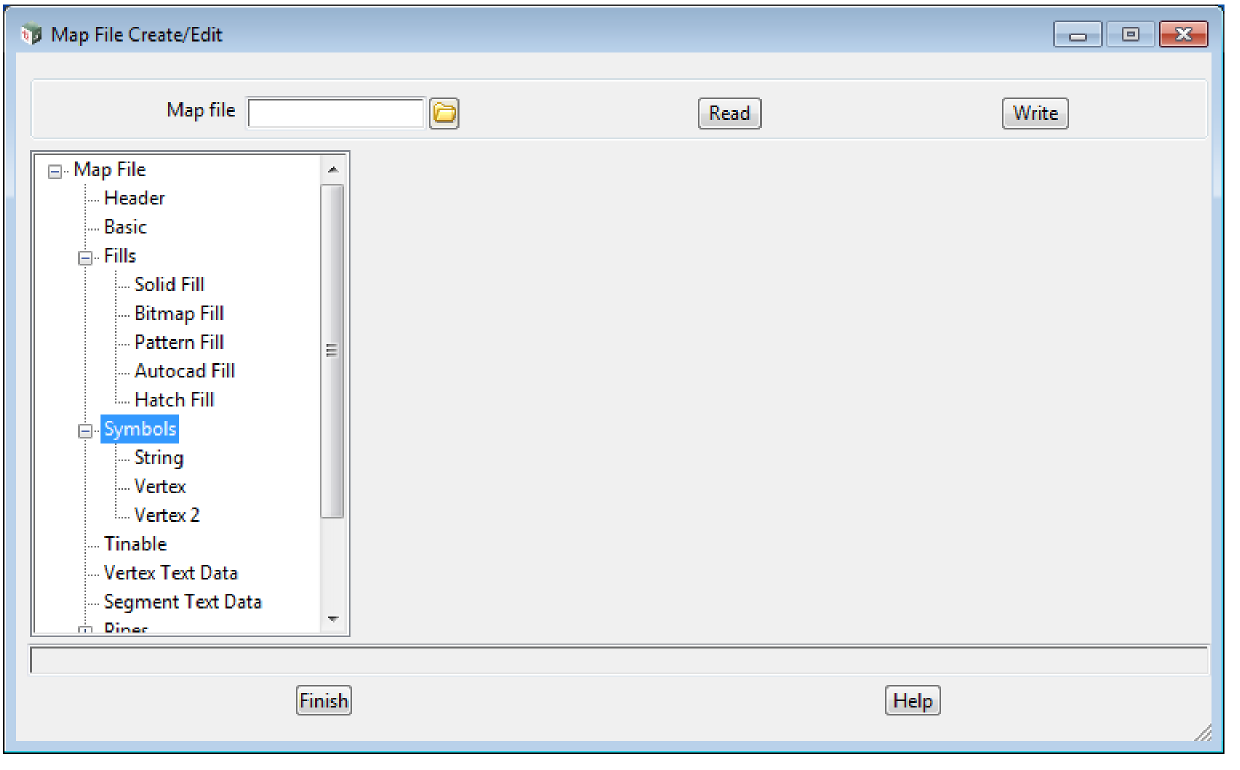
8.8.1.4 Symbols

The **Symbols** node creates symbols at the vertices of the super strings.

There can only be **one** symbol at each vertex so if ***Symbols >String*** is used to set symbols for every vertex of a string, and ***Symbols >Vertex*** applies a different symbol to any of those vertices, then the symbols from ***Symbols >Vertex*** are used at the appropriate vertices.

Symbols >Vertex 2 can be used to generate a second symbol at a vertex position BUT ***Symbols >Vertex 2*** creates a ***new*** string with a vertex and the second symbol.

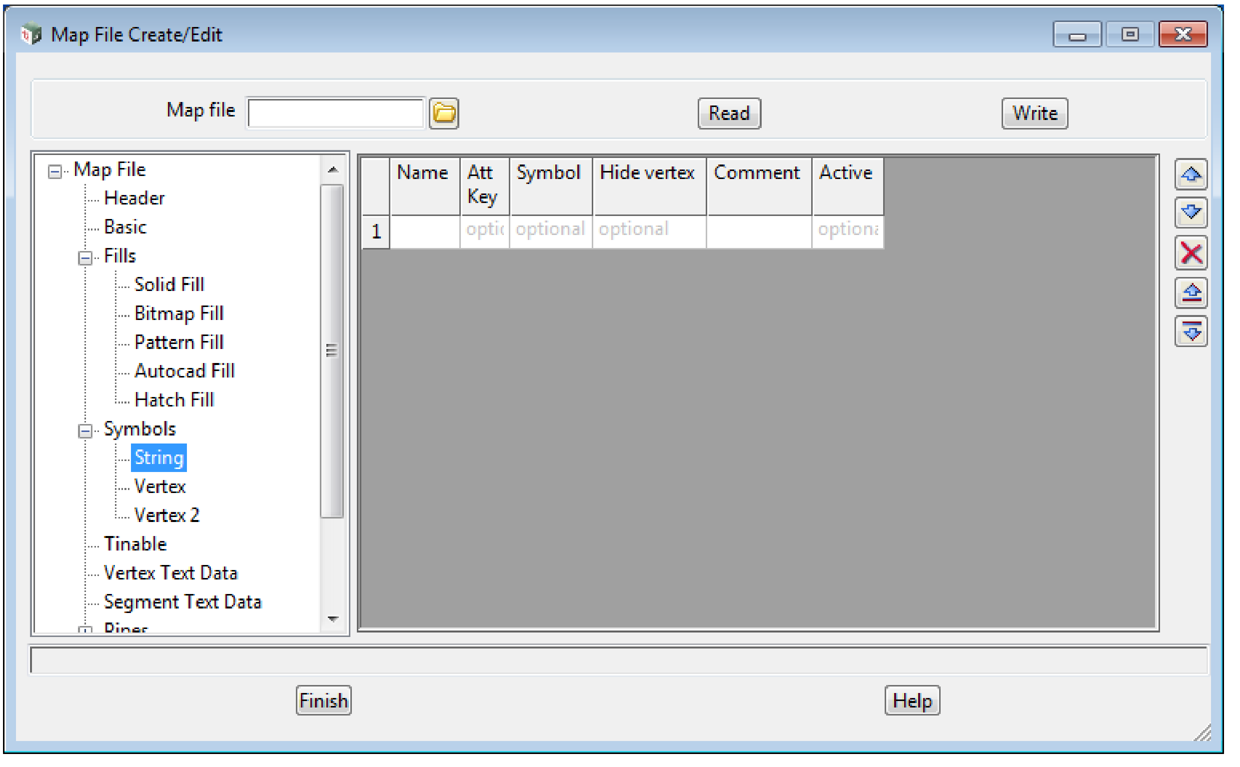
For more information on *String*, go to 8.8.1.4.1 Symbols >String
Vertex 8.8.1.4.2 Symbols >Vertex
Vertex 2 8.8.1.4.3 Symbols >Vertex 2



8.8.1.4.1 Symbols >String

String sets the same symbol at each vertex of a super string

IMPORTANT NOTE:
There can only be **one** symbol at each vertex so if ***Symbols >String*** is used to set symbols for every vertex of a string, and ***Symbols >Vertex*** applies a different symbol to any of those vertices, then the symbols from ***Symbols >Vertex*** are used at the appropriate vertices.



Processing Using Name and Att Key for Symbols>String Node

when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* Matching Using Name and Att Key:*), each vertex of the string is given a Symbol as defined in the parameters of the matching line.*

Name and Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key**, *and how to access* **Att Key**, *see* Name and Att Key.

Symbol **select symbol** data

Symbol *is an* ***Symbol Information*** *grid cell and sets parameters for creating a symbol on the vertices of super strings. The symbol is positioned about the vertex.*
This field can not be blank.
To access ***Symbol***, *click LB on the* ***Symbol*** *field to highlight the field, then click LB again to bring up the* **Symbol Information** *panel. See* 4.7.1 Symbol Data *for information about the field to enter.*

Note: *Fields in the* **Symbol Information** *can have attribute substitution from string attributes. See* 8.8.3 Map File Substitution by Attributes.

Hide vertex **tick box**

if ticked, no default cross is placed at the vertex of the string.

Note: **Hide Vertex** *can have attribute substitution from string attributes. See* 8.8.3 Map File Substitution by Attributes.

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

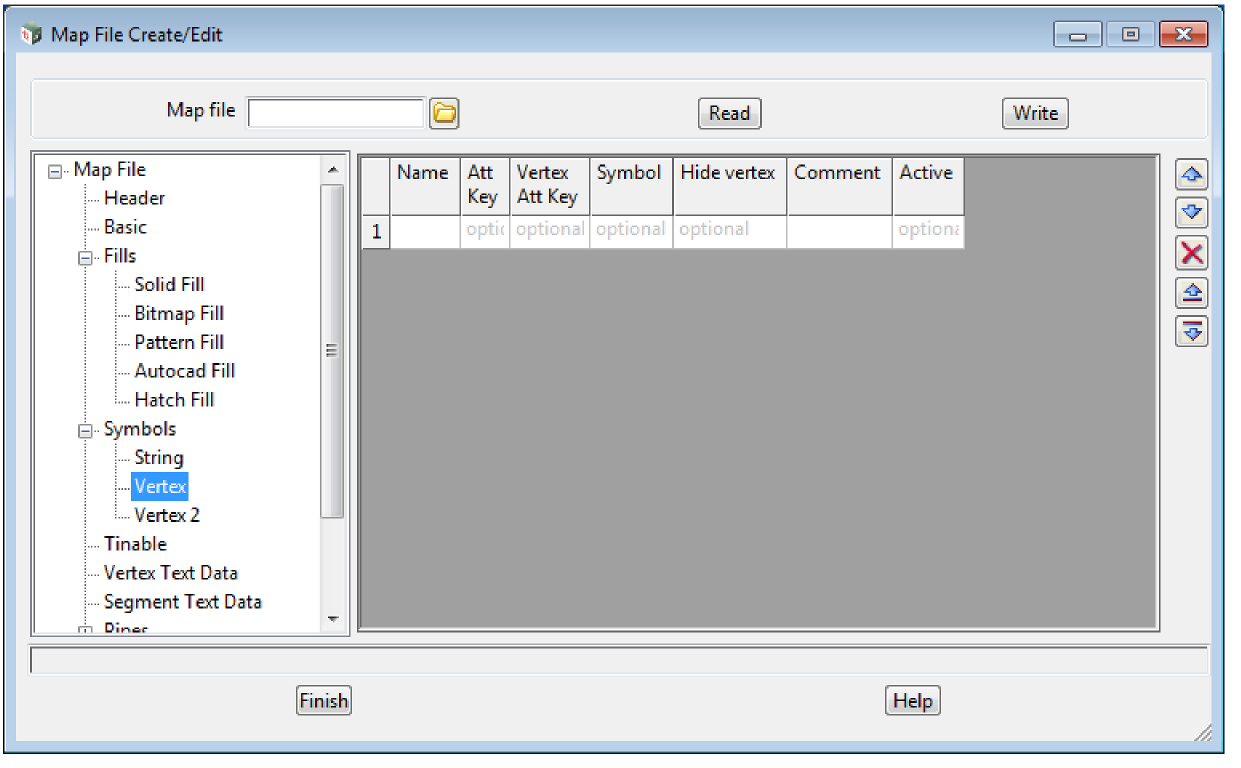
To assist is debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Go to the next section 8.8.1.4.2 Symbols >Vertex or return to 8.8.1.4 Symbols or 8.8.1 Create/ Edit a Map File.

8.8.1.4.2 Symbols >Vertex

Vertex sets a given symbol for each vertex of a super string that matches a string name, a string attribute value and a vertex attribute value.

There can only be **one** symbol at each vertex so if ***Symbols >String*** is used to set symbols for every vertex of a string, and ***Symbols >Vertex*** applies a different symbol to any of those vertices, then the symbol from ***Symbols >Vertex*** is used at the appropriate vertices.



Processing Using Name, Att Key and Vertex Att Key

when a string finds a first match with **Name**, **Att Key** *and* **Vertex Att Key** *in the grid (see* Matching Using Name, Att Key and Vertex Att Key:*), each matching vertex of the string is given a Symbol as defined in the parameters of the matching line.*

Name, Att Key and Vertex Att Key

Name *is at Text grid and the text entered into* **Name** *can include wild cards* ******* *and wild characters* ***?****.*
The string name is matched against **Name***. This field can not be blank.*
Att Key *is an Attribute Data grid cell which contains the definition of the attributes and their values that are to be matched against. There can be more than one attribute in the Attribute Data but they must have unique names.*
The ***string*** *attributes are matched against the attribute details in* **Att Key.**
Vertex Att Key *is an Attribute Data grid cell which contains the definition of the vertex attributes and their values that are to be matched against. There can be more than one vertex attribute in the Attribute Data but they must have unique names.*
The ***vertex*** *attributes are matched against the attribute details in* **Vertex Att Key**.
To access ***Att Key*** *or* **Vertex Att Key** *data, click LB on the* ***Att Key/*** **Vertex Att Key** *field to highlight the field, then click LB again to bring up the* **Attribute Data** *panel. To enter data, see* Attribute Data Panel.

Matching Using Name, Att Key and Vertex Att Key:

Strings are first created via the ***Basic*** *node and given a string name of either the Entity Name or the text given in the Name column of the Basic Map File grid.*
Starting with the first line of the grid, matching and processing occurs as follows

If **Name, Att Key** *and* **Vertex Att Key** *are not blank, and a match of the string name occurs with* **Name**, *a match of the string attributes occurs with* **Att Key** *and a match of the string vertex attributes occurs with* **Vertex Att Key**, *then the rest of the fields for this line of the Map File grid are used on this string vertex.*
If **Name** *and* **Att Key** *are not blank, and* **Vertex Att Key** *is blank, and a match of the string name occurs with* **Name** *and a match of the string attributes occurs with* **Att Key**, *then the rest of the fields for this line of the Map File grid are used on each string vertex.*
If **Name** *and* **Vertex Att Key** *are not blank, and* **Att Key** *is blank, and a match of the string name occurs with* **Name** *and a match of a string vertex attribute occurs with* **Vertex Att Key**, *then the rest of the fields for this line of the Map File grid are used on this string vertex.*

If **Name** *in not blank and* **Att Key** *and* **Vertex Att Key** *are blank, and a match of the string name occurs with* **Name**, *then the rest of the fields for this line of the Map File grid are used on each string vertex.*

If **Name** *in blank then no match occurs and this line of the Map File grid is ignored.*

If a ***match occurs****, then no tests for matches against* **Name**, **Att Key** *and* **Vertex Att Key** *further down in the grid are made.*

If ***no match occurs****, then this line of the map file grid is ignored and a test for a match is made against the next line of the grid.*

Symbol **select symbol** data

Symbol *is Symbol Information grid cell and sets parameters for creating a symbol on the vertices of super strings. The symbol is positioned about the vertex.*
This field can not be blank.
To access ***Symbol****, click LB on the* ***Symbol*** *field to highlight the field, then click LB again to bring up the* **Symbol Information** *panel.*

Note*: Fields in the* **Symbol Information** *can have attribute substitution from vertex attributes. See* 8.8.3 Map File Substitution by Attributes.

Hide vertex tick box

if ticked, no default cross is placed at the vertex of the string.

Note*:* **Hide Vertex** *can have attribute substitution from string attributes. See* 8.8.3 Map File Substitution by Attributes.

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

To assist is debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

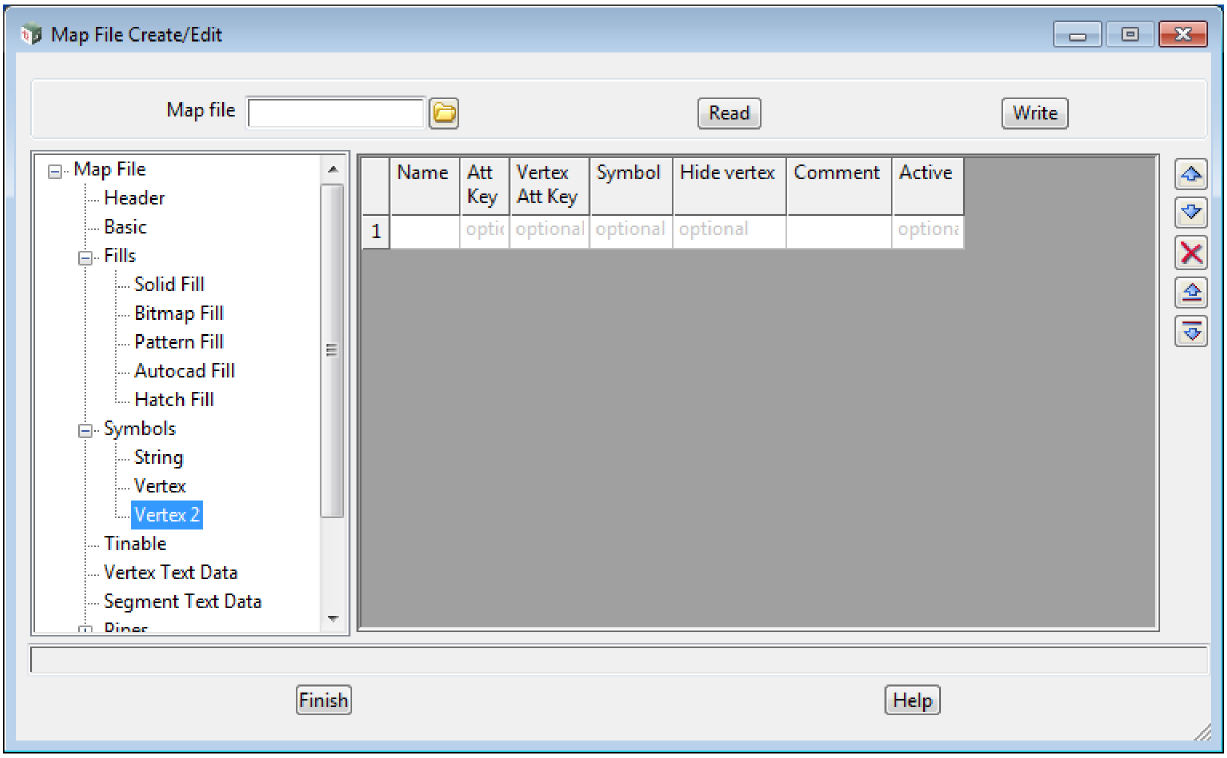
Go to the next section 8.8.1.4.3 Symbols >Vertex 2 or return to 8.8.1.4 Symbols or 8.8.1 Create/Edit a Map File.

8.8.1.4.3 Symbols >Vertex 2

Vertex 2 creates a ***new*** string with vertices and symbols at those super strings that match a string name, a string attribute value and a vertex attribute value in the ***Symbols >Vertex 2*** grid.

IMPORTANT RESTRICTION:

Symbols >Vertex 2 does not work for **Utilities =>H-Z =>Map.**



Processing Using Name, Att Key and Vertex Att Key

when a string finds a first match with **Name**, **Att Key** *and* **Vertex Att Key** *in the grid (see* Matching Using Name, Att Key and Vertex Att Key:*), each matching vertex of the string is given a Symbol as defined in the parameters of the matching line.*

Name, Att Key and Vertex Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
Vertex Att Key *is an Attribute Data grid cell. The* ***vertex attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key**, *and how to access* **Att Key**, *see* Name, Att Key and Vertex Att Key.

Symbol **select symbol** data

Symbol *is Symbol Information grid cell and sets parameters for creating a symbol on the vertices of super strings. The symbol is positioned about the vertex.*
This field can not be blank.
To access ***Symbol***, *click LB on the* ***Symbol*** *field to highlight the field, then click LB again to bring up the* **Symbol Information** *panel.*

Note*: Fields in the* **Symbol Information** *can have attribute substitution from vertex attributes. See* 8.8.3 Map File Substitution by Attributes.

Hide vertex **tick box**

if ticked, no default cross is placed at the vertex of the string.

***Note**: **Hide Vertex** can have attribute substitution from string attributes. See* 8.8.3 Map File Substitution by Attributes.

Comment and Active

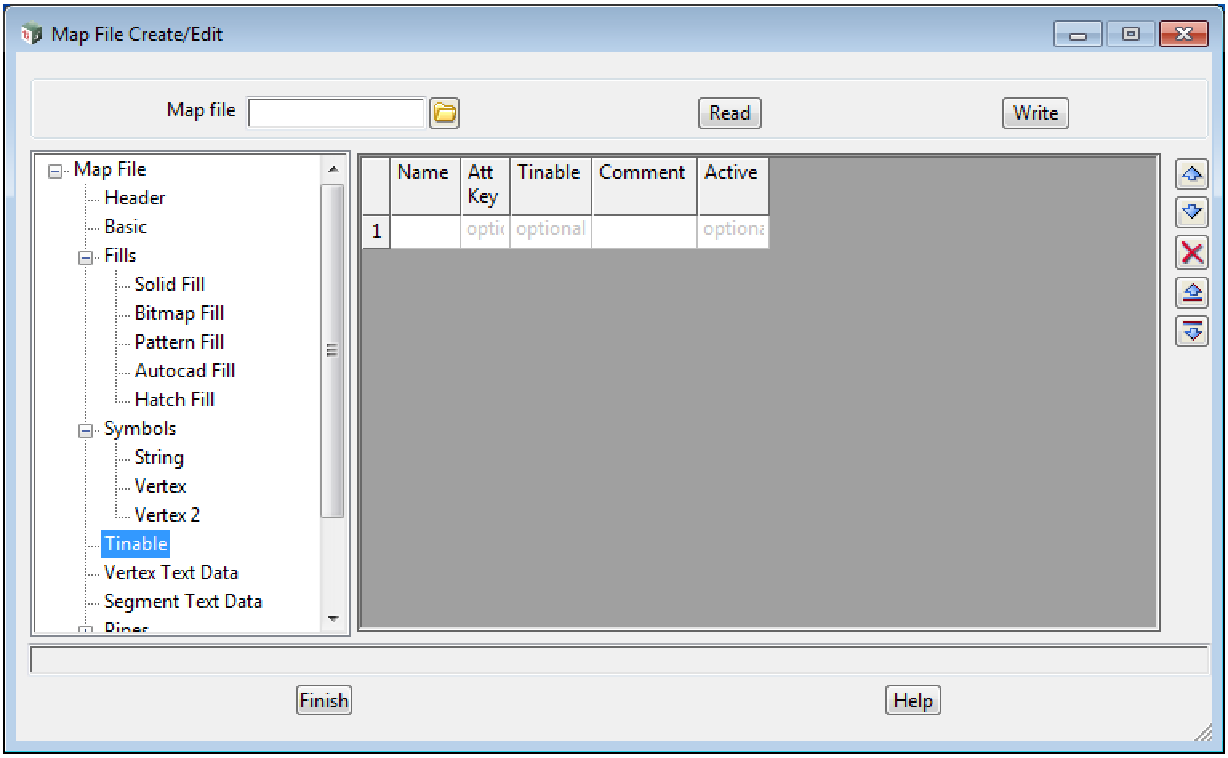
See 8.8.2 Comment and Active Column in Grids.

To assist is debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Go to the next section 8.8.1.5 Tinable or return to 8.8.1.4 Symbols or 8.8.1 Create/Edit a Map File.

8.8.1.5 Tinable

Tinable sets whether the vertices and segments are tinable (used in triangulations), not tinable (not used in triangulations) or only the vertices (points) are tinable.



Processing Using Name and Att Key for Tinable Node

when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* Matching Using Name and Att Key:*), each vertex and segment of the string is given a tinability value as defined in the parameters of the matching line.*

Name and Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key***, and how to access* **Att Key***, see* Name and Att Key.

Tinable **yes, no, points**

if ***yes****, the vertices and segments for all the strings matching the* **Name** *and* **Att Key** *are tinable.*
If ***no****, the vertices and segments for all the strings matching the* **Name** *and* **Att Key** *are not tinable.*
If ***points****, the segments are not tinable and the vertices are tinable for all the strings matching the* **Name** *and* **Att Key**.
This field can not be blank.

Note*:* **Tinable** *can have attribute substitution from string attributes. See* 8.8.3 Map File Substitution by Attributes.

Comment and Active

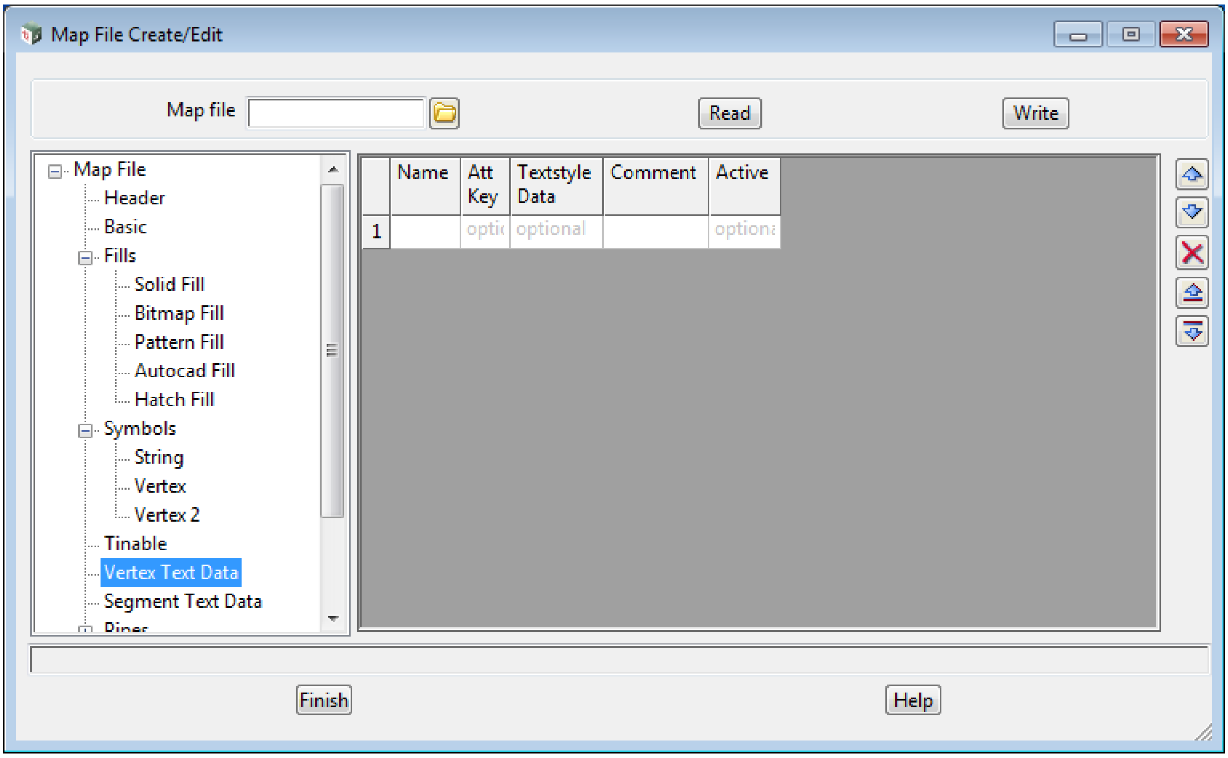
See 8.8.2 Comment and Active Column in Grids.

To assist is debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Go to the next section 8.8.1.6 Vertex Text Data or return to 8.8.1 Create/Edit a Map File.

8.8.1.6 Vertex Text Data

Vertex Text Data sets parameters for displaying vertex text on super strings.



Processing Using Name and Att Key

when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* Matching Using Name and Att Key:*), a Textstyle Data for use with vertex text on the string is given in the parameters of the matching line.*

Name and Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key***, and how to access* **Att Key***, see* Name and Att Key.

Textstyle Data **select textstyle data** menu

Textstyle Data *is a Textstyle Data grid cell. The Textstyle Data sets text parameters (see* 4.6 Text Definitions*) for displaying vertex text on all strings matching* **Name** *and* **Att Key**.
To access the **Textstyle Data***, click LB on the* **Textstyle Data** *field to highlight the field, then click LB again to bring up the* **Textstyle Data** *panel.*

Note*: Fields in the* **Textstyle Data** *can have attribute substitution from string attributes. See* 8.8.3 Map File Substitution by Attributes.

Comment and Active

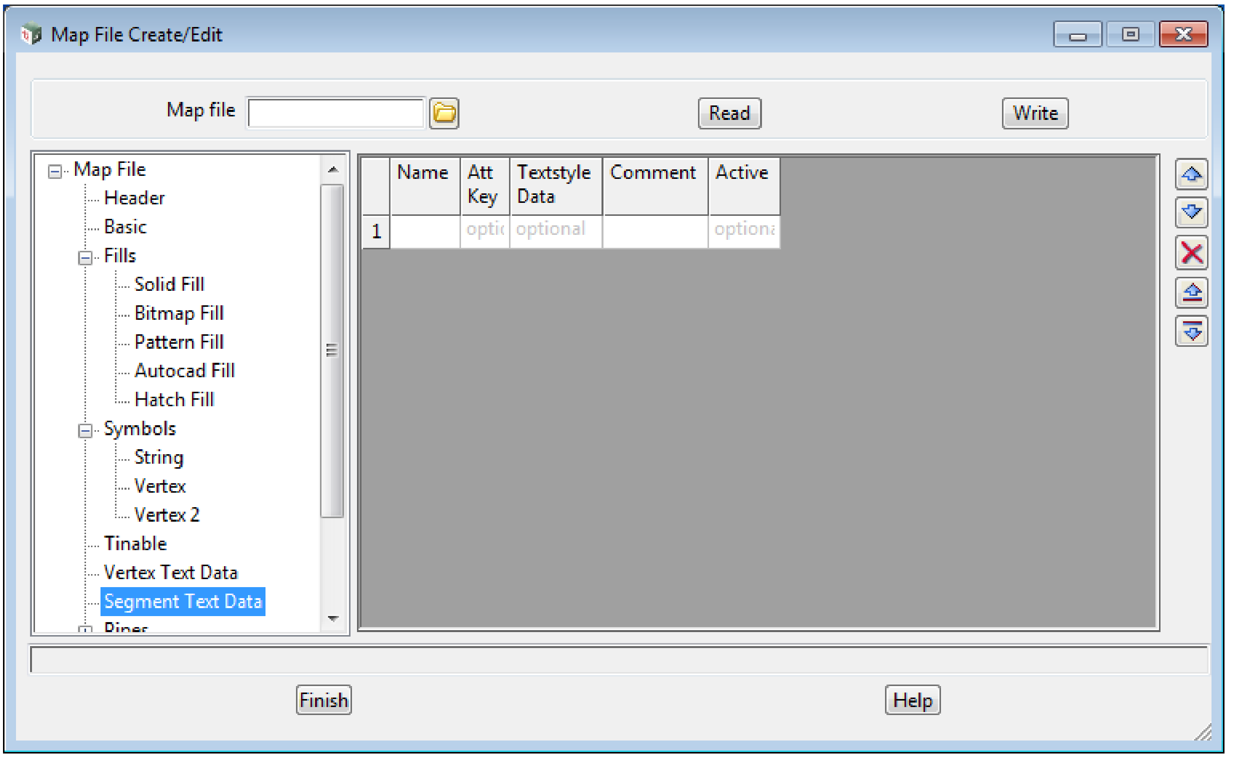
To assist in debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Go to the next section 8.8.1.7 Segment Text Data or return to 8.8.1 Create/Edit a Map File.

8.8.1.7 Segment Text Data

Segment Text Data sets parameters for displaying segment text on super strings.



Processing Using Name and Att Key

when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* Matching Using Name and Att Key:*), a Textstyle Data for use with segment text on the string is given in the parameters of the matching line.*

Name and Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key***, and how to access* **Att Key***, see* Name and Att Key.

Textstyle Data **select textstyle data** menu

Textstyle Data *is a Textstyle Data grid cell. The Textstyle Data sets text parameters (see* 4.6 Text Definitions*) for displaying segment text on all strings matching* **Name** *and* **Att Key**.
To access the **Textstyle Data***, click LB on the* **Textstyle Data** *field to highlight the field, then click LB again to bring up the* **Textstyle Data** *panel.*

Note*: Fields in the* **Textstyle Data** *can have attribute substitution from string attributes. See* 8.8.3 Map File Substitution by Attributes.

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

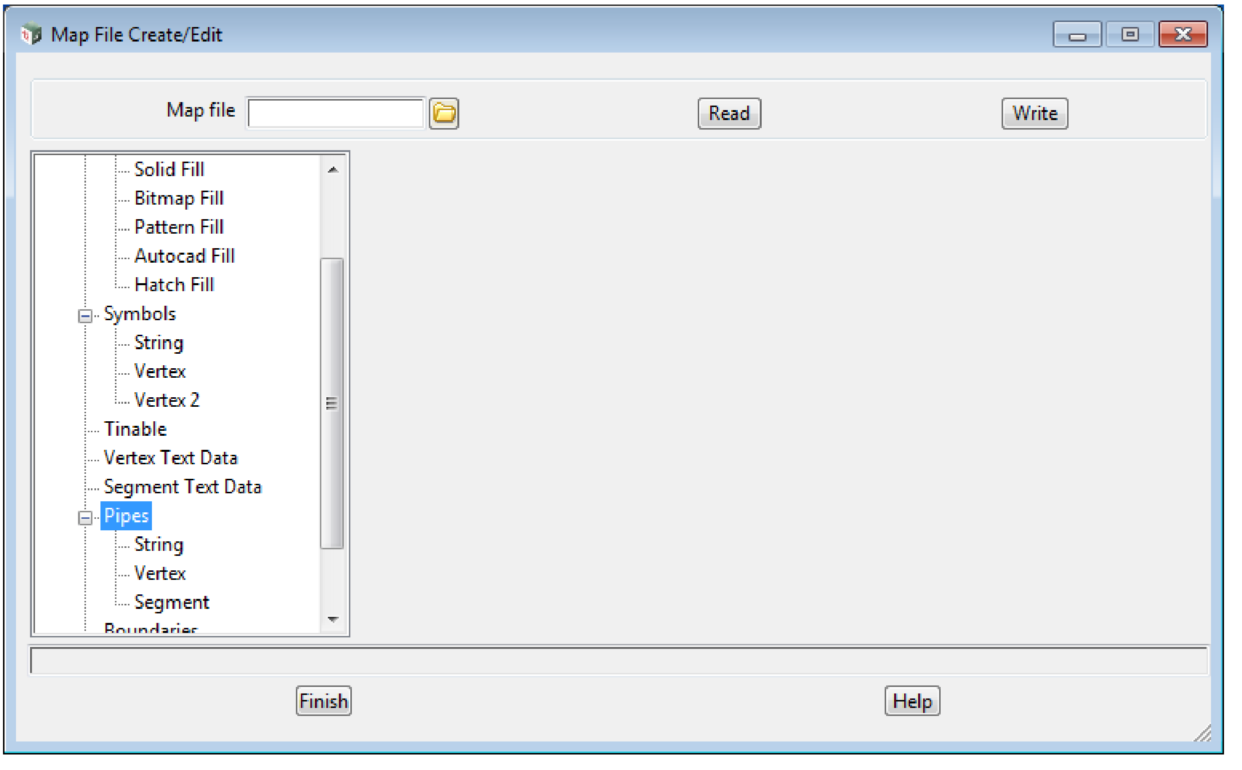
To assist in debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Go to the next section 8.8.1.8 Pipes or return to 8.8.1 Create/Edit a Map File.

8.8.1.8 Pipes

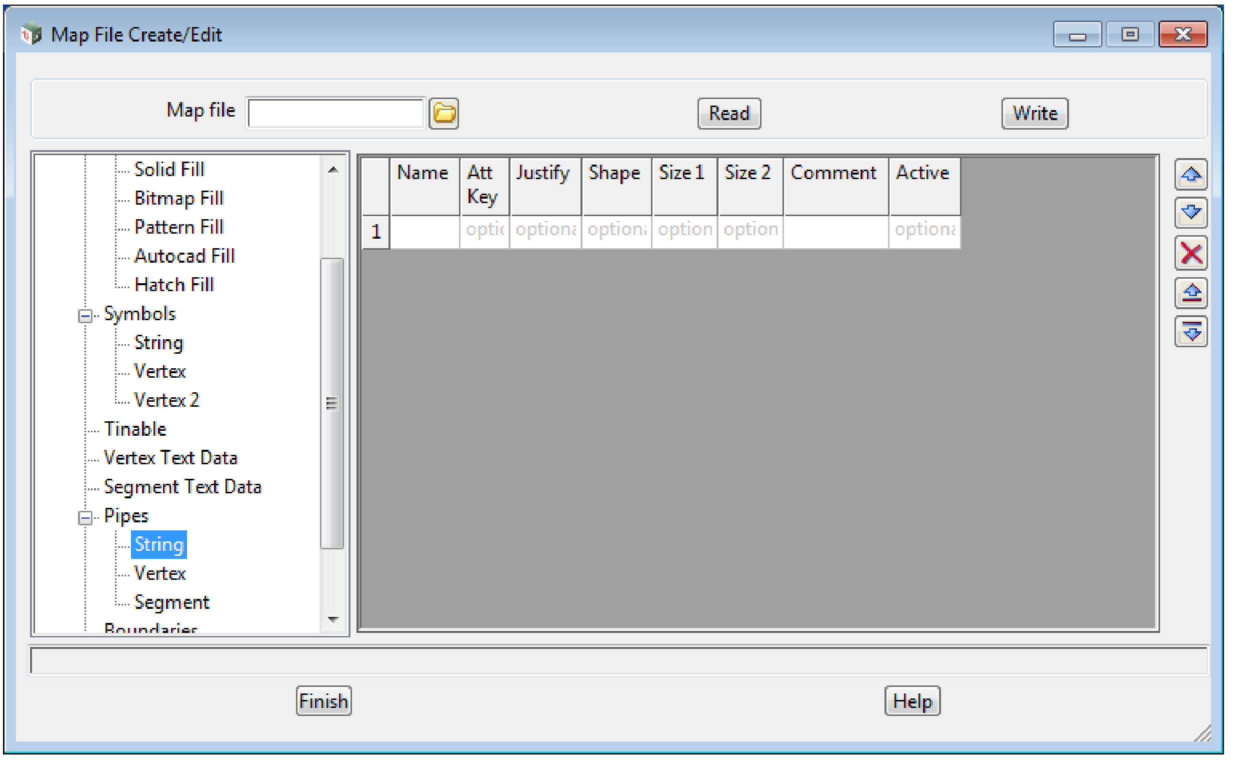
The **Pipes** node turns the string into a super pipe and sets parameters for pipe justification, whether it is round pipe and its diameter, or a rectangular pipe (culvert) and its width and height.

For information on *String*, go to 8.8.1.8.1 Pipes >String
Vertex 8.8.1.8.2 Pipes >Vertex
Segment 8.8.1.8.3 Pipes >Segment



8.8.1.8.1 Pipes >String

Strings matches on string name and string attributes to make the selected string a pipe string with either a diameter (round pipe) or a width and height (rectangular pipe), and a justification for the z-values of the string.



Processing Using Name and Att Key for Pipes>String Node

when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* Matching Using Name and Att Key:*), the super string is turned into a super pipe using the parameters of the matching grid line.*

Name and Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key***, and how to access* **Att Key***, see* Name and Att Key.

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See 8.8.3 Map File Substitution by Attributes.

Justify invert, centre, obvert

the justification for the pipe string.
This field can not be blank.

Shape diameter, culvert

sets whether the pipe is a round pipe or a rectangular pipe (culvert).
If **diameter***, the string is made a round pipe.*
If **culvert***, the string is made a rectangular pipe.*
This field can not be blank.

Size 1 **measures** menu

for **Shape** *choice* **diameter***, the diameter of all the segments of the pipe are set to the value in* **Size 1**.

For **Shape** *choice* **culvert***, the width of all the segments of the pipe are set to the value in* **Size 1***.*
This field can not be blank.

Size 2 **measures** menu

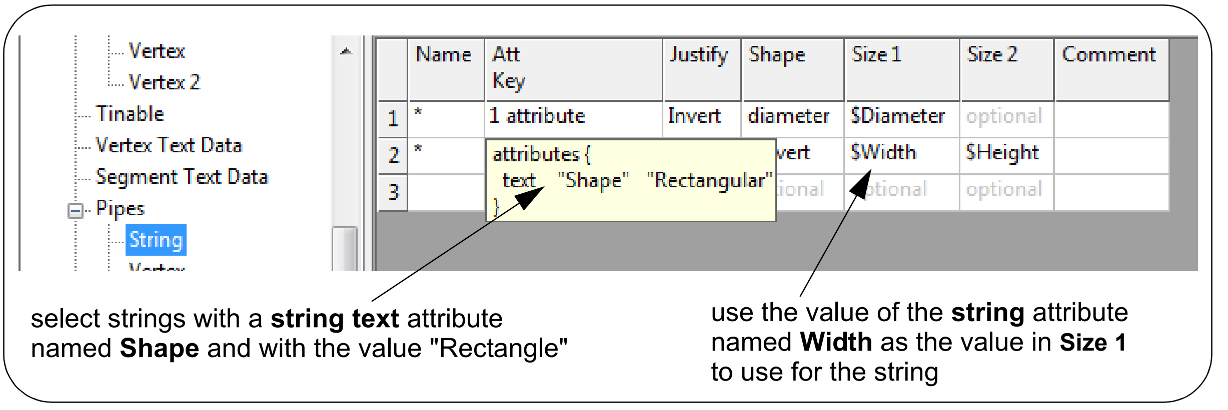
for **Shape** *choice* **culvert***, the height of all the segments of the pipe are set to the value in* **Size 2***.*
for **Shape** *choice* **diameter***, this field is ignored.*
This field can only be blank for a **Shape** *choice* **diameter***.*

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

To assist in debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Example of Pipes >String

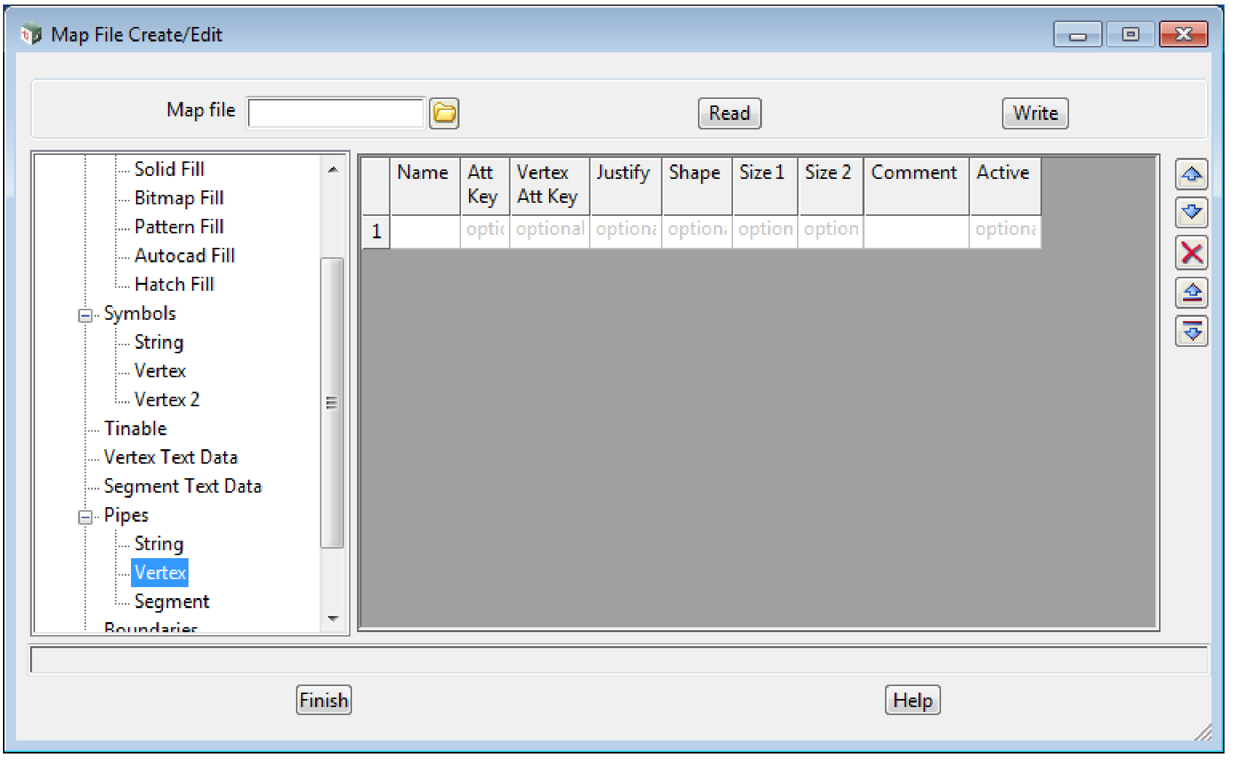


Go to the next section 8.8.1.8.2 Pipes >Vertex or return to 8.8.1.8 Pipes or 8.8.1 Create/Edit a Map File.

8.8.1.8.2 Pipes >Vertex

Vertex sets parameters for the sizing and justification of the **segment starting** with the selected vertex of the super string.

Note: All the segments of a super pipe string must have the same Shape. That is, all the segments must be **Shape *diameter*** (round pipe segment) or all the segments must be **Shape *culvert*** (rectangular pipe segment). And **Shape** must be the same as any **Shape** set for the string in 8.8.1.8.1 Pipes >String.



Processing Using Name, Att Key and Vertex Att Key

when a string finds a first match with **Name**, **Att Key** *and* **Vertex Att Key** *in the grid (see* Matching Using Name, Att Key and Vertex Att Key:*), the segment that starts with the matching vertex of the string, is given the pipe justification, pipe shape and pipe size as defined in the parameters of the matching line.*

Name, Att Key and Vertex Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
Vertex Att Key *is an Attribute Data grid cell. The* ***vertex attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key**, *and how to access* **Att Key**, *see* Name, Att Key and Vertex Att Key.

Note: all the fields on the line after **Vertex Att Key** can have attribute substitution from vertex attributes. See 8.8.3 Map File Substitution by Attributes.

Justify invert, centre, obvert

the justification for this segment of the pipe string.
This field can not be blank.

Shape diameter, culvert

sets whether this segment of the pipe is a round pipe or a rectangular pipe (culvert).
If **diameter***, the segment is made a round pipe.*
If **culvert***, the segment is made a rectangular pipe.*
This field can not be blank.

Note*: the shape can not be different from a shape set by Pipes >String*

Size 1 **measures** menu

for **Shape** *choice* **diameter***, the diameter of this segments of the pipe is set to the value in* **Size 1**.
For **Shape** *choice* **culvert***, the width of this segments of the pipe is set to the value in* **Size 1**.
This field can not be blank.

Size 2 **measures** menu

for **Shape** *choice* **culvert***, the height of this segment of the pipe is set to the value in* **Size 2**.
for **Shape** *choice* **diameter***, this field is ignored.*
This field can only be blank for a **Shape** *choice* **diameter**.

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

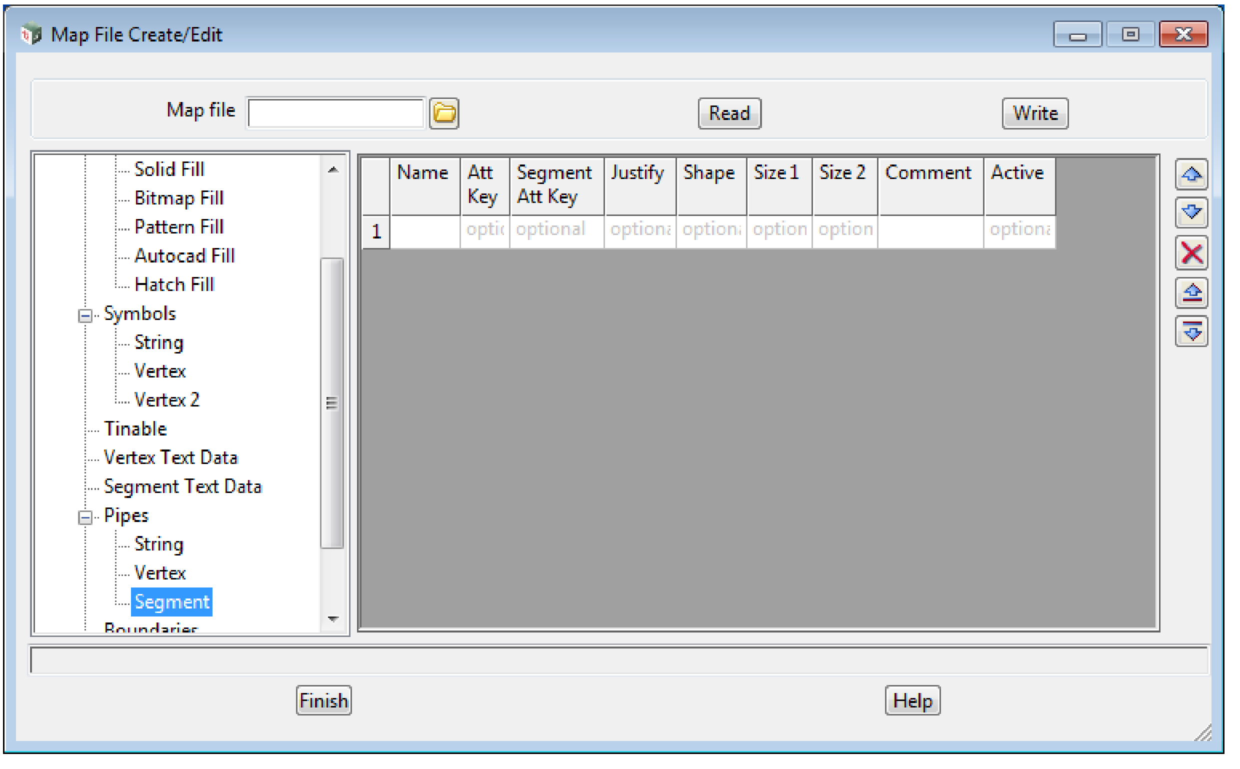
To assist in debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Go to the next section 8.8.1.8.3 Pipes >Segment or return to 8.8.1.8 Pipes or 8.8.1 Create/Edit a Map File.

8.8.1.8.3 Pipes >Segment

Segment sets parameters for the sizing and justification of the selected segment of the super string.

Note: All the segments of a super pipe string must have the same Shape. That is, all the segments must be **Shape** ***diameter*** (round pipe segment) or all the segments must **Shape** ***culvert*** (rectangular pipe segment). And **Shape** must be the same as any **Shape** set for the string in 8.8.1.8.1 Pipes >String.



Processing Using Name, Att Key and Segment Att Key

when a string finds a first match with **Name**, **Att Key** *and* **Segment Att Key** *in the grid (see* Matching Using Name, Att Key and Segment Att Key:*), each matching segment of the string is the pipe, justification, pipe shape and pipe size as defined in the parameters of the matching line.*

Name, Att Key and Segment Att Key

Name *is at Text grid and the text entered into* **Name** *can include wild cards* *** *and wild characters* **?**. *The string name is matched against* **Name**. *This field can not be blank.*
Att Key *is an Attribute Data grid cell which contains the definition of the attributes and their values that are to be matched against. There can be more than one attribute in the Attribute Data but they must have unique names.*
The ***string*** *attributes are matched against the attribute details in* **Att Key.**
Segment Att Key *is an Attribute Data grid cell which contains the definition of the segment attributes and their values that are to be matched against. There can be more than one segment attribute in the Attribute Data but they must have unique names.*
The ***segment*** *attributes are matched against the attribute details in* **Segment Att Key**.
To access ***Att Key*** *or* **Segment Att Key** *data, click LB on the* ***Att Key/*** **Segment Att Key** *field to highlight the field, then click LB again to bring up the* **Attribute Data** *panel. To enter data, see* Attribute Data Panel.

Matching Using Name, Att Key and Segment Att Key:

Strings are first created via the ***Basic*** *node and given a string name of either the Entity Name or the text given in the Name column of the Basic Map File grid.*

Starting with the first line of the grid, matching and processing occurs as follows
If **Name, Att Key** *and* **Segment Att Key** *are not blank, and a match of the string name occurs with* **Name**, *a match of the string attributes occurs with* **Att Key** *and a match of the string segment attributes occurs with* **Segment Att Key**, *then the rest of the fields for this line of the Map File grid are used on this string segment.*
If **Name** *and* **Att Key** *are not blank, and* **Segment Att Key** *is blank, and a match of the string name occurs with* **Name** *and a match of the string attributes occurs with* **Att Key**, *then the rest of the fields for this line of the Map File grid are used on each string segment.*
If **Name** *and* **Segment Att Key** *are not blank, and* **Att Key** *is blank, and a match of the string name occurs with* **Name** *and a match of a string segment attribute occurs with* **Segment Att Key**, *then the rest of the fields for this line of the Map File grid are used on this string segment.*
If **Name** *in not blank and* **Att Key** *and* **Segment Att Key** *are blank, and a match of the string name occurs with* **Name**, *then the rest of the fields for this line of the Map File grid are used on each string segment.*

If **Name** *in blank then no match occurs and this line of the Map File grid is ignored.*

If a ***match occurs***, *then no tests for matches against* **Name**, **Att Key** *and* **Segment Att Key** *further down in the grid are made.*

If ***no match occurs***, *then this line of the map file grid is ignored and a test for a match is made against the next line of the grid.*

Note: all the fields on the line after **Segment Att Key** can have attribute substitution from segment attributes. See 8.8.3 Map File Substitution by Attributes.

Justify invert, centre, obvert

the justification for this segment of the pipe string.
This field can not be blank.

Shape diameter, culvert

sets whether this segment of the pipe is a round pipe or a rectangular pipe (culvert).

If **diameter**, *the segment is made a round pipe.*

If **culvert**, *the segment is made a rectangular pipe.*

This field can not be blank.

Note: *the shape can not be different from a shape set by Pipes >String*

Size 1 **measures** menu

for **Shape** *choice* **diameter**, *the diameter of this segments of the pipe is set to the value in* **Size 1**.
For **Shape** *choice* **culvert**, *the width of this segments of the pipe is set to the value in* **Size 1**.
This field can not be blank.

Size 2 **measures** menu

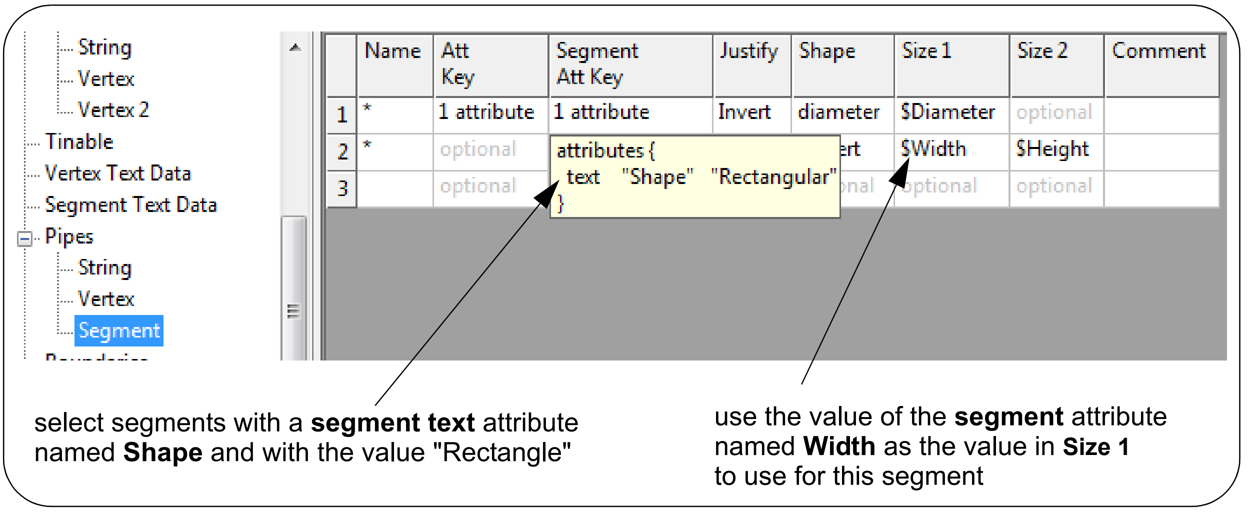
for **Shape** *choice* **culvert**, *the height of this segment of the pipe is set to the value in* **Size 2**.
for **Shape** *choice* **diameter**, *this field is ignored.*
This field can only be blank for a **Shape** *choice* **diameter**.

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

To assist in debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

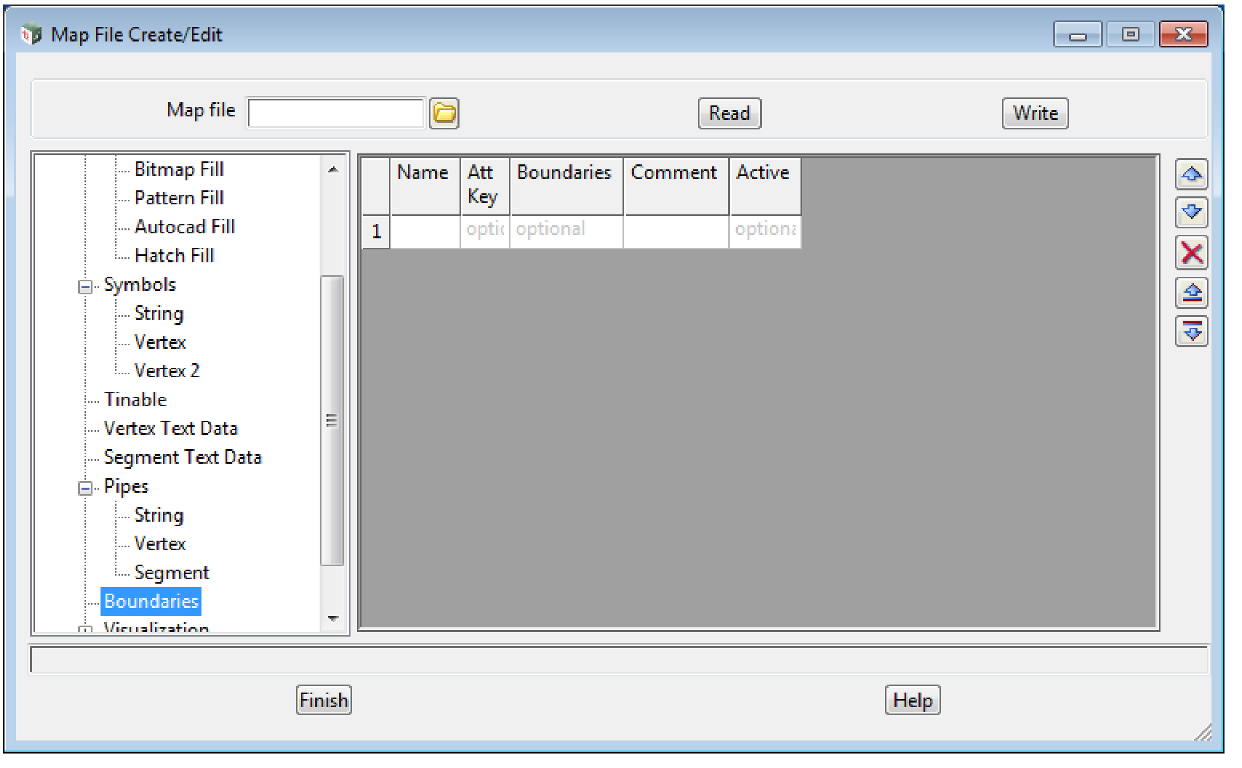
Example of Pipes >Segment



Go to the next section 8.8.1.9 Boundaries or return to 8.8.1.8 Pipes or 8.8.1 Create/Edit a Map File.

8.8.1.9 Boundaries

Boundaries sets an attribute for the string so that when it is used for Nulling of triangles in a Tin, the triangles inside the string will either be set to null (exclude), or set back to not null (include).



Processing Using Name and Att Key

when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* Matching Using Name and Att Key:*), the string is given a Boundaries value as defined in the parameters of the matching line.*

Name and Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key**, *and how to access* **Att Key**, *see* Name and Att Key.

Boundaries exclude, include

If ***exclude****, then any triangles inside the string are set to null.*

If ***include****, then any triangles inside the string are reset so that they aren't null.*

This field can not be blank.

This field can not be blank.

Note: **Boundaries** *can have attribute substitution from segment attributes. See* 8.8.3 Map File Substitution by Attributes.

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

To assist in debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Go to the next section 8.8.1.10 Visualization or return to 8.8.1 Create/Edit a Map File.

8.8.1.10 Visualization

Note that when any Visualization mapping is applied, it is additive. This means that these mappings are added to any existing visualization element of the super string. This allows for a number of extrusions or billboards to be applied on a mapping. It does have the unexpected result that if you run Map File **Apply** more than once, multiple instances of Visualization mappings can end up on a same string. For more information on extrusions, see 12.13.6 Extrusions.

For Visualisation >*Library Extrude*, go to 8.8.1.10.1 Visualisation >Library Extrude
String Extrude 8.8.1.10.2 Visualisation >String Extrude
Interval Extrude 8.8.1.10.3 Visualisation >Interval Extrude

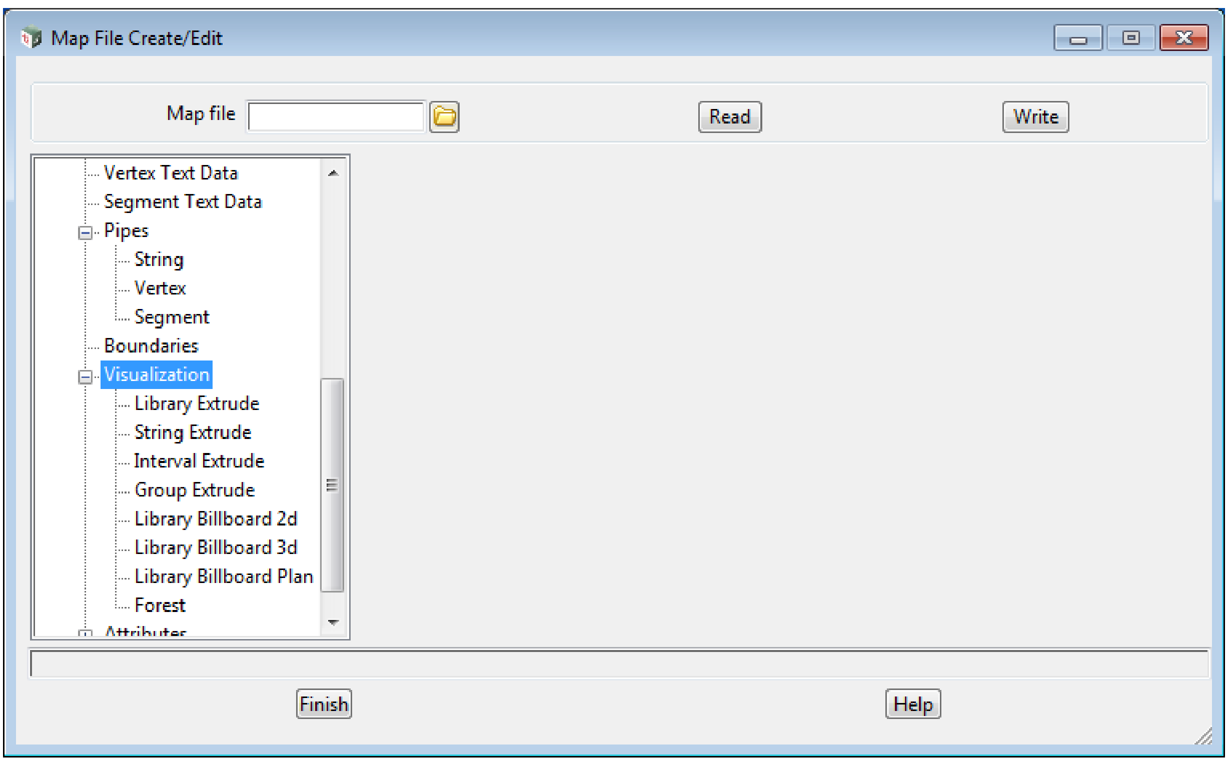
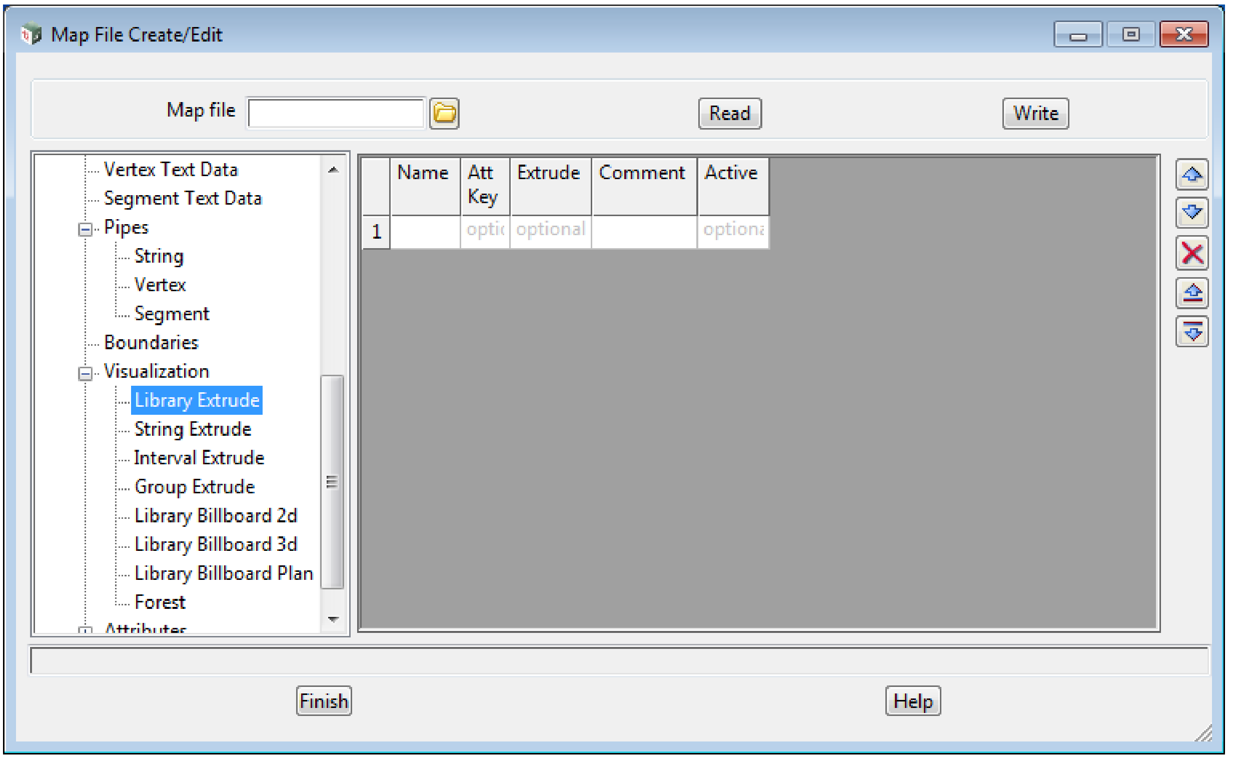
Library Billboard Plan 8.8.1.10.7 Visualisation >Library Billboard Plan
Forest 8.8.1.10.8 Visualisation >Forest



8.8.1.10.1 Visualisation >Library Extrude

Library Extrude applies an extrude from the 12d library to selected super strings. Note that extrudes can only be applied to super strings.



Processing Using Name and Att Key

when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* [Matching Using Name and Att Key:](#)*), the string is given the Library Extrude as defined in the parameter of the matching line.*

Name and Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key***, and how to access* **Att Key***, see* Name and Att Key.

Extrude **select extrudes** menu

the library extrude to apply to the super string. This extrude can any extrude type, and is applied to the entire length of the string.

Note: **Extrude** *can have attribute substitution from string attributes. See* 8.8.3 Map File Substitution by Attributes.

Comment and Active

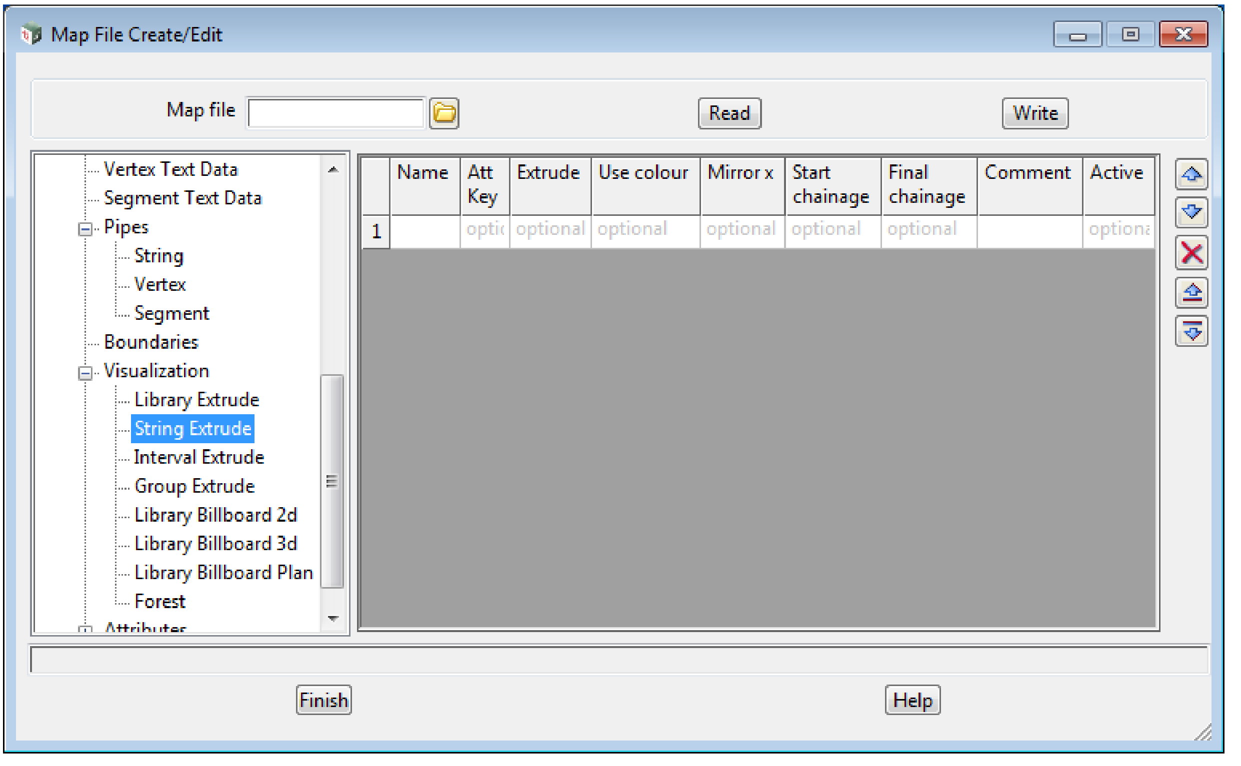
See 8.8.2 Comment and Active Column in Grids.

To assist in debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Go to the next section 8.8.1.10.2 Visualisation >String Extrude or return to 8.8.1.10 Visualization or 8.8.1 Create/Edit a Map File.

8.8.1.10.2 Visualisation >String Extrude

String Extrude applies an extrude to selected super strings. Note that extrudes can only be applied to super strings or super alignments.



Processing Using Name and Att Key

when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* Matching Using Name and Att Key:*), the string is given the extrude as defined in the parameter of the matching line.*

Name and Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name***.*
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key***.*
For further information on what is allowed in **Name** *and* **Att Key***, and how to access* **Att Key***, see* Name and Att Key*.*

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See 8.8.3 Map File Substitution by Attributes.

Extrude

the library extrude to be applied. This extrude must be of the type ***string extrude****.*

If ***blank****, no extrusion is applied.*

Use Colour

if ***yes****, the colours in the extrusion are used.*

If ***no*** *or* ***blank****, the colour of the super string is used.*

Mirror X

if ***yes****, the x values of the extrusion are mirrored. This allows for one extrusion definition to be used in both a left and right context.*

If ***no*** *or* ***blank****, not mirroring occurs.*

Start Chainage

*if **not blank**, the extrusion starts at this chainage.*
*If **blank**, the extrusion starts at the beginning of the string.*

Final Chainage

*if **not blank**, the extrusion ends at this chainage.*
*If **blank**, the extrusion end at the end of the string.*

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

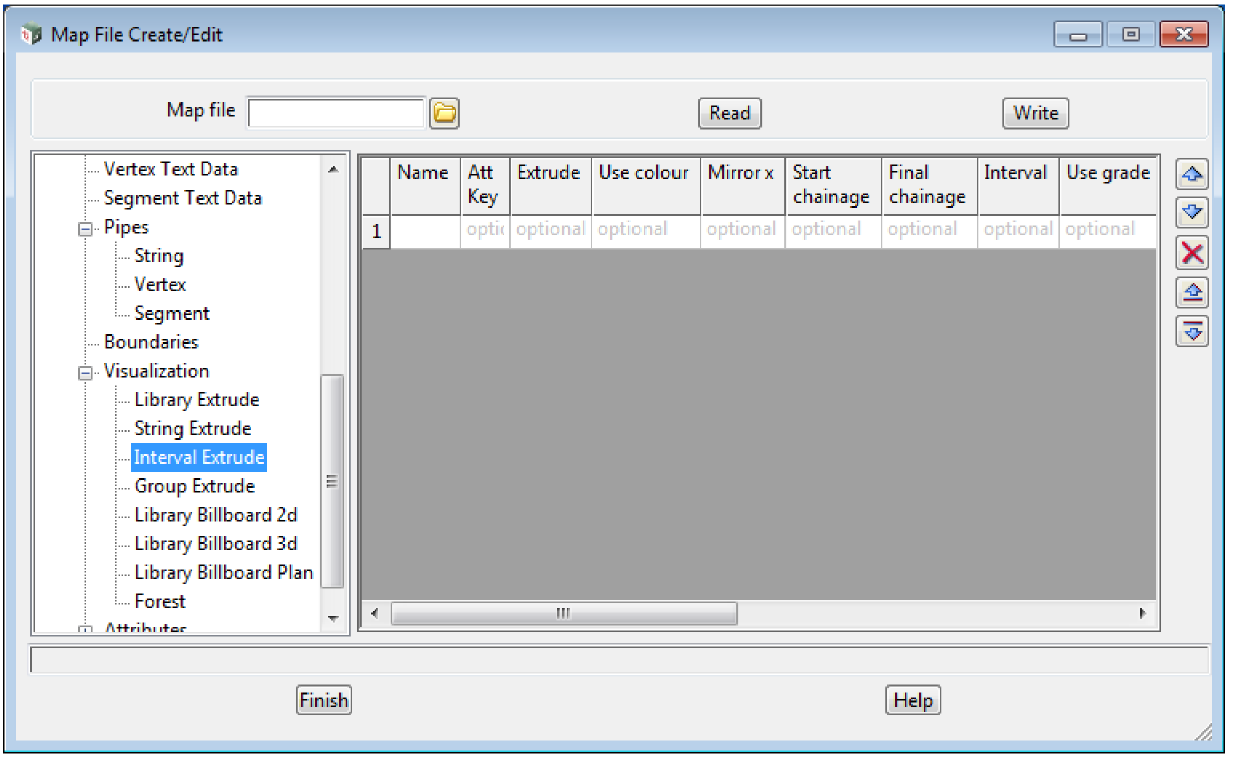
To assist in debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Go to the next section 8.8.1.10.3 Visualisation >Interval Extrude or return to 8.8.1.10 Visualization or 8.8.1 Create/Edit a Map File.

8.8.1.10.3 Visualisation >Interval Extrude

Interval Extrude applies an extrude to selected super strings. Note that extrudes can only be applied to super strings and super alignments. A typical use of interval extrudes is placing guide posts down the length of a string at a regular interval.The process here is that you reference an existing interval extrude, and can optionally apply one more components of a 3d transformation to it. For more information on transformations, see 12.13.8 3D Transformations.

Each **extrude** drawn at the interval will take the x,y,z, and direction from the string first, then any transformation is applied. So in the example of the post, if no transformation is applied, each post will be positioned on the string and oriented in the direction of the string.



Processing Using Name and Att Key

when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* Matching Using Name and Att Key:*), the string is given the interval extrude as defined in the parameters of the matching line.*

Name and Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key***, and how to access* **Att Key***, see* Name and Att Key.

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See 8.8.3 Map File Substitution by Attributes.

Extrude

the library extrude to be applied. This extrude must be of the type ***interval extrude***.
If ***blank****, no extrusion is applied.*

Use Colour

if ***yes****, the colours in the extrusion are used.*

*If **no** or **blank**, the colour of the super string is used.*

Mirror X

*if **yes**, the x values of the extrusion are mirrored. This allows for one extrusion definition to be used in both a left and right context.*

*If **no** or **blank**, not mirroring occurs.*

Start Chainage

*if **not blank**, the extrusion starts at this chainage.*

*If **blank**, the extrusion starts at the beginning of the string.*

Final Chainage

*if **not blank**, the extrusion ends at this chainage.*

*If **blank**, the extrusion end at the end of the string.*

Interval

the spacing between instances of the extrude along the string.

Use grade

*if **no** or **blank**, the interval extrude is drawn upright.*

*If **yes**, the interval extrude is on the same angle as the segment of the string it is on.*

X/Y/Z rotation

the relative rotation about the x/y/z-axis.

*If **blank**, no rotation is applied.*

X/Y/Z factor

the factor applied to x/y/z coordinates of the extrusion.

*If **blank**, no factor is applied.*

X/Y/Z offset

the offset applied to the x/y/z coordinate of each interval point on the string.

*If **blank**, no offset is applied.*

Comment and Active

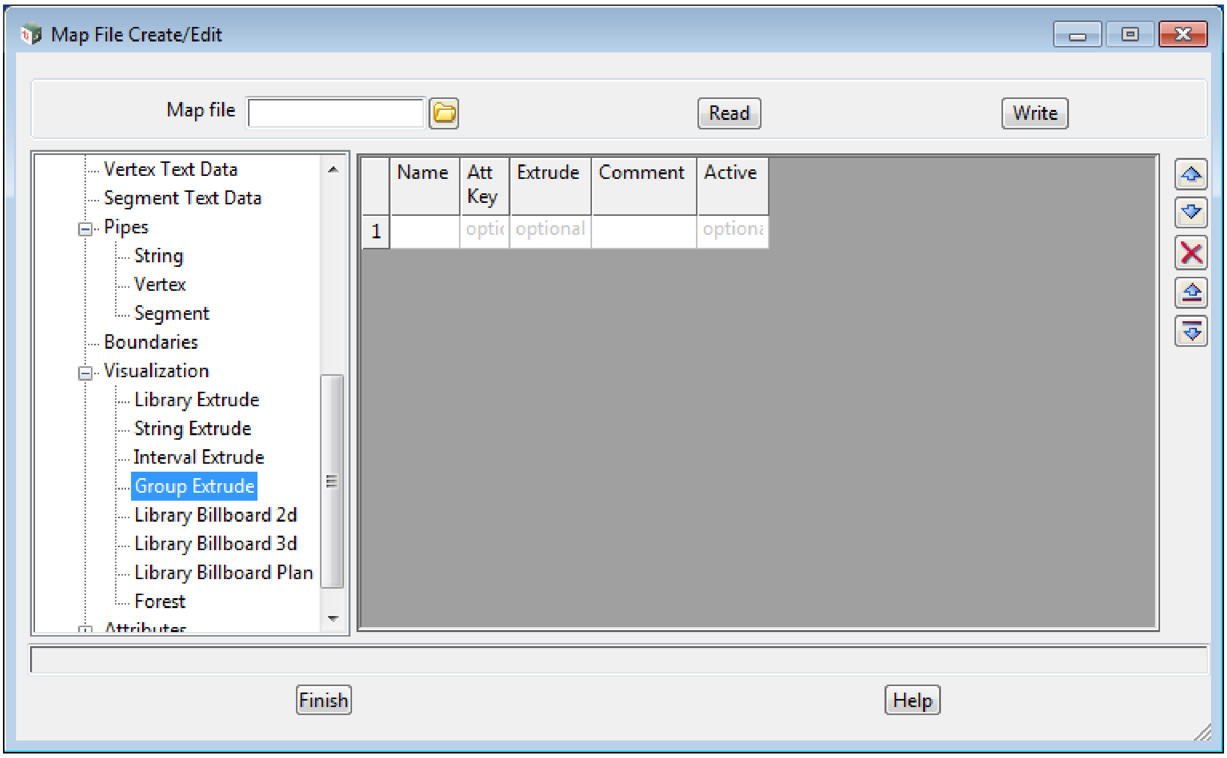
See 8.8.2 Comment and Active Column in Grids.

To assist in debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Go to the next section 8.8.1.10.4 Visualisation >Group Extrude or return to 8.8.1.10 Visualization or 8.8.1 Create/Edit a Map File.

8.8.1.10.4 Visualisation >Group Extrude

Group Extrude applies a group extrude to selected super strings. Note that extrudes can only be applied to super strings, or super alignments.



Processing Using Name and Att Key

when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* Matching Using Name and Att Key:*), the string is given the group extrude as defined in the parameter of the matching line.*

Name and Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key***, and how to access* **Att Key***, see* Name and Att Key.

Extrude

the library extrude to be applied. This extrude must be of the type ***group extrude***.

If ***blank****, no extrusion is applied.*

Note*:* **Extrude** *can have attribute substitution from string attributes. See* 8.8.3 Map File Substitution by Attributes.

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

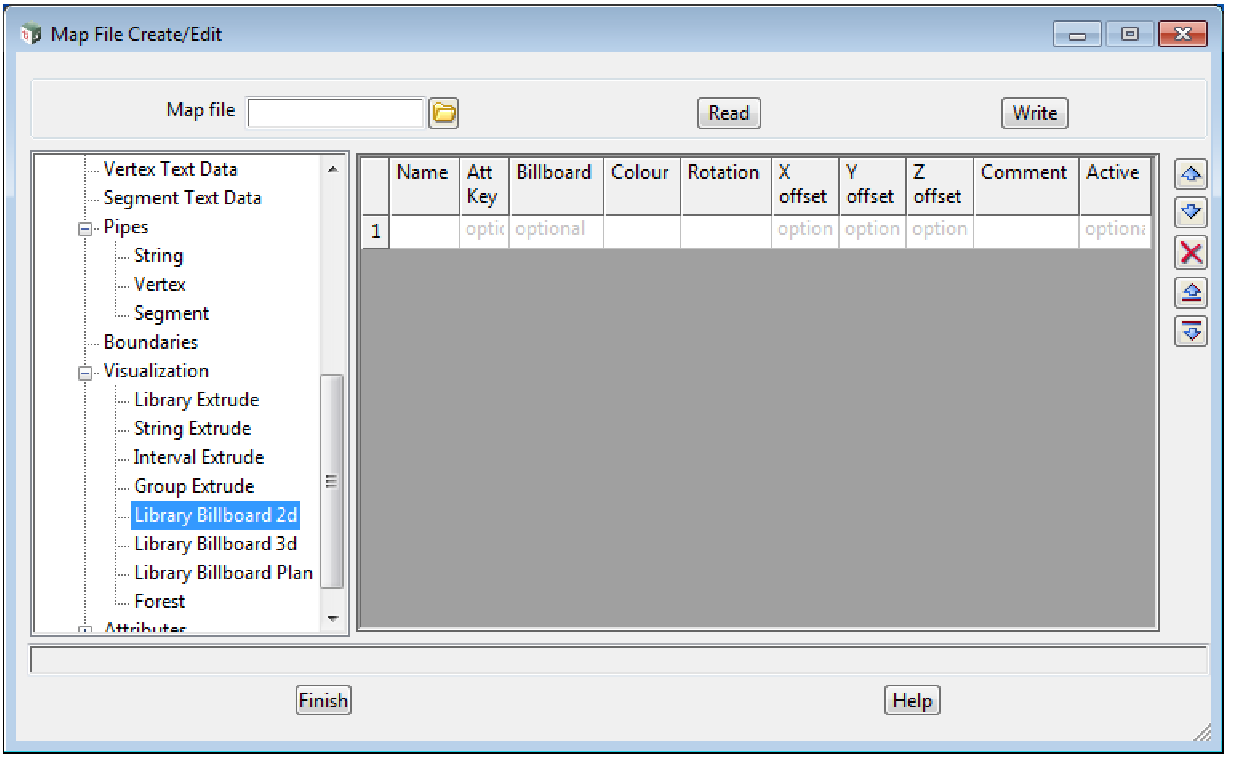
To assist in debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Go to the next section 8.8.1.10.5 Visualisation >Library Billboard 2d or return to 8.8.1.10 Visualization or 8.8.1 Create/Edit a Map File.

8.8.1.10.5 Visualisation >Library Billboard 2d

This section of documentation is a work in progress and will be updated in subsequent releases.

The process here is that you reference a library billboard, and can optionally apply one more components of a 3d transformation to it. For more information on transformations, see 12.13.8 3D Transformations. For more information on library billboards, see 12.13.5 Billboards.



Processing Using Name and Att Key

when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* Matching Using Name and Att Key:*), the string is given the a library 2d billboard as defined in the parameter of the matching line.*

Name and Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key***, and how to access* **Att Key***, see* Name and Att Key.

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See 8.8.3 Map File Substitution by Attributes.

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

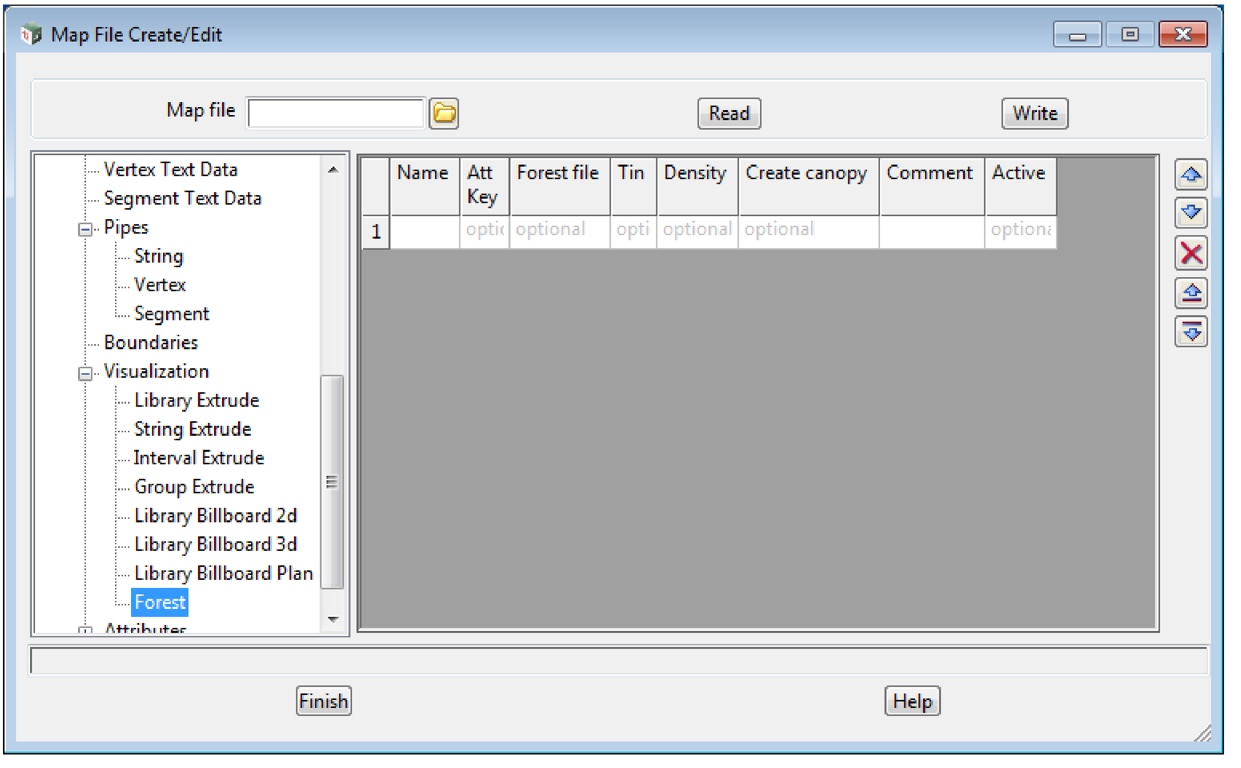
To assist in debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Go to the next section 8.8.1.10.8 Visualisation >Forest or return to 8.8.1.10 Visualization or 8.8.1 Create/Edit a Map File.

8.8.1.10.8 Visualisation >Forest

Forest applies a Forest file to selected strings. If a string is open then its is taken as closed by joining the first and last points before applying the Forest file.

This section of documentation is a work in progress and will be updated in subsequent releases.



Processing Using Name and Att Key

when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* Matching Using Name and Att Key:*), a forest file is applied to the string as specified by the parameter of the matching line.*

Name and Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key***, and how to access* **Att Key***, see* Name and Att Key.

Note: all the fields on the line after **Att Key** can have attribute substitution from string attributes. See 8.8.3 Map File Substitution by Attributes.

Forest file

the name of the Forest file to use for the string.

Tin

the tin to put the base on the trees on

Density

the number of tries per hectare

Create canopy

Comment and Active

See 8.8.2 Comment and Active Column in Grids.

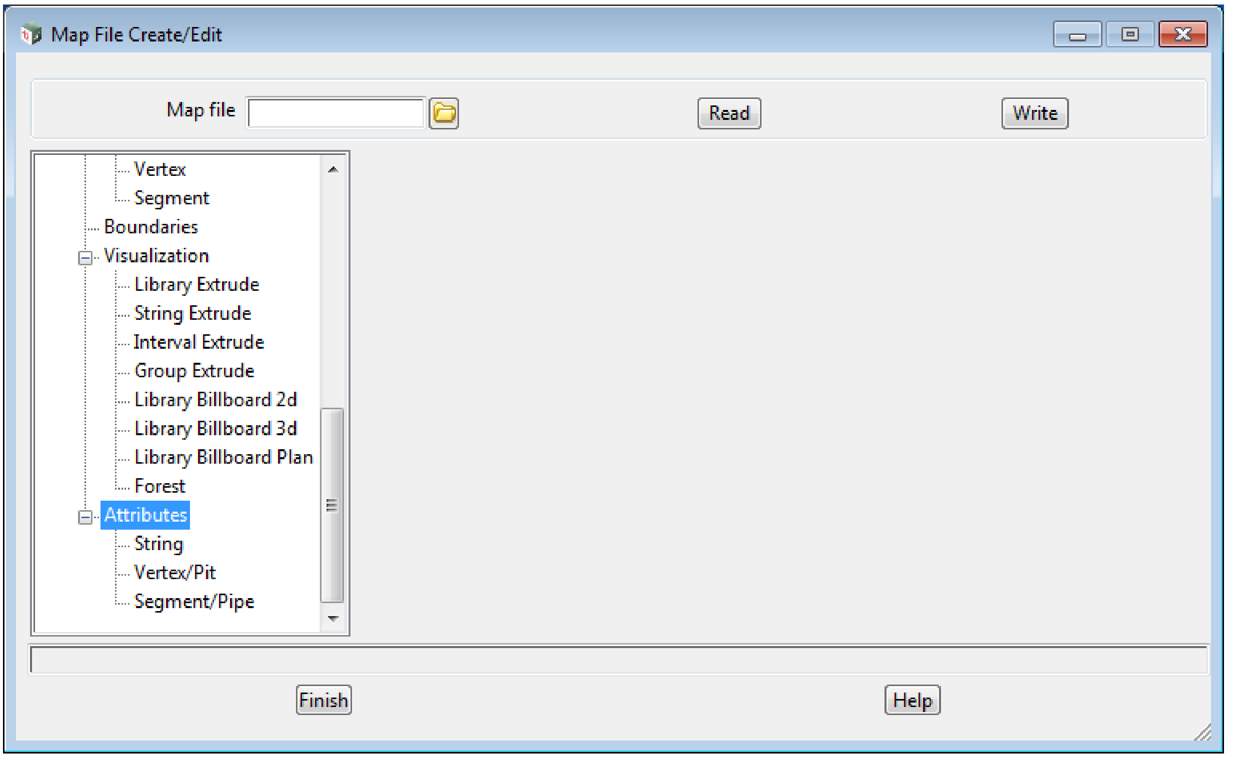
To assist in debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Go to the next section 8.8.1.11 Attributes or return to 8.8.1.10 Visualization or 8.8.1 Create/Edit a Map File.

8.8.1.11 Attributes

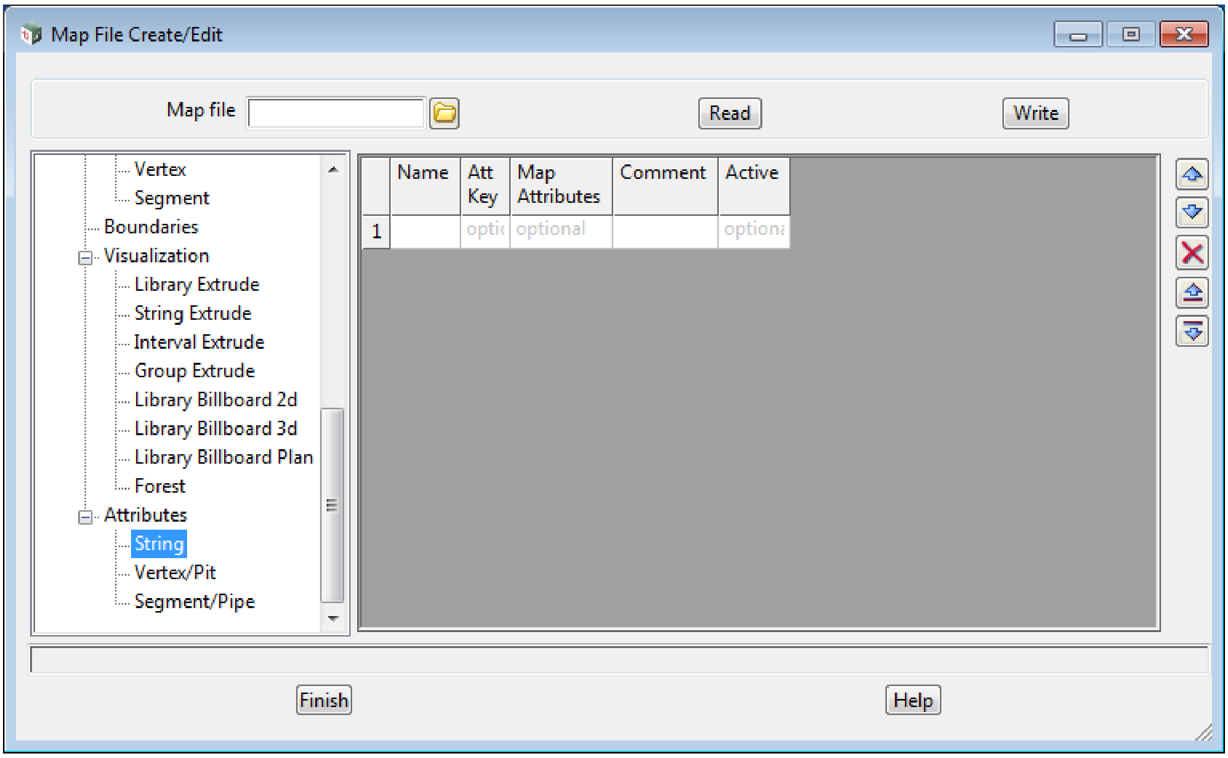
The **Attributes** node in the ***Map File*** which is used to apply attributes to Strings, Vertices and/or Segments.

For information on *String*, go to 8.8.1.11.1 Attributes >String
Vertex 8.8.1.11.2 Attributes >Vertex/Pit
Segment 8.8.1.11.3 Attributes >Segment/Pipe



8.8.1.11.1 Attributes >String

Strings matches on string name and string attributes and adds the attributes in the ***Map Attributes*** column to the string.



Processing Using Name and Att Key for Attributes>String Node

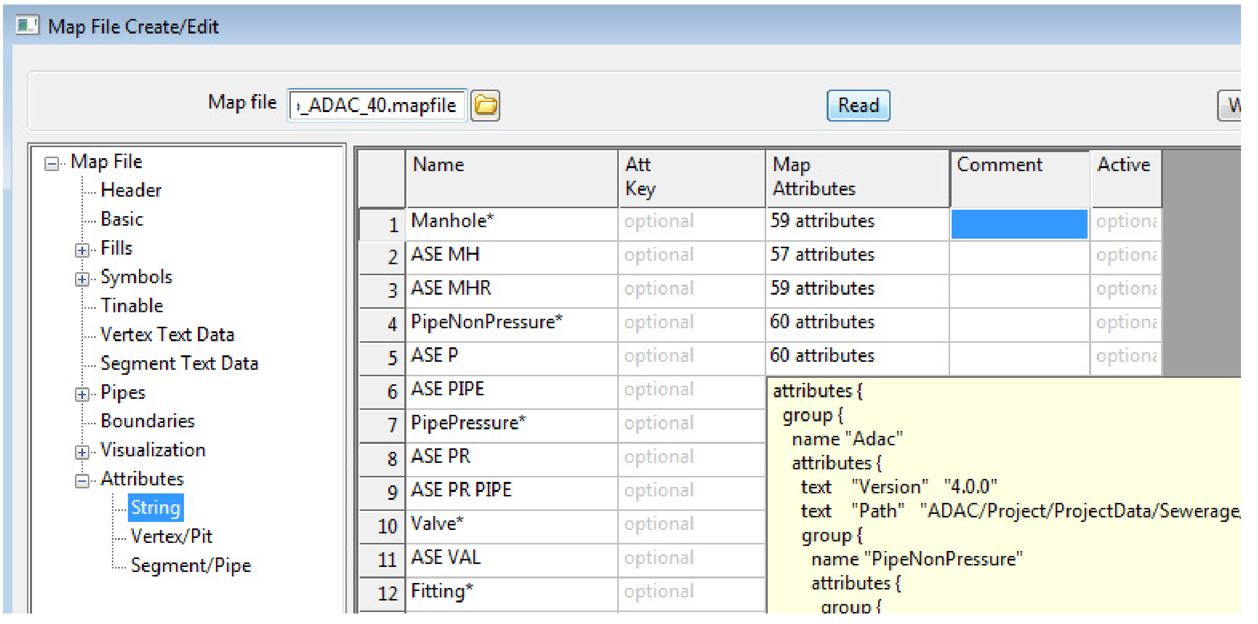
when a string finds a first match with **Name** *and* **Att Key** *in the grid (see* [Matching Using Name and Att Key:](#)*), the Map Attributes are added as string attributes to the matching string.*

Name and Att Key

Name *is at Text grid. The* ***string name*** *is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The* ***string attributes*** *are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key**, *and how to access* **Att Key**, *see* [Name and Att Key](#).

Map Attributes

attributes that are added as string attributes.



Comment and Active

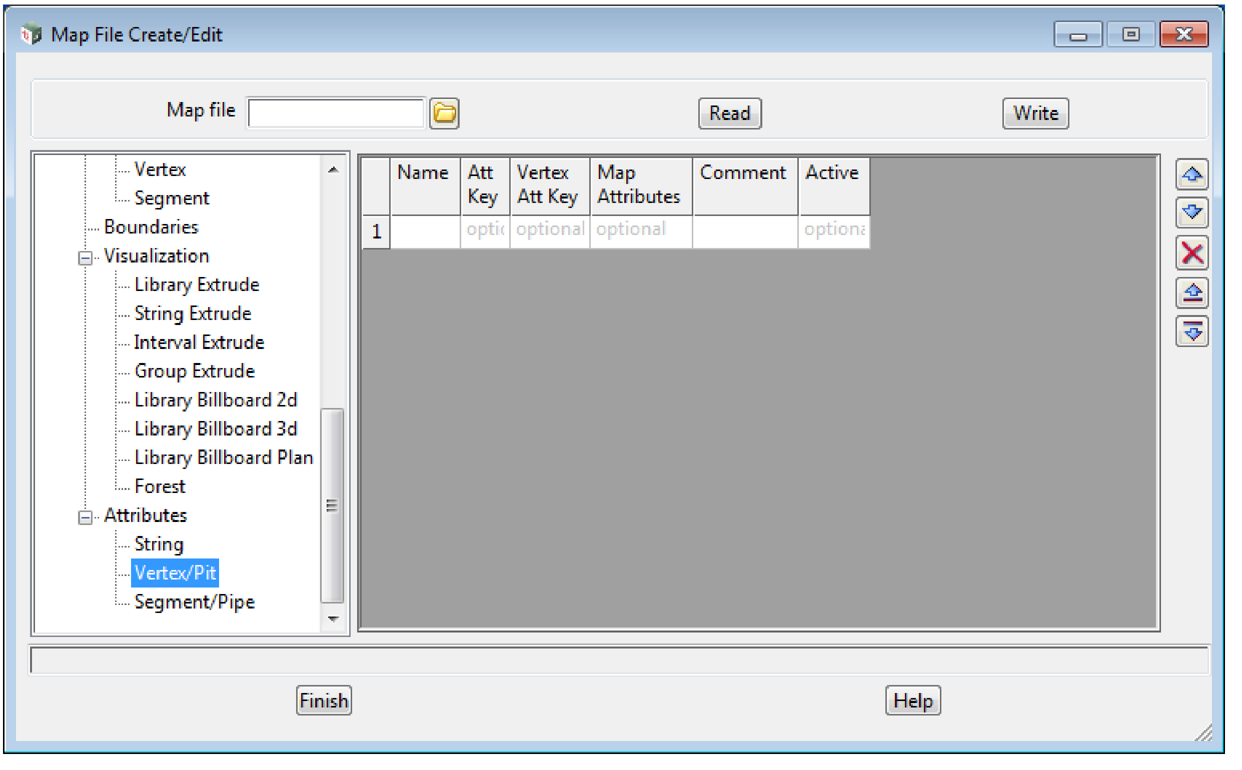
See 8.8.2 Comment and Active Column in Grids.

To assist in debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Go to the next section 8.8.1.11.1 Attributes >String or return to 8.8.1.11 Attributes or 8.8.1 Create/Edit a Map File.

8.8.1.11.2 Attributes >Vertex/Pit

Vertex/Pit matches on string name, string attributes and vertex attributes and adds the attributes in the ***Map Attributes*** column as vertex attributes to the selected vertex of the super string or drainage string.



Processing Using Name, Att Key and Vertex Att Key

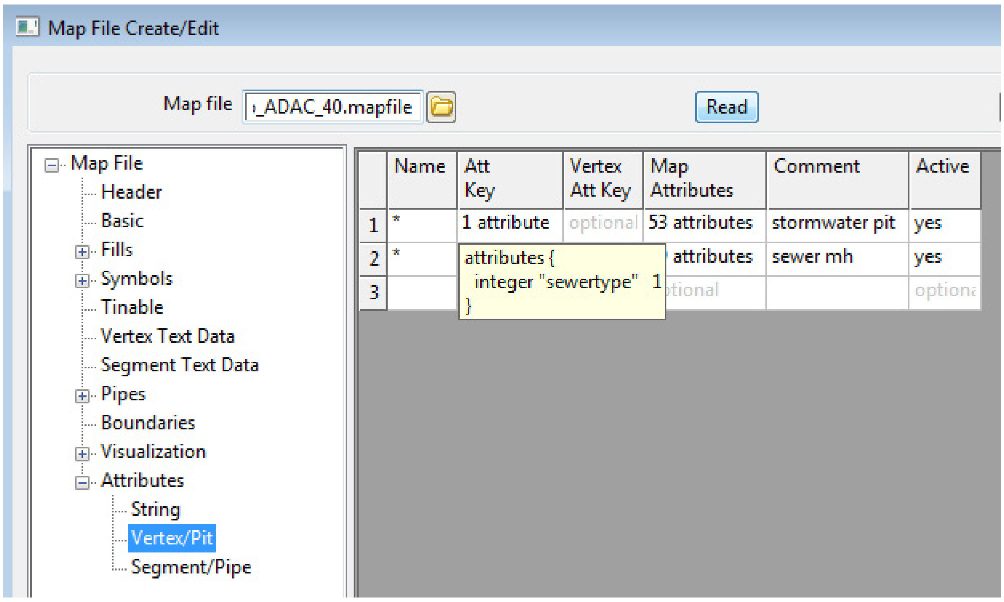
when a string finds a first match with **Name**, **Att Key** *and* **Vertex Att Key** *in the grid (see* Matching Using Name, Att Key and Vertex Att Key:*), the selected vertex has the attributes in **Map Attributes** added to it.*

Name, Att Key and Vertex Att Key

Name *is at Text grid. The **string name** is matched against* **Name**.
Att Key *is an Attribute Data grid cell. The **string attributes** are matched against the attribute details in* **Att Key**.
Vertex Att Key *is an Attribute Data grid cell. The **vertex attributes** are matched against the attribute details in* **Att Key**.
For further information on what is allowed in **Name** *and* **Att Key**, *and how to access* **Att Key**, *see* Name, Att Key and Vertex Att Key.

Map Attributes

attributes that are added as vertex/pit attributes.



Comment and Active

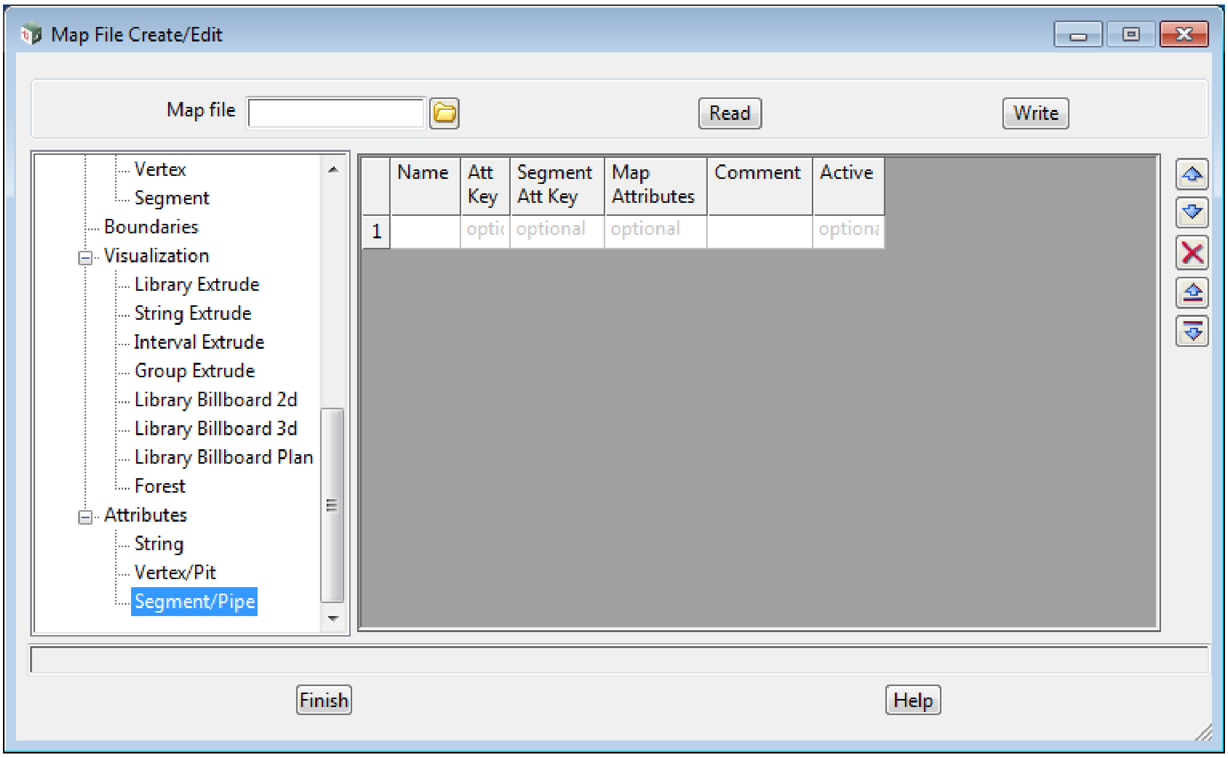
See 8.8.2 Comment and Active Column in Grids.

To assist in debugging a ***Map File***, match logging can be turned on. *See* 8.8.4 Map File Logging.

Go to the next section 8.8.1.11.3 Attributes >Segment/Pipe or return to 8.8.1.11 Attributes or 8.8.1 Create/Edit a Map File.

8.8.1.11.3 Attributes >Segment/Pipe

Segment/Pipe matches on string name, string attributes and vertex attributes and adds the attributes in the ***Map Attributes*** column as segment attributes to the selected segment of the super string or drainage string.



Processing Using Name, Att Key and Segment Att Key

when a string finds a first match with **Name**, **Att Key** *and* **Segment Att Key** *in the grid (see* Matching Using Name, Att Key and Segment Att Key:*), the selected segments has the attributes in* ***Map Attributes*** *added to it*

Name, Att Key and Segment Att Key

Name *is at Text grid and the text entered into* **Name** *can include wild cards* ***** *and wild characters* ***?****.*
The string name is matched against **Name**. *This field can not be blank.*
Att Key *is an Attribute Data grid cell which contains the definition of the attributes and their values that are to be matched against. There can be more than one attribute in the Attribute Data but they must have unique names.*
The ***string*** *attributes are matched against the attribute details in* **Att Key.**
Segment Att Key *is an Attribute Data grid cell which contains the definition of the segment attributes and their values that are to be matched against. There can be more than one segment attribute in the Attribute Data but they must have unique names.*
The ***segment*** *attributes are matched against the attribute details in* **Segment Att Key**.
To access ***Att Key*** *or* **Segment Att Key** *data, click LB on the* ***Att Key/*** **Segment Att Key** *field to highlight the field, then click LB again to bring up the* **Attribute Data** *panel. To enter data, see* Attribute Data Panel.

Matching Using Name, Att Key and Segment Att Key:

Strings are first created via the ***Basic*** *node and given a string name of either the Entity Name or the text given in the Name column of the Basic Map File grid.*
Starting with the first line of the grid, matching and processing occurs as follows
If **Name, Att Key** *and* **Segment Att Key** *are not blank, and a match of the string name occurs with* **Name**, *a match of the string attributes occurs with* **Att Key** *and a match of the string segment attributes*

occurs with **Segment Att Key**, *then the rest of the fields for this line of the Map File grid are used on this string segment.*

If **Name** *and* **Att Key** *are not blank, and* **Segment Att Key** *is blank, and a match of the string name occurs with* **Name** *and a match of the string attributes occurs with* **Att Key**, *then the rest of the fields for this line of the Map File grid are used on each string segment.*

If **Name** *and* **Segment Att Key** *are not blank, and* **Att Key** *is blank, and a match of the string name occurs with* **Name** *and a match of a string segment attribute occurs with* **Segment Att Key**, *then the rest of the fields for this line of the Map File grid are used on this string segment.*

If **Name** *in not blank and* **Att Key** *and* **Segment Att Key** *are blank, and a match of the string name occurs with* **Name**, *then the rest of the fields for this line of the Map File grid are used on each string segment.*

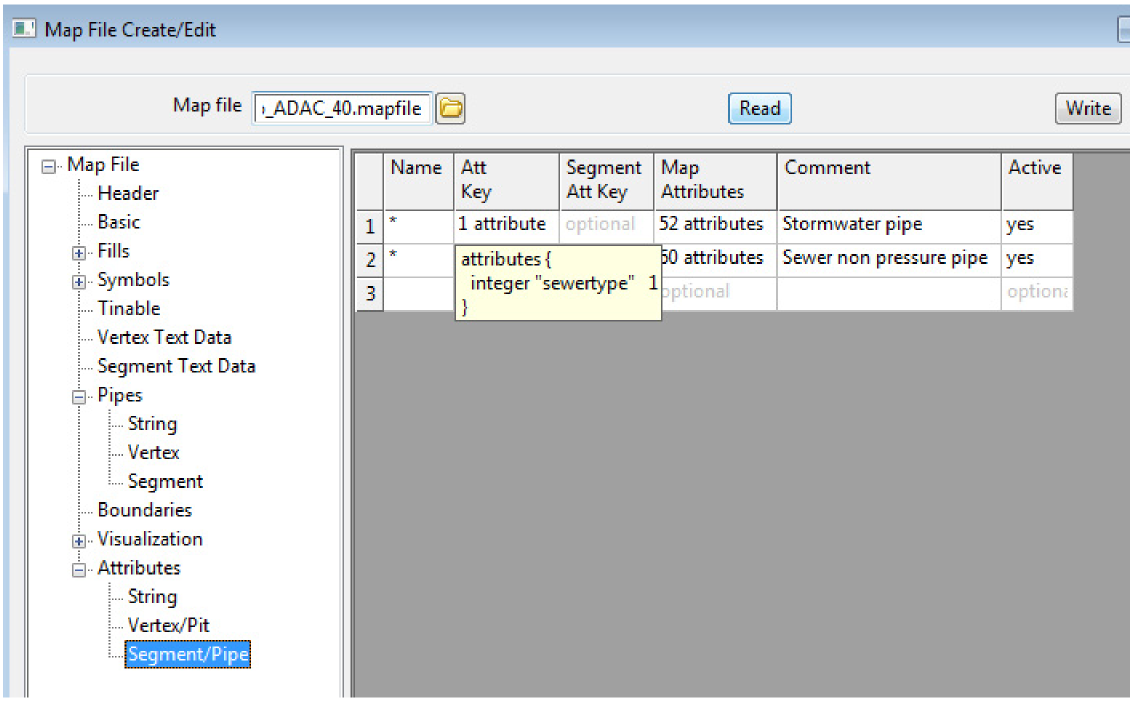
If **Name** *in blank then no match occurs and this line of the Map File grid is ignored.*

If a ***match occurs***, *then no tests for matches against* **Name**, **Att Key** *and* **Segment Att Key** *further down in the grid are made.*

If ***no match occurs***, *then this line of the map file grid is ignored and a test for a match is made against the next line of the grid.*

Map Attributes

attributes that are added as segment/pipe attributes.



Comment and Active

See 8.8.2 Comment and Active Column in Grids.

To assist in debugging a *Map File*, match logging can be turned on. *See* 8.8.4 Map File Logging.

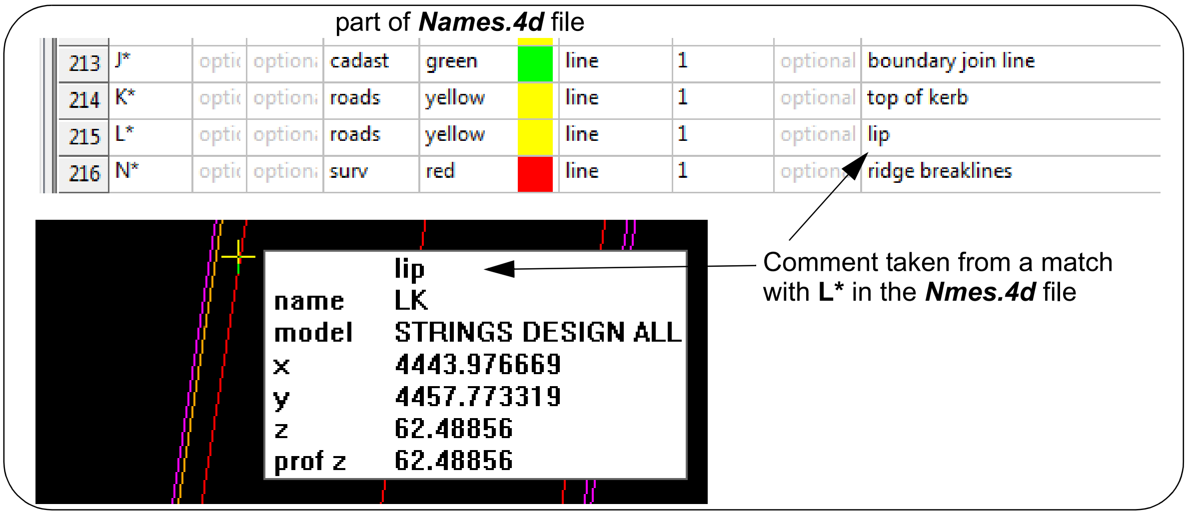
Go to the next section 8.8.3 Map File Substitution by Attributes or return to 8.8.1.11 Attributes or 8.8.1 Create/Edit a Map File or 8.8 Map Files.

8.8.2 Comment and Active Column in Grids

Comment

comment to be to be used in this line of the map file or names files.

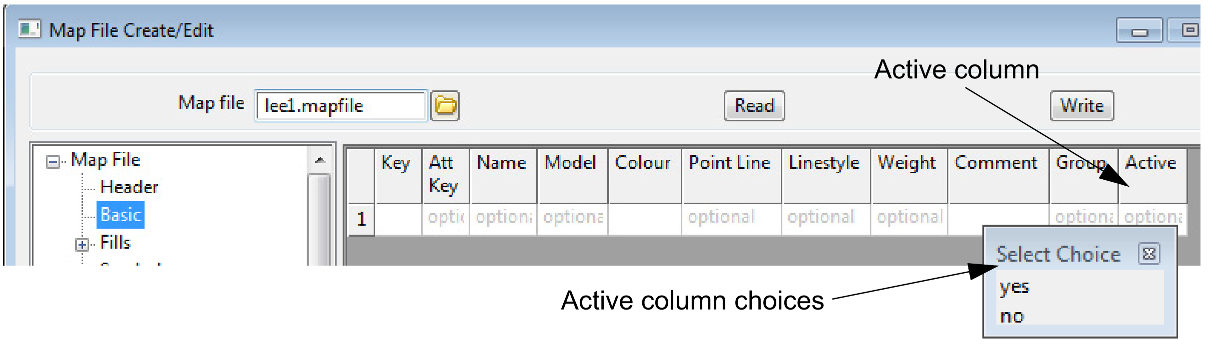
When there is a comment in the ***names.4d*** *file and* ***Data tooltips*** *are turned on (****D*** *snap) and a string matches a row in the* ***Names.4d*** *file with a comment, then the comment is displayed at the top of the Data Tool tip.*



Active

There is an **Active** *column in each grid so that the individual rows of the grid can be turned off and so not used. This means that the row does not have to be deleted.*

If the value in the Active column for a row column is left ***blank****, then the row is used.*
If the value in the Active column for a row column is ***yes****, then the row is used.*
If the value in the Active column for a row column is ***no****, then the row is* ***not*** *used.*



Return to 8.8 Map Files.

8.8.3 Map File Substitution by Attributes

Once there has been a first match for an element with the **Name and Att key (or Vertex Att key or Segment Att key)** of a line in the grid, the remaining fields in the rest of the grid line are applied to the element.

To increase the usefulness of the remaining fields in the line, it is possible to use the ***value of an attribute*** from the element, rather then just the static value in the field.

To use the value of an attribute in the gird field, simply ***specify the attribute pathname prefixed by the $ sign***.

For example, if it was the ***Tinable*** section of the Map File (see 8.8.1.5 Tinable,) and the tinability of the string is to be given by a string attribute called ***12d Field/My Tinability***, type

$12d Field/My Tinability

into the ***Tinable*** cell of the grid.

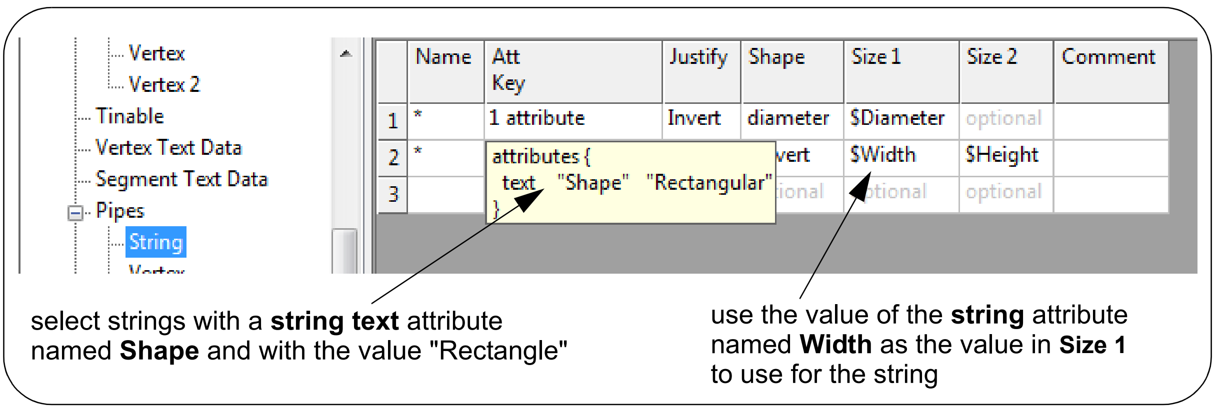
So **$** denotes the start of the attribute substitution.

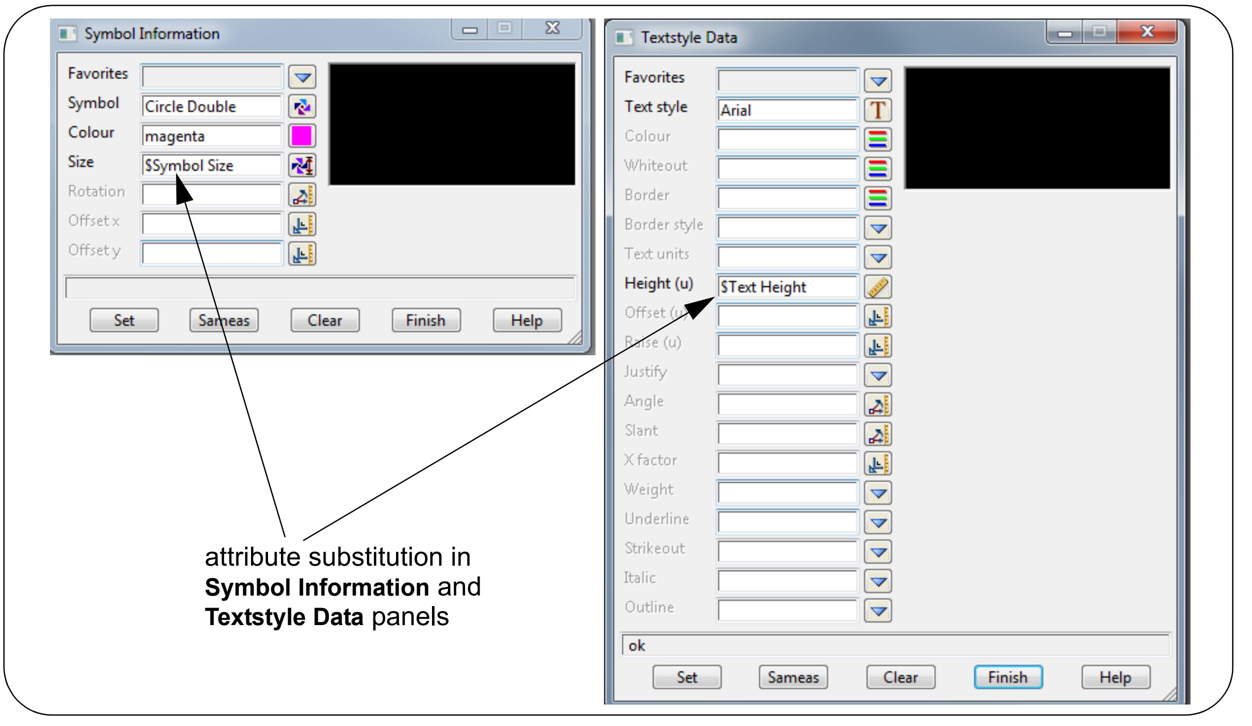
The ***value of the attribute*** must be a **valid** answer (in the case of the Tinable cell, it must be **no**, **yes**, or **point**). If the value of the attribute is **not** a valid answer, a logline in the output window will be generated to identify the element in error and the line in the mapfile.

Note that the **$** character must be the first character in the field, and that the rest of the field is taken as the attribute pathname so quotes should not be used even if there are spaces in the attribute pathname. Hence only one attribute can be used in the substitution process for a grid cell.

Remember that attribute names are case sensitive and in the case where more than one attribute of the same name exists, the first attribute found will be used.

Note - Attribute substitution is valid in the **Textstyle Data** and **Symbol Information** panels on a grid line.





An Important Restriction

There is currently no way of distinguishing between string, vertex or segment attributes in the grid cells.

So if you are in a section of the Map File that has:

(a) only an **Att Key**, then ***only string attributes*** can be used for substitution in the grid cells in that section. For example 8.8.1.5 Tinable.

(b) an **Att Key** and a **Vertex Att Key** then ***only vertex attributes*** can be used for substitution in the grid cells in that section. For example 8.8.1.4.2 Symbols >Vertex.

(c) an **Att Key** and a **Segment Att Key** then ***only segment attributes*** can be used for substitution in the grid cells in that section. For example 8.8.1.8.3 Pipes >Segment.

Go to the next section 8.8.4 Map File Logging or return to 8.8 Map Files.

8.8.4 Map File Logging

To help determine what is going on, or not going on, when using a Map File, ***Logging*** can be turned on.

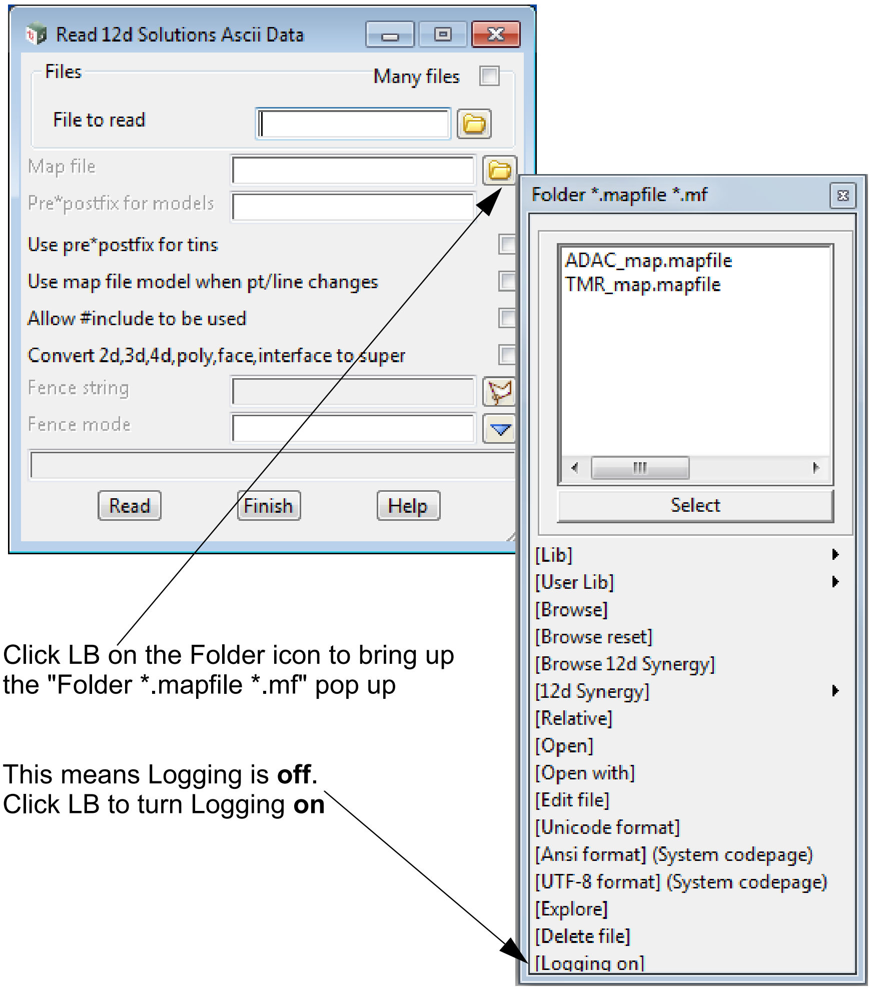
When turned on, as a Map File processes the data and a match occurs, an entry is written to the ***Output Window*** giving in what section of the Map File section the match occurred, the line number of that section of the grid that the match occurred (written as item number), and by clicking onto the created log line, the mapped object will be highlighted.

To turn **Map File Logging** on or off, click LB or RB on the folder icon at the end of the **Map File** panel field to bring up the ***Folder *mapfile *.mf*** pop up.

If **[Logging off]** is displayed then Logging is now turned **on** and clicking LB on [Logging off] will turn Logging off.

If **[Logging on]** is displayed then Logging is now turned **off** and clicking LB on [Logging on] will turn Logging on.

For example, when reading in a ***12da*** file, clicking LB on the **Map file** panel field brings up the ***Folder *mapfile *.mf*** pop up.



Note: Logging can generate a large number of log lines and this could affect the performance of ***12d Model***. So it is a good idea to save the project first, or run the logging in a temporary project.

Go to the next section 8.8.5 Apply Map File or return to 8.8 Map Files.

8.8.5 Apply Map File

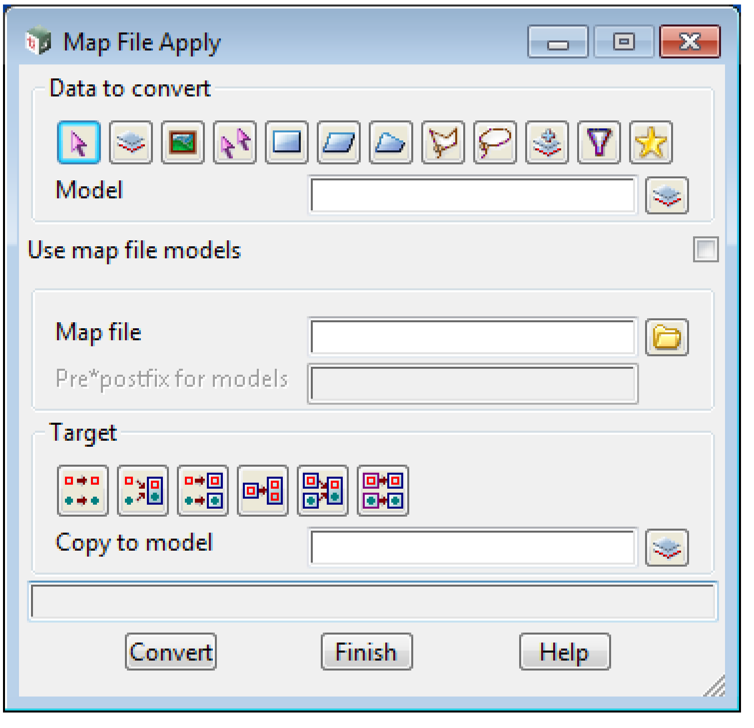
Position of option on menu: **File =>Map file =>Apply**

Position of option on menu: **Utilities =>H-Z =>Map**

Map applies a 12d Model Map File to the selected strings. The map file can be used to change string attributes such as string names, models, colours, breakline type and style, apply extrudes, apply polygon fills *etc*.

The layout and operation of a Map File is described in the section 8.8.1 Create/Edit a Map File.

Selecting **Map** displays the **Map File Apply** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to be mapped.

Use map file models	tick box		

*if **ticked**, use the models from the map file.*

*If **not ticked**, use the models from the Target.*

Map file	map file box		*.mapfile, *.mf files

the Map File to use.

Prefix for models	input		available models

*If **non-blank**, the* **prefix for models** *field gives the characters to be prepended and appended to the model names given in the Map File. The prepended and appended characters are entered into the* **prefix for models** *field, separated by a *. For example, **pre*pos** would add **pre** before each model name and **pos** after each model name. For prepend only, no * is required. The **pre** and **pos** can included spaces.*

Target type

data selection type - for a full description go to 4.19.3 Data Source.

Target info input

extra information required for the target.

Map button

run the option - process the selected strings

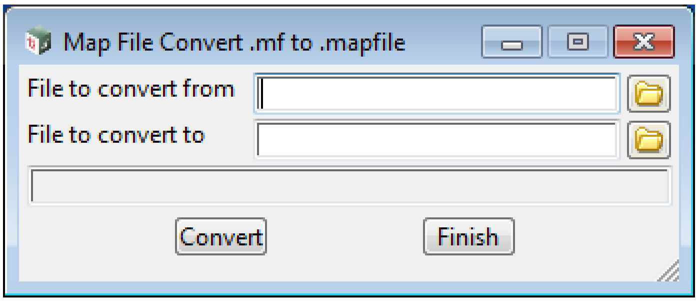
Go to the next section 8.8.6 Convert .mf Files to .mapfile or return to 8.8 Map Files.

8.8.6 Convert .mf Files to .mapfile

Position of option on menu: **File I/O =>Map files =>Convert .mf to .mapfile**

The **map file convert** option converts a map file in the pre-V9 format to the XML map file format introduced in ***12d Model 9***.

Selecting **Convert .mf to .mapfile** displays the **Map File Convert .mf to .mapfile** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File to convert from	file box		*.mf
name of the pre-V9 map file to be converted to the new map file format			
File to convert to	file box		*.mapfile
name of the new converted map file			
Convert	button		
convert a file in the pre-V9 map file format to the new map file format.			

Go to the next section 8.8.7 Create/Edit .mf File or return to 8.8 Map Files.

8.8.7 Create/Edit .mf File

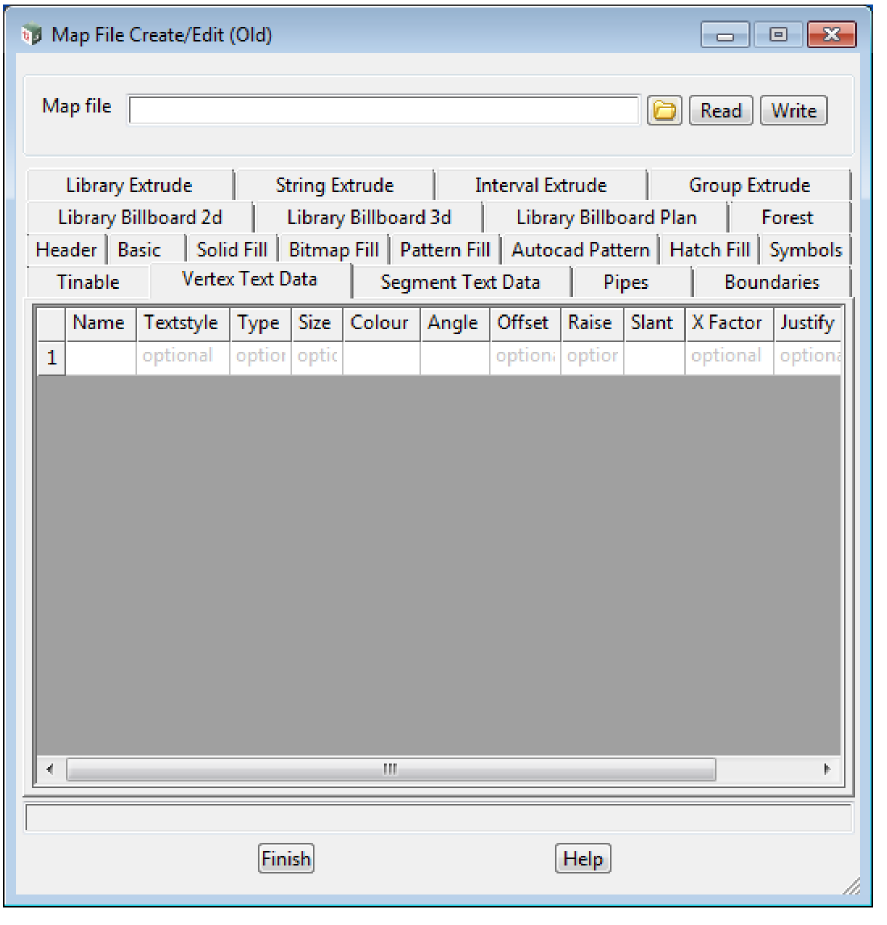
Position of option on menu: **File I/O =>Map files =>Create/edit .mf**

The **Create/edit .mf** option **creates** and/or **edit** the 12d Map Files in the pre-V9 format.

This old format is now superseded so the user should use 8.8.6 Convert .mf Files to .mapfile to convert old .mf files to the .mapfile format, or the option 8.8.1 Create/Edit a Map File does this conversion when you select a .mf file. This editor is only supplied for a while and will be removed in a future version.

Vertex Text Data

The **Vertex Text Data** tab sets parameters for drawing text on the vertices of super strings.



Key **select name** menu

key to match the string name against in the Vertex Text Data tab. The key can include wild cards (*) and wild characters (?).

If a match occurs, then the rest of the grid fields for this line of this tab of the map file are used and no other tests for matches against keys further down in the table are made.

If a match does not occur, then a test for a match is made against the key on the next line of this tab of the map file.

Textstyle **select text style** menu

the textstyle used for any vertex text for all strings matching the key.
This field can not be blank.

Type screen, paper, world

the textstyle type used for any vertex text for all strings matching the key. This field can not be blank.

Size **measures** menu

the size of the vertex text to be used for each vertex of all strings matching the key. This field can not be blank.

Colour **select colour** menu

the colour of the vertex text to be used for each vertex of all strings matching the key. This field can not be blank.

Angle **measures** menu

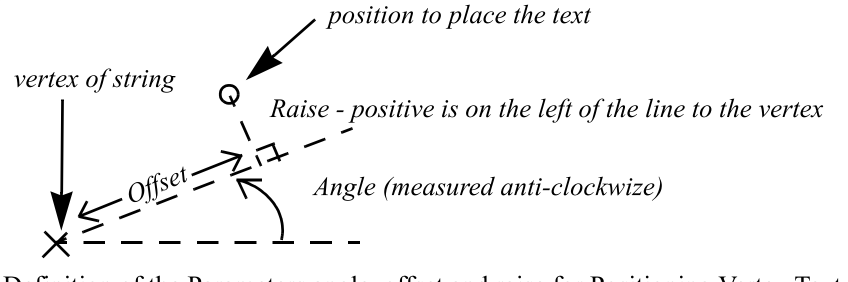
the angle of the vertex text to be used for each vertex of all strings matching the key. This field can not be blank.

Offset **measures** menu

the distance to offset the text from each vertex of the strings matching the key. This field can not be blank.

Raise **measures** menu

the distance to perpendicularly raise the text for each vertex of all strings matching the key. This field can not be blank.



Definition of the Parameters angle, offset and raise for Positioning Vertex Text

Slant **Measures** menu

the slant for the vertex text of all strings matching the key. This field can not be blank.

X factor **Measures** menu

the x-factor for the vertex text of all strings matching the key. This field can not be blank.

Justify **Select Justification Choice** menu

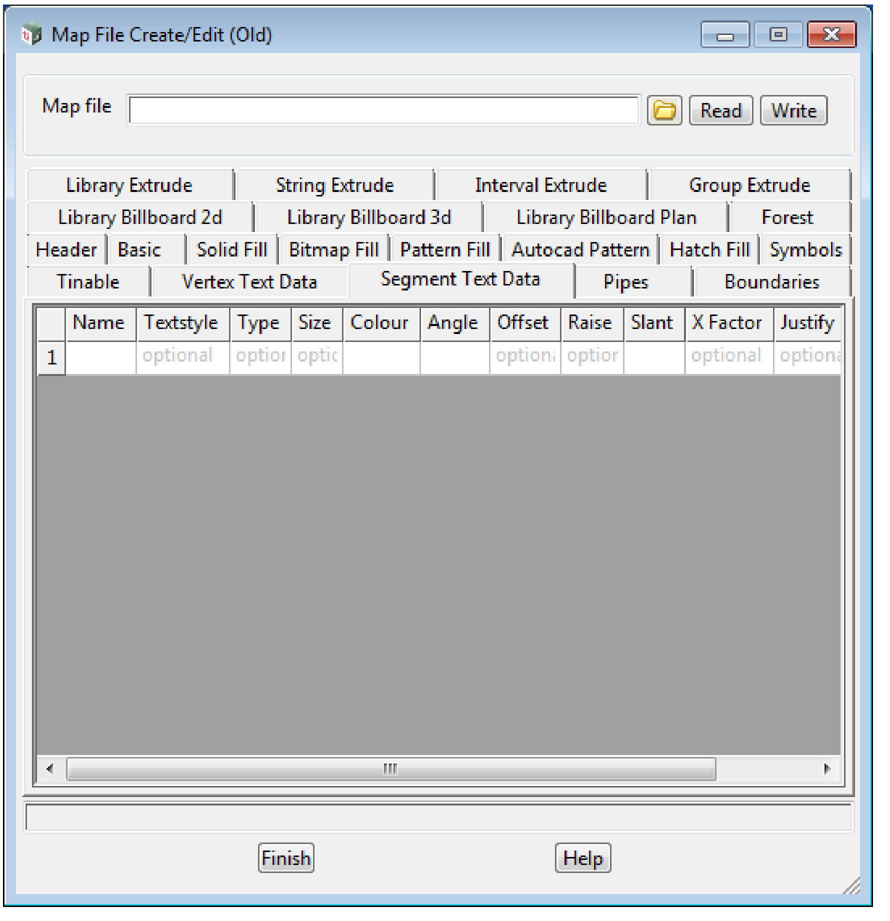
the justification for the vertex text of all strings matching the key. This field can not be blank.

Comment

comment to be to be used in this line of the map file. A double slash // is written out to the text map file before the comment, and a comment in an text map file is read in and displayed without the double slash.

Segment Text Data

the Segment Text Data tab sets parameters for drawing text on the segments of super strings. The text is positioned about the mid point of the segment.



Key **select name** menu

key to match the string name against in the ***Segment Text Data*** *tab. The key can include wild cards (*) and wild characters (?).*

If a match occurs, then the rest of the grid fields for this line of this tab of the map file are used and no other tests for matches against keys further down in the table are made.

If a match does not occur, then a test for a match is made against the key on the next line of this tab of the map file.

Textstyle **select text style** menu

the textstyle used for any segment text for all strings matching the key.
This field can not be blank.

Type screen, paper, world

the textstyle type used for any segment text for all strings matching the key.

This field can not be blank.

Size **measures** menu

the size of the segment text to be used for each segment of all strings matching the key.
This field can not be blank.

Colour **select colour** menu

the colour of the segment text to be used for each segment of all strings matching the key.
This field can not be blank.

Angle **measures** menu

the angle of the segment text to be used for each segment of all strings matching the key.

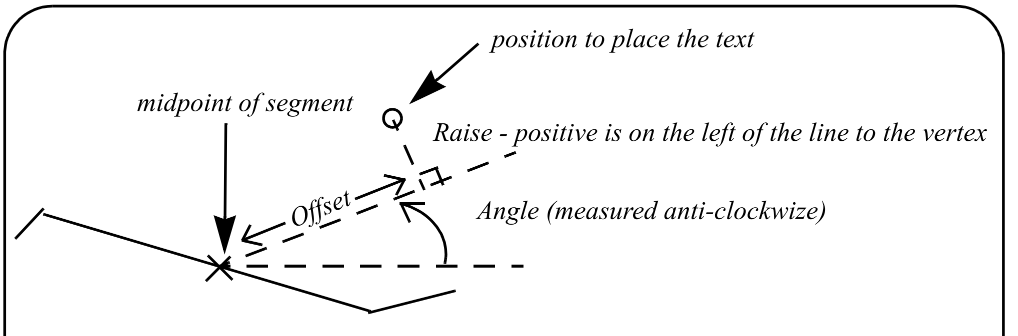
This field can not be blank.

Offset **measures** menu

the distance to offset the text from each segment of the strings matching the key. This field can not be blank.

Raise **measures** menu

the distance to perpendicularly raise the text for each segment of all strings matching the key. This field can not be blank.



Definition of the Parameters angle, offset and raise for Positioning Segment Text

Slant **Measures** menu

the slant for the segment text of all strings matching the key. This field can not be blank.

X factor **Measures** menu

the x-factor for the segment text of all strings matching the key. This field can not be blank.

Justify **Select Justification Choice** menu

the justification for the segment text of all strings matching the key. This field can not be blank.

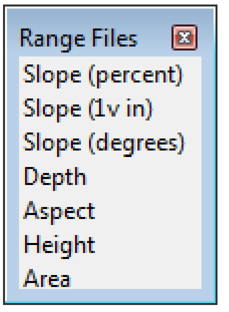
Comment

comment to be to be used in this line of the map file. A double slash // is written out to the text map file before the comment, and a comment in an text map file is read in and displayed without the double slash.

Go to the next section 8.9 Range Files or return to 8.8 Map Files.

8.9 Range Files

Position on menu: ***File =>Range files***



Range files consist of a list of ranges and colours, one set per line

lower_value upper_value range_colour

where this line represents all values satisfying

lower_value < value <= upper_value.

See

8.9.1 Percent Slope Range File
8.9.2 Degrees Slope Range File

Comment	text	

a comment for this line of the grid

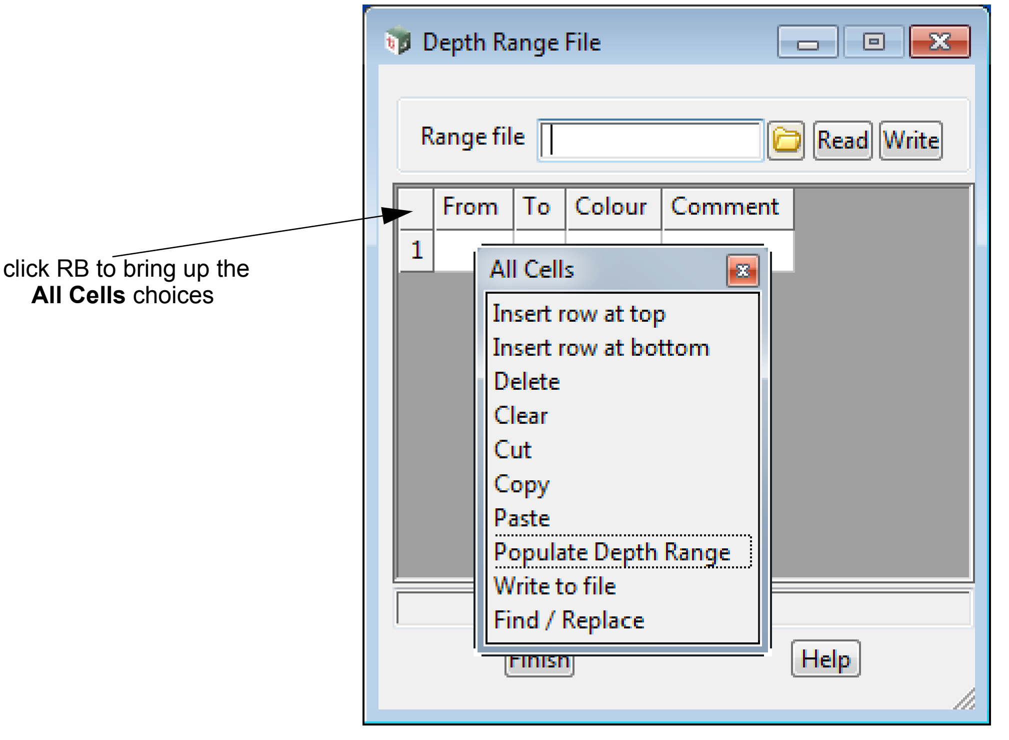
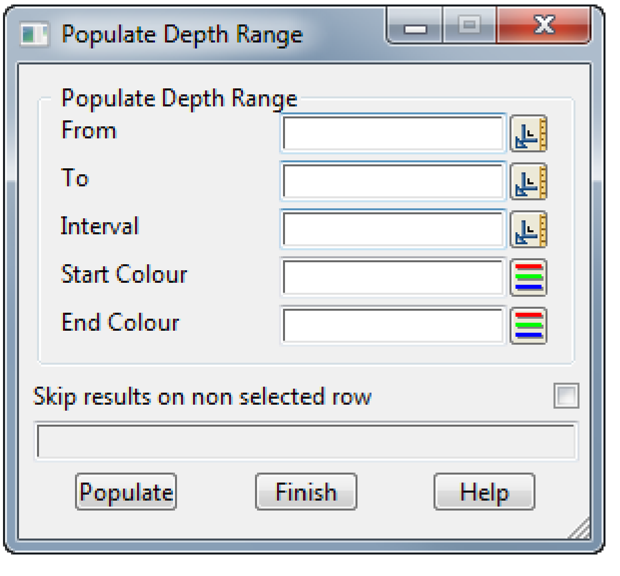
Go to the next section 8.9.8 Creating Ranges in a Range File or return to 8.9 Range Files.

8.9.8 Creating Ranges in a Range File

To quickly create a number of lines of ranges in a Range file, when a **Range File** panel is displayed, click RB in the blank cell at the top left hand corner of the grid title area (to the left of the **From** text) to bring up the **All Cells** choices and select **Populate Range.**



Selecting ***Populate Range*** brings up the **Populate Range** panel which is used to insert a number of range lines into the grid of the **Range File** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
From	real		

the lower value for the generated range

To real

the upper value for the generated range

Interval measure box

the interval between values for the generated range

Start colour colour box available colours

the start colour for the generated range. The colours are interpolated in RGB between the **Start colour** *and the* **End colour**.

End colour colour box available colours

the end colour for the generated range. The colours are interpolated in RGB between the **Start colour** *and the* **End colour**.

Skip results on non selected row tick box not ticked

Populate button

generate the defined grid lines and insert them into the grid. The new lines will be inserted at the highlighted grid lines and can replace any highlighted lines in the grid.

The ***Populate Range*** panel can be used a number of times to generate range lines in various colours.

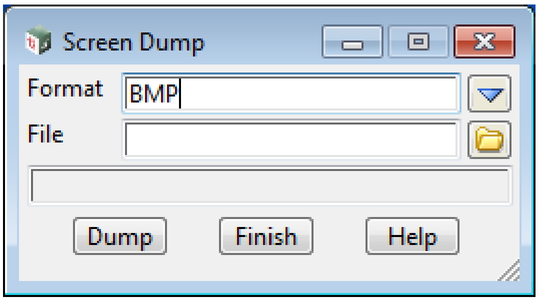
Return to 8.9 Range Files or continue to the next section 8.10 Screen Dump.

8.10 Screen Dump

Position of option on menu: **File I/O =>Screen dump**

The 12d Model screen can be dumped to disk in a variety of images formats, or as a screen layout file.

On selecting the **Screen dump** option, the **Screen Dump** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Format	choice box	BMP	
format to write the screen dump out in.

File	file box		*.bmp files

file to write the screen. dump to.

Dump	button		

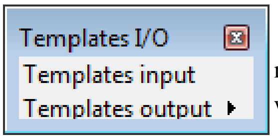
after selecting this button, the screen/window is dumped out in the selected format.

8.11 Templates

Position of menu: **File I/O =>Templates**

The option under **Template** read and write Design Template files.

The **Templates** walk-right menu is



read in a template file
write out template files

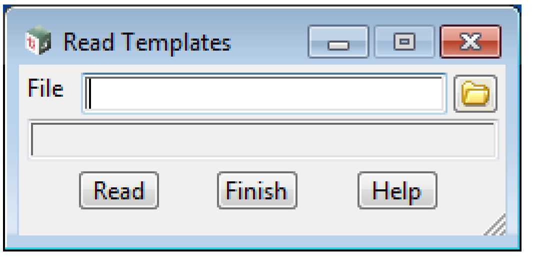
For *Templates input*, go to 8.11.1 Templates Input
Templates output 8.11.2 Templates Output

8.11.1 Templates Input

Position of option on menu: **File I/O =>Templates =>Templates Input**

This option is used to read in templates from files in the special 12d Model template format.

On selecting the **Templates input** option, the **Read Templates** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File	input		*.tpl files

name of the 12d template file to be read in

Read	button		

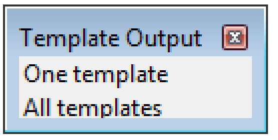
read the data in.

Note: If a template already exists, then the template in the file is ignored.

8.11.2 Templates Output

Position of menu: **File I/O =>Templates =>Templates Output**

The **templates output** option writes out one or all templates in the 12d Model template format. The **Output** walk-right menu is



For the option One template, go to 8.11.3 One Template

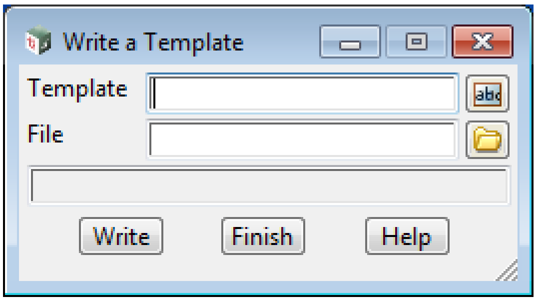
All templates 8.11.4 All Templates

8.11.3 One Template

Position of option on menu: **File I/O =>Templates =>Templates Output =>One Template**

This option is for writing a single template out in the special 12d template format.

On selecting the **One template** option, the **Write a Template** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Template	input		available templates

name of the template to be written out.

File	input		

name of the file to write the template to.

Write	button		

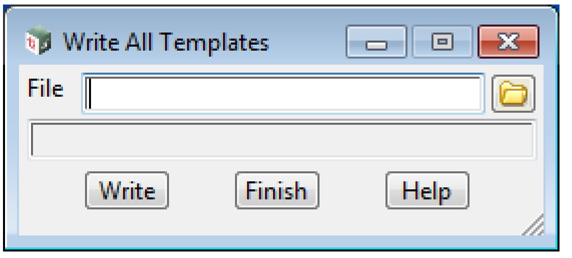
after selecting this button, the template given in the **template** *field will be written out to the file with the name given in the* **file** *field.*

8.11.4 All Templates

Position of option on menu: **File I/O =>Templates =>Templates output =>All templates**

This option is for writing all template out in the special 12d Model template format.

On selecting the **All templates** option, the **Write All Templates** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
File	input		

name of the file to write all the templates to.

Write	button		

all the templates will be written out to the file with the name given in the **file** *field.*

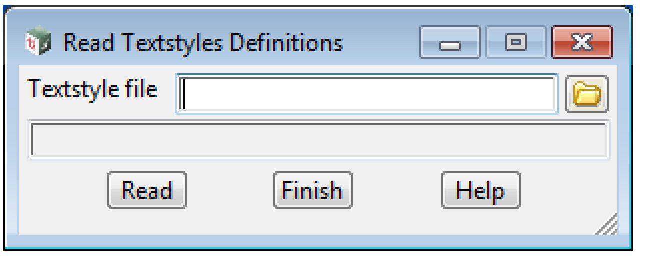
8.12 Textstyle Input

Position of option on menu: **File I/O =>Textstyle Input**

When 12d Model starts up, a textstyles definition file can be automatically read in. The textstyles definitions file defines the textstyles and fonts used in the project.

It is possible to redefine the textstyles by reading in another textstyles definitions file using the **Textstyle input** option.

On selecting the **Textstyle input** option, the **Read Textstyles Definitions** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Textstyle file	input		*.tsf

the name of the file to read the textstyle information from.

Read	button		

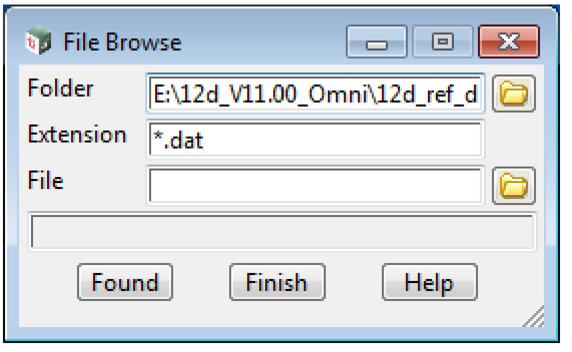
after selecting this button, the textstyles definitions file will be read in.

8.13 Edit a File

Position of option on menu: **File I/O =>Edit**

Files can be searched for and then displayed in the editor using the browse option.

Selecting **Edit** brings up the **File Browse** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Folder	input	current folder	Microsoft browser

folder to search for files with the extension given in the **extension** *field.*

Extension	input	*.dat	

wild cards and extension to limit the search of files. An <enter> needs to be typed after changing the extension.

File	input		files satisfying the **folder** and **extension** fields.

select the file to be displayed in the editor.

Found	button		

display in the editor the file of the name given in the **file** *field.*

Note

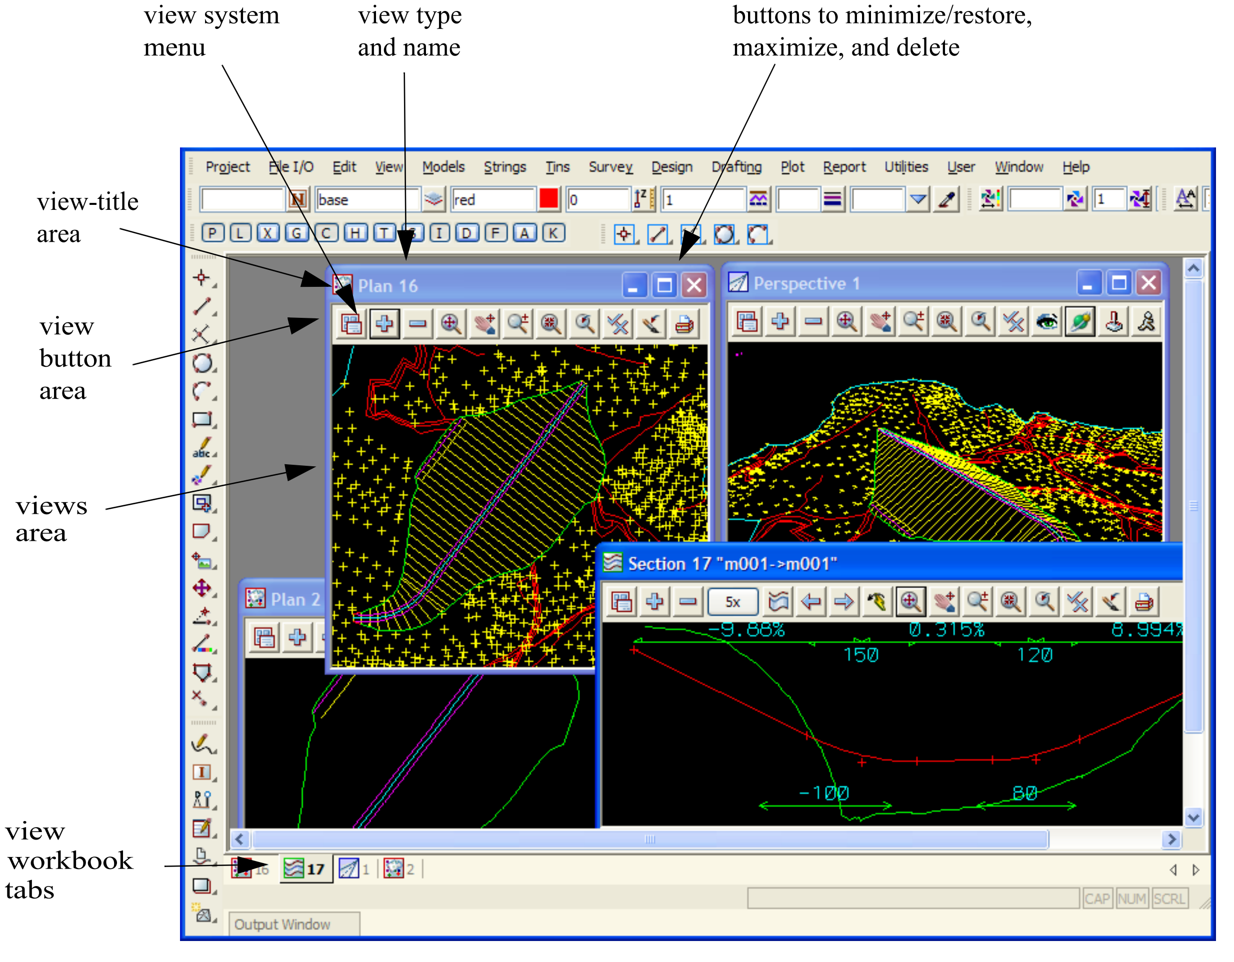
The **editor** is pointed to by the environment variable EDITOR_4D (see Appendix A).

9 Menus on Views

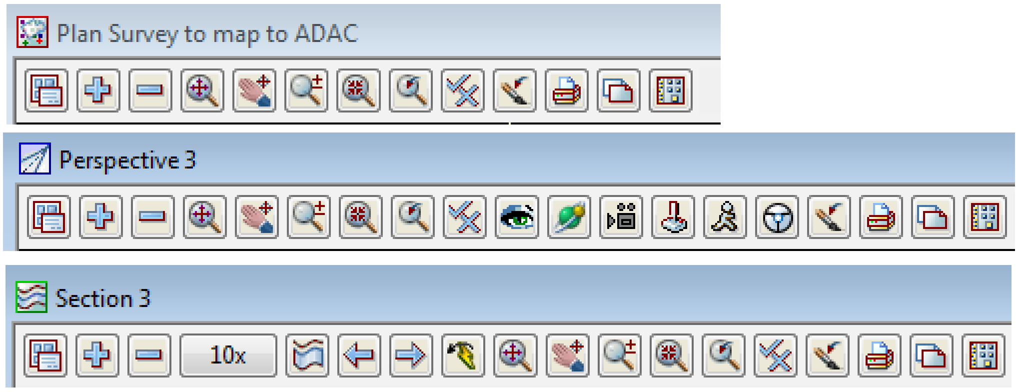
Views are the screen drawing areas for 12d Model and come in three flavours - plan, perspective and section. Views can be created and deleted as required by the user and there is no limit to the number of views on the screen. The views can overlap and be minimized.

Each view has a unique name of up to two hundred characters.

Each view has a *view title area* which is used to display the view name and a *view button area* which displays the view buttons.



view buttons



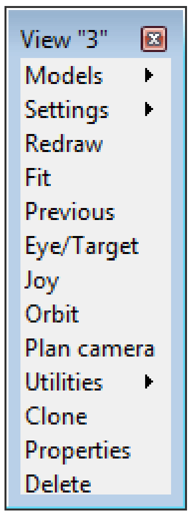
The *View Buttons* are documented in the section 9.5 View Buttons

If the **Menu** button is selected in the *view button area* of any view, or if RB is clicked in the *view-title area* or in the *view-button area*, a new menu called the **View** menu appears.

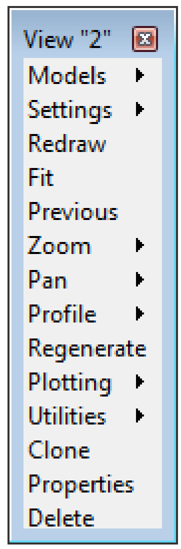
Because of the differences between plan, perspective and section views, the options on the **View** menu vary for each view type. The plan, perspective and section **View** menus are

Plan View Menu

Perspective View Menu



Section View Menu



The **View** menu is removed by selecting the **[X]** button or if the **View** menu hasn't been moved, by simply clicking **RB** again in the *view-title* or *view button* area. If the **View** menu has been moved, clicking **RB** will warp the cursor to the moved View menu.

For further documentation on the items on each menu, please go to:

9.1.1.1 Drawing Engine

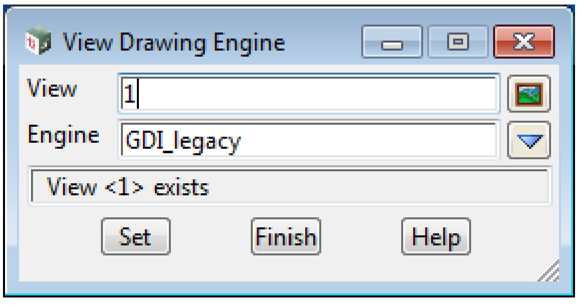
Position of option on menu: **Plan View Menu** **View =>Settings =>Drawing engine**

Position of option on menu: **Perspective View Menu** **View =>Settings =>Drawing engine**

The **Drawing engine** option allows the type of engine that draws the information on a perspective view to be changed.

You can draw in GDI or OpenGL drawing for Plan and Perspective views, and there are choices for the GDI or OpenGL engines,

Selecting **Drawing engine** brings up the **View Drawing Engine** panel.

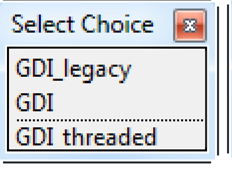


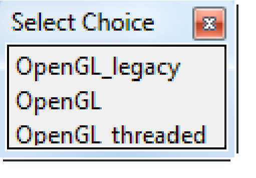
The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

view to set the drawing engine for.

Engine	choice box	GDI_legacy	





For views using GDI drawing

*if **GDI_legacy**, drawing in GDI as in V10.*

***GDI**, some improvements over GDI_Legacy*

***GDI threaded**, allows <Escape> to stop view drawing, and update on where the drawing is up to, it avoids application not responding (TDR), stops endless looping when an application takes too long, and better cooperating with GPU's.*

For views using OpenGL drawing

*if **OpenGL_legacy**, drawing in OpenGL as in V10.*

***OpenGL**, some improvements over OpenGL_Legacy*

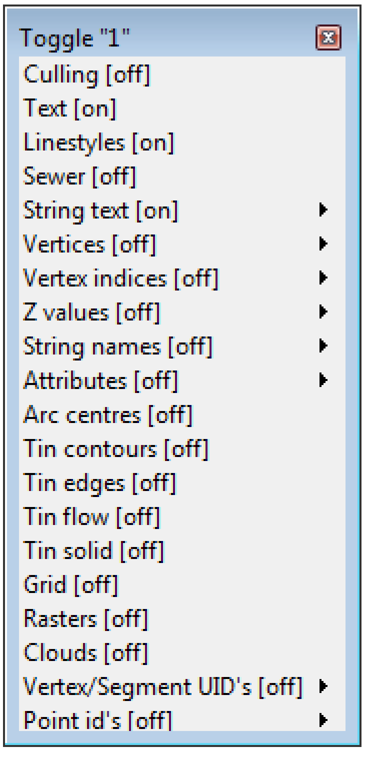
***OpenGL threaded**, allows <Escape> to stop view drawing, and update on where the drawing is up to, it avoids application not responding (TDR), stops endless looping when an application takes too long, and better cooperating with GPU's.*

Return to 9.1.1 Plan View Settings or 9.2.1 Perspective View Settings or 9 Menus on Views.

9.1.1.2 Plan Toggle

Position of menu: **Plan View Menu** **View => Settings =>Toggle**

The **Toggle** walk right brings up the **Toggle** plan view menu.



Selecting any options from this menu will toggle the option on/off.

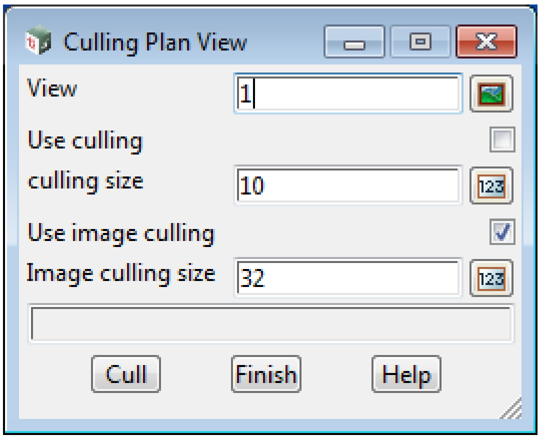
Continue to 9.1.1.3 Culling Plan View or return to 9.1.4 Plan Utilities or 9.1.1 Plan View Settings.

9.1.1.3 Culling Plan View

Position of option on menu: **Plan View Menu** **View =>Settings => Culling**

The **Culling** option is used to suppress the drawing of strings whose on-screen extent is less than a user defined pixel size.

Selecting **Culling** raises the **Culling Plan View** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

name of the view to set cutting for.

Use culling	tick box		

*if **ticked**, a string is **not** drawn on the plan view whenever the string's extent box when drawn on the view would be smaller than the culling size given in the **culling size** field.*

Culling size	input	10	

pixel size used for culling

Use image culling	tick box		
Image culling size			
Cull	button		

*record the culling size given in the **culling field**. If the **use culling** field is set to tick, the recorded culling size will be used whenever the plan view is redrawn.*

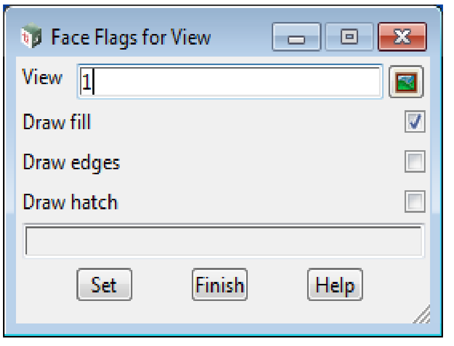
Continue to 9.1.1.4 Face Flags for View or return to 9.1.4 Plan Utilities or 9.1.1 Plan View Settings.

9.1.1.4 Face Flags for View

Position of option on menu: **Plan View Menu** **View =>Settings => Faces**

The **Faces** option allows the user to specify how faces are displayed in the plan view and on any plan view plots.

Selecting **Faces** fires up the **Face Flags for View** panel.



The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

name of the view to set for drawing faces.

Draw fill	tick box	tick	

if ticked, all faces in the view are drawn in their fill colour.

Draw edges	tick box		

if ticked, all face edges in the view are drawn.

Draw hatch	tick box		

if ticked, all faces in the view are drawn in their hatch pattern.

Set	button		

set the **draw fill/edges/hatch** *fields to the value in the panel fields. The plan view is then redrawn using this value.*

Continue to 9.1.1.5 Linestyles for Plan View or return to 9.1.4 Plan Utilities or 9.1.1 Plan View Settings.

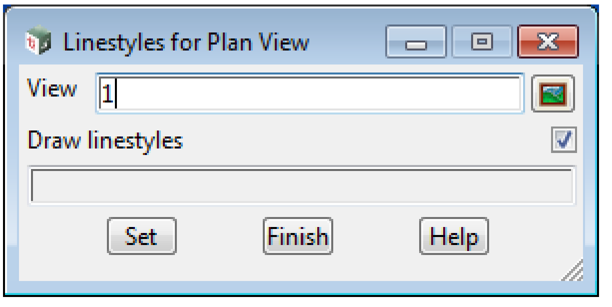
9.1.1.5 Linestyles for Plan View

Position of option on menu: **Plan View Menu** **View => Settings => Linestyles**

The **Linestyles** option allows the user to specify how linestyles (**styles**) are displayed in the plan view and on any plan view plots.

If linestyles are not used for drawing in a view then all strings are drawn according to their breakline type. That is, line strings are drawn with solid lines for each line in the string and point strings with only crosses at the string points. This style is the default style, **1**.

Selecting **Linestyles** fires up the **Linestyles for View** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

name of the view to modify draw linestyle flag for.

Draw linestyles	tick box	tick	

if ticked, all strings in the view are drawn with linestyles.
If not ticked, all lines strings are drawn as solid lines and point strings with crosses at their vertices.

Set	button		

set the **draw linestyles** *field to the value in the panel field. The plan view is then redrawn using this value.*

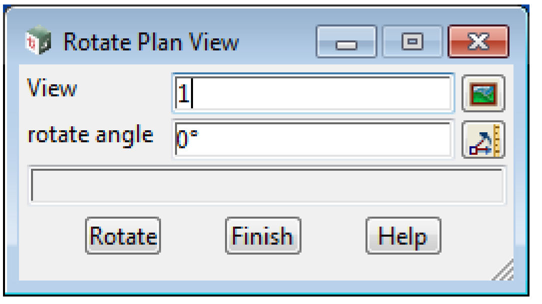
Continue to 9.1.1.6 Rotate Plan View or return to 9.1.4 Plan Utilities or 9.1.1 Plan View Settings.

9.1.1.6 Rotate Plan View

Position of option on menu: **Plan View Menu** **View => Settings => Rotate**

The **rotate** option is used to rotate a plan view through a user supplied angle about the centre point of the plan view.

After selecting the **Rotate** option, the **Rotate Plan View** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

name of the view to set rotation angle for.

Rotate angle	input	0	angles

angle (in degrees) to rotate the view to.

Rotate	button		

rotate the view about the view centre point until the angle the view makes with the positive x axis is the angle given in the **rotate angle** *field.*

Continue to 9.1.1.7 Sewer Annotations for Plan View or return to 9.1.4 Plan Utilities or 9.1.1 Plan View Settings.

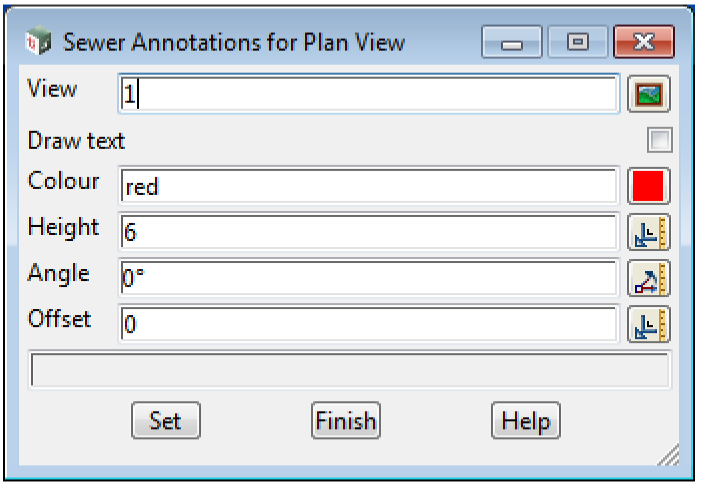
9.1.1.7 Sewer Annotations for Plan View

Position of option on menu: **Plan View Menu** **View => Settings => Sewer**

This is part of the optional sewer module.

The **Sewer** option allows the user to specify how sewer text is displayed in the plan view and on any plan view plots.

Selecting **sewer** fires up the **Sewer Annotations for Plan View** panel.



The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views
name of the view to set sewer annotation information for.			
Draw text	tick box		
*if **ticked**, sewer text annotation will be drawn for any sewer strings in the plan view.*			
Colour	input	red	available colours
the colour for any sewer text annotation.			
Height	input	default text height	
the height for any sewer text annotation.			
Angle	input	0	
the angle for any sewer text annotation.			
Offset	input	0	
the offset for any sewer text annotation.			
Set	button		
set the values in the panel fields and then redraw the view.			

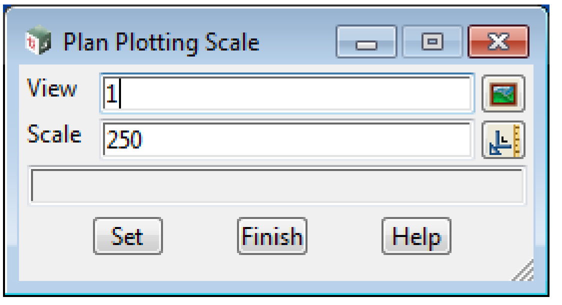
Continue to 9.1.1.8 Plan Plotting Scale or return to 9.1.4 Plan Utilities or 9.1.1 Plan View Settings.

9.1.1.8 Plan Plotting Scale

Position of option on menu: **Plan View Menu** **View => Settings => Plotting scale**

The **Plotting scale** option is used to set a scale for the plan view which is used to determine the size to draw any *paper* text on the plan view.

After selecting **Plotting scale**, the **Plan Plotting Scale** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

name of the view to set the scale for.

Scale	input	250	

"1 in" to use to calculate a drawing size for any paper text on the view.

Set	button		

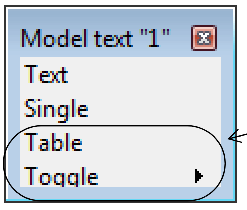
set the plotting scale for the view.

Continue to 9.1.1.9 Text or return to 9.1.4 Plan Utilities or 9.1.1 Plan View Settings.

9.1.1.9 Text

Position of menu: **Plan View Menu** **View => Settings =>Text**

The **text** walk-right menu is



These items are only on the menu if PLAN_TABLE_SETTNGS_4D is non zero

The options on the **Text** menu allows

(a) **Text**

If the text is defined in world units, the user can specify whether the text is displayed in **full**, **quick mode** or **not** drawn **at all** depending on how the text height would be as pixels on the screen.

This setting also applies to the Z-values and Vertex ids controlled by Plan View Settings.

(a) **Single, Table, Toggle**

If the text is defined in pixel units, then when the screen scale is such that the height of the text in world units is too large, then the text is not drawn.

This stops the drawing of *pixel* text when its displaying world size is large in proportion to other world units. For example, this happens to pixel text when zooming out.

Hence the options on the **Text** menu tries to control the drawing of ***both*** pixel and world text in models on the view so that the text stops displaying in the view as the user *zooms out*

For more information on each option on the menu, go to

Text 9.1.1.9.1 Plan Text
Single, Table and Toggle 9.1.1.9.2 Single, Table and Toggle for String Text on a Plan View

9.1.1.9.1 Plan Text

Position of option on menu: **Plan View Menu** **View => Settings => Text => Text**

The **Text** option allows the user to specify how text is displayed in the plan view and on any plan view plots.

For world text, there are also two text threshold values (***quick*** and ***none***) designed for use with world text. When the *screen* size of text in pixels drops below the thresholds, the mode of display is automatically adjusted.

Hence world text can be drawn either in

(a) full

(b) **quick mode** which consists of the top half of a rectangle indicating the height and the length of the text.

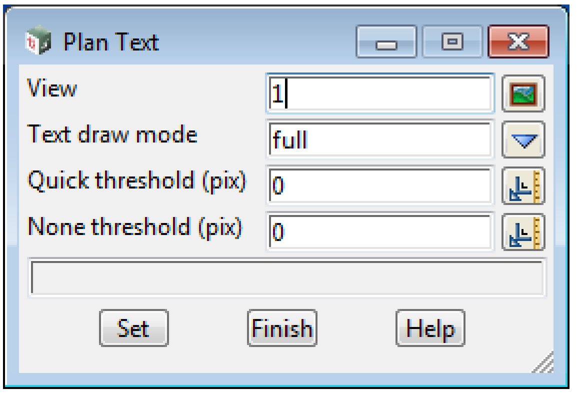
or

(c) **not** drawn **at all**.

So when the *screen* size of **world** text gets small, the text can automatically be drawn as **quick** text or even **not** displayed **at all**.

This setting also applies to the Z values and Vertex Ids controlled by View Settings.

Selecting **Text** brings up the **Plan Text** panel.



The fields and buttons used in this panel have the following functions.

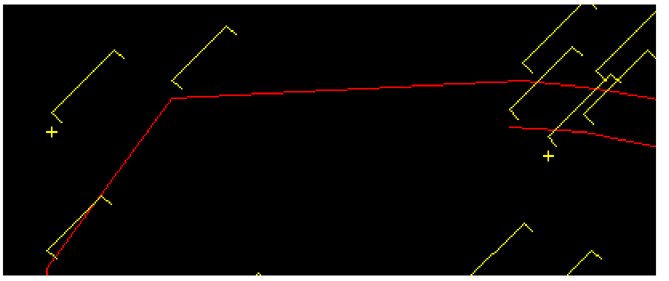
Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

name of the view to modify text drawing flags for.

Text draw mode	choice box	full	full, quick, none

*if **full**, all text in the plan view is tested against the **Quick threshold** and **None threshold** modes and if neither of them apply, the text is drawn in full.*

*If **quick**, all text in the plan view is tested against the **None threshold** modes and if it does not apply, the text characters are not drawn and the whole text strings is replaced by a three sided box to indicate where the text is.*



*If **none**, nothing is displayed on the plan view for text.*

Quick threshold (pix) input 4.5

*If **Text draw mode** is **none** then no text is drawn in the plan view.*

*If **Text draw mode** is **full** or **quick** then when text is displayed on the screen and the screen size of the displayed text in pixels would be below the **Quick threshold** value but above the None threshold, then the text is drawn in **quick** mode.*

None threshold (pix) input 2

*If **Text draw mode** is **none** then no text is drawn in the plan view.*

*If **Text draw mode** is **full** or **quick**, then when text is displayed on the screen and the screen size of the displayed text in pixels would be below the **None threshold** value, then the text is **not drawn**.*

Set button

set the text draw mode and thresholds to the values given in the panel fields. The plan view is then redrawn using the new values.

Important Note

The **Text** =>**Text** option applies to *all* text on the view. That is, for any text from strings in models on the view, or for the z-values and vertex ids text controlled by view settings (view text).

The **Single** and **Table** options of **Text** are *only* for text in models. There are **Single** and **Table** options for view text under the **Vertex no.s** and **Z values Settings** options.

Continue to 9.1.1.9.2 Single, Table and Toggle for String Text on a Plan View or return to 9.1.1.2 Plan Toggle or 9.1.1 Plan View Settings.

9.1.1.9.2 Single, Table and Toggle for String Text on a Plan View

The text for text strings, and the vertex text and segment text for super strings is known as **String Text**.

Plan View =>Settings =>Text has options **Single**, **Table** and **Toggle** for controlling the display of String Text and allow the user to specify whether **String Text** is

(a) not drawn at all

or

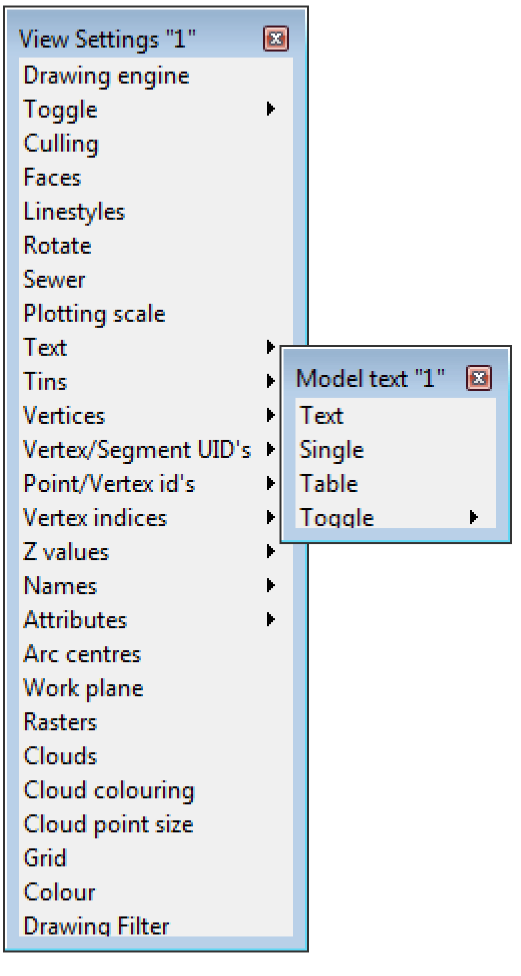
(b) if set to draw, then the *String Text* is only drawn if the equivalent world size of the text/vertex is not too large. This stops the drawing of *the String Text* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

Hence the **String Text** options try to control the drawing of values/vertices on the view so that the **String Text stop displaying** as the **user *zooms out***.

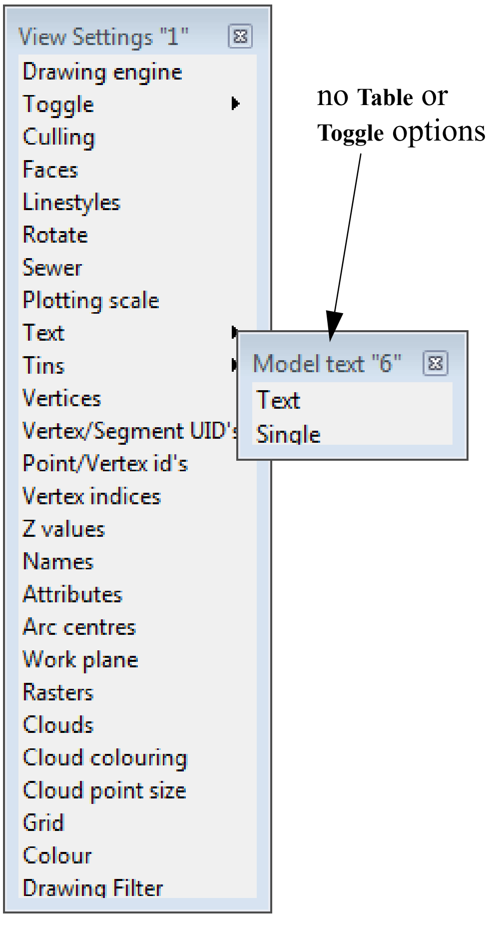
There is also an environment variable PLAN_TABLE_SETTINGS_4D that specifies whether the **Text** options draw the ***String Text*** for strings for ***all models*** on the view, or if the drawing of the *String Text* can be controlled for ***individual models***.

In either

PLAN_TABLE_SETTINGS_4D = 1
Models can be individually controlled



PLAN_TABLE_SETTINGS_4D = 0
Models can't be individually controlled



For both values of PLAN_TABLE_SETTINGS_4D there is also a there is a **Toggle** button on the **Plan View** that brings up the **Toggle** menu to make it easy to toggle the drawing of the ***String Text*** **on** and **off**. See 9.6.4 Toggle Menu for Values Text, Crosses and Text on Plan Views.

The options ***Single*** and ***Table*** tor the two cases of PLAN_TABLE_SETTINGS_4D documented in.

9.6 Displaying Values Text, Vertices and Text on a Plan View (the default)

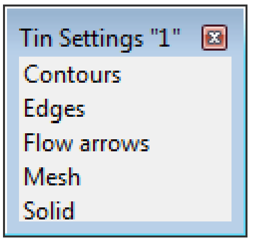
9.6.5 Env Var PLAN_TABLE_SETTINGS_4D Set to 0:

Continue to 9.1.1.10 Tins or return to 9.1.1 Plan View Settings.

9.1.1.10 Tins

Position of menu: **Plan View Menu** **View => Settings => Tins**

The options on the **Tins** walk-right menu control the display of tins on the view.The **Tins** walk-right menu is



For the options:

Contours	9.1.1.10.1 Tin Draw Contours for View
Edges	9.1.1.10.2 Tin Draw Edges for View
Flow arrows	9.1.1.10.3 Tin Draw Flow Arrows for View
Mesh	9.1.1.10.4 Tin Draw Mesh for View

Tuflow	

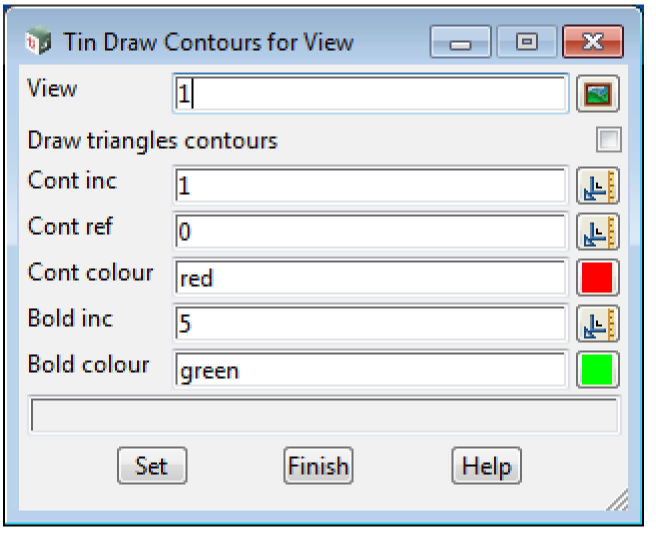
9.1.1.10.1 Tin Draw Contours for View

Position of option on menu: **Plan View Menu** **View => Settings => Tins => Contours**

Position of option on menu: **Perspective View Menu** **View => Settings => Tins => Contours**

The **Contours** option defines contour and bold increments and colours, and also whether these contours are displayed for the triangles from any tins on the view. Because the contours are just drawn separately for each triangle, they are know as **quick** or **fast contours**.

Selecting **Contours** fires up the **Tin Draw Contours for View** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

name of the view to modify fast contour drawing parameters for.

Draw triangles contours tick box

*if **ticked**, the contours for any triangles in any tins on the view are displayed.*

Cont inc input 1.0

increment between contoured values.

Cont ref input 0.0

reference value for the contour increments.

Cont colour input cyan available colours

colour of the contours

Bold inc input 5.0

increment for the bold contours. If the bold increment is blank or zero, then no bold contours are drawn. If the bold increment is non-zero, it must be an integer multiple of the contour increment

Bold colour input magenta available colours

colour of the bold contours

Set button

set the value in the panel and then redraw the plan view.

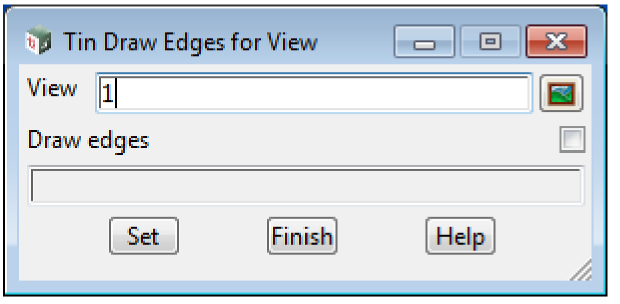
Continue to 9.1.1.10.1 Tin Draw Contours for View or return to 9.1.1.10 Tins or 9.1.1 Plan View Settings or 9.1 Plan View Menu.

9.1.1.10.2 Tin Draw Edges for View

Position of option on menu: **Plan View Menu** **View => Settings => Tins => Edges**

Position of option on menu: **Perspectives View Menu** **View => Settings => Tins => Edges**

The **Edges** option allows the user to specify whether the edges of triangles from any tins on the view are displayed. Selecting **Edges** fires up the **Tin Draw Edges for View** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

name of the view to modify tin edge drawing flag for.

Draw triangles edges tick box

*if **ticked**, the edges of any triangles in any tins on the view are displayed.*

Set button

set the value and then redraw the plan view.

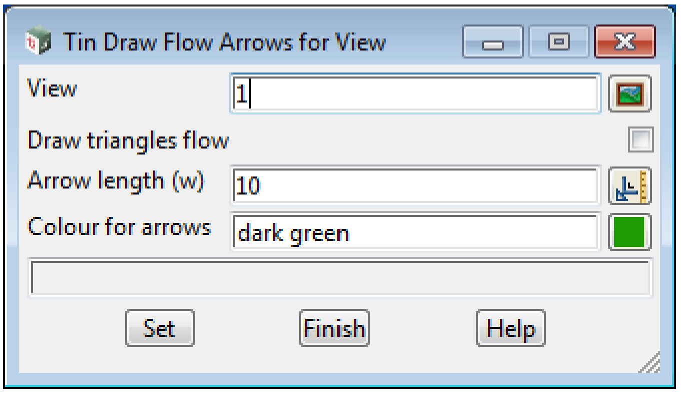
Continue to 9.1.1.10.2 Tin Draw Edges for View or return to 9.1.1.10 Tins or 9.1.1 Plan View Settings or 9.1 Plan View Menu.

9.1.1.10.3 Tin Draw Flow Arrows for View

Position of option on menu: Plan View Menu **View =>Settings =>Tins =>Flow arrows**

Position of option on menu: Perspective View Menu **View =>Settings =>Tins =>Flow arrows**

The **Flow arrows** option defines the colour and length of flow arrows, and also whether the flow arrows are displayed for the triangles from any tins on the view. Selecting **Flow arrows** fires up the **Tin Draw Flow Arrows for View** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

name of the view to modify tin arrow drawing flag for.

Draw triangles flow arrows tick box

*if **ticked**, the flow arrows for any triangles in any tins on the view are displayed.*

Arrow length (w) input

length in world units to draw flow arrows.

Colour for arrows	input	cyan	available colours

colour for the arrows.

Set button

set the value in the panel and then redraw the plan view.

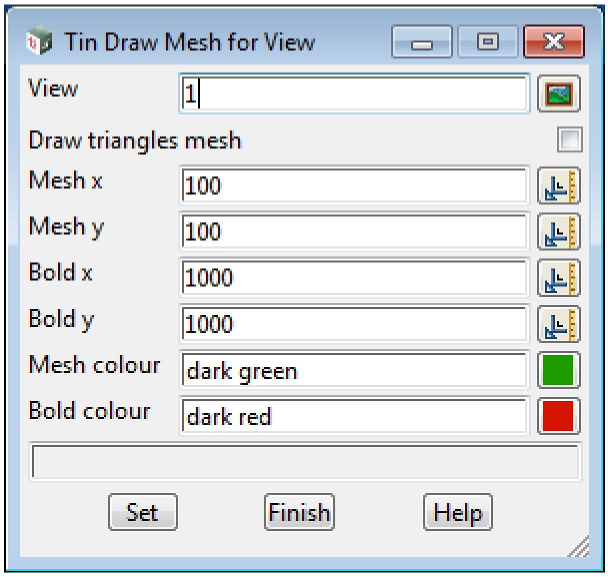
Continue to 9.1.1.10.3 Tin Draw Flow Arrows for View or return to 9.1.1.10 Tins or 9.1.1 Plan View Settings or 9.1 Plan View Menu.

9.1.1.10.4 Tin Draw Mesh for View

Position of option on menu: **Plan View Menu** **View => Settings => Tins => Mesh**

Position of option on menu: **Perspective View Menu** **View => Settings => Tins => Mesh**

The **mesh** option defines a rectangular mesh, and also whether the mesh is displayed for the triangles from any tins on the view. Selecting **Mesh** fires up the **Tin Draw Mesh for View** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

name of the view to modify tin mesh drawing flag for.

Draw triangles mesh tick box

*if **ticked**, a rectangular mesh for any triangles in any tins on the view are displayed.*

Mesh x input 100

the distance between the x mesh lines. If this value is zero, the x mesh lines will not be drawn.

Mesh y input 100

the distance between the y mesh lines. If this value is zero, the y mesh lines will not be drawn.

Bold x input 100

the distance between the bold x mesh lines. If this value is zero, the bold x mesh lines will not be drawn.

Bold y input 100

the distance between the bold y mesh lines. If this value is zero, the bold y mesh lines will not be drawn.

Mesh colour input dark green available colours

colour that the mesh is drawn in.

Bold colour input dark green available colours

colour that the bold mesh is drawn in.

Set button

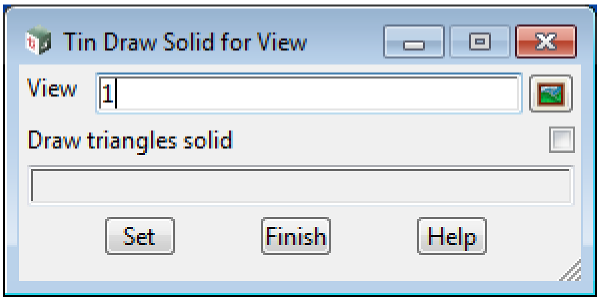
set the value in the panel and then redraw the plan view.

Continue to 9.1.1.10.4 Tin Draw Mesh for View or return to 9.1.1.10 Tins or 9.1.1 Plan View Settings or 9.1 Plan View Menu.

9.1.1.10.5 Tin Draw Solid for View

Position of option on menu: **Plan View Menu** **View => Settings => Tins => Solid**

The **solid** option allows the user to specify whether the triangles from any tins on the view are displayed as solid colour. Selecting **Solid** fires up the **Tin Draw Solid for View** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

name of the view to modify tin solid drawing flag for.

Draw triangles solid	tick box		

*if **ticked**, any triangles in any tins on the view are displayed in solid colour.*

Set	button		

set the value and then redraw the plan view.

Return to 9.1.1.10 Tins or 9.1.1 Plan View Settings or 9.1 Plan View Menu.

9.1.1.11 Vertices

Position of menu: **Plan View Menu** **View => Settings => Vertices**

Vertices displays **crosses at the vertices of strings**. For a Text string, a cross is placed at the text justification position.

Plan View =>Settings has an option **Text** to draw ***String Text,*** an option **Vertices** to draw ***Crosses at*** all the **Vertices** in a string (often just called ***Vertices***) and the options ***Vertex/ Segment UIDs***, ***Point/Vertex Id's***, ***Vertex indices***, ***Z values***, ***Names*** and ***Attributes*** for labelling specific values from a string as text (for these options we call the **text** of the **value**, the **Values Text**.).

All these options work in a similar manner and are being documented together. For more information on each options, go to 9.6 Displaying Values Text, Vertices and Text on a Plan View.

Continue to 9.1.1.12 Vertex/Segment UID's or return to 9.1.1 Plan View Settings or 9.1 Plan View Menu.

9.1.1.12 Vertex/Segment UID's

Position of menu: **Plan View Menu** **View => Settings => Vertex/Segment UID's**

Vertex/Segment UID's displays the **Vertex UID's** any **Segment UIDs** for the vertices and segments of super strings.

Plan View =>Settings has an option **Text** to draw ***String Text,*** an option **Vertices** to draw ***Crosses at*** all the **Vertices** in a string (often just called ***Vertices***) and the options ***Vertex/ Segment UIDs***, ***Point/Vertex Id's***, ***Vertex indices***, ***Z values***, ***Names*** and ***Attributes*** for labelling specific values from a string as text (for these options we call the **text** of the **value**, the **Values Text**.).

All these options work in a similar manner and are being documented together. For more information on each options, go to 9.6 Displaying Values Text, Vertices and Text on a Plan View.

Continue to 9.1.1.13 Point/Vertex Ids or return to 9.1.1 Plan View Settings or 9.1 Plan View Menu.

9.1.1.13 Point/Vertex Ids

Position of menu: **Plan View Menu** **View => Settings => Point/Vertex id's**

Point/Vertex IDs displays the **Point/Vertex ID** (a point ID recorded for a vertex) for the vertices of super strings.

Note - Point/Vertex IDs are not to be confused with *Vertex Indices* which are simply the position of the vertex in the string.

Plan View =>Settings has an option **Text** to draw ***String Text,*** an option **Vertices** to draw ***Crosses at*** all the **Vertices** in a string (often just called ***Vertices***) and the options ***Vertex/ Segment UIDs***, ***Point/Vertex Id's***, ***Vertex indices***, ***Z values***, ***Names*** and ***Attributes*** for labelling specific values from a string as text (for these options we call the **text** of the **value**, the **Values Text**.).

All these options work in a similar manner and are being documented together. For more information on each options, go to 9.6 Displaying Values Text, Vertices and Text on a Plan View.

Continue to 9.1.1.14 Vertex Indices or return to 9.1.1 Plan View Settings or 9.1 Plan View Menu.

9.1.1.14 Vertex Indices

Position of menu: **Plan View Menu** **View => Settings => Vertex indices**

Vertex Indices displays the **Vertex Indices** (position of the vertex in the string) for all the vertices of strings.

Note - Vertex Indices are not to be confused with *Point/Vertex IDs* which may not even exist for a vertex in the string.

Plan View =>Settings has an option **Text** to draw ***String Text,*** an option **Vertices** to draw ***Crosses at*** all the **Vertices** in a string (often just called ***Vertices***) and the options ***Vertex/ Segment UIDs***, ***Point/Vertex Id's***, ***Vertex indices***, ***Z values***, ***Names*** and ***Attributes*** for labelling specific values from a string as text (for these options we call the **text** of the **value**, the **Values Text**.).

All these options work in a similar manner and are being documented together. For more information on each options, go to 9.6 Displaying Values Text, Vertices and Text on a Plan View.

Continue to 9.1.1.15 Z Values or return to 9.1.1 Plan View Settings or 9.1 Plan View Menu.

9.1.1.15 Z Values

Position of menu: **Plan View Menu** **View => Settings => Z values**

Z values displays the z coordinate to a user specified number of decimal places, for all the vertices of strings.

Plan View =>Settings has an option **Text** to draw ***String Text,*** an option **Vertices** to draw ***Crosses at*** all the **Vertices** in a string (often just called ***Vertices***) and the options ***Vertex/ Segment UIDs***, ***Point/Vertex Id's***, ***Vertex indices***, ***Z values***, ***Names*** and ***Attributes*** for labelling specific values from a string as text (for these options we call the **text** of the **value**, the **Values Text**.).

All these options work in a similar manner and are being documented together. For more information on each options, go to 9.6 Displaying Values Text, Vertices and Text on a Plan View.

Continue to 9.1.1.16 Names or return to 9.1.1 Plan View Settings or 9.1 Plan View Menu.

9.1.1.16 Names

Position of menu: **Plan View Menu** **View => Settings => Names**

Names displays the string name at each vertex of a string.

Plan View =>Settings has an option **Text** to draw ***String Text,*** an option **Vertices** to draw ***Crosses at*** all the **Vertices** in a string (often just called ***Vertices***) and the options ***Vertex/ Segment UIDs***, ***Point/Vertex Id's***, ***Vertex indices***, ***Z values***, ***Names*** and ***Attributes*** for labelling specific values from a string as text (for these options we call the **text** of the **value**, the **Values Text**.).

All these options work in a similar manner and are being documented together. For more information on each options, go to 9.6 Displaying Values Text, Vertices and Text on a Plan View.

Continue to 9.1.1.17 Attributes or return to 9.1.1 Plan View Settings or 9.1 Plan View Menu.

9.1.1.17 Attributes

Position of menu: **Plan View Menu** **View => Settings => Attributes**

Attributes displays the vertex attributes for all the vertices of super strings.

Plan View =>Settings has an option **Text** to draw ***String Text,*** an option **Vertices** to draw ***Crosses at*** all the **Vertices** in a string (often just called ***Vertices***) and the options ***Vertex/ Segment UIDs***, ***Point/Vertex Id's***, ***Vertex indices***, ***Z values***, ***Names*** and ***Attributes*** for labelling specific values from a string as text (for these options we call the **text** of the **value**, the **Values Text**.).

All these options work in a similar manner and are being documented together. For more information on each options, go to 9.6 Displaying Values Text, Vertices and Text on a Plan View.

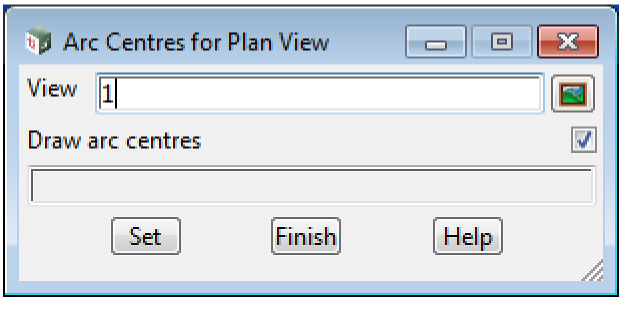
Continue to 9.1.1.18 Arc Centres for Plan View or return to 9.1.1 Plan View Settings or 9.1 Plan View Menu.

9.1.1.18 Arc Centres for Plan View

Position of option on menu: **Plan View Menu** **View => Settings => Arc centres**

The **arc centres** option allows the user to specify whether the centres of arcs and circles are displayed on the view.

Selecting **Arc centres** fires up the **Arc Centres for Plan View** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

name of the view to modify arc centres flag for.

Draw arc centres	tick box	tick	

*if **ticked** is selected, any arcs or circles on the view will also have their centres drawn. Otherwise the centres are not displayed.*

Set	button		

set the draw arc centres mode to the value in the **draw arc centre** *tick box panel box. The plan view is then redrawn using the mode.*

Continue to 9.1.1.19 Work Plane or return to 9.1.1 Plan View Settings or 9.1 Plan View Menu.

9.1.1.19 Work Plane

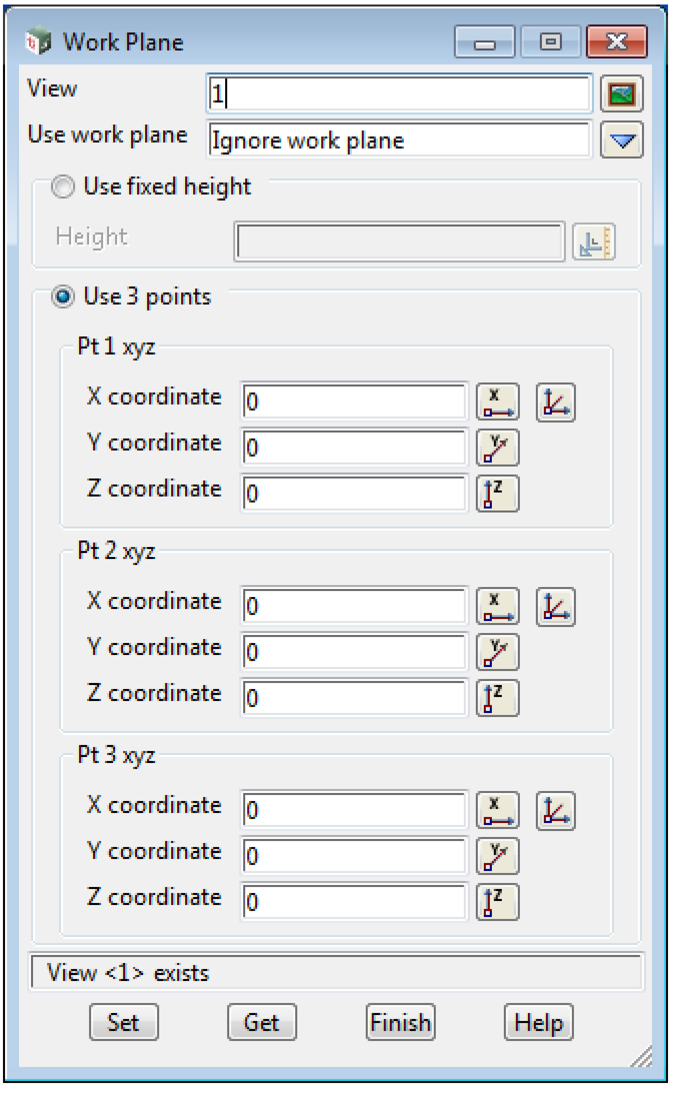
Position of option on menu: **Plan View Menu** **View => Settings => Work plane**

A plane not perpendicular to the (x,y) plane, can be used to define a unique z-value for any (x,y) co-ordinate pair. This fact is often invaluable when trying to defined three dimensional points using two-dimensional views.

In ***12d Model***, a **work plane** can be defined by giving three non-colinear points. If the work-plane is used in a plan or perspective view, then the (x,y,z) values are restricted to lie in the defined work plane.

The **Work plane** option is used to define and set work planes.

After selecting the **Work Plane** option, the **Work Plane** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box		available views

name of the view to get or set the work plane in.

User work plane	choice box	ignore work plane	ignore work plane

use work plane

the work plane is used or not depending on this field value.

Use fixed height tick box

if ticked, all the created points are given the height from the Height panel field, instead of the z-value from the plane.

Height Real value

if User fixed height is ticked, this is the height to use for all the created points instead of the z-value from the plane.

Pt 1/2/3 xyz input/output 0 0 0

points in the work plane

Set button

A plane is defined by the three points given in the **Pt xyz** *fields. This plane is set as the work plane for the view given by the* **view** *field. Although the work plane is set, it is not active unless the* **use work plane** *field is set to* ***use work plane****.*

Get button

get the three points of the defined work plane for the view given in the view field. The points are displayed in the **Pt xyz** *fields of the panel.*

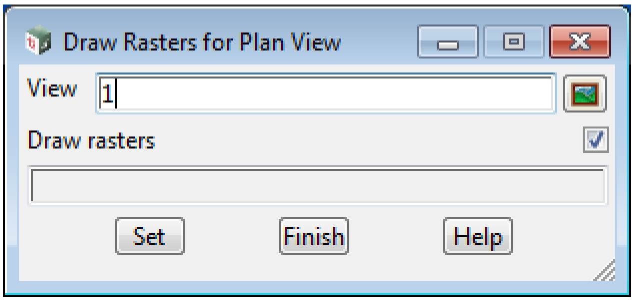
Continue to 9.1.1.20 Draw Rasters for Plan View or return to 9.1.1 Plan View Settings or 9.1 Plan View Menu.

9.1.1.20 Draw Rasters for Plan View

Position of option on menu: **Plan View Menu** **View => Settings => Rasters**

The **Rasters** option is used to turn on or off the drawing of any rasters in models on the view.

After selecting the **Rasters** option, the **Draw Rasters for Plan View** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

name of the view to toggle the drawing of rasters on or off.

Field Description	Type	Defaults	Pop-Up
Draw rasters	tick box	ticked	

*if **ticked**, draw any rasters in any models on the view.*

Field Description	Type	Defaults	Pop-Up
Set	button		

set the draw rasters mode.

Continue to 9.1.1.21 Clouds or return to 9.1.1 Plan View Settings or 9.1 Plan View Menu.

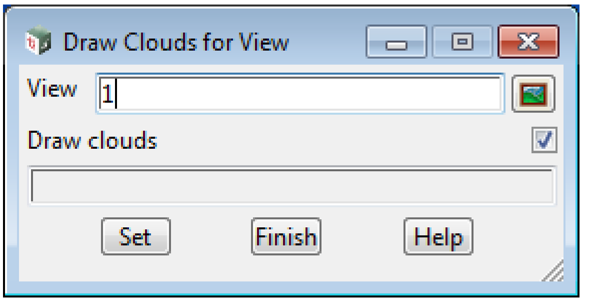
9.1.1.21 Clouds

Draw_Clouds_for_View**Position of option on menu:** **Plan View Menu** **View => Settings => Clouds**

Point clouds can consist of millions, or even billions, of individual points. The drawing of them on a plan view may slow things considerably.

The **Clouds** option is used to optionally draw point clouds in any models on the view.

After selecting the **Clouds** option, the **Draw Clouds for View** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

name of the view to toggle the drawing of point clouds on or off.

Draw clouds	tick box	ticked

*if **ticked**, draw any point clouds in any models on the view.*
*if **not ticked**, don't draw any point clouds in any models on the view.*

Set	button

sets the draw clouds mode.

Continue to 9.1.1.22 Grid on View or return to 9.1.1 Plan View Settings or 9.1 Plan View Menu.

9.1.1.22 Grid on View

Position of option on menu: **Plan View Menu** **View => Settings => Grid**

Section View Menu **View => Settings => Grid**

Perspective View Menu **View => Settings => Grid**

A regular grid of x (East) and/or y (North) lines can be displayed in a view. The grid is set in a plane of constant z (the level of the grid). The x and y spacing for the grid lines can be set and labelled independently.

For a plan or section view, the grid covers the entire view. However, for a perspective view, the grid only covers the maximum extents of the models in the view.

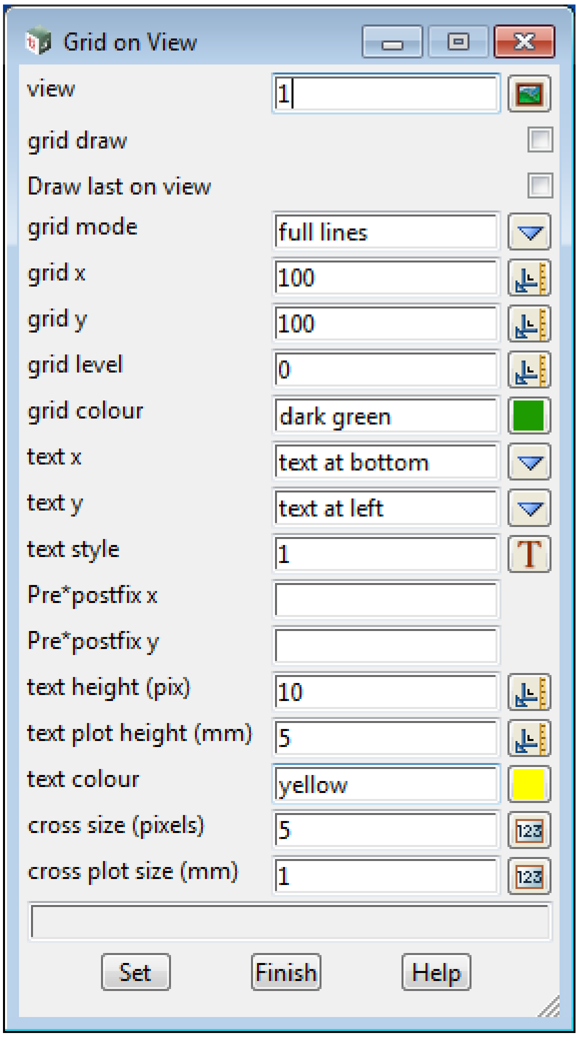
If the grid mode is set to

full lines solid lines are drawn at the grid x (East) and y (North) spacing
crosses crosses are drawn at the intersection of the grid x and y spacing

marks lines are drawn at the beginning/end of the grid at x and y spacing

marks and crosses marks and crosses are drawn

On selecting the option, the **Grid on View** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

the name of the view to define a grid for.

Grid draw	tick box		

*if **ticked**, the grid is drawn according to parameters in the rest of the panel.*

Grid mode	input	full lines	full lines, crosses, marks marks and crosses

the style of the grid being drawn - full lines, crosses or marks.
*If **full lines**, then solid lines are drawn at the grid x and y spacing.*
*If **crosses**, then crosses of size **cross size** are drawn at the intersection of the grid x and y spacing.*
*If **marks**, then solid lines size **cross size** are drawn at the beginning/end of the grid at the x and y spacing.*
*If **marks and crosses**, then marks at the beginning/end of the grid at the x and y spacing, and crosses are drawn.*

Grid x	input	100	

the distance between the x (East) grid lines. If this value is zero, the x grid lines will not be drawn.

Grid y	input	100	

the distance between the y (North) grid lines. If this value is zero, the y grid lines will not be drawn.

Grid level	input	0	

the (x,y) grid is set in a plane of constant z. The **grid level** *is the value of the constant z. This will only be used for a perspective view.*

Grid colour	input	dark green	available colours

colour that the grid is drawn in.

Text x	input	text at bottom	text off, text at top, text at bottom, text at top and bottom

the x (East) grid lines can be labelled with their x value. If the grid lines are labelled, the labels can be drawn on the top, the bottom or both ends of the x-grid lines

Text y	input	text at left	text off, text at left, text at right, text at left and right

the y (North) grid lines can be labelled with their y value. If the grid lines are labelled, the labels can be drawn on the left, the right or both ends of the y-grid lines

Text style	input	1	

the text style of any grid labels.

Pre*postfix x	input		

*prefix/postfix (pre*post) to be applied to the value of x (East). If pretext only, just give the text. If post text is required, precede it by a *. For example E*m will place E before the x value and m after the number.*

Pre*postfix y	input		

*prefix/postfix (pre*post) to be applied to the value of y (North). If pretext only, just give the text. If post text is required, precede it by a *. For example N*m will place N before the y value and m after the number.*

Text height (pix)	input	10.0	

height in screen pixels of any grid labels.

Text plot height (mm)	input	10.0	

height in millimetres of any grid labels in a plot.

Text colour	input	yellow	available colours

colour that any grid labels are drawn in.

Cross size (pixels)	input	5.0	

size in screen pixels of grid crosses.

Cross plot size (mm)	input	1.0	

size in millimetres of grid crosses in a plot.

Set	button		

the grid parameters are set to the values given in the panel. The grid is then redrawn in the view.

Note - If the view name is selected from the pop-up, or a <enter> is done after the view name is entered into the view field, the data for the grid on the named view is placed in the panel fields.

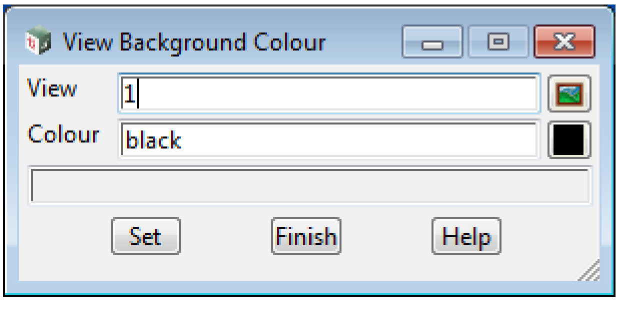
Continue to 9.1.1.23 View Background Colour or return to 9.1.1 Plan View Settings or 9.1 Plan View Menu.

9.1.1.23 View Background Colour

Position of option on menu: **Plan View Menu** **View => Settings => Colour**

The **Colour** option is used to set the background colour for the view.

After selecting the **Colour** option, the **View Background Colour** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

name of the view to set the background colour for.

Colour	colour box	black	available colours

if ticked, draw any rasters in any models on the view.

Set	button		

set the background colour.

Continue to 9.1.1.24 View Drawing Filter or return to 9.1.1 Plan View Settings or 9.1 Plan View Menu.

9.1.1.24 View Drawing Filter

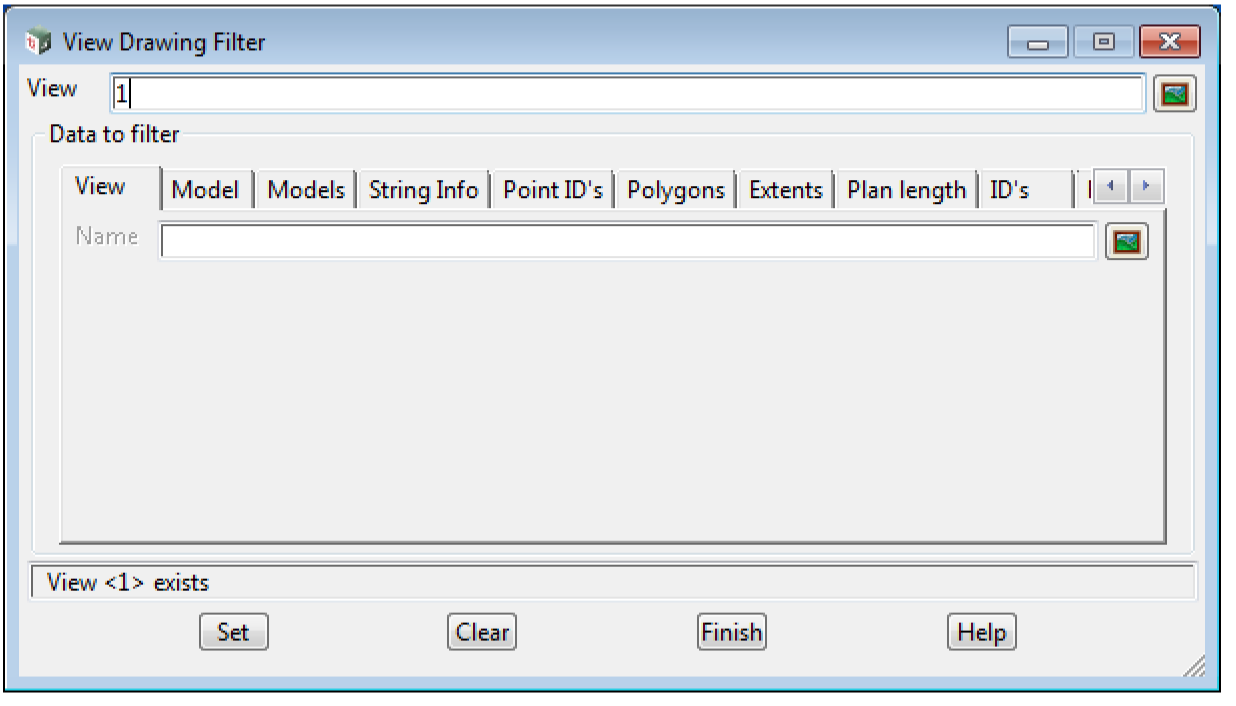
Position of option on menu: **Plan View Menu** **View => Settings => Drawing filter**

Position of option on menu: **Perspective View Menu** **View => Settings => Drawing filter**

The **Drawing filter** option is used to set a filter on the view so that only the data satisfying the filter is drawn.

NOTE: the filter is not saved with the project.

After selecting the **Drawing filter** option, the **View Drawing Filter** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views
name of the view to apply the drawing filter to.			
Data filter	view box	current view	available views
only the data satisfying the drawing filter is drawn on the view.			
Set	button		
apply the drawing filter to the view.			
Clear	button		
clear the drawing filter being applied to the view.			

Return to 9.1.1 Plan View Settings or 9.2.1 Perspective View Settings.

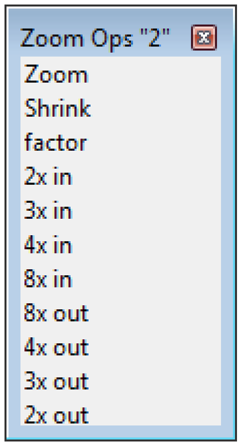
9.1.2 Zoom

Position of menu: **Plan View Menu** **View => Settings => Zoom**

Position of menu: **Section View Menu** **View => Settings => Zoom**

The zoom option operators in the same way for Plan and Section views.

The **zoom** option can be selected in three ways. By clicking LB on **zoom** on a view button area, selecting the **zoom option** itself by clicking LB when the zoom option is highlighted on the zoom menu, or by activating the zoom option's walk-right menu, **Zoom Ops**.



The zoom uses either a *dynamics zoom* or a *zoom box*

For more information on **zoom ops** go to 9.1.2.3 Zoom Ops menu

9.1.2.1 Dynamic Zoom

After selecting the **Zoom** option, *dynamic zoom* is selected by clicking MB or by typing **d**.

Then press LB at the point that is to stay put during the dynamic zoom and then move the mouse up to zoom in or move the mouse down to zoom out. Another point can be selected to dynamically zoom in or out about.

The dynamic zoom continues until either RB is clicked, or MB is clicked (or **d** typed) to place the zoom option into *zoom box* mode.

9.1.2.2 Zoom Box

Position of option on menu: **Plan View Menu** **View => Settings => Zoom =>Zoom**

After selecting the **zoom** option, the user can define the zoom box by

(a) pressing down LB at one corner of the box and dragging the mouse and releasing LB when at the other corner of the zoom box

or

(b) picking two points from any plan views (by clicking LB in a plan view for each point) to define the diagonally opposite points of the zoom box. Note that the two points **do not** have to be from the same plan view.

Next the user selects the view (by clicking LB in the view) which is to be redrawn using this rectangle as the new drawing limits.

Often the same view is chosen for both defining the rectangle and redrawing. However, the power of the option is that the area to be “zoomed in” or “blown up” can be selected from one view and the zoomed area displayed in another view. The other view may not only be different to the views used to defined the zoom box, but may also have different models attached to it.

It is a useful technique to have a master view displaying the entire area of interest in one view, and use it to define zoom-rectangles for use in viewing smaller regions of data in other plan views.

To cancel the zoom after the zoom operation has been selected, click RB.

Next step messages - sent to the screen message area

<View Zoom> [Select][][] select 1st corner of box - RB to cancel
<View Zoom> [Select][][] select 2nd corner of box - RB to cancel
<View Zoom> [Select][][] select destination view - RB to cancel

WARNING - this option can not be applied to a perspective view.

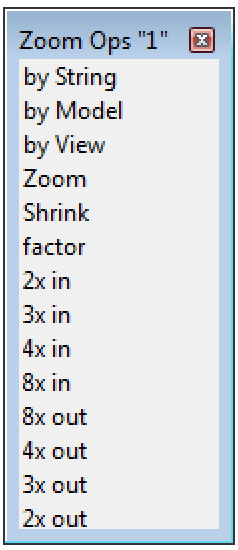
Please continue to the next section 9.1.2.3 Zoom Ops menu.

9.1.2.3 Zoom Ops menu

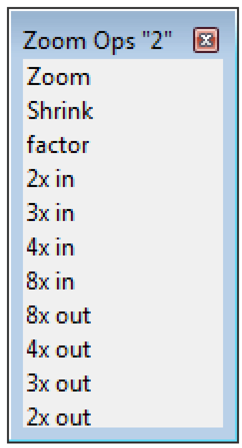
Position of menu: **Plan View Menu** **View => Settings => Zoom**

Position of menu: **Section View Menu** **View => Settings => Zoom**

The **Zoom** walk-right menu is



a string defines the extent of the view
a model defines the extent of the view
a view defines the extent of the view
two point zoom - see previous section
two point shrink
zoom by a user supplied factor
zoom into the view by factor of 2
zoom into the view by factor of 3
zoom into the view by factor of 4
zoom into the view by factor of 8
zoom out of the view by a factor of 8
zoom out of the view by a factor of 4
zoom out of the view by a factor of 3
zoom out of the view by a factor of 2



The **by String**, **by Model** and **by View** options use the x and y extents of the String, Model or View to define the display area for the view. These options will be described in more detail.

The option **zoom** is the same operation as the option just discussed, **factor** - to enlarge or reduce the view by a given magnification/reduction factor, and a number of preset view magnification and reduction factors.

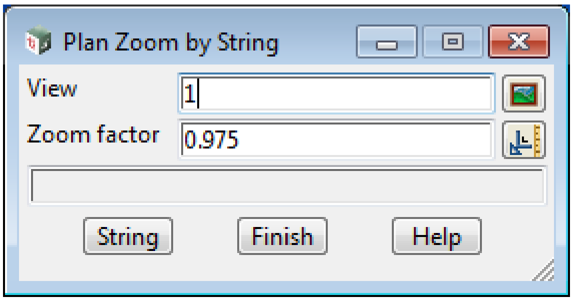
9.1.2.3.1 By String, by Model and by View

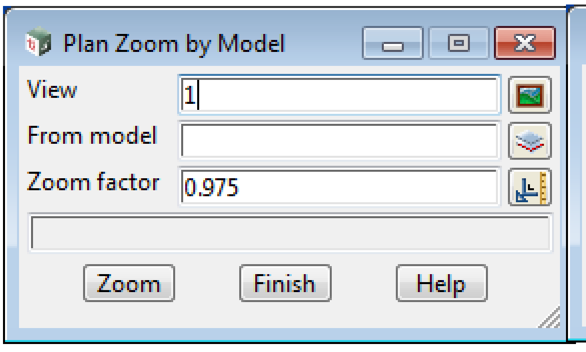
Position of option on menu: **Plan View Menu** **View =>Settings =>Zoom =>by string**

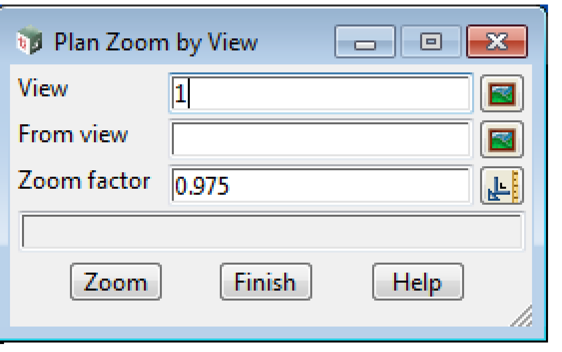
Position of option on menu: **Plan View Menu** **View =>Settings =>Zoom =>by model**

Position of option on menu: **Plan View Menu** **View =>Settings =>Zoom =>by view**

The three zoom options **by String**, **by Model** and **by View** work in a similar manner. After selecting the option, the **Plan Zoom by String/ Model/ View** panel is brought up.







For **by String**, the user selects a string using the **String** button and the data on the view is redrawn so the selected string is fitted to the view, adjusted by the **Zoom factor given in the panel**.

Note that the selected string can be from a different view.

For **by Model**, the user enters a model name into the **Model** field and then selects the **Zoom** button. The data on the view is redrawn so the specified model is fitted to the view, adjusted by the **Zoom factor given in the panel**.

Note that the specified model does not have to be on the view.

For **by View**, the user enters a view name into the **View** field and then selects the **Zoom** button. The data on the view is redrawn so the specified view is fitted to the current view, adjusted by the **Zoom factor given in the panel**.

Note that the specified view does not have to be on the current view.

9.1.2.3.2 Shrink

Position of option on menu:

Plan, Section, Perspective View Menu **View =>Settings =>Zoom =>Shrink**

Shrink is the opposite of zoom: instead of the information in the view box being expanded to fill the view, the information in the view is shrunk to fit into the zoom box.

After selecting the shrink option, the user picks two points from the appropriate plan/section/perspective views (by clicking LB in a view for each point) to define the diagonally opposite points of a rectangle. Note that the two points **do not** have to be from the same plan/section/perspective view.

Next the user selects the view (by clicking LB in the view) which is to be redrawn by shrinking the data on the view to fit into this rectangle.

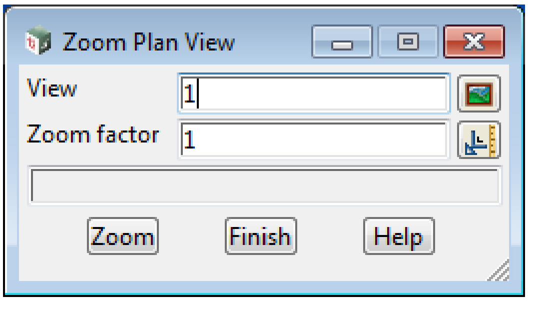
To cancel the zoom after the zoom operation has been selected, click RB.

9.1.2.3.3 Factor

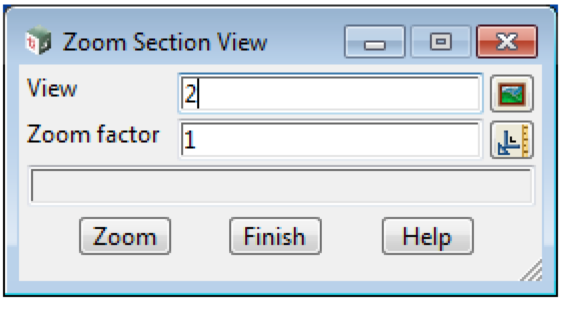
Position of option on menu: **Plan View Menu** **View => Settings => Zoom => Factor**

Position of option on menu: **Section View Menu** **View => Settings => Zoom => Factor**

In Plan View, when selecting the **Factor** option, the **Zoom Plan View** panel is displayed.



In Section View, when selecting the **Factor** option, the **Zoom Section View** panel is displayed.



This option is used to magnify or reduce the information in the view by a user given amount.

The field and buttons in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views
name of the view to set zoom factor for.			
Zoom factor	input	1.0	

factor to magnify/reduce the information inside the view by. The value can be greater than 1.0 (zoom in) or less than 1.0 (zoom out).

Zoom button

the information displayed in the view is magnified/reduced by the factor given in the **zoom factor** *field.*

WARNING - this option can not be applied to a perspective view.

9.1.2.3.4 Pre-set Zoom Factors

Upon selecting a particular zoom factor (e.g. 4 x in), the user is asked to indicate a point in a view which is to become the new view-centre. The user then indicates (by clicking LB in the view) which view is to be redrawn with this point as the new centre and with the selected zoom factor applied to that view.

To cancel the zoom after the zoom operation has been selected, click RB.

Next step messages - sent to the screen message area

<View Magnify> [Select][][] select new centre of view - RB to cancel
<View Magnify> [Select][][] select destination view - RB to cancel

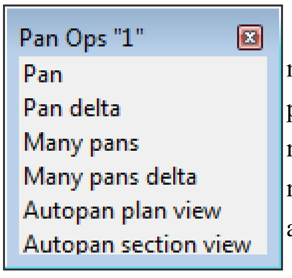
9.1.3 Pan

Position of menu: **Plan View Menu** **View => Pan**

Position of menu: **Section View Menu** **View => Pan**

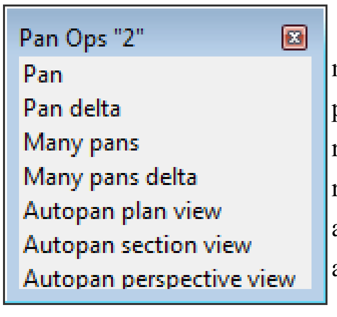
The **Pan** walk-right menu for Plan and Section views are

Plan View Pan Menu



make selected point the new view centre
pick a point and the place it is to be moved to on the screen
repeated pan
repeated pan delta
autopan for plan locked to plan view

Section View Pan Menu



make selected point the new view centre
pick a point and the place it is to be moved to on the screen
repeated pan
repeated pan delta
autopan for plan locked to section view
autopan for section locked to section view

Pan operates the same way for *Plan* and *Section* views.

The **pan** option can be selected in four ways:

(a) by clicking LB on **Pan** on a view button area

(b) by clicking on **<Control> LB** whilst in the view

(c) selecting the **Pan option** itself by clicking LB when the **Pan** option is highlighted on the **Pan** menu

(d) by activating the Pan option's walk-right menu, **Pan Ops**.

The *pan* uses either a *dynamics pan* or two point mode.

9.1.3.1 Dynamic Pan

After selecting the **pan** option, *dynamic pan* is selected by clicking MB or by typing **d**.

Then press LB at the point that is to be dragged across the view during the dynamic pan and then move the mouse to the new position for the point. Another point can then be selected to dynamically pan.

The *dynamic pan* continues until either RB is clicked, or MB is clicked (or **d** typed) to place the pan option into *two point* mode.

After activating the **Pan** walk-right menu, the user is presented with the option **Pan** (which is the same operation as the option just discussed), **Pan delta**, and **Many pans** and **Many pans delta.**

9.1.3.1.1 Pan

Position of option on menu: **Plan View Menu** **View => Pan => Pan**

Position of option on menu: **Section View Menu** **View => Pan => Pan**

After selecting **Pan**, the user is asked to indicate a point in a view which is to become the new view-centre. The user then indicates (by clicking LB in the view) which view is to be redrawn with this point as the new centre.

To cancel the **Pan** after the *pan* operation has been selected, click **RB**.

Next step messages - sent to the screen message area

<View Pan> [Select][][] select new centre of view - RB to cancel
<View Pan> [Select][][] select destination view - RB to cancel

9.1.3.1.2 Pan Delta

Position of option on menu: **Plan View Menu** **View => Settings => Pan => Pan delta**

Position of option on menu: **Section View Menu** **View => Settings => Pan => Pan delta**

After selecting the **Pan delta** option, the user is asked to indicate a point in a view and the point on a view where the first point will be moved to. The user then indicates (by clicking LB in the view) which view is to be redrawn with the new position of the point on the view.

To cancel the **Pan delta** after the *pan delta* operation has been selected, click RB.

Next step messages - sent to the screen message area

<View Pan> [Select][][] select 1st position of pan - RB to cancel
<View Pan> [Select][][] select 2nd position of pan - RB to cancel
<View Pan> [Select][][] select destination view - RB to cancel

9.1.3.1.3 Many Pans

Position of option on menu: **Plan View Menu** **View => Pan => Many pans**

Position of option on menu: **Section View Menu** **View => Pan => Many pans**

The **Many pans** option is simply one *pan* operation followed by another.

After one *pan* operation has been performed, a new *pan* operation is begun.

The sequence is terminated by clicking RB.

9.1.3.1.4 Many Pans Delta

Position of option on menu: **Plan View Menu** **View => Pan => Many pans delta**

Position of option on menu: **Section View Menu** **View => Pan => Many pans delta**

The **Many pans delta** option is simply one *pan delta* operation followed by another.

After one *pan delta* operation has been performed, a new *pan delta* operation is begun.

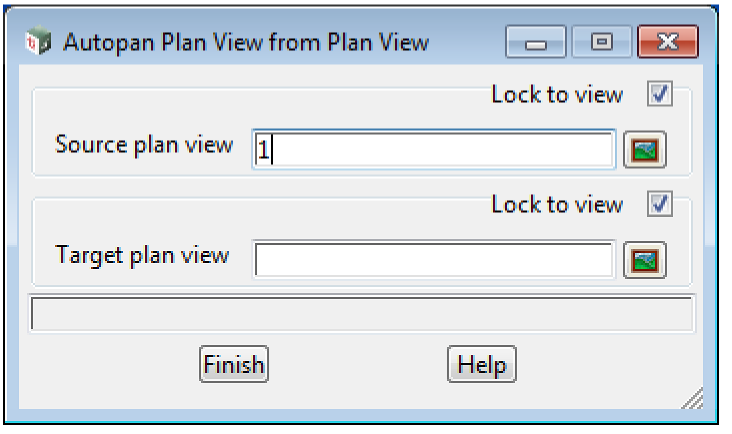
The sequence is terminated by clicking RB.

9.1.3.1.5 Autopan Plan View Locked to a Plan View

Position of option on menu: **Plan View Menu   View =>Pan =>Autopan plan view**

The **Autopan plan view** option locks a target plan view to a source plan view. As the cursor is moved in the source plan view, the target plan view is automatically panned to keep the cursor in the middle of it. The target plan view keeps its scale.

Selecting **Autopan plan view** brings up the **Autopan Plan View from Plan View** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
Source plan view	view box	current view	available plan views

plan view to lock the target plan view to.

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
Target plan view	view box		available plan views

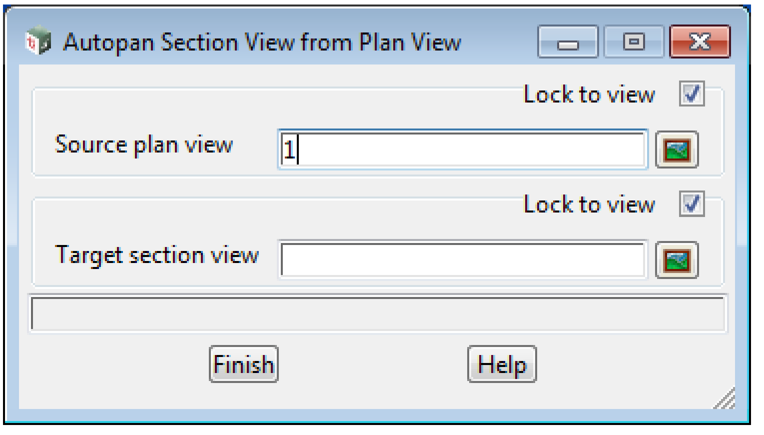
plan view to lock the source plan view. As the cursor moves in the source plan view, the target view is automatically panned so that the cursor is in the centre of the target plan view.

9.1.3.1.6 Autopan Section View Locked to a Plan View

Position of option on menu: **Plan View Menu** **View =>Pan =>Autopan section view**

The **Autopan section view** option locks a target section view to a source plan view. As the cursor is moved in the source plan view, the cursor position is dropped onto the profiled string in the target section view and the target section view is automatically panned to keep the dropped cursor in the middle of it. The target section view keeps its scale.

Selecting **Autopan section view** brings up the **Autopan Section View from Plan View** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
Source plan view	view box	current view	available plan views

plan view to lock the section view to.

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
Target section view	view box		available section views

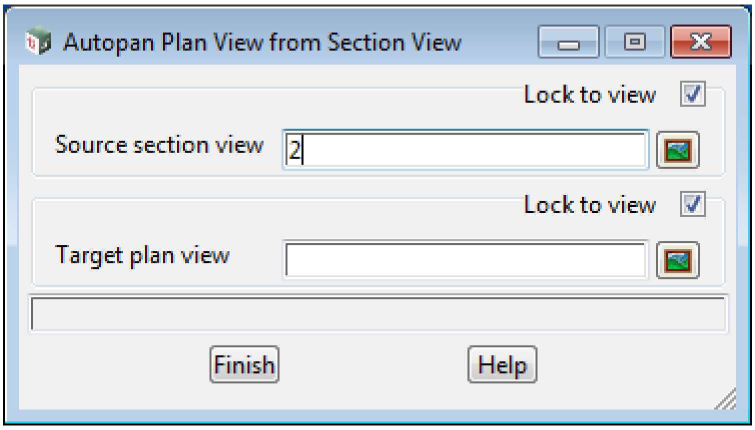
section view to lock the source plan view. As the cursor is moved in the source plan view, the cursor position is dropped onto the profiled string in the target section view and the target section view is automatically panned to keep the dropped cursor in the middle of it. The target section view keeps its scale.

9.1.3.1.7 Autopan Plan View Locked to a Section View

Position of option on menu: **Section View Menu** **View => Settings => Pan => Autopan plan view**

The **Autopan plan view** option locks a target plan view to a source section view. As the cursor is moved in the source section view, the target plan view is automatically panned to keep the cursor in the middle of it. The target plan view keeps its scale.

Selecting **Autopan plan view** brings up the **Autopan Plan View from Section View** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
Source section view	view box	current view	available plan views

section view to lock the target plan view to.

Lock to view	tick box	tick	
Target plan view	view box		available plan views

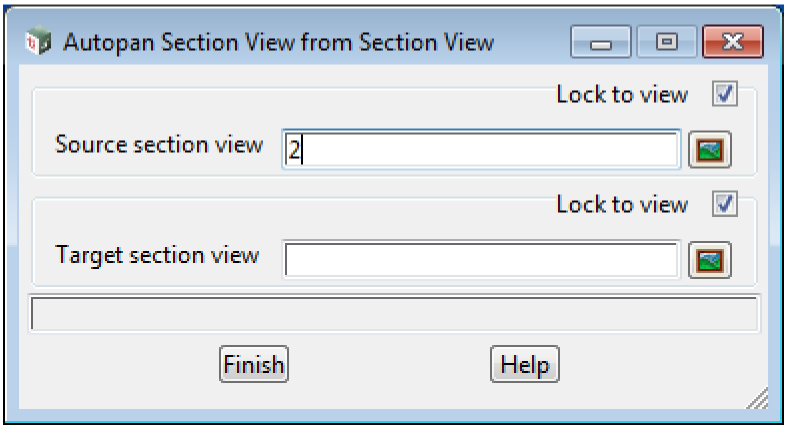
plan view to lock the source section view. As the cursor moves in the source section view, the target view is automatically panned so that the cursor is in the centre of the target plan view.

9.1.3.1.8 Autopan Section View Locked to a Section View

Position of option on menu:Section View Menu View =>Pan =>Autopan section view

The **Autopan section view** option locks a target section view to a source plan view. As the cursor is moved in the source section view, the cursor position is dropped onto the profiled string in the target section view and the target section view is automatically panned to keep the dropped cursor in the middle of it. The target section view keeps its scale.

Selecting **Autopan section view** brings up the **Autopan Section View from Section View** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
Source section view	view box	current view	available section views

section view to lock the target section view to.

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
Target section view	view box		available section views

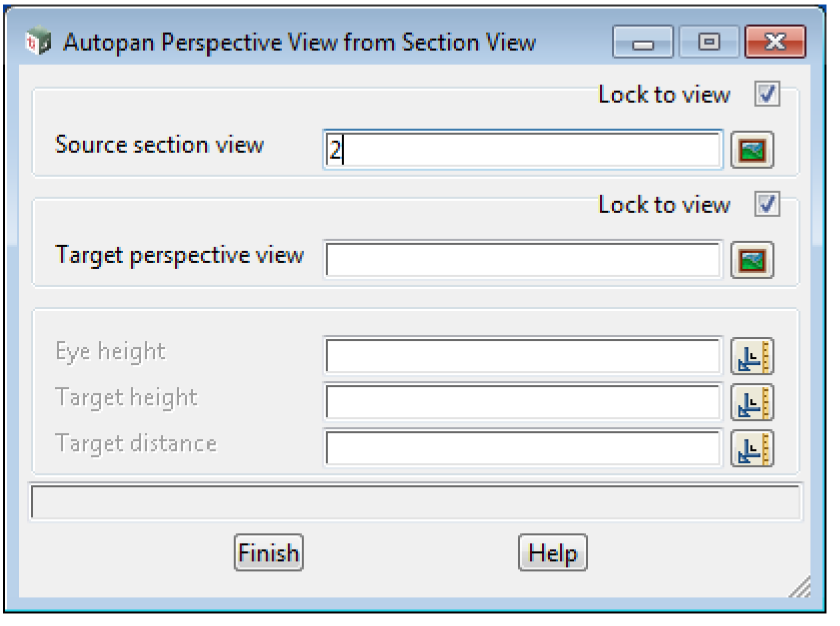
section view to lock the source section view. As the cursor is moved in the source section view, the cursor position is dropped onto the profiled string in the target section view and the target section view is automatically panned to keep the dropped cursor in the middle of it. The target section view keeps its scale.

9.1.3.1.9 Autopan Perspective View Locked to a Section View

Position on menu: **Section View Menu** **View => Settings => Pan => Autopan perspective view**

The **Autopan perspective view** option locks a target perspective view to a source section view. As the cursor is moved in the source section view, the eye and target for the perspective view is automatically changed. Only the eye and target positions are modified for the target perspective view.

Selecting **Autopan perspective view** brings up the **Autopan Perspective View from Section View** panel.



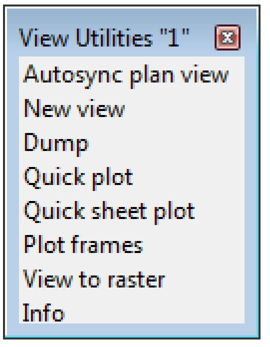
The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Lock to view	tick box	tick	
if ticked, the source view is used.			
Source section view	view box	current view	available section views
section view to lock the target perspective view to.			
Lock to view	tick box	tick	
if ticked, the target view is used.			
Target perspective view	view box		available perspective views
perspective view to lock to the source section view. As the cursor moves in the source section view, the eye and target position for the target perspective view is calculated from the (x,y,z) of the profiled string in the section view, and the eye and target information in the panel.			

9.1.4 Plan Utilities

Position of menu: **Plan View Menu** **View => Settings => Utilities**

The **Utilities** menu contains miscellaneous options involving the plan view. The **Utilities** walk-right menu is



For the option:

Autosync plan view, go to 9.1.4.1 Autosync Plan View Locked to a Plan View

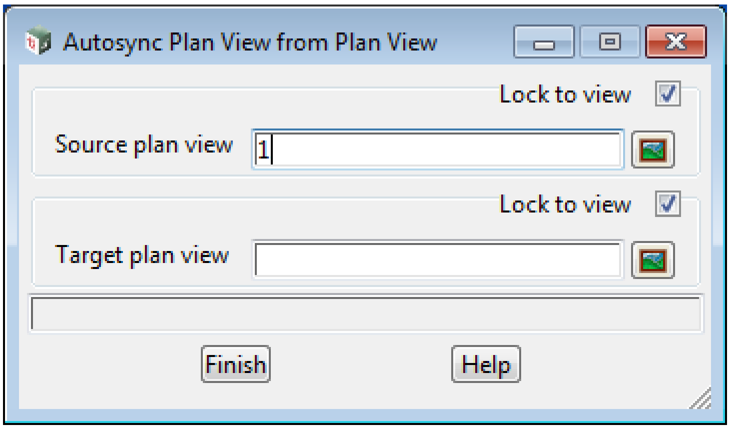
New view settings	9.1.4.2 New View Settings
Dump	9.1.4.3 View Dump
Quick *plot*	9.1.4.4 Quick Plan Plot
Quick sheet *plot*	9.1.4.5 Quick Sheet Plot
Plot frames	9.1.4.6 Plot Frames
View to raster	9.1.4.7 Create Raster from Plan View
Info	9.1.4.8 View Info

9.1.4.1 Autosync Plan View Locked to a Plan View

Position of option on menu: **Plan View Menu** **View =>Utilities =>Autosync plan view**

The **Autosync plan view** option locks a target plan view to a source plan view. As the cursor is moved in the source plan view, the same movement is made in the target plan view.

Selecting **Autosync plan view** brings up the **Autosync Plan View from Plan View** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Lock to view	tick box	tick	
Source plan view	view box	current view	available plan views

plan view to lock the target plan view to.

Lock to view	tick box	tick	
Target plan view	view box		available plan views

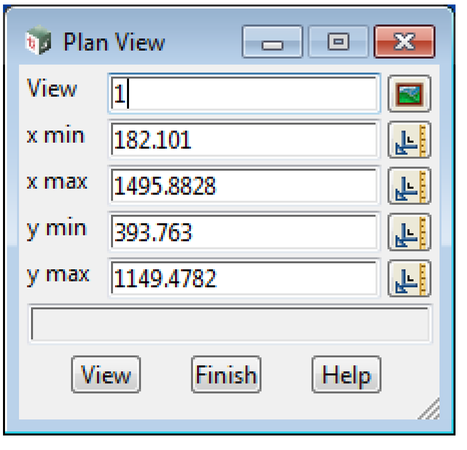
plan view to lock to the source plan view. As the cursor is moved in the source plan view, the same movement is made in the target plan view.

9.1.4.2 New View Settings

Position of option on menu: Plan View Menu View =>Settings =>Utilities =>New view settings

The **new view settings** option displays the current view setting and permits the user to specify new x and y minimum and maximum values as the viewing parameters.

Selecting **New view settings** fires up the **Plan View** panel.



Because the aspect ratio of the view may be different from the aspect ratio defined by the user supplied x and y minimums and maximums, slightly more data than the specified range may need to be drawn in the view. However, the view will always **include** the user given range.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

view to set min and max for.

x min/max	input/output	current x min/max	

minimum/maximum x co-ordinate for the view

y min/max	input/output	current y min/max	

minimum/maximum y co-ordinate for the view

View	button		

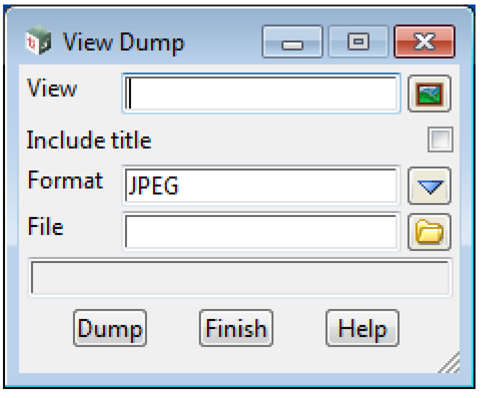
define the view parameters according to the information in the panel. If the box given by the x and y values in the panel is not the same shape as the view itself (that is, has the same aspect ratio), the x and y values will be modified so that the x and y values match the view shape. The final x and y values are *displayed in the panel.*

9.1.4.3 View Dump

Position of option on menu: **Plan View Menu** **View => Settings => Utilities => Dump**

This option is used to write the image of the view out to disk in a user selected format.

Selecting **Dump** brings up the **View Dump** panel.



The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input	view option picked from	available views

view to dump out in the specified format.

Include title	tick box		

*if **ticked**, the view title area is included in the dump.*

Format	input	gif	gif, xwd, colour postscript

the format to dump the view out in.

File	input	*.gif	

the file to dump the view images out to

Dump	button		

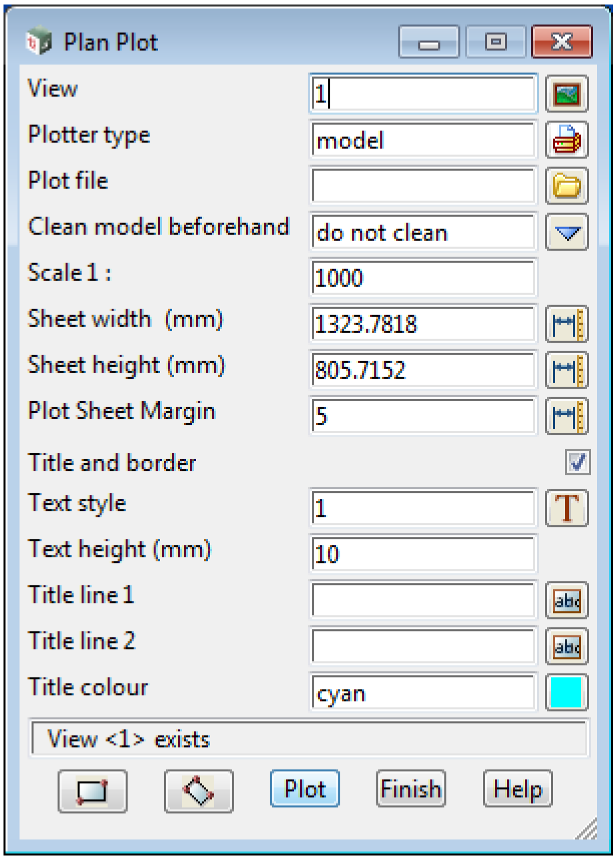
dump in the given format the image of the view given in the **view** *field to the file given in the* **file** *field.*

9.1.4.4 Quick Plan Plot

Position of option on menu: **Plan View Menu** **View =>Settings =>Utilities =>Quick plot**

The **Quick plot** option writes out all the information displayed in the plan view to either a plot file (in a user selected format) or to a 12d Model model. The user selects a scale for the plot and the sheet width and height are calculated by 12d Model.

Selecting **Quick plot** brings up the **Plan Plot** panel.



The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

view to plot.

Plotter type	input	hp	hp, dxf, postscript *etc.*

format for the plot information.

Plot file	input	depends on plotter type	

stem of the name of the file to write the plot of the view to. The name ending is added automatically and depends on the plotter type.

Clean model beforehand	choice box		do not clean prompt for clean always clean

only applicable if plotting to a model.

*if **always clean**, the model is cleaned before the plot is created.*
*If **prompt for clean**, the user is prompted that the model will be cleaned before the plot is created.*
*If **do not clean**, the model is not cleaned before the plot is created.*

Scale 1:	input		

if a value is entered by the user and an <enter> given, the sheet width and height required by the plot are calculated and displayed in the **sheet width** *and* **sheet height** *fields.*

Sheet width (mm) output

if a value is entered by the user and an <enter> given, the scale and height required by the plot are calculated and displayed in the **scale** *and* **sheet height** *fields. The units for sheet width are* ***millimetres****.*

Sheet height (mm) output

if a value is entered by the user and an <enter> given, the scale and width required by the plot are calculated and displayed in the **scale** *and* **sheet width** *fields. The units for sheet height are* ***millimetres***

Title and border tick box

if ***ticked****, a border and two lines of title are placed on the bottom of the plot.*

Title line 1/2 input

first/second line of title information.

Title height (mm) input 10

height (in ***millimetres****) to draw the two lines of title information.*

Title colour input cyan available colours

colour used for the border and the title information.

Rectangle button

create a rectangle (parallel to the x,y axis) that the plot is restricted to.

Rotated Rectangle button

create a rotated rectangle that the plot is restricted to.

Plot button

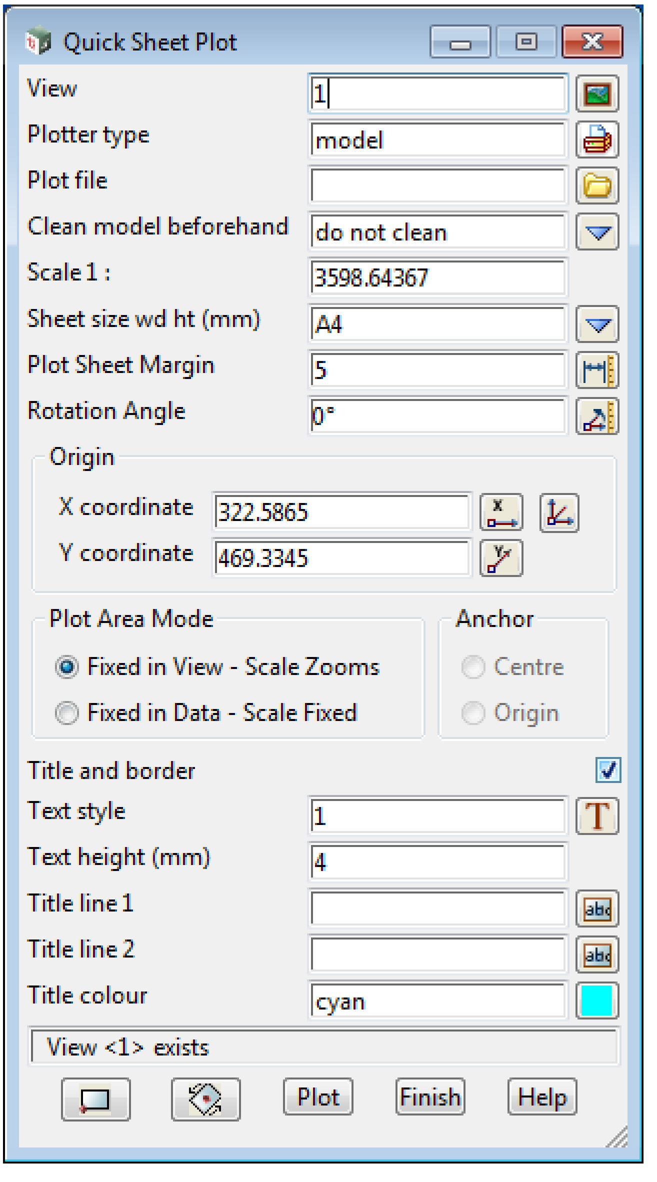
write out the plot of the information displayed in the view to the file given in the **plot file** *field. The format of the file is given by the* **plotter type.**

9.1.4.5 Quick Sheet Plot

Position of option on menu: Plan View Menu View =>Settings =>Utilities =>Quick sheet plot

The **Quick sheet plot** option takes a user selected plot sheet and writes out all the information displayed in the plan view in the sheet to either a plot file (in a user selected format) or to a 12d Model model. The user selects the plot sheet and a scale for the plot.

Selecting **Quick sheet plot** displays the **Quick Sheet Plot** panel.



The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

view to plot.

Plotter type	choice box	hp	hp, dxf, postscript *etc.*

format for the plot information.

Plot file	input	depends on plotter type	

stem of the name of the file to write the plot of the view to. The name ending is added automatically and *depends on the plotter type.*

Clean model beforehand choice box do not clean / prompt for clean / always clean

only applicable if plotting to a model.

*if **always clean**, the model is cleaned before the plot is created.*
*If **prompt for clean**, the user is prompted that the model will be cleaned before the plot is created.*
*If **do not clean**, the model is not cleaned before the plot is created.*

Scale 1: real value

the plot scale.

Sheet size wd ht (mm) sheet box defined sheet sizes

a sheet is selected from the pop-up or the width and height (in mm) are entered, separated by a space.

Rotation angle dms value

the anti-clockwise rotation (in dms) for the plot sheet.

Origin

select or type in the position of the bottom left hand corner of the plot region.

View controlled/ Data controlled radio buttons

*if **Data controlled**, the plot sheet maintains its size and position with **respect to the data in the view.** That is, the plot sheet origin is locked to the selected data co-ordinates, and the plot scale is fixed so that the plot sheet then has a set size in world (data) units. If pans and zooms are made to the data in the view, the plot sheet will then move/zoom with data.*

*if **View controlled**, the plot sheet maintains its size and position with **respect to the view itself**. That is, the plot sheet is locked in size and position with respect to the view itself. If pans and zooms are made to the data in the view, the sheet scale and origin are automatically modified to keep the plot frame in exactly the same position and size in the view.*

Title and border tick box

*if **ticked**, a border and two lines of title are placed on the bottom of the plot.*

Title line 1/2 input

first/second line of title information.

Title height (mm) input 10

height (in millimetres) to draw the two lines of title information.

Title colour input cyan available colours

colour used for the border and the title information.

Rectangle button

if selected, the plot frame is placed by selecting a cursor position from a view. This defines the Origin of the plot sheet. The sheet size, plot sheet scale and sheet rotation are taken from the panel fields.

Centre and Rotate button

if selected, a centre of for the plot sheet is selected and then an second point to define the rotation of the plot sheet. This defines the Origin and Rotation of the plot sheet. The sheet size and scale are taken from the panel fields.

Plot button

write out the plot of the information displayed in the plot sheet to the file given in the **plot file** *field. The format of the file is given by the* **plotter type.**

9.1.4.6 Plot Frames

Position of option on menu: **Plan View Menu** **View => Settings => Utilities => Plot frames**

To create plan plots of an arbitrary size, rotation and scale, 12d Model uses **plot frames**.

Basically a plot frame consists of a sheet size (in mm), margins within the sheet and a scale for the plot. This will define a plotting area in world co-ordinates (the plot frame).

The plot frame can be arbitrarily positioned and rotated on a plan view.

This option is documented in the section 25.8.12 Plotting Old Plot Frames.

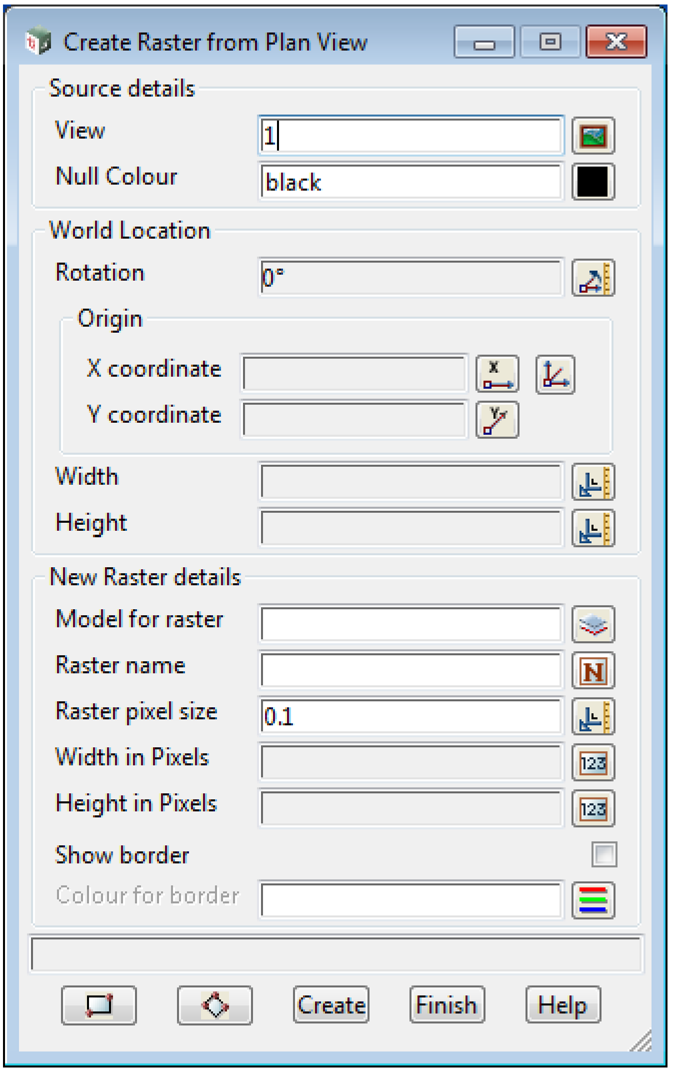
9.1.4.7 Create Raster from Plan View

Position of option on menu: **Plan View Menu** **View => Settings => Utilities => View to raster**

Position of option on menu: **Strings =>Raster => Plan to raster**

This option creates a 12d raster of a user specified pixel size, for the image on a plan view. This is useful for creating a 12d raster from an ECW file to use in draping on a tin in visualisations.

On selecting the **View to Raster** option, the **Create Raster from Plan View** panel is displayed.



The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up

Source Details

View	view box	current view	available views

view to create raster from.

Null colour	colour box		available colours

colour to set to no pixel in the raster

World Location

Anticlockwise rotation	angle box		

the world rotation of the selected rectangle.

X/Y co-ordinate real box

the world x/y co-ordinate of the corner of the bottom left corner of the rectangle.

Width/height real box

the width/height in world units of the rectangle.

New Raster Details

Model for raster model box available models

name of the model for the raster element.

Raster name text box

the name for the raster.

Raster pixel size input

the size (in world units) for each pixel in the created raster.

Width/Height in pixels output only

the width/height in pixels of the created raster.

Show border tick box tick

if ticked then the border of the created raster element is displayed.

Colour for border input default colour available colours

the colour of the border for the created raster.

Rectangle button

create a rectangle (parallel to the x,y axis) that the created raster is restricted to.

Rotated Rectangle button

create a rotated rectangle that the created raster is restricted to.

Create button

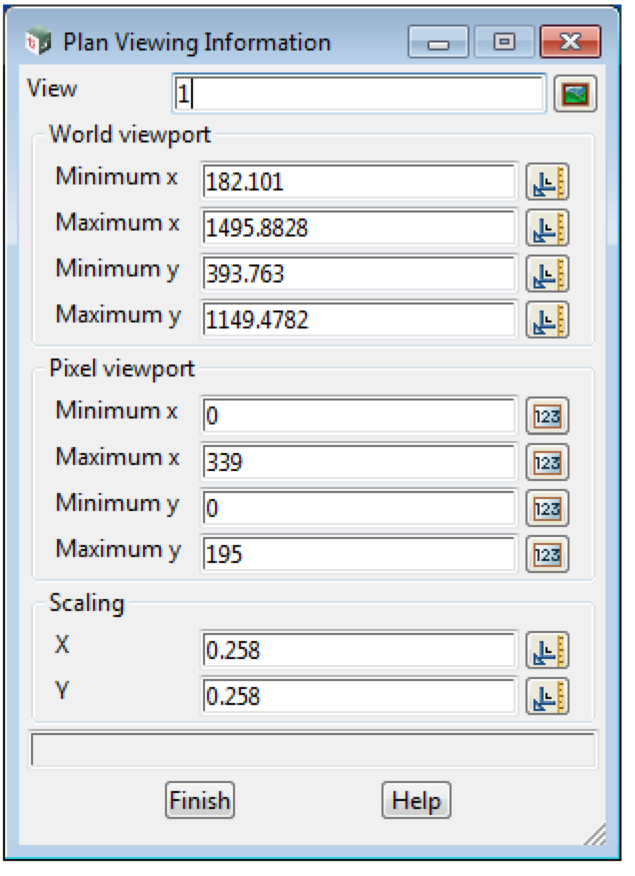
create a 12d raster from the image on the plan view.

9.1.4.8 View Info

Position of option on menu: **Plan View Menu** **View => Utilities => Info**

This option displays information about the world and pixel size of a plan view.

On selecting the **Info** option, the **Plan Viewing Information** panel is displayed.



The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available plan views

when activated from the Plan View menu, the name of the view is placed into this field and the information about this view is displayed in the panel fields.

Once the panel is up, a different Plan View name can be selected and the information will be displayed for that view.

World viewport

Minimum, Maximum x display only

display the world minimum and maximum x coordinates for the view.

Minimum, Maximum y display only

display the world minimum and maximum y coordinates for the view.

Pixel viewport

Minimum, Maximum x display only

display the minimum and maximum x pixels coordinates for the view.

Minimum, Maximum y display only

display the world minimum and maximum y pixels coordinates for the view.

Note - for pixels coordinates, (0,0) is at the top left hand corner of the view and positive x goes to the right, and positive y goes down the view.

Scaling

X display only

the ratio of x pixel length of the view to the x world unit length of the view. That is,

(maximum x pixels - minimum x pixels)/ (maximum x world units - minimum x world units)

Y display only

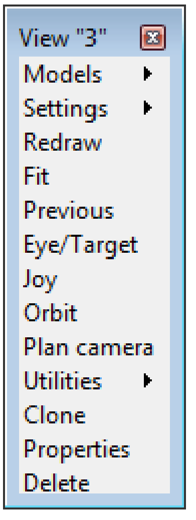
the ratio of y pixel length of the view to the y world unit length of the view. That is,

(maximum y pixels - minimum y pixels)/ (maximum y world units - minimum y world units)

9.2 Perspective View Menu

Position of menu: **Perspective View Menu** **View**

The **Perspective view** menu is



For the options

9.2.1.1 Drawing Engine

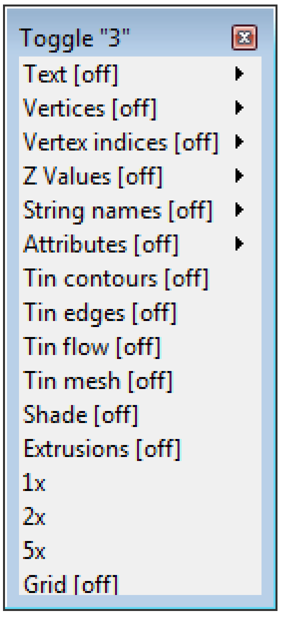
This is documented in 9.2.1.1 Drawing Engine.

Continue to 9.2.1.2 Perspective Toggle or return to 9.2.1 Perspective View Settings.

9.2.1.2 Perspective Toggle

Position of menu: **Perspective View Menu** **View =>Settings =>Toggle**

The **Toggle** walk right brings up the **Toggle** perspective view menu.



Selecting any options from this menu will toggle the option on/off.

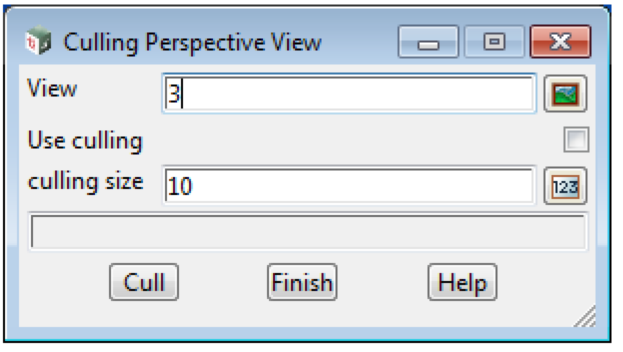
Continue to 9.2.1.3 Culling or return to 9.2.1 Perspective View Settings.

9.2.1.3 Culling

Position of option on menu: **Perspective View Menu** **View =>Settings =>Culling**

The **Culling** option is used to suppress the drawing of strings whose on-screen extent is less than a user defined pixel size.

Selecting **Culling** raises the **Culling Perspective View** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

view to set culling parameters for.

Use culling	tick box		

*if **ticked**, a string is **not** drawn on the perspective view whenever the string's extent box when drawn on the view would be smaller the culling size given in the* **culling size** *field.*

Culling size	input	10	

pixel size used for culling

Cull	button		

record the culling size given in the **culling field**. *If the* **use culling** *field and redraw the view.*

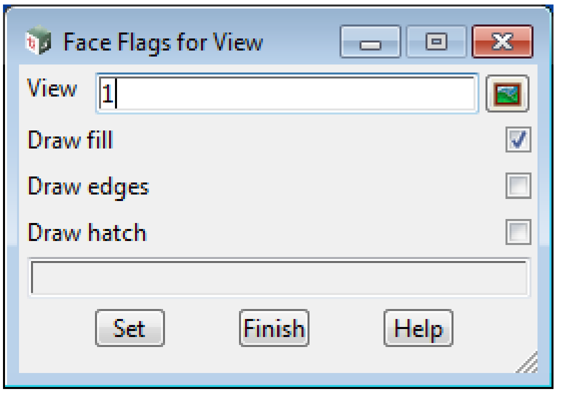
Continue to 9.2.1.4 Face Flags for View or return to 9.2.1 Perspective View Settings.

9.2.1.4 Face Flags for View

Position of option on menu: **Perspective View Menu** **View =>Settings =>Faces**

The **faces** option allows the user to specify how faces are displayed in the perspective view and on any perspective view plots.

Selecting **Faces** fires up the **Face Flags for View** panel.



The fields and buttons have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

view to face flags for.

Draw fill	tick box	tick	

*if **ticked**, all faces in the view are drawn in their fill colour.*

Draw edges	tick box		

*if **ticked**, all face edges in the view are drawn.*

Draw hatch	tick box		

*if **ticked**, all faces in the view are drawn in their hatch pattern.*

Set	button		

set the **draw fill/edges/hatch** *fields to the value in the panel fields. The plan view is then redrawn.*

Continue to 9.2.1.5 Hide View or return to 9.2.1 Perspective View Settings.

9.2.1.5 Hide View

Position of option on menu: **Perspective View Menu** **View =>Settings =>Hide**

When looking across a landscape, part of the terrain is often hidden by other parts of the terrain. For example hills in the foreground will hide hills behind them.

In ***12d Model***, a landscape is represented by a triangulated surface (a tin) and a tin can be used by a hidden line algorithm to determining what is visible is a scene.

The **hide** option in***12d Model*** uses a tin to define a surface and processes any strings on the perspective against the tin to determine what is visible or hidden.

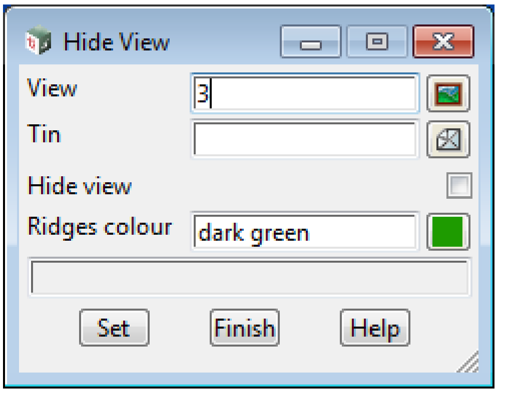
Only strings that lie on the tin can be sensibly processed. For example, contours, meshes, draped strings and any of the data that was used to create the tin.

When viewing a terrain from an eye point, the **ridge lines** are the edges of transition between visible and invisible areas. The **hide** option displays the ridge lines to delineate the hidden regions.

Once the **hide** option is set on, a hide will be done on the view whenever the view parameters are changed. If a model is added to the view when hide is set on, the strings in the model are processed and only the visible sections displayed in the view.

Note - strings can still be selected in a hidden view.

Selecting **Hide** raises the **Hide View** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

view to set hide parameters for.

Tin	input		available tins

the name of the triangulated surface (tin) to be used for determining what is visible or not.

Hide view	tick box		

*if **ticked**, then the view is processed when the* **set** *button is selected.*

Ridges colour	input		available colours

the colour for the ridge lines.

Set	button		

record the answers for the **hide view**, **tin** *and* **ridges colour** *fields and then process the perspective view using the new parameters. The view type will be changed to **hidden**.*

WARNING - a hide can be very slow for large tins and/or large data sets.

Continue to 9.2.1.6 Clipping Planes for View or return to 9.2.1 Perspective View Settings.

9.2.1.6 Clipping Planes for View

Position of option on menu: **Perspective View Menu** **View =>Settings =>Planes**

The perspective viewing direction is defined by specifying an eye and target point.

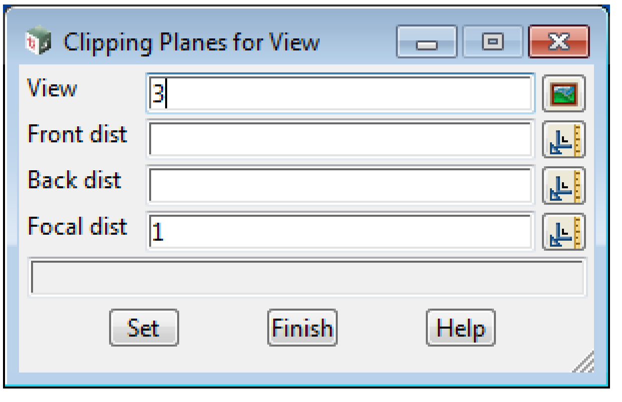
The three dimensional view is then projected onto a plane at right angles to the eye-target line, and at a user defined distance from the eye-point. This plane is called the focal plane and the distance from the eye-point to the focal plane is the focal distance.

The projection of all the data onto the focal plane is what is seen on the screen in a perspective view. Moving the focal plane has the same effect as varying the telephoto lens on a camera - it gives the impression of zooming into and out of the view.

It is not always desirable to include all the data in the perspective view. For example, data behind the viewer is not normally required to be seen. The user can specify the position of two planes (called the front and back clipping planes) parallel to the focal plane. Only data lying between the clipping planes will be seen. Thus the view is "clipped" using the front and back clipping planes.

The distance to the clipping planes is measured from the eye point along the line joining the eye and target points (the eye-target line).

Selecting **Planes** fires up the **Clipping Planes for View** panel. This panel allows the user to set the focal distance and the front and back clipping plane distances.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

view to set clipping plane for.

Front dist	input/output

distance from the eye point to the front clipping plane. If this field is blank, no front clipping plane is used.

Back dist	input/output

distance from the eye point to the back clipping plane. If this field is blank, no back clipping plane is use.

Focal dist	input/output

distance from the eye point to the focal plane. This distance must be non-zero.

Set	button

set the distances to the front and back clipping planes and the focal plane. If the front or back clipping distance is blank, that plane is not set. After the set button is chosen, the view is redrawn using the new parameters,

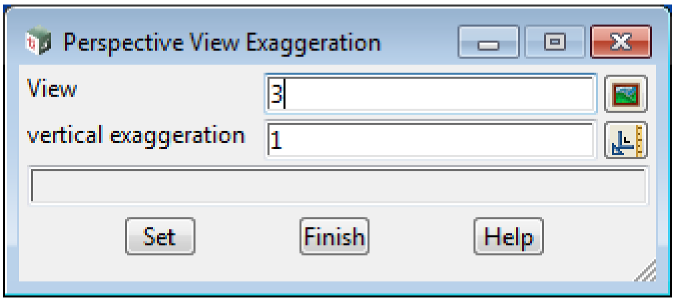
Continue to 9.2.1.7 Perspective View Exaggeration or return to 9.2.1 Perspective View Settings.

9.2.1.7 Perspective View Exaggeration

Position of option on menu: **Perspective View Menu** **View =>Settings =>Exaggeration**

The exaggeration option allows the user to specify the vertical exaggeration in the perspective view. The heights (z values) are multiplied by the vertical exaggeration value before drawing on the perspective view.

Selecting **Exaggeration** fires up the **Perspective View Exaggeration** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

view to set exaggeration for.

Vertical exaggeration	input	10	1,5,10

value to multiply the heights (z values) by before drawing in the perspective view.

Set	button		

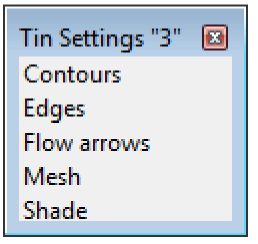
set the vertical exaggeration to the value in the vertical exaggeration field.

Continue to 9.2.1.8 Tins or return to 9.2.1 Perspective View Settings.

9.2.1.8 Tins

Position of menu: **Perspective View Menu** **View =>Settings =>Tins**

The options on the **Tins** walk-right menu control the display of tins on the view.The **Tins** walk-right menu is



For the option Contours, go to	9.2.1.8.1 Contours
Edges	9.2.1.8.2 Edges
Flow arrows	9.2.1.8.3 Flow Arrows
Mesh	9.2.1.8.4 Mesh
Shade	9.2.1.8.5 Shade

9.2.1.8.1 Contours

Position of option on menu: **Perspective View Menu** **View =>Settings =>Tins =>Contours**

The **contours** option defines contour and bold increments and colours, and also whether these contours are displayed for the triangles from any tins on the view. The panel is the same as for the plan view option. If **Shade** is set on, the triangles will be drawn in back to front order.

Continue to 9.2.1.8.2 Edges or return to 9.2.1.8 Tins or 9.2.1 Perspective View Settings.

9.2.1.8.2 Edges

Position of menu: **Perspective View Menu** **View =>Settings =>Tins =>Edges**

The **Edges** option allows the user to specify whether the edges of triangles from any tins on the view are displayed. The panel is the same as for the plan view option. If **Shade** is set on, the triangles will be drawn in back to front order.

Continue to 9.2.1.8.3 Flow Arrows or return to 9.2.1.8 Tins or 9.2.1 Perspective View Settings.

9.2.1.8.3 Flow Arrows

Position of option on menu: **Perspective View Menu** **View =>Settings =>Tins =>Flow arrows**

The **Flow arrows** option defines the colour and length of flow arrows, and also whether the flow arrows are displayed for the triangles from any tins on the view. The panel is the same as for the plan view option. If **Shade** is set on, the triangles will be drawn in back to front order.

Continue to 9.2.1.8.4 Mesh or return to 9.2.1.8 Tins or 9.2.1 Perspective View Settings.

9.2.1.8.4 Mesh

Position of option on menu: **Perspective View Menu** **View =>Settings =>Tins =>Mesh**

The **Mesh** option defines a rectangular mesh, and also whether the mesh is displayed for the triangles from any tins on the view. The panel is the same as for the plan view option. If **Shade** is set on, the triangles will be drawn in back to front order.

Continue to 9.2.1.8.5 Shade or return to 9.2.1.8 Tins or 9.2.1 Perspective View Settings.

9.2.1.8.5 Shade

Position of option on menu: **Perspective View Menu** **View =>Settings =>Tins =>Shade**

Position of option on menu: **Perspective View Menu** **View =>Settings =>Shade**

This is exactly the same option as the **Shade** described in the section 9.2.1.9 Shade.

Return to 9.2.1.8 Tins or 9.2.1 Perspective View Settings.

9.2.1.9 Shade

Position of option on menu: **Perspective View Menu** **View =>Settings =>Tins =>Shade**

Position of option on menu: **Perspective View Menu** **View =>Settings =>Shade**

In ***12d Model***, a landscape is represented by a triangulated surface - a tin. Each triangle in the tin is a part of a plane and has its own colour.

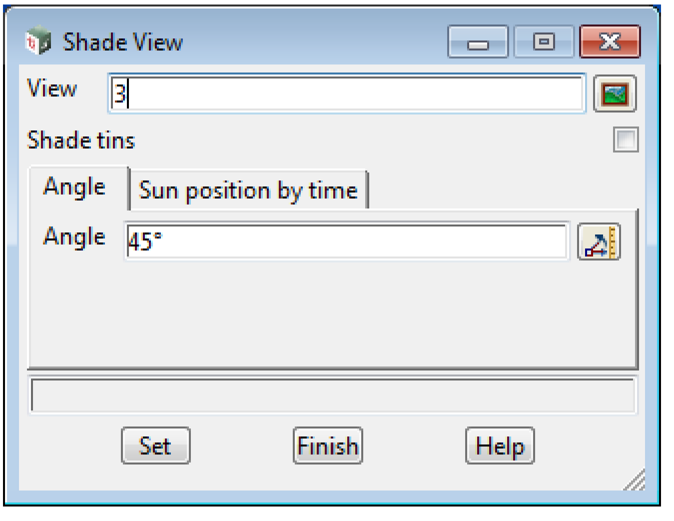
In a perspective view, each triangle can be drawn with a colour that is modified depending on the angle that the triangle makes with the sun (a point light source at infinity). This is called a **flat shade**.

If the triangles are drawn in a back to front order, then when the shaded landscape is drawn, any triangles in the foreground obscure triangles in the background and it looks like a hidden view.

If **shade** is set for a view, all the triangles in all the tins on the view are drawn as shaded triangles and the triangles are drawn in a back to front order.

Once the **Shade** is set on, a shade will be done on the view whenever the view parameters are changed. A plot of the shaded view can be made using the **dump** option on the view.

Selecting **Shade** fires up the **Shade View** panel:



The fields and buttons used in this panel have the functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

view to set shade parameters for.

Shade tins	tick box		

*if **ticked**, draw all the tins on the perspective view in shade mode.*

Angle	input	45	

angle of the sun (measured from the horizon).

Set	button		

record and redraw the view using the current parameters.

Return to 9.2.1 Perspective View Settings.

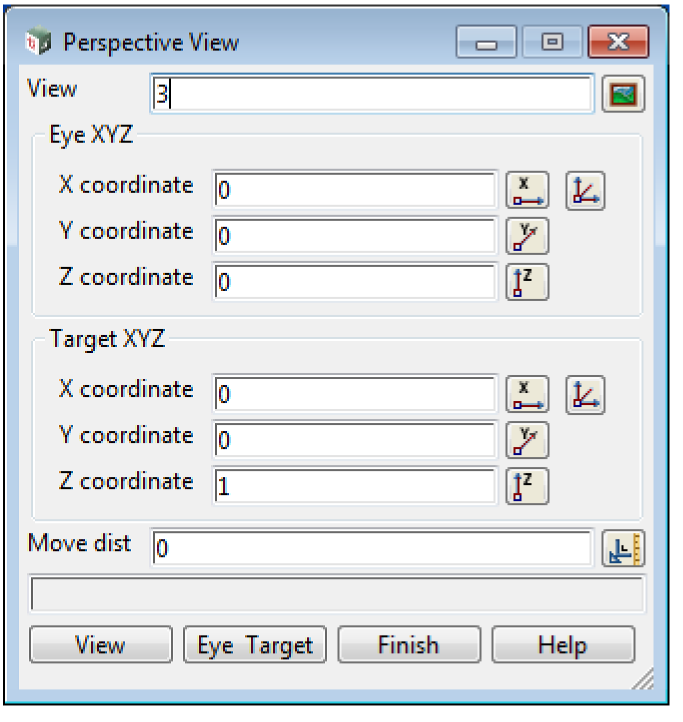
9.2.2 Eye/Target

Position of option on menu: **Perspective View Menu** **View =>Eye/Target**

The **Eye/Target** option displays the current eye and target co-ordinates and also allows the user to specify new eye and target points. The points can be chosen from any plan view using the cursor or by typed-input.

The view is projected onto a focal plane using a perspective transformation, and clipped using front and back clipping planes. The focal distance and the front and back clipping plane distances are set and modified in the **planes** option.

Selecting **Eye/Target** fires up the **Perspective View** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

view to set perspective parameters for.

Eye X Y Z	XYZ select	current eye position	xyz ops menu

co-ordinates of the eye viewing point. New values can be typed, or a point selected using the **xyz ops** *pop-up menu.*

Target X Y Z	XYZ select	current target position	xyz ops menu

co-ordinates of the target viewing point. New values can be typed, or a point selected using the **xyz ops** *pop-up menu.*

Move dist	input/output		

distance to move the eye point along the eye-target line in the direction of the target point. The target point is also moved the same distance along the eye-target line so that the eye-target distance is kept constant.

View	button		

define the perspective parameters according to the information in the panel. If the move distance is *non-zero, then the eye and target points are both moved along the eye-target line by the distance given in the Move field. In this case, the new eye and target positions will be written to the* **eye** *and* **target** *fields.*

Eye Target button

allows the user to define the (x, y) position of the eye and target points using the cursor and views.

After selection the button, the user is asked to select the eye position from a view by clicking LB in a view. A level *input box is then displayed on the screen for the user to enter the level (z value) for the eye point. The level is recorded and the level box removed after a <enter> is entered in the level input box.*

The user is then asked to select the target point from any view by clicking LB at the position of the target point. A level *input box is then displayed for the user to enter the level (z value) for the target point.*

After the target point is defined, the view is redrawn using the new eye and target positions.

How to Use the Panel and Panel Messages

(a) The eye and target points are set by using typed-input, or by selection in either the **eye XYZ** or **target XYZ** fields, or the **Eye Target** button.

(b) When the **View** button is selected, the perspective viewing parameters are calculated according to the information in the panel. If a non-zero move distance is given, the eye and target points are both moved along the eye-target line through the move distance The new values for the eye and target points are written into the panel. If no errors are detected in calculating the new viewing parameter, the view is redrawn using the new parameters.

Continue to 9.2.3 Joy for View or return to 9.2 Perspective View Menu.

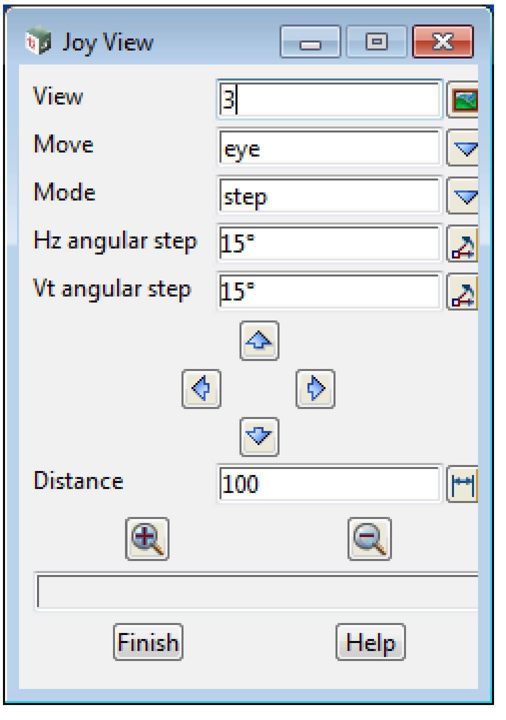
9.2.3 Joy for View

Position of option on menu: **Perspective View Menu** **View =>Joy**

The hardest thing in a perspective view is finding a good viewing position. The joy option makes it easy to construct a new perspective viewing position relative to the existing position.

The panel can be used to move the eye or target point by rotating them through a given angle to the left, right, up or down, or to move one towards or away from the other. It is also possible to move the eye and target points keeping the distance between them the same.

Selecting **Joy** fires up the **Joy view** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

view to set joy parameters for.

Move	choice box	eye	eye, target, eye & target

move the eye point, the target point or both.

Mode	choice box	step	step, continuous

in step mode, the view is modified each time an appropriate button is picked. In continuous mode, after the view is redrawn, the picked joy option is continually re-applied until either a new joy button is picked, button LB is clicked anywhere else in the joy panel.

Hz angular step	angle box	15	

angle in degrees (in 4.17.1 HP Notation*) that is used with the joy buttons* **Left** *and* **Right** *when moving just the eye or target point.*

Vt angular step	angle box	15	

angle in degrees (in 4.17.1 HP Notation*) that is used with the joy buttons* **Up** *and* **Down** *when moving just the eye or target point.*

Joy Buttons

*The Joy buttons **Up**, **Down**, **Left**, **Right**, **In** and **Out** are used to modify the perspective parameters and then redraw the view with the new parameters.*

*The effect of each joy button depends on whether the **Move** field is set to **eye**, **target** or **eye & target**.*

Up, Down, Left, Right buttons

Move field set to eye

Up/Down button

*rotate the eye-target line about the target point up/down by the angle given in the **Angle step** field. That is, the eye point is moved upwards/downwards, the target point kept fixed.*

Left/Right button

*rotate the eye-target line about the target point to the left/right by the angle given in the **Angle step** field. The target point kept fixed.*

In/Out button

*move the eye point towards/away the target point along the eye-target line by the distance given in the **Distance** field. The target point kept fixed.*

Move field set to target

*similar to the movements when the **Move** field is set to **eye** except the eye point is kept fixed and the target point is moved.*

Move field set to eye & target

Up/Down/Left/Right button

*the eye and target points are both moved up/down/left/right by the distance given in the **Distance** field. That is, the entire eye-target line is moved up/down/left/right and neither the eye or target point is kept fixed.*

Distance input 100

distance used to move the eye or target point.

In, Out button

*move the eye and target points along the eye-target line by the distance given in the **Distance** field. The direction is towards/away the target point.*

How to Use the Panel

(a) The **move**, **mode**, **angular step** and **distance** field are given the desired values and then one of the joy buttons (up, down, left, right, in or out) is selected. The perspective view is then redrawn

(b) If the mode is set to continuous, once drawing is completed, the selected joy option will be re-applied. This sequence is repeated until either a new joy button is picked, button LB is clicked anywhere else in the joy panel or a **c** key is typed.

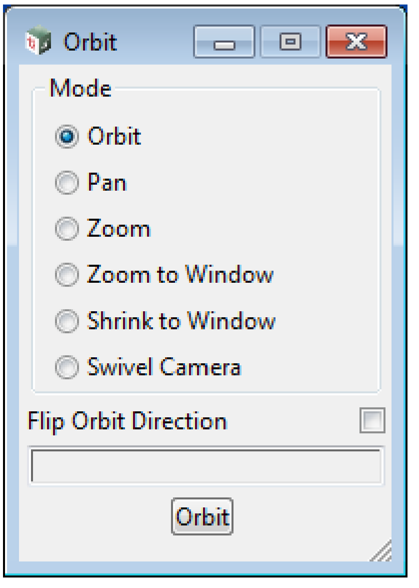
Continue to 9.2.4 Orbit or return to 9.2 Perspective View Menu.

9.2.4 Orbit

Position of option on menu: **Perspective View Menu** **View =>Orbit**

The orbit option quickly rotates the data around in the perspective view.

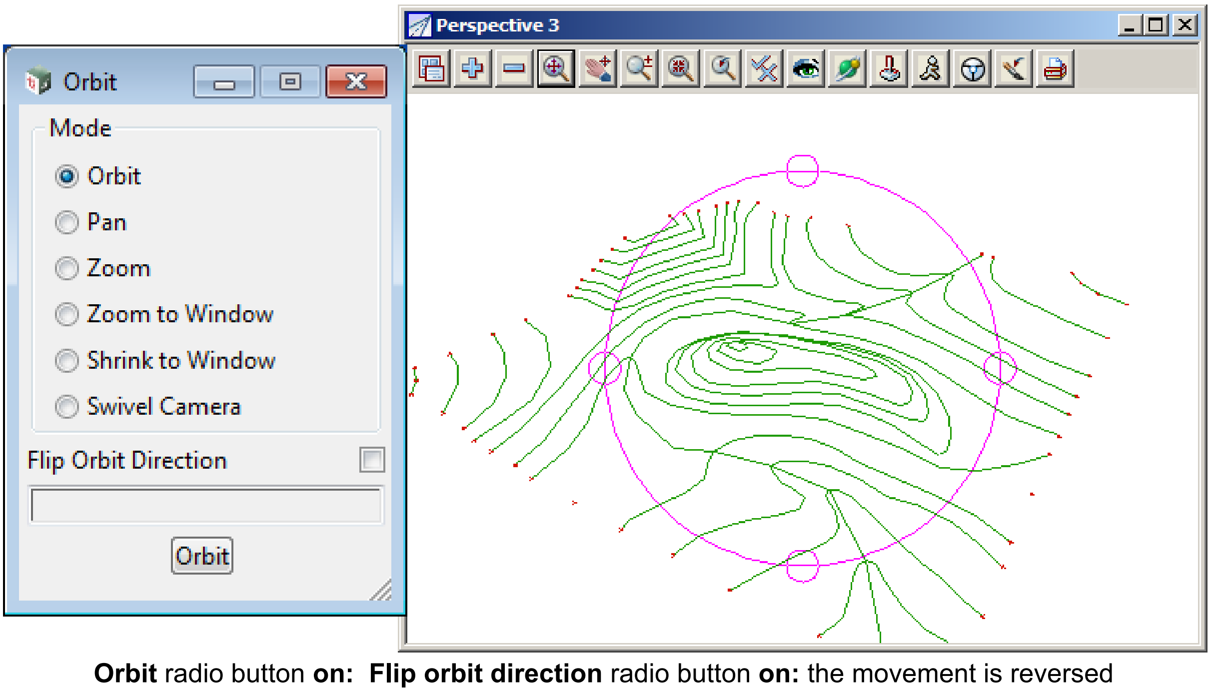
Selecting **Orbit** fires up the **Orbit** panel.



To use Orbit:

Orbit radio button **on:** **Flip orbit direction** radio button **off:**

when the left button is clicked in the perspective view, the orbit circle appears and
*holding LB down and **moving up** in the orbit circle tilts the **object up***
*holding LB down and **moving down** in the orbit circle tilts the **object down***
*holding LB down and **moving left** rotates the **object to the left***
*holding LB down and **moving right** rotates the **object to the right***



Orbit radio button **on:** **Flip orbit direction** radio button **on:** the movement is reversed

Pan radio button **on:**

*holding LB down and **moving up** in the view **raises** the **object***
*holding LB down and **moving down** in the view **lowers** the **object***
*holding LB down and **moving left** in the view **pans** the **object to the left***
*holding LB down and **moving right** in the view **pans** the **object to the right***

Zoom radio button **on:**

*holding LB down and **moving up** in the view **zooms into** the object*
*holding LB down and **moving down** in the view **zooms out** from the object*

Zoom to window radio button **on:**

when a zoom box is drawn on the view, the perspective is modified so that the contents of the zoom box fill the entire view.

Shrink to window radio button **on:**

when a zoom box is drawn on the view, the perspective is modified so that the contents of the window are shrunk to fit into the zoom box.

Swivel camera radio button **on:**

holding LB down moves the target point.

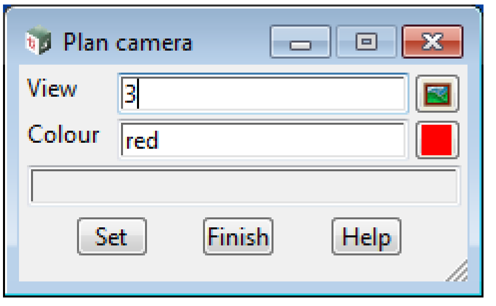
Continue to 9.2.5 Plan Camera or return to 9.2 Perspective View Menu.

9.2.5 Plan Camera

Position of option on menu: **Perspective View Menu** **View =>Plan Camera**

This creates a camera for the current perspective OpenGL view, which can be controlled from a plan view. This allows you to see where a camera is and where it is looking and move those points together or independently.

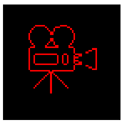
Selecting **Plan Camera**  brings up the **Plan Camera** panel.



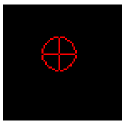
The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box		select view
the view to control			
Colour	colour box		
the colour to draw the plan camera and target symbol in			
Set	button		
Create the plan camera			

Setting the plan camera will create two symbols on your plan view, as shown below:



Camera / Eye



The target

To move the camera, simply click on one of these images and drag it. The perspective OpenGL view will move with it. If you wish to lift or lower the selected component, use the scroll wheel on your mouse. The distance you move is proportional to the zoom level on your plan view.

Key Strokes

There are a number of key strokes available when running the plan camera.

(**S**)et

sets a component (x, y, z) coordinate of the camera to be equal to the target or vice versa

(**L**)ock

locks the camera and target together, so they will maintain the same distance from each other when *either one or the other is moved.*

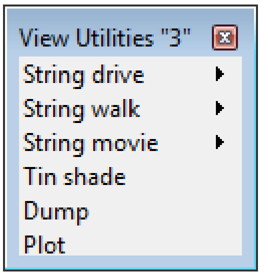
Continue to 9.2.6 Perspective Utilities or return to 9.2 Perspective View Menu.

9.2.6 Perspective Utilities

Position of option on menu: **Perspective View Menu** **View => Utilities**

The **Utilities** menu contains miscellaneous options involving the perspective view.

The **Utilities** walk-right menu is



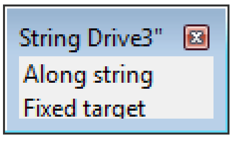
For the option *String drive*, go to [9.2.6.1 String Drive](#)
String walk [9.2.6.2 String Walk](#)
String movie [9.2.6.3 String Movie](#)
Tin shade [9.2.6.4 Tin Shade](#)
Dump [9.2.6.5 Dump](#)
Plot [9.2.6.6 Perspective Plot](#)

9.2.6.1 String Drive

Position of menu: **Perspective View Menu** **View => Utilities =>String drive**

The string drive option makes it easy to construct the perspective view one gets when moving along a string (for example, driving along a road centre line).

The two options on the **String drive** walk-right menu are



and they specify the positioning of eye and target points by:

along string - the eye and target points are automatically moved along the selected string

fixed target - the eye point automatically moves along the selected string but the target point is a selected fixed point.

Note - the **string drive** option can be aborted by pressing the **<esc>** key or clicking RB.

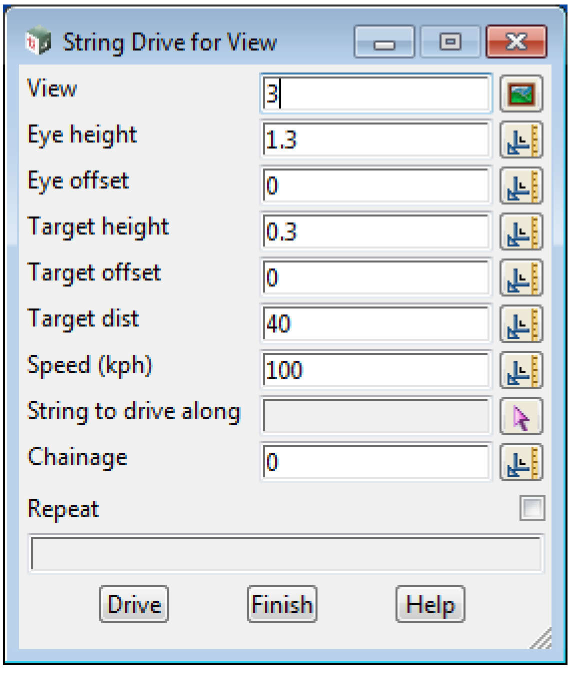
For the option Along string, go to [9.2.6.1.1 String Drive - Along String](#)
Fixed target [9.2.6.1.2 String Drive - Fixed Target](#)

Or return to [9.2 Perspective View Menu](#).

9.2.6.1.1 String Drive - Along String

Position of option on menu: **Perspective View Menu** **View => Utilities =>String drive =>Along string**

Selecting **Along string** fires up the **String Drive for View** panel.



For **string drive along a string**, a selected string is used to provide the (x, y, z) positions for the eye and target points.

The z-values can be adjusted by typing in a non-zero value for the eye and target heights in the **string drive** panel. These heights are relative to the z-values of the points on the string and are **added** to the z-values.

Like the new view option, the view is projected onto a focal plane and “clipped” using front and back clipping planes.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

view to set drive parameters for

Eye height	input	1.3	

height of the eye viewing point above the picked string

Eye offset	input	0	

offset of the eye viewing point from the picked string

Target height	input	0.3	

height of the target viewing point above the picked string

Target offset	input	0	

offset of the target viewing point from the picked string

Target distance	input	40	

distance (in string chainage) from the eye point to the target point.

Speed (kph) input 100

speed in kilometres per hour (that is, one thousand base units per hour) that the eye-target points move along the string.

String to drive along string select box

a string to drive along is selected from any view. The string must have z-values.

Chainage input/output 0

the chainage that the eye point is at on the string. The chainage is updated as the eye and target points are automatically moved along the string. The drive can be set to start at a specific start chainage by simply entering the start chainage into the **chainage** *field and then selecting the* **Drive** *button.*

Repeat tick box

if ***ticked****, the drive starts again at the beginning of the string.*

Drive button

When the **drive** *button is selected, the eye and target points are placed above the string as specified in the panel fields, and the view redrawn. The eye and target points are then moved along the string at the given speed until either reaches the end of the string. The chainage of the eye point is continually updated.*

Notes

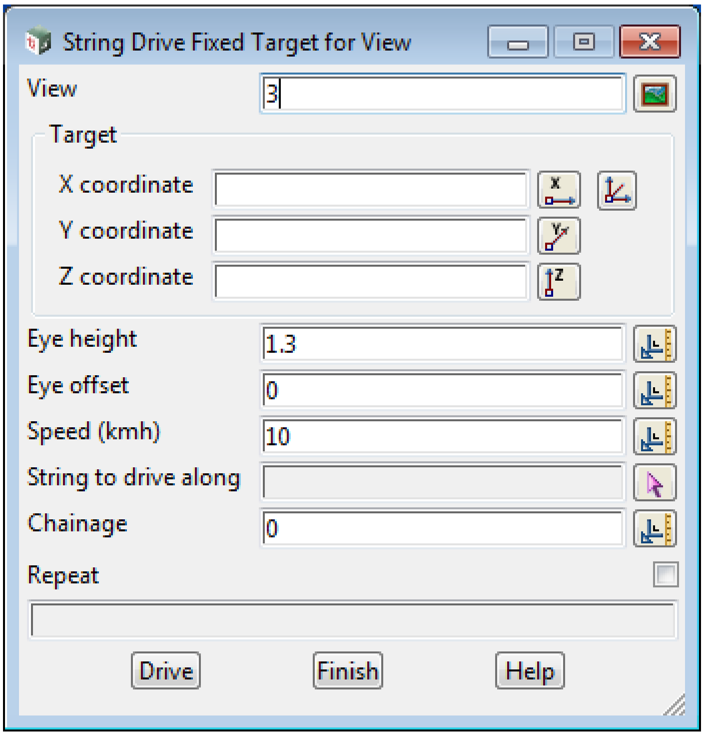
- the target distance and speed can be positive or negative.
- the eye and target points are shown on any view displaying the string being driven along. The eye point is drawn as a red cross, the target point, a green cross.
- if the front distance for the clipping plane of the perspective view is set to zero by the user, it is automatically reset to 2 so that the red cross drawn at the eye point is not visible in the perspective view.

Return to 9.2.6 Perspective Utilities or 9.2 Perspective View Menu.

9.2.6.1.2 String Drive - Fixed Target

Position of option on menu: **Perspective View Menu** **View => Utilities =>String drive =>Fixed target**

Selecting **Fixed target** fires up the **String Drive Fixed Target for View** panel.



For **string drive fixed target**, a selected string is used to provide the (x, y, z) positions for the eye point, and the target is a selected fixed point. The z-value for the eye is adjusted by adding to it the eye height in the **eye height** field in the **String Drive Fixed Target fro View** panel.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

View view box current view available views

view to set drive parameters for.

Target xyz select box

a fixed target point is selected from any view. The point's co-ordinates are displayed in the X, Y, Z coordinates panel fields.

Eye height input 1.3

height of the eye viewing point above the picked string

Eye offset input 0

offset of the eye viewing point from the picked string

Speed (kph) input 100

speed in kilometres per hour (that is, in one thousand of the base units per hour that the eye point moves along the string.

String to drive along string select box

a string to drive along is selected from any view. The string must have z-values.

Chainage input/output 0

the chainage that the eye point is at on the string. The chainage is updated as the eye point automatically moves along the string. The drive can be set to start at a specific start chainage by simply entering the start chainage into the **chainage** *field and then selecting the* **Drive** *button.*

Target button

a fixed target point is selected from any view. The point's co-ordinates are displayed in the **target** *panel field.*

Repeat tick box

if ***ticked****, the drive starts again at the beginning of the string.*

Drive button

When the **drive** *button is selected, the eye point is placed above the string at the chainage given in the* **chainage** *field, and the view redrawn. The eye point is then moved along the string at the given speed until it reaches the end of the string. The chainage of the eye point is continually updated.*

Notes

- the speed can be positive or negative.
- the eye point is shown on any view displaying the string being driven along. The eye point is drawn as a red cross, the target point, a green cross.
- if the front distance for the clipping plane of the perspective view is set to zero by the user, it is automatically reset to 2 so that the red cross drawn at the eye point is not visible in the perspective view

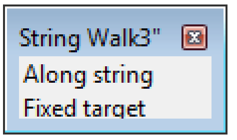
Return to 9.2.6 Perspective Utilities or 9.2 Perspective View Menu.

9.2.6.2 String Walk

Position of menu: **Perspective View Menu** **View => Utilities =>String walk**

The *string walk* option makes it easy to construct the perspective view one gets when walking along a string (for example, walking along a road centre line).

The two options on the **String Walk** walk-right menu are



and they specify the positioning of eye and target points by:

along string - the eye and target points are automatically moved along the selected string

fixed target - the eye point automatically moves along the selected string but the target point is a selected fixed point.

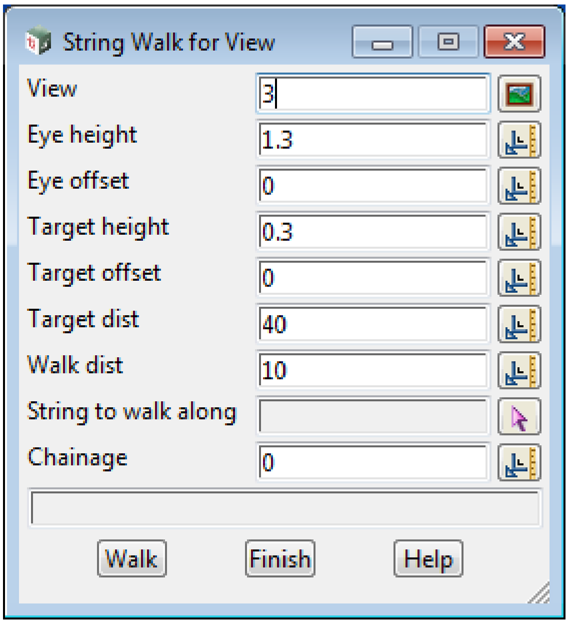
For the option Along string, go to 9.2.6.2.1 String Walk - Along String
Fixed target 9.2.6.2.2 String Walk - Fixed Target

Or to 9.2.6 Perspective Utilities or 9.2 Perspective View Menu.

9.2.6.2.1 String Walk - Along String

Position of option on menu: **Perspective View Menu** **View => Utilities =>String walk =>Along string**

Selecting **along string** fires up the **string walk for view** panel



For **string walk along a string**, a selected string is used to provide the (x, y, z) positions for the eye and target points.

The z-values can be adjusted by typing in a non-zero value for the eye and target heights in the **string walk** panel. These heights are relative to the z-values of the points on the string and are **added** to the z-values.

Like the new view option, the view is projected onto a focal plane and “clipped” using front and back clipping planes.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

view to set walk parameters for.

Eye height	input	1.3	

height of the eye viewing point above the picked string

Eye offset	input	0	

offset of the eye viewing point from the picked string

Target height	input	0.3	

height of the target viewing point above the picked string

Target offset	input	0	

offset of the target viewing point from the picked string

Target distance	input	40	

distance (in string chainage) from the eye point to the target point.

String to walk along	string select box		

a string to walk along is selected from any view. The string must have z-values.

Walk dist input 10

distance to move the eye point along string from the previous eye point chainage. The target point is also moved the same distance along the eye-target line so that the eye-target distance is kept constant.

Chainage input/output 0

the chainage that the eye point is at on the string. The chainage is updated whenever the walk button is activated. The eye point can be set to a specific chainage by simply entering the chainage into the **chainage** *field and selecting the walk button.*

Walk button

the perspective parameters are defined according to the information in the panel. The first time the **Walk** *button is selected, the eye point is placed above the string at the chainage given in the* **chainage** *field. For subsequent selections of the* **Walk** *button, the eye and target points are moved along the eye-target line by the chainage distance given in the* **walk dist** *field.*

The view is redrawn with the new view parameters and the new eye-chainage displayed in the panel message area and the chainage field.

Notes

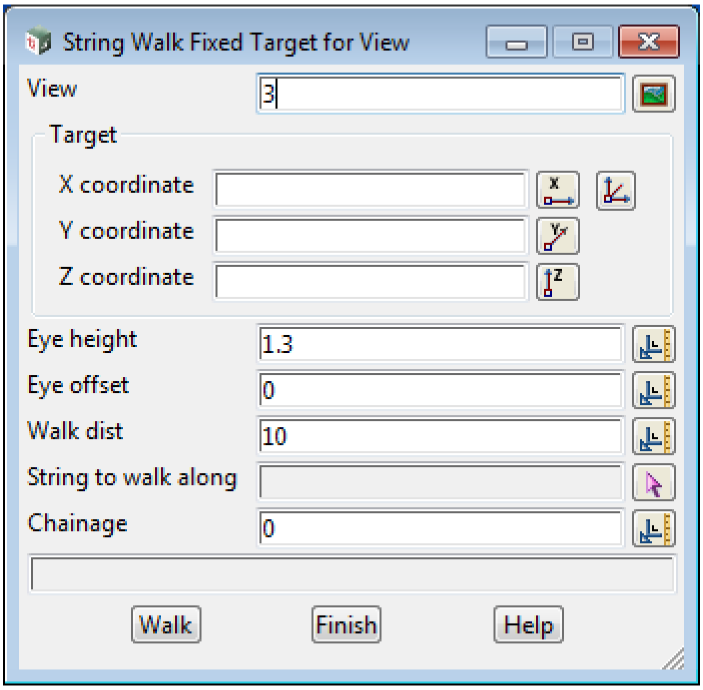
- the target and move distances can be positive or negative.
- the eye and target points are shown on any view displaying the string being walked along. The eye point is drawn as a red cross, the target point, a green cross.
- if the front distance for the clipping plane of the perspective view is set to zero by the user, it is automatically reset to 2 so that the red cross drawn at the eye point is not visible in the perspective view.

Return to 9.2.6 Perspective Utilities or 9.2 Perspective View Menu.

9.2.6.2.2 String Walk - Fixed Target

Position of option on menu: **Perspective View Menu** **View => Utilities =>String walk =>Fixed target**

Selecting **Fixed target** fires up the **String Walk Fixed Target for View** panel.



For **string walk fixed target**, a selected string is used to provide the (x, y, z) positions for the eye point, and the target is a selected fixed point. The z-value for the eye is adjusted by adding to it the eye height in the **eye height** field in the **String Walk Fixed target for View** panel.

The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

View view box current view available views

view to set walk parameters for.

Target xyz box

a fixed target point is selected from any view. The point's co-ordinates are displayed in the X, Y, Z coordinates panel fields.

Eye height input 1.3

height of the eye viewing point above the picked string

Eye offset input 0

offset of the eye viewing point from the picked string

Walk dist input 10

distance to move the eye point along string from the previous eye point chainage.

String to walk along string select

a string to walk along is selected from any view. The string must have z-values.

Chainage input/output 0

the chainage that the eye point is at on the string. The chainage is updated as the eye point automatically moves along the string. The walk can be set to start at a specific start chainage by simply *entering the start chainage into the* **chainage** *field and then selecting the* **Walk** *button.*

Walk button

the perspective parameters are defined according to the information in the panel. The first time the **Walk** *button is selected, the eye point is placed above the string at the chainage given in the* **chainage** *field. For subsequent selections of the* **Walk** *button, the eye point is moved along the string by the chainage distance given in the* **walk dist** *field.*

The view is redrawn with the new view parameters and the new eye-chainage displayed in the panel message area and the chainage field.

Notes

- the walk distance can be positive or negative.
- the eye point is shown on any view displaying the string being walked along. The eye point is drawn as a red cross, the target point, a green cross.
- if the front distance for the clipping plane of the perspective view is set to zero by the user, it is automatically reset to 2 so that the red cross drawn at the eye point is not visible in the perspective view

Return to 9.2.6 Perspective Utilities or 9.2 Perspective View Menu.

9.2.6.3 String Movie

Position of menu: **Perspective View Menu** **View => Utilities =>String movie**

The **String movie** option makes it easy to construct and save to disk the sequence of perspective views one gets when walking along a string (for example, walking along a road centre line).

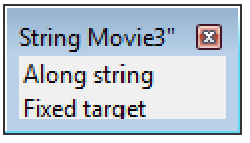
The screen images are automatically written out to disk in gif format so that they can be replayed at a later time.

This is especially useful when it takes a while to construct each view, for example, when hidden line is turned on.

Under NT/95, the screen images are written to an **avi** file.

Under Unix, the screen images are written to a **gif** file and there can be up to 99,999 of them in the one movie.

The two options on the **String movie** walk-right menu are



and they specify the positioning of eye and target points by:

along string - the eye and target points are automatically moved along the selected string

fixed target - the eye point automatically moves along the selected string but the target point is a fixed selected point.

Note - the **string movie** option can be aborted by pressing the **<esc>** key or clicking RB.

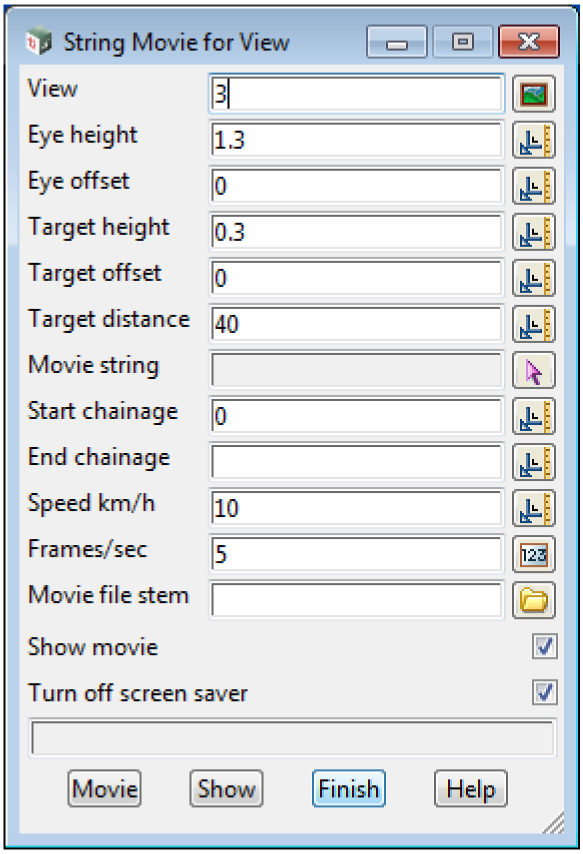
For the option Along string, go to 9.2.6.3.1 String Movie - Along String
Fixed target 9.2.6.3.2 String Movie - Fixed Target

Or return to 9.2.6 Perspective Utilities or 9.2 Perspective View Menu.

9.2.6.3.1 String Movie - Along String

Position of option on menu: **Perspective View Menu** **View => Utilities =>String movie =>Along string**

Selecting **Along string** fires up the **String Movie for View** panel



For **string movie along a string**, a selected string is used to provide the (x, y, z) positions for the eye and target points.

The z-values can be adjusted by typing in a non-zero value for the eye and target heights in the **string movie** panel. These heights are relative to the z-values of the points on the string and are **added** to the z-values.

Like the new view option, the view is projected onto a focal plane and “clipped” using front and back clipping planes

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

view to set movie parameters for.

Eye height	input	1.3	

height of the eye viewing point above the picked string

Eye offset	input	0	

offset of the eye viewing point from the picked string

Target height	input	0.3	

height of the target viewing point above the picked string

Target offset input 0

offset of the target viewing point from the picked string

Target distance input 40

distance (in string chainage) from the eye point to the target point.

Movie string string select

a string to drive along is selected from any view. The string must have z-values.

Start chainage input/output 0

the chainage that the eye point starts on the string for the movie.

End chainage input/output 0

the chainage to stop the movie at.

Speed (kph) input 10

speed in kilometres per hour (that is, one thousand base units per hour) that the eye-target points move along the string.

Frames/sec) input 5

number of frames per second to produce for the movie.

Movie file stem input 4d-

each frame of the drive in the view is written to disk in avi format using the **movie file stem** *plus the ending* ***.avi*** *as the file name.*

Show movie tick box tick

if ***ticked****, after all the views along the string are written to disk, a new window, the same size as the perspective view, will be created and movie then run.*

Turn off screen saver tick box tick

if ***ticked****, the screen saver is disabled so it doesn't come on whilst creating the movie.*

Movie button

the perspective parameters are defined according to the information in the panel. When the **Movie** *button is selected, the eye point is placed above the string at the chainage given in the* **chainage** *field. The view is drawn with these view parameters. After that view is processed and written to disk, the eye and target points are moved along the eye-target line and frames written out to simulate the given speed.*

Show button

This button is used to display a previously created movie. If selected, the movie created with the stem given in the **movie file stem** *field is displayed. If Unix, there is a pause between each frame by the number of seconds given in the* **delay** *field.*

Displaying the Movie

If a movie has just been created and the **show movie** field is set to **tick**, or an existing movie name is given in the **movie file stem** field and the **show** button is selected, then a new window will be created and the movie will be displayed frame by frame. Outside of ***12d Model***, the movie can be displayed by simply double clicking on the **avi** file.

Notes

- the target and move distances can be positive or negative.
- the eye and target points are shown on any view displaying the string being walked along. The eye point is drawn as a red cross, the target point, a green cross.
- if the front distance for the clipping plane of the perspective view is set to zero by the user, it is

automatically reset to 2 so that the red cross drawn at the eye point is not visible in the perspective view.

- the movie can also be displayed from outside 12d Model by simply double clicking on the avi file

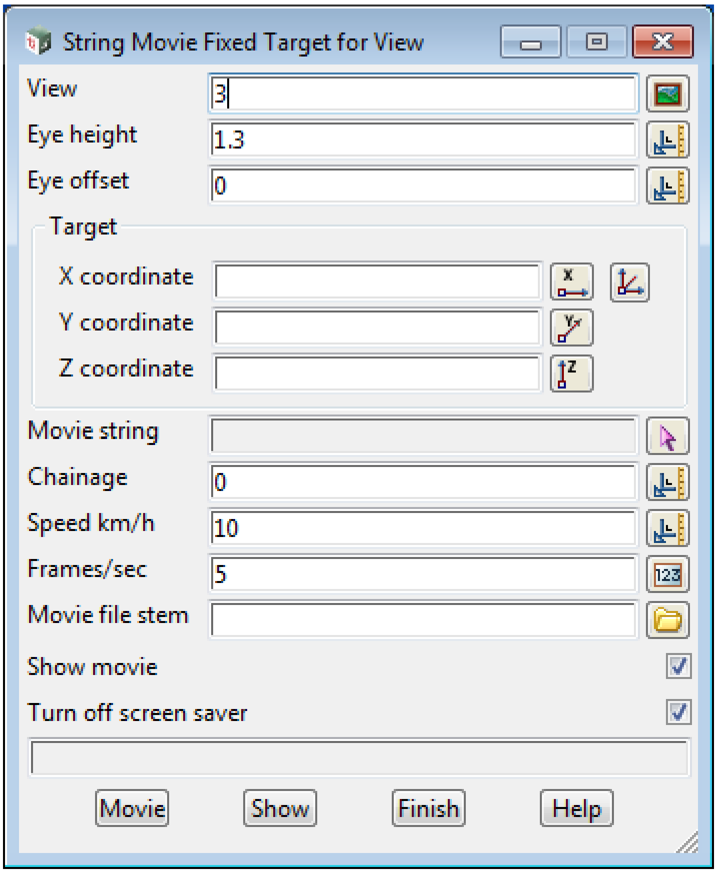
  movie-file-stem.avi

Return to 9.2.6 Perspective Utilities or 9.2 Perspective View Menu.

9.2.6.3.2 String Movie - Fixed Target

Position of option on menu: **Perspective View Menu** **View => Utilities =>String movie =>Fixed target**

Selecting **Fixed target** fires up the **String Movie Fixed Target for View** panel.



For **string movie fixed target**, a selected string is used to provide the (x, y, z) positions for the eye point, and the target is a selected fixed point. The z-value for the eye is adjusted by adding to it the eye height in the **eye height** field in the **String Movie Fixed Target for View** panel.

The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

view to set movie parameters for.

Eye height	input	1.3	

height of the eye viewing point above the picked string

Eye offset	input	0	

offset of the eye viewing point from the picked string

Target	xyz box		

a fixed target point is selected from any view. The point's co-ordinates are displayed in the X, Y, Z coordinates panel fields.

Movie string	string select		

a string to drive along is selected from any view. The string must have z-values.

Chainage input/output 0

the chainage that the eye point starts on the string for the movie.

Speed (kph) input 10

speed in kilometres per hour (that is, one thousand base units per hour) that the eye-target points move along the string.

Frames/sec) input 5

number of frames per second to produce for the movie.

Movie file stem input 4d-

each frame of the drive in the view is written to disk in avi format using the **movie file stem** *plus the ending* ***.avi*** *as the file name.*

Show movie tick box tick

if ***ticked****, after all the views along the string are written to disk, the movie is then run.*

Turn off screen saver tick box tick

if ***ticked****, the screen saver is disabled so it doesn't come on whilst creating the movie.*

Movie button

the perspective parameters are defined according to the information in the panel. When the **Movie** *button is selected, the eye point is placed above the string at the chainage given in the* **chainage** *field. The view is drawn with these view parameters. After that view is processed and written to disk, the eye and target points are moved along the eye-target line by the chainage distance given in the* **step distance** *field and the new view drawn and processed.*

This sequence is repeated until the end of the string is reached or the ***c*** *key is pressed.*

Show button

This button is used to display a previously created movie. If selected, the movie created with the stem given in the **movie file stem** *field is displayed.*

Return to 9.2.6 Perspective Utilities or 9.2 Perspective View Menu.

9.2.6.4 Tin Shade

Position of option on menu: **Perspective View Menu** **View => Utilities =>Tin shade**

In ***12d Model***, a landscape is represented by a triangulated surface - a tin. Each triangle in the tin is a part of a plane and has its own colour.

In a perspective view, each triangle can be drawn with a colour that is modified depending on the angle that the triangle makes with the sun (a point light source at infinity). This is called a **flat shade.**

If the triangles are drawn in a back to front order, then when the shaded landscape is drawn, any triangles in the foreground obscure triangles in the background and it looks like a hidden view.

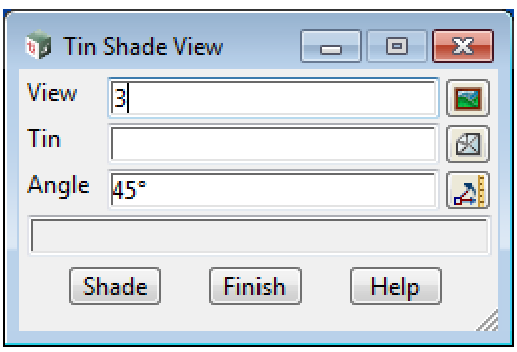
If **Shade** is set for a view, all the triangles in all the tins on the view are drawn as shaded triangles and the triangles are drawn in a back to front order.

Once the **Shade** is set on, a shade will be done on the view whenever the view parameters are changed. A plot of the shaded view can be made using the **Dump** option on the view.

The **Tin shade** option draws the selected tin over the perspective view as a shade. The selected tin does not have to be on the view for the shade to function.

When the view is refreshed, the shade is lost (the **Shade** option under settings is used for setting a shade permanently on). A plot of the shaded view can be made using the **Dump** option on the view.

Selecting **Tin shade** fires up the **Tin Shade View** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

view to set shade parameters for.

Tin	input		available tins

name of the tin to be used for the shade.

Angle	input	45	

angle of the sun.

Shade	button		

draw the given tin on the view as a shaded tin.

Return to 9.2.6 Perspective Utilities or 9.2 Perspective View Menu.

9.2.6.5 Dump

Position of option on menu: **Perspective View Menu** **View => Utilities =>Dump**

This option is used to write the view image out to disk in a user selected format. It is the same as the **Dump** option for a plan view.

Return to 9.2.6 Perspective Utilities or 9.2 Perspective View Menu.

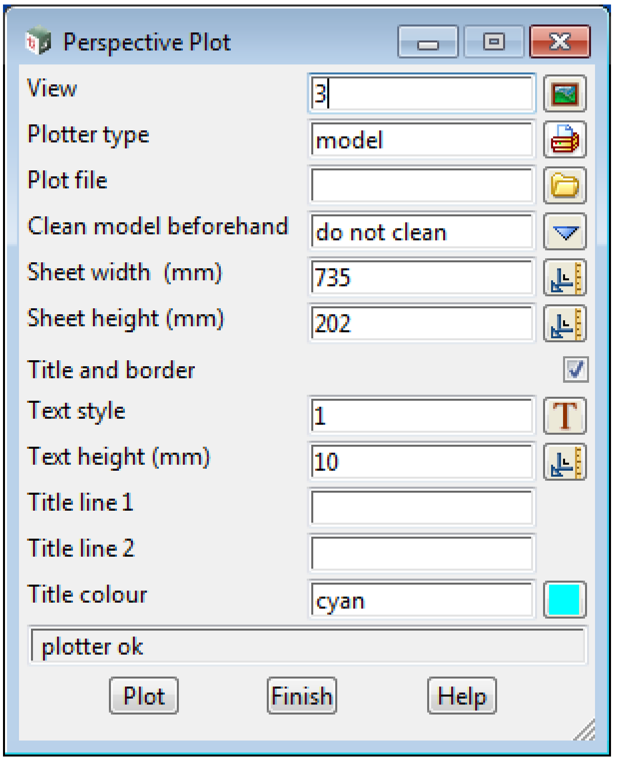
9.2.6.6 Perspective Plot

Position of option on menu: **Perspective View Menu** **View => Utilities =>Perspective plot**

The **Perspective plot** option is used to make a plot file of all the information displayed in the perspective view.

The user simply gives a sheet width and height and ***12d Model*** calculates the scaling factor required to best fit the plot of the view to the sheet.

Selecting **Plot** displays the **Perspective Plot** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views
view to set perspective plot parameters for.			
Plotter type	input	hp	hp, dxf, postscript *etc.*
file format for the plot information.			
Plot file	input	depends on plotter type	

stem of the name of the file to write the plot of the view to. The name ending is added automatically and *depends on the plotter type.*

Clean model beforehand	choice box		do not clean prompt for clean always clean

only applicable if plotting to a model.

if ***always clean,*** *the model is cleaned before the plot is created.*
*If p****rompt for clean****, the user is prompted that the model will be cleaned before the plot is created.*
If ***do not clean****, the model is not cleaned before the plot is created.*

Sheet width/height (mm)	input		

if a value is entered by the user and an <enter> given, the height/width required by the plot is calculated and displayed in the **sheet height/width** *field. The units for sheet width and height are* ***millimetres****.*

If both Sheet width and height are given with no <enter>, then a scaling factor is calculated by 12d *Model to best fit the plot of the view to a rectangle of size given by the sheet width and height.*

Title and border	tick box		

if ***ticked****, a border and two lines of title are placed on the bottom of the plot*

Title line 1/2	input		

first/second line of title information

Title height (mm)	input	10	

height (in millimetres) to draw the two lines of title information

Title colour	input	cyan	available colours

colour used for the border and the title information

Plot	button		

write out the plot of the information displayed in the view to the file given in the **plot file** *field. The format of the file is given by the* **plotter type.**

Return to 9.2.6 Perspective Utilities or 9.2 Perspective View Menu.

9.3 Section View Menu

Position of menu: **Section View Menu** **View**

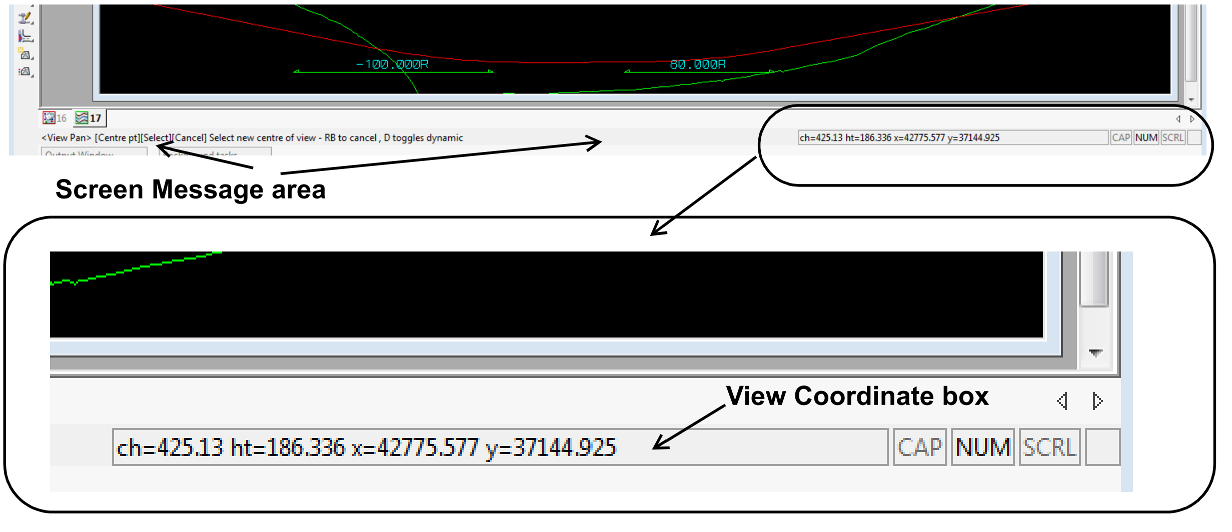
The section view is used to display string profiles and sections through tins and service items. The horizontal units are taken to be the **chainage** along a particular string called the **primary string** for the view. The z-values (heights) are the vertical units for the section. Hence, the section view is a (chainage, z-value) diagram with respect to the primary string on the view. The primary string's model and name is displayed in the view title area of the section view.

Since a tin represents a two dimension continuous surface, sectioning through a tin along a string appears as a continuous line string in a section view. For example, the natural surface on a road long-section is the section of the road centre-line through the natural surface tin.

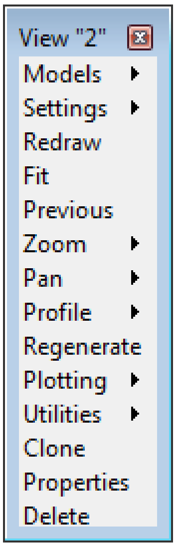
When a corridor is set, any strings in models added to the section view (service items) will be drawn on the section view wherever they are inside the corridor.

A section view has a **vertical exaggeration** and whenever a string is profiled on the view, the vertical exaggeration is displayed inside square brackets after the view name in the view title area. For example **[10x]** is a vertical exaggeration of 10.

When in a Section view that has a string profiled on it, the chainage, height, and (x,y) coordinates of the cursor position are also displayed in the **View Coordinate** box in the **Screen Message Area** at the bottom of the *12d Model* window.



The **Section views** menu is



For the options:

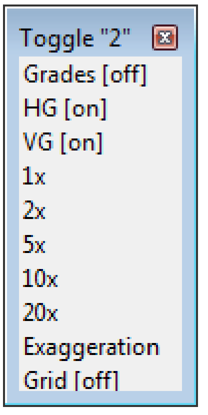
9.3.1.1 Section View Toggle

Position of menu: **Section View Menu** **View => Settings =>Toggle**

The **Toggle** walk right brings up the **Toggle** section view menu.



Selecting any options from this menu will toggle the option on/off.

Continue to 9.3.1.2 Corridor or return to 9.3.5 Section Utilities to 9.3 Section View Menu.

9.3.1.2 Corridor

Position of option on menu: **Section View Menu** **View => Settings =>Corridor**

The standard section view is designed to profile any selected string and create and display sections along the profiled string through any tins in any models added to the section view.

Hence the section view is like a vertical ribbon tracing out the path of the primary string.

The **Corridor** option extends the ribbon to the left and right and projects any strings in any models added to the section view back onto the section view.

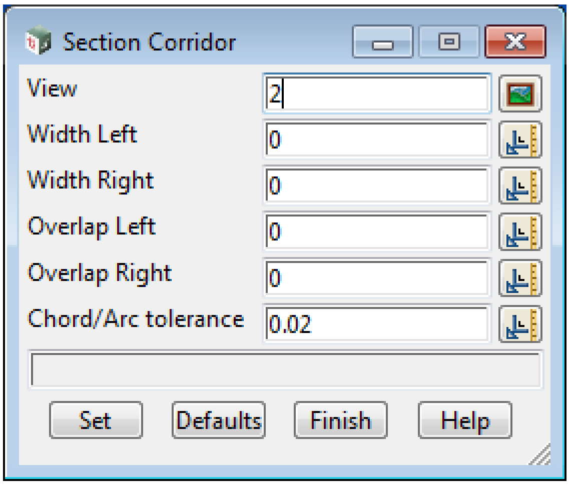
Consequently, the section view will display any strings or parts of strings that cross the corridor, run parallel to the primary string but stay within the corridor as well as displaying the standard sections through any tins in any models added to the section view.

The corridor is particularly useful for examining any **clashes** of strings with the primary string.

For example, services such as telephone cables, water and gas pipes and electricity cables could be modelled as 3d or pipe strings and added to the section view.

The section view with non-zero corridor widths would then display any of the services that lie within the corridor about the chosen primary string.

Selecting **Corridor** fires up the **Section Corridor** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	
View	view box	current view	available views

view to set corridor parameters for.

Width left/right	input	0.01

width of the corridor to the left/right of the primary string.

Overlap left/right	input	0.01

for each straight/arc in the primary string, extend the straight/arc to the left/right by the value of the **overlap left/right** *field before drawing the straight/arc. Section through the extended string.*

Chord/Arc tolerance	input	0.02

value of the chord to arc ratio to be used when approximating circles in alignments, arcs and pipeline strings.

Set	button

define the corridor parameters according to the information in the panel. The section view for the new corridor will then be calculated and displayed.

Defaults button

reset the corridor settings to the default values.

Continue to 9.3.1.3 Draw Tolerance or return to 9.3.5 Section Utilities to 9.3 Section View Menu.

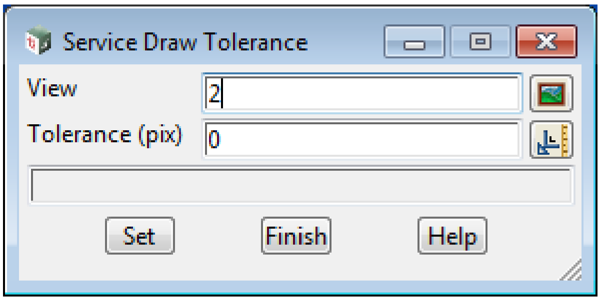
9.3.1.3 Draw Tolerance

Position of option on menu: **Section View Menu** **View => Settings =>Draw tolerance**

It is possible for the bits of services displayed on a section view to be very small and possibly too small to be easily seen. This is often the case for strings that are perpendicular to the corridor.

To overcome this visualization difficulty, a tolerance can be defined for the section view and when the size of any piece of a service is below the tolerance, it will be drawn as a cross.

Selecting **Draw tolerance** fires up the **Service Draw Tolerance** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	
View	view box	current view	available views

view to set service parameters for.

Tolerance (pix)	input	4

if the size of any piece of a service is below this tolerance, it will be drawn as a cross.

Set	button

set the service draw tolerance.

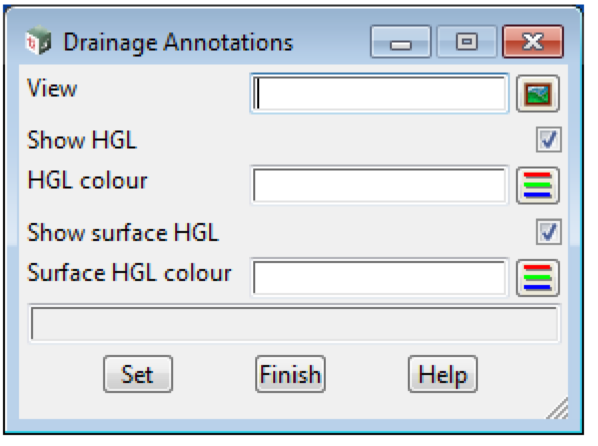
Continue to 9.3.1.4 Drainage HGL or return to 9.3.5 Section Utilities to 9.3 Section View Menu.

9.3.1.4 Drainage HGL

Position of option on menu: **Section View Menu** **View => Settings =>Drainage**

If the data exists in the drainage string, the HGL line can be drawn when profiling a drainage string.

Selecting **Drainage** fires up the **Drainage Annotations** panel.



The fields and buttons used in this panel have the following functions.

Field Description | Type | Defaults

View | input/output | current view | available views

view to set HGL parameters for.

Show HGL | tick box | tick

*if **ticked** then the HGL line is drawn for any drainage strings that are profiled (and have HGL data)*

HGL colour | colour box | | available colours

colour to draw the HGL line

Show surface HGL | tick box

if ticked then the surface HGL (the HGL of any bypass channels) will be shown on the long section

Note: not available for the Rational Method

Surface HGL colour | colour box | | available colours

colour to draw the HGL surface

Set | button

set the HGL drawing parameters.

Continue to 9.3.1.5 Extend or return to 9.3.5 Section Utilities to 9.3 Section View Menu.

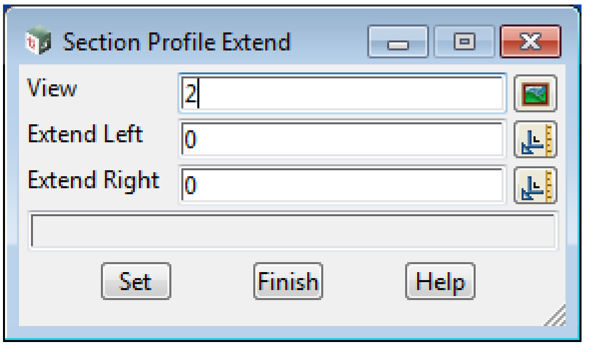
9.3.1.5 Extend

Position of option on menu: **Section View Menu** **View => Settings =>Extend**

When displaying the profile of a string on a section view, the user often wishes to see sections through the information before the string begins and after the string ends. This is particularly useful if it is intended to extend the string in either direction.

The **Extend** option allows the user to extend the profile length.

Selecting **Extend** fires up the **Section Profile Extend** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	
View	view box	current view	available views

view to set extension parameters for.

Extend left	input	0

pre-extend the profile by this distance before sectioning through any tins or models on the view.

Extend right	input	0

post-extend the profile by this distance before sectioning through any tins or models on the view.

Set	button

define the profile length according to the length of the primary string plus the two **extend** *lengths. The section view for the new length will then be calculated and displayed.*

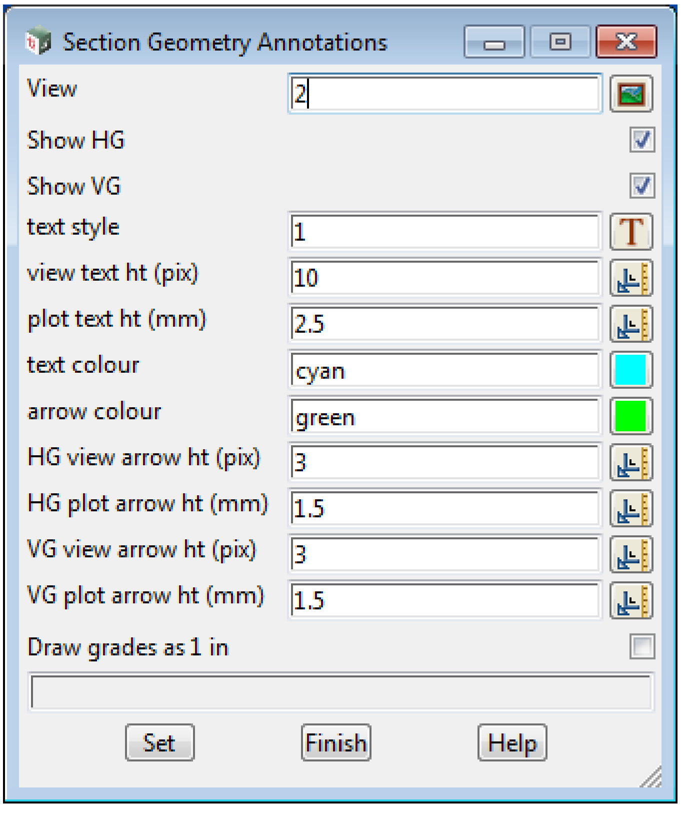
Continue to 9.3.1.6 Geometry Annotation or return to 9.3.5 Section Utilities to 9.3 Section View Menu.

9.3.1.6 Geometry Annotation

Position of option on menu: **Section View Menu** **View => Settings =>Geom annot**

The **Geom annot** option allows the user to specify whether horizontal geometry and/or vertical geometry is displayed for any alignment and pipeline strings profiled in the section view and hence on any section view plots.

Selecting **Geom annot** fires up the **Section Geometry Annotations** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

view to set alignment geometry parameters for.

Show HG	tick box	tick	

*if **ticked**, the value of the radii and spiral lengths for any horizontal curves selected as the primary string will be shown plus an arrow indicating the chainage extent of the radii.*
*If **no ticked**, the horizontal geometry will not be displayed in the section view or on any plots of the section view.*

Show VG	tick box	tick	

*if **ticked**, the value of the curve length for any vertical curves selected as the primary string will be shown, plus an arrow indicating the chainage extent of the curve length. The percentage grades for any vertical straights will also be displayed with an arrow indicating the chainage extent of the vertical straight.*
*If **no ticked**, the vertical curve lengths and percentage grades will not be displayed in the section view or on any plots of the section view.*

Text style	input	1	

text style to be used for all text in the geometry annotation.

View text ht (pix) input 10

height (in pixels) to draw the geometry annotation values in the section view (the screen width is approximately 1000 pixels).

Plot text ht (mm) input 10

height (in mm) to draw the geometry annotation values on any plots of the section view.

Text colour input cyan available colours

colour of the geometry annotation values drawn on the screen and any plots.

Arrow colour input green available colours

colour of the HG arrows drawn on the screen and any plots.

HG view arrow ht (pix) input 3

height (in pixels) of the arrow head above the arrow line when drawing the HG arrows in the view.

HG plot arrow ht (mm) input 1.5

height (in mm) of the arrow head above the arrow line when drawing the HG arrows on any plots of the section view.

VG view arrow ht (pix) input 3

height (in pixels) of the arrow head above the arrow line when drawing the VG arrows in the view.

VG plot arrow ht (mm) input 1.5

height (in mm) of the arrow head above the arrow line when drawing the VG arrows on any plots of the section view.

Draw grades as 1 in tick box

if ticked, grades are drawn as 1:in values.
if not ticked, grades as drawn as percent (%)

Set button

set the section settings values to the values in the above panel fields. The section view is then redrawn using these values.

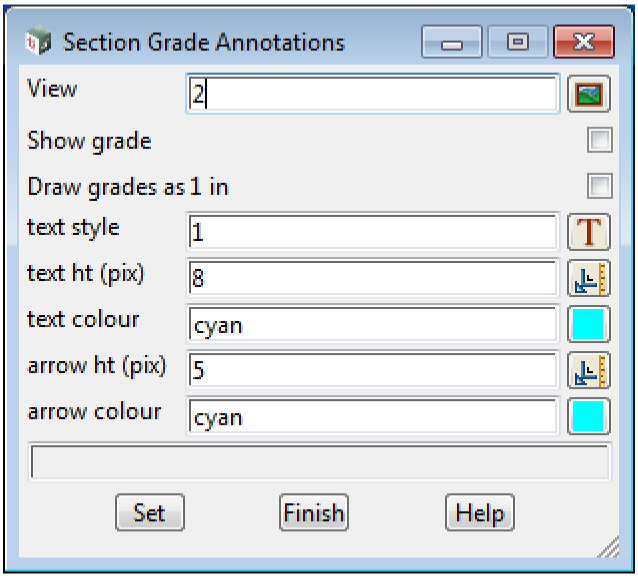
Continue to 9.3.1.7 Grade Annotation or return to 9.3.5 Section Utilities to 9.3 Section View Menu.

9.3.1.7 Grade Annotation

Position of option on menu: **Section View Menu** **View => Settings =>Grade annot**

The **grade annot** option allows the user to specify whether the grades and plan widths of string links are displaced for strings profiled in the section view.

Selecting **Grade annot** fires up the **Section Grade Annotations** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

view to set grade annotation parameters for.

Show grade	tick box	tick	

*if **ticked**, the value of the grades (in percent grade) and plan widths of string links for any strings selected as the primary string will be shown plus an arrow indicating the chainage extent of the grade. If **no ticked**, the grades and widths will not be displayed in the section view or on any plots of the section view.*

Text style	input	1	

text style to be used for all text in the grade annotation.

Text ht (pix)	input	8	

height (in pixels) to draw the grade annotation values in the section view (the screen width is approximately 1000 pixels).

Text colour	input	cyan	available colours

colour of the grade annotation values drawn on the screen and any plots.

Arrow ht (pix)	input	3	

height (in pixels) of the arrow head above the arrow line when drawing the arrows in the section view.

Arrow colour	input	cyan	available colours

colour of the arrows drawn on the screen.

Set	button		

set the section settings values to the values in the above panel fields. The section view is then redrawn *using these values.*

Continue to 9.3.1.8 Section View Exaggeration or return to 9.3.5 Section Utilities to 9.3 Section View Menu.

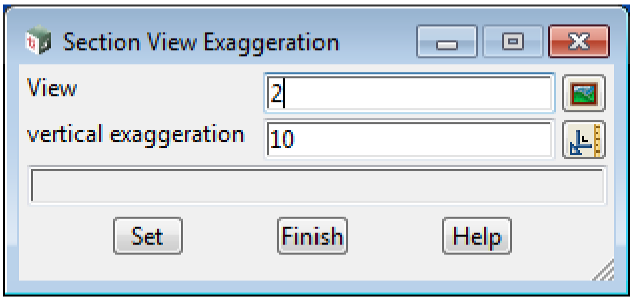
9.3.1.8 Section View Exaggeration

Position of option on menu: **Section View Menu** **View =>Settings =>Exaggeration**

The **Exaggeration** option allows the user to specify the vertical exaggeration for the section view. The heights (z values) are multiplied by the vertical exaggeration value before drawing on the section view.

Whenever a string is profiled on the section view, the **vertical exaggeration** is displayed inside square brackets after the view name in the view title area. For example **[10x]** is a vertical exaggeration of 10.

Selecting **Exaggeration** fires up the **Section View Exaggeration** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

view to set exaggeration parameters for.

Vertical exaggeration	input	10	1,5,10

value to multiply the heights (z values) by before drawing in the section view.

Set	button		

set the vertical exaggeration to the value in the vertical exaggeration field.

Return to 9.3.5 Section Utilities to 9.3 Section View Menu.

9.3.2 Profile

Position of menu: **Section View Menu** **View => Profile**

The **Profile** option is used to display a long-section view of a selected string. That is, the coordinate system for the section view is defined in terms of the chosen string by

(a) the chainage along the selected string defines the horizontal axis for the section view

(b) the vertical axis is the z-axis (heights).

Hence a (chainage,height) diagram of the selected string is drawn in the section view. The scale is automatically chosen so that all of the selected string fits into the section view.

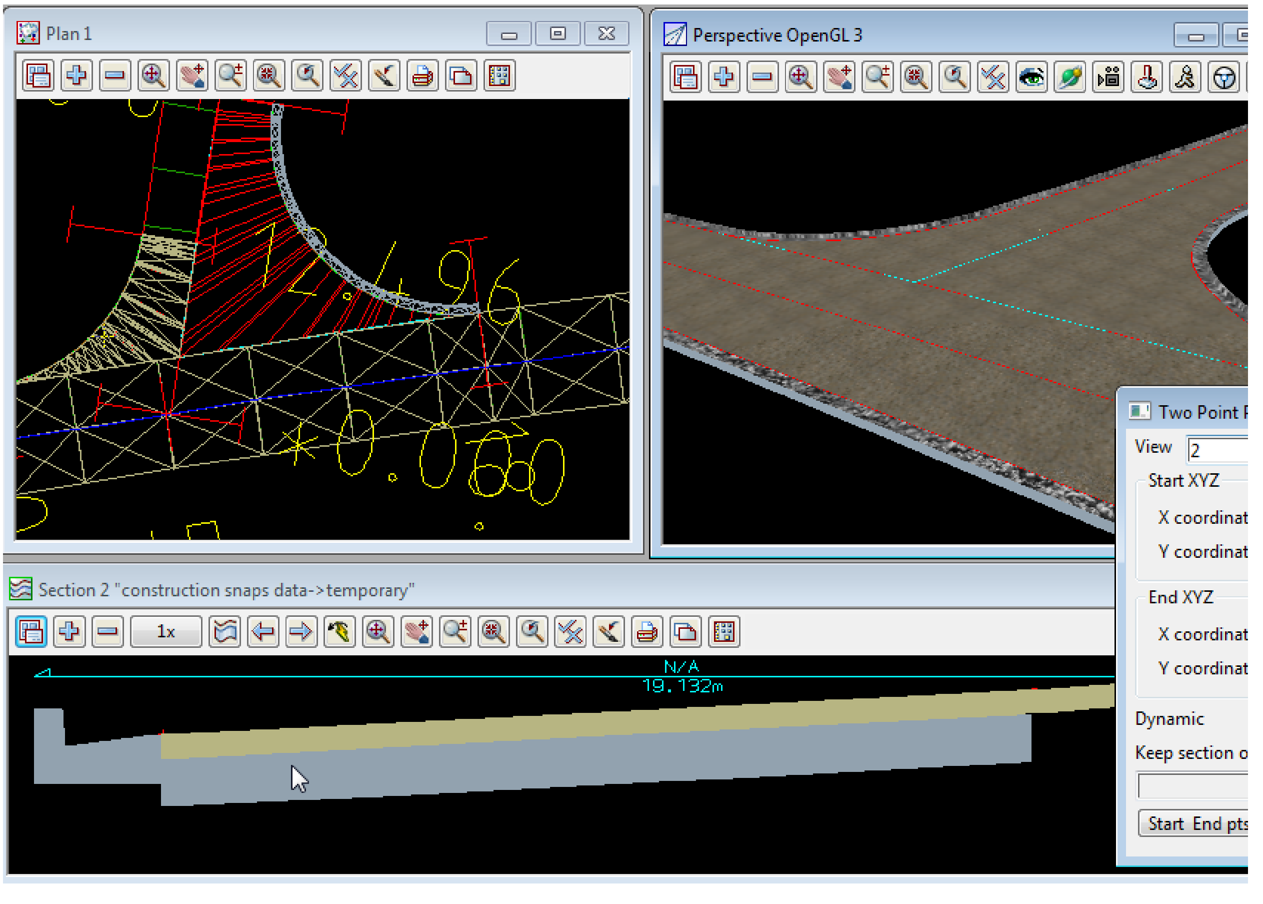
The string selected to be profiled is called the **primary string** for the section view.

The model and name of the primary string is displayed in the section view's title area (after the vertical exaggeration).

The primary string is drawn on the section view in the primary string's colour.

If the primary string is an alignment or pipeline string, the radii and chainage extent of any horizontal curves can be displayed in the section view plus any vertical curve lengths and percent-grades of vertical straights. For other strings, the grade and widths of each string link can be displayed.

For any tins in the models added to the section view, the section along the primary string through the tin will be calculated and drawn on the section view in the same colour as the tin colour.

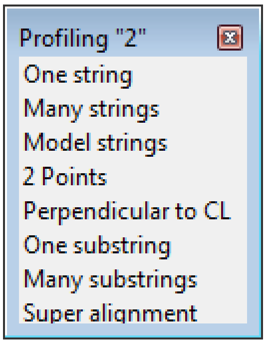


Any strings (service items) in models added to the section view, the parts of the strings in any corridor defined for the primary string will be calculated and drawn on the section view in the same colour as the strings.

For any extrusions, trimeshes and meshes in models added to the section, the section along the primary string through the objects will be calculated and drawn on the section view.

Each time a new primary string is chosen with the profile option, the sections along the new primary string are calculated and displayed for all the tins and strings in the models added to the section view.

The **Profile** walk-right menu is



The **One string** option allows one string to be profiled and then the option terminates (see 9.3.2.1 One String).

The **Many strings** option profiles one string and then allows the user to select another string to be profiled without leaving the profile option. The **Many strings** option is very useful when a number of strings need to be examined one after another in a section view (see 9.3.2.2 Many Strings).

The **Model strings** option profiles the strings from a given model, one at a time. For example, it is used to sequentially examine each cross-section down a road when all the cross-sections are stored in one model (see 9.3.2.3 Model Strings).

The **2 points** option dynamically profiles between two selected points. The profile between the first selected point and the cursor position is dynamically recalculated as the cursor is moved around the view (see 9.3.2.4 2 Points).

The **Perpendicular to CL** option dynamically profiles along a cross-section which is perpendicular to a selected string. The cross section profile is dynamically recalculated as the cursor is moved along the selected string (see 9.3.2.5 Perpendicular to CL).

The **One substring** and **Many substrings** options are used to section along house connections and property controls for sewer and drainage strings (see 9.3.2.1 One String, 9.3.2.2 Many Strings).

For the option *One String*, go to	9.3.2.1 One String
Many strings	9.3.2.2 Many Strings
Model strings	9.3.2.3 Model Strings
2 points	9.3.2.4 2 Points
Perpendicular to CL	9.3.2.5 Perpendicular to CL
One substring	9.3.2.6 One Substring
Many substrings	9.3.2.7 Many substrings
Super alignment	9.3.2.8 Super alignment

9.3.2.1 One String

Position of option on menu: **Section View Menu** **View =>Profile =>One string**

After choosing the **One string** option, the user selects the string to be profiled. The option then terminates.

To cancel the option without selecting any string, click LB to bring up the **Pick Ops** menu and select **Cancel**.

Return to 9.3.2 Profile or 9.3 Section View Menu.

9.3.2.2 Many Strings

Position of option on menu: **Section View Menu** **View =>Profile =>Many strings**

The **many strings** option is designed for profiled a number of strings one after another.

After selecting **Many strings**, a string is selected for profiling. After the string has been profiled, another string is selected for profiling.

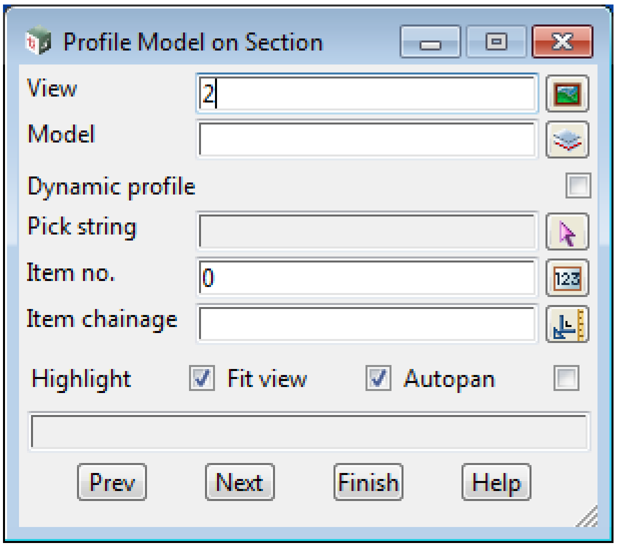
The option will keep profiling selected strings until the option is terminated by clicking LB to get the **Pick Ops** menu and selecting **Cancel**.

Return to 9.3.2 Profile or 9.3 Section View Menu.

9.3.2.3 Model Strings

Position of option on menu: **Section View Menu** **View =>Profile =>Model strings**

After selecting **Model strings**, the **Profile Model on Section** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

view to set profile parameters for.

Model	model box		available models

name of the model containing the strings to be profiled one at a time

Dynamic profile	tick box		

if ticked, as you move over each string in the given model in a plan or perspective view, the string under the mouse is selected and profiled on the section view.

Item no. input/output

number of the string in the model being profiled.

Item chainage input/output

only applicable if the selected strings are X-section strings

The chainage of the section string in the model being profiled. Also if a chainage is typed in followed by an <Enter> then the model will be searched for a X-section of that chainage and if it exists, it will be profiled.

Highlight tick box tick

*if **ticked**, the string being profiled in the section view is locked and highlighted on any views where it is visible.*

Fit view tick box tick

*if **ticked**, the string being profiled is fitted to the section view.*
*if **not ticked**, the same scale is used for the next section being profiled.*

Autopan tick box

*if **ticked**, then if the profiled string is not visible on any plan views that the model containing the string is on, then the plan view is modified so that the profiled string is in the centre of the plan view.*

Pick button

after selecting the **pick** *button, a string is selected. The string is automatically profiled and its model becomes the model being profiled and* **item no.** *is set to the string's number in the model.*

Prev button

the previous string given by the **item no.** *field is profiled and the* **item no.** *field decremented by one.*

Next button

the next string given by the **item no.** *field is profiled and the* **item no.** *field incremented by one.*

How to Use the Panel

(a) Either a string is picked after selecting the **Pick** button, or the name of the model containing the strings to be profiled is entered into the **model** field.

(b) The **item no.** field is initially set to the picked strings item no. or 0, but can be set to the number of any string in the model.

(c) When the **Prev** or **Next** button is selected, the string given by the number in the **item no.** field is decremented or incremented and the string given by the new item no. is profiled in the section view.

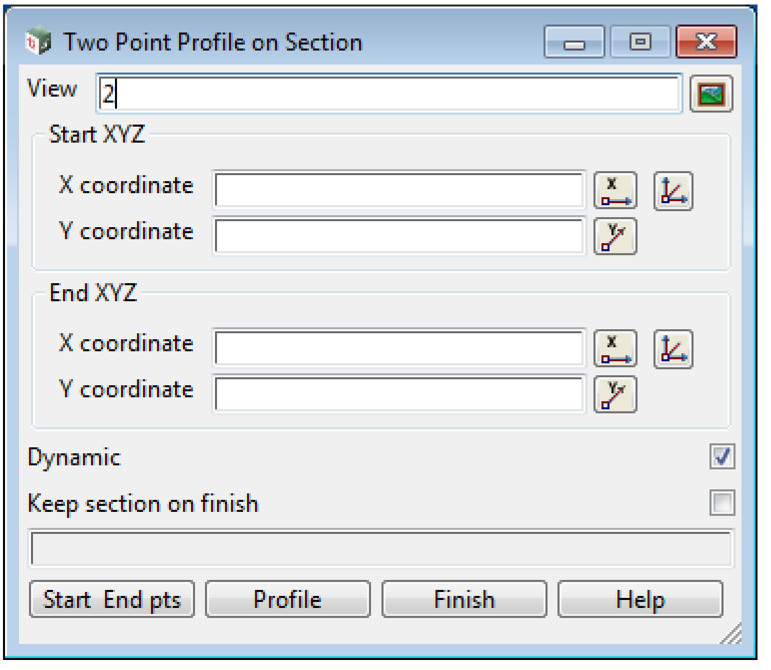
Hence with the **Model strings** option, a number of strings in the one model can be profiled (one after another) by simply repeatedly selecting the **Prev** or **Next** buttons.

Return to 9.3.2 Profile or 9.3 Section View Menu.

9.3.2.4 2 Points

Position of option on menu: **Section View Menu** **View =>Profile =>2 points**

After selecting **2 points**, the **Two Point Profile on Section** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

view to set profile parameters for.

Start X Y Z	input/output		xyz ops menu

co-ordinates of the start section point. New values can be typed, or a point selected using the **xyz ops** *pop-up menu.*

End X Y Z	input/output		xyz ops menu

co-ordinates of the end section point. New values can be typed, or a point selected using the **xyz ops** *pop-up menu.*

Dynamic	tick box	tick	

*if **ticked**, the profile will be dynamically calculated between the first selected point and the cursor position.*

Keep section on finish	tick box		

*if **ticked**, the two point profile will be remembered by the section view when the* **Finish** *button is selected.*

*if **not ticked**, the definition of the two points to profile is lost when the* **Finish** *button is selected.*

Start End pts	button		

after selecting the **Start End pts** *button, the first point of the section to be profiled is selected and its value written to the* **start xyz** *field. If* **dynamic** *is set on, then a profile from the first point to the cursor position is automatically calculated as the cursor is moved around the view. Selecting the second points finalises the section and the co-ordinates of the final point is written to* **end xyz** *field.*

Profile	button		

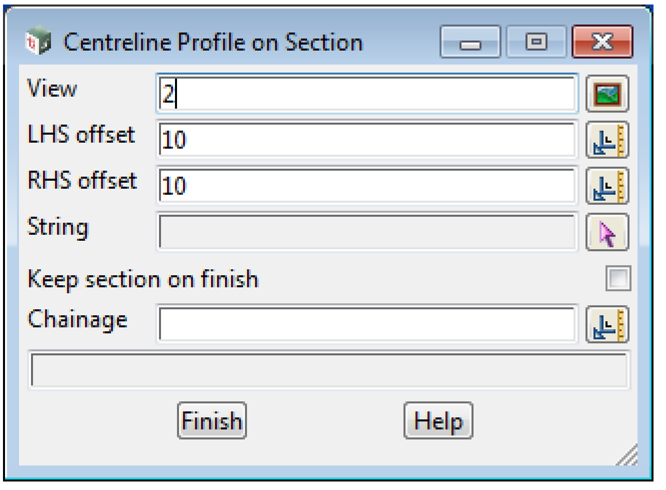
after selecting the **Profile** *button, a section is calculated between the* **start xyz** *and* **end xyz** *points.*

Return to 9.3.2 Profile or 9.3 Section View Menu.

9.3.2.5 Perpendicular to CL

Position of option on menu: **Section View Menu** **View =>Profile =>Perpendicular to CL**

After selecting **Perpendicular to CL**, the **Centreline Profile on Section** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box	current view	available views

view to set profile parameters for.

LHS offset	input	10

distance (in world units) to take the section to the left of the selected string.

RHS offset	input	10

distance (in world units) to take the section to the right of the selected string.

String	string-select

the selected string is used to specify the position where a cross-section is defined. Once the string is selected, then as the cursor is moved around in a view, its position will be dynamically be dropped perpendicularly onto the selected string, and a cross-section defined at right angle to the selected string. A profile along the cross-section will then be drawn in the section view. The cross-section profile will be dynamically modified as the cursor position is modified.

Keep section on finish	tick box

*if **ticked**, the final definition of the profile for the section view will be remembered by the section view when the* **Finish** *button is selected.*

*if **not ticked**, the definition of the profile for the section view is lost when the* **Finish** *button is selected.*

Chainage	output

dynamically displays the centreline chainage of the selected string

Return to 9.3.2 Profile or 9.3 Section View Menu.

9.3.2.6 One Substring

Position of option on menu: **Section View Menu** **View =>Profile =>One substring**

As well as profiling strings, the **One substring** option can profile a house connection or property control (**substrings**) in a drainage or sewer string.

After choosing **One substring** from the menu, the user selects a substring for profiling. After the string or substring has been profiled, the option terminates.

Return to 9.3.2 Profile or 9.3 Section View Menu.

9.3.2.7 Many substrings

Position of option on menu: **Section View Menu** **View =>Profile =>Many substrings**

The **Many substrings** option is designed for profiled a number of substrings, one after another.

After choosing **Many substring**, the user selects a substring for profiling. After the substring has been profiled, another string or substring can be chosen for profiling.

The option is terminated by clicking LB to get the pick ops menu and selecting **cancel**.

Return to 9.3.2 Profile or 9.3 Section View Menu.

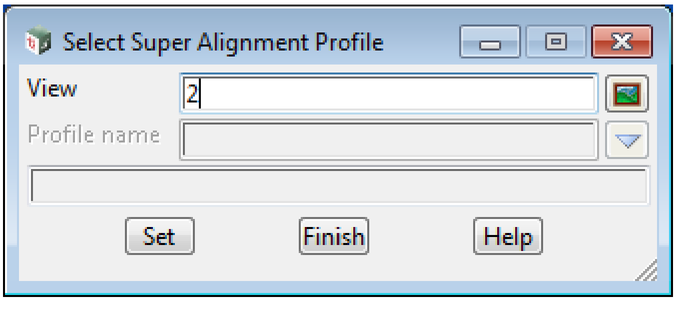
9.3.2.8 Super alignment

Position of option on menu: **Section View Menu** **View =>Profile =>Super alignment**

A super alignment contains one horizontal string but can have more than one vertical dimension For example, vertical geometry, super elevation, widening and sight distance.

When a super alignment is being profiled on the section view, this option allows you to specify which of the vertical dimensions is displayed on the section view.

Selecting **Super alignment** brings up the **Select Super Alignment Profile** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current section view	all views

the view that the super alignment is profiled on.

Field Description	Type	Defaults	Pop-Up
Profile Name	choice box		super alignment dimensions on the profiled super alignment

If profile name is blank, all profiles are shown or the user can select an individual profile to display from the from the choice box.

The possible vertical dominions are Left Super Elevation, Right Super Elevation, Left Widening, Right

Widening, Sight Distance and Stopping Distance.

Set

profile the super alignment with the selected vertical dimension.

Return to 9.3.2 Profile or 9.3 Section View Menu.

9.3.3 Regenerate

Position of option on menu: **Section View Menu** **View =>Regenerate**

The **Regenerate** option is used to re-calculate and re-display the profile of the primary string of the section view.

This is necessary because modifications to the primary string or any strings or tins one the view may make the initial profile invalid. A **Regenerate** is a quick method of bringing the profile up to date.

Continue to 9.3.4 Section Plotting or return to 9.3 Section View Menu.

9.3.4 Section Plotting

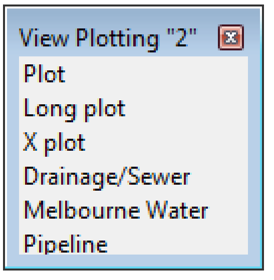
Position of menu: **Section View Menu** **View =>Plotting**

The **Plotting** walk-right menu contains the options **Plot**, **Long plot, X plot, Drainage/Sewer, Melbourne Water** and **Pipeline.**

The **Plot** option is used to make a plot file of all the information displayed in the section view.

The **Long plot** option is used to make a traditional long section plot with string chainages and elevations displayed for each of the strings in the section view. The form of the long plot can be finely controlled by a file of plot parameters.

The **X plot** creates the traditional stacked x-section plots for each x-section string in a given model. The form of the x-plot can be finely controlled by a file of plot parameters.



For the options:

Plot	9.3.4.1 Section Plot
Long plot	25.8.4 Long Plot
X plot	25.8.3 X Plot
Drainage/Sewer	22.9.2 Drainage Longsections
Melbourne water	22.9.3 Melbourne Water
Pipeline	22.5 Plots

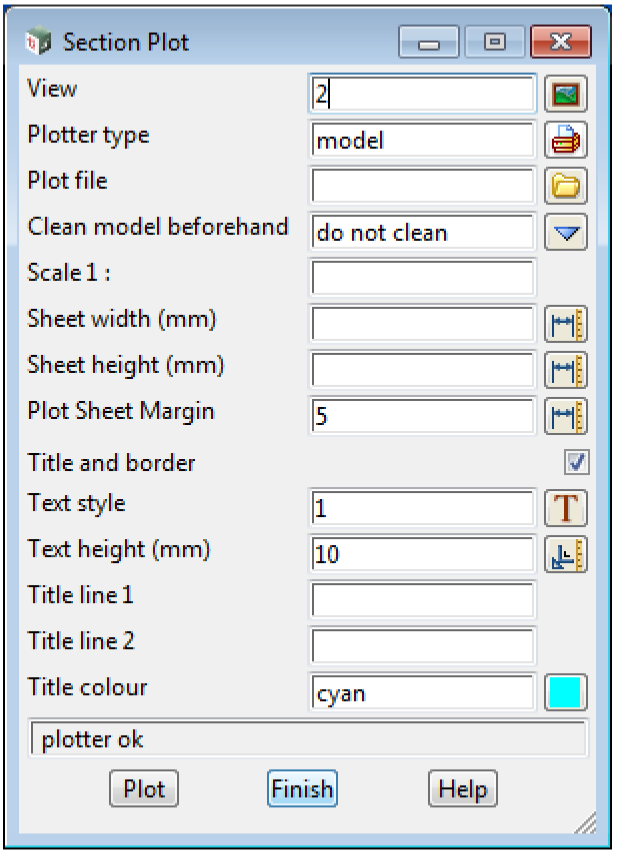
Or continue to 9.3.5 Section Utilities or return to 9.3 Section View Menu.

9.3.4.1 Section Plot

Position of option on menu: **Section View Menu** **View =>Plotting =>Plot**

The **Plot** option writes out all the information displayed in the section view to either a plot file (in a user selected format) or to a 12d Model model. The user selects a scale for the plot and the sheet width and height are calculated by 12d Model.

After selecting **Plot** plot, the **Section Plot** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

view to set plot parameters for.

Plotter type	input	hp	hp, dxf, postscript *etc.*

file format for the plot information.

Plot file	input	depends on plotter type	

stem of the name of the file to write the plot of the view to. The name ending is added automatically and depends on the plotter type.

Clean model beforehand	choice box		do not clean prompt for clean always clean

only applicable if plotting to a model.
*if **always clean**, the model is cleaned before the plot is created.*
*If **prompt for clean**, the user is prompted that the model will be cleaned before the plot is created.*

*If **do not clean**, the model is not cleaned before the plot is created.*

Scale 1: input

if a value is entered by the user and an <enter> given, the sheet width and height required by the plot are calculated and displayed in the **sheet width** *and* **sheet height** *fields.*

Sheet width (mm) output

if a value is entered by the user and an <enter> given, the scale and height required by the plot are calculated and displayed in the **scale** *and* **sheet height** *fields. The units for sheet width are **millimetres**.*

Sheet height (mm) output

if a value is entered by the user and an <enter> given, the scale and width required by the plot are calculated and displayed in the **scale** *and* **sheet width** *fields. The units for sheet height are **millimetres***

Title and border tick box tick

*if **ticked** then a border and two lines of title are placed on the bottom of the plot*

Text style input 1

text style for the title information

Text Height (mm) input 10

height (in millimetres) to draw the two lines of title information

Title line 1/2 input

first/second line of title information

Title colour input cyan available colours

colour used for the border and the title information

Plot button

write out the plot of the information displayed in the view to the file given in the **plot file** *field. The format of the file is given by the* **plotter type**

Continue 9.3.4.2 Long Plot or return to 9.3.4 Section Plotting or 9.3 Section View Menu.

9.3.4.2 Long Plot

Position of option on menu: **Section View Menu** **View =>Plotting =>Long plot**

The option is for creating long section plots.

The **Long plot** option is documented in the section 25.8.4 Long Plot.

Continue 9.3.4.3 X Plot or return to 9.3.4 Section Plotting or 9.3 Section View Menu.

9.3.4.3 X Plot

Position of option on menu: **Section View Menu** **View =>Plotting =>X plot**

The **x plot** option is for creating x-section plots.

The option is documented in the section 25.8.3 X Plot.

Continue 9.3.4.4 Drainage/Sewer Plot or return to 9.3.4 Section Plotting or 9.3 Section View Menu.

9.3.4.4 Drainage/Sewer Plot

Position of option on menu: **Section View Menu** **View =>Plotting =>Drainage/Sewer**

The ***Drainage/Sewer plot*** option is used to make the long section plots for a drainage or sewer network.

This option is documented in the section 22.9.2 Drainage Longsections.

Continue 9.3.4.5 Melbourne Water Plot or return to 9.3.4 Section Plotting or 9.3 Section View Menu.

9.3.4.5 Melbourne Water Plot

Position of option on menu: **Section View Menu** **View =>Plotting =>Melbourne Water**

The ***Melbourne Water plot*** option is used to make the long section plots for a sewer network to Melbourne Water standards.

This option is documented in the section 22.9.3 Melbourne Water.

Continue 9.3.4.6 Pipeline Plot to return to 9.3.4 Section Plotting or 9.3 Section View Menu.

9.3.4.6 Pipeline Plot

Position of option on menu: **Section View Menu** **View =>Plotting =>Pipeline**

The ***Pipeline plot*** option is used to make the long section plots for a sewer network to Melbourne Water standards.

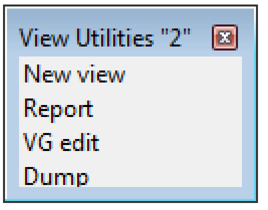
This option is documented in the section 22.5.1 Longsections.

Return to 9.3.4 Section Plotting or 9.3 Section View Menu.

9.3.5 Section Utilities

Position on menu: **Section View Menu** **View =>Utilities**

The **Utilities** menu contains miscellaneous options involving the section view. The **Utilities** walk-right menu is



For the option *New view settings*, go to the section 9.3.5.1 New View Settings
Report 9.3.5.2 Report
VG edit 9.3.5.3 VG Edit
Dump 9.3.5.4 View Dump

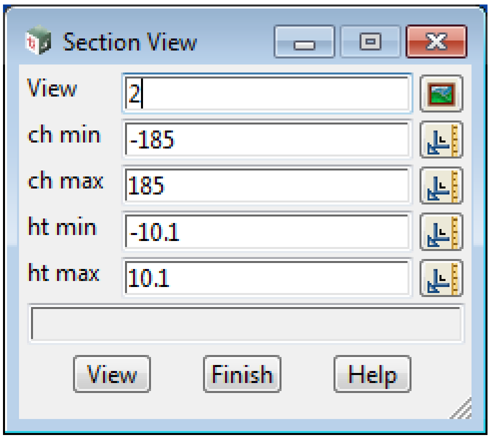
Or return to 9.3 Section View Menu.

9.3.5.1 New View Settings

Position of option on menu: **Section View Menu** **View =>Utilities =>New view settings**

The **New view settings** option displays the current minimum and maximum chainage and height values for the view, and permits the user to specify new values as the section's viewing parameters.

Selecting **New view settings** fires up the **Section View** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults

View input/output current view available views

view to set section parameters for.

chain min/max input/output current chainage min/max

minimum/maximum string chainage for the view. Chainage is used as the x-axis co-ordinates in a section view.

Ht min/max input/output current height min/max

minimum/maximum height (z value) for the view. Height is used as the y-axis co-ordinates in a section view.

View button

define the section view parameters according to the information in the panel. If the box given by the chainage and height values in the panel is not the same shape as the view itself, the chainage and height values will be modified so that the chainage and height values match the view shape. The final chainage and height values are displayed in the panel.

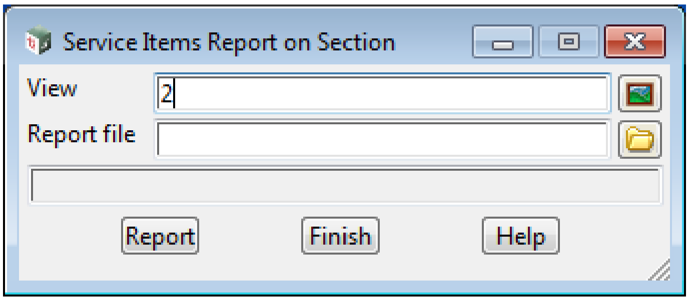
Continue to 9.3.5.2 Report or return to 9.3.5 Section Utilities or 9.3 Section View Menu.

9.3.5.2 Report

Position of option on menu: **Section View Menu** **View =>Utilities =>Report**

This **Report** option is for producing information on all the items displayed in the section view.

After selecting **Report**, the **Service Items Report on Section View** panel is displayed



For the profiled string, this option generates a report which includes the

- section through any tins on the section view
- name and model of any services in the corridor defined by the section view
- co-ordinates and chainages of the parts of the service in the corridor, and the chainage and offset for each of the point of the parts projected onto the profiled string.
- clearance at the point where any service goes under or over the profiled string.

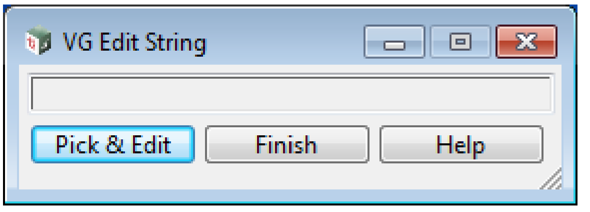
Continue to 9.3.5.3 VG Edit or return to 9.3.5 Section Utilities or 9.3 Section View Menu.

9.3.5.3 VG Edit

Position of option on menu: **Section View Menu** **View =>Utilities =>VG Edit**

The **VG edit** option is used to interactively create and modify the vertical geometry of a 12d Model alignment string, or the vertical information of any string that can be edited in a section view (e.g. drainage string). Vertical geometry can only be created for an existing string.

After selecting the **VG edit** option, the **VG edit string** panel is placed on the screen.



The option is already in **Pick** mode and the user simply picks and accepts the string whose vertical geometry is to be created and/or edited The **Pick Edit** button only needs to be used if the pick was cancelled from the **Pick Ops** menu.

Once the string has been selected, it is automatically made the primary string for the section view and a string profile created along the string.

As discussed in the section view profile options, for each tin in a model added to the section view, the section through the tin along the primary string (the selected string) is calculated and displayed in the section view.

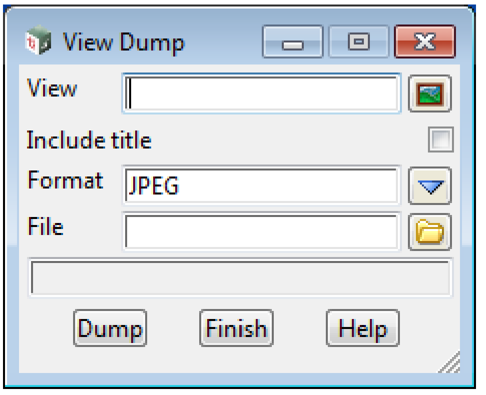
The **VG edit** option then fires up the standard string editor which is described in detail in the **string edit** options.

Continue to 9.3.5.4 View Dump or return to 9.3.5 Section Utilities or 9.3 Section View Menu.

9.3.5.4 View Dump

Position of option on menu: **Section View Menu View =>Utilities =>Dump**

This option is used to write the view out in a user selected format. It is the same as the dump option for the plan view and is fully documented in the plan **View => Utilities** section.



For more information on this option please go to 12.7 Dump.

Return to 9.3.5 Section Utilities or 9.3 Section View Menu.

9.4 Options Common to All Views

Some options are common to all view types and will be documented in the one place rather than for each View type.

See

9.4.1 Model Ops
9.4.2 Redraw
9.4.3 Fit
9.4.4 Previous
9.4.5 Clone
9.4.6 Properties
9.4.7 Delete

9.4.1 Model Ops

Position of menu: **Plan View Menu View =>Models**

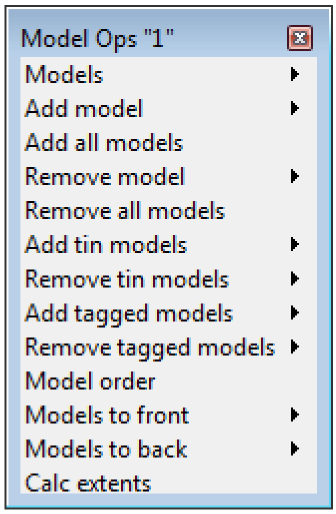
Position of menu: **Section View Menu View =>Models**

Position of menu: **Perspective View Menu View =>Models**

Walking right on **Models** brings up the **Model Ops** walk-right menu which is used to add and remove models from the view.

These options are the same for Plan, Perspective and Section views.

The **Model Ops** walk-right is



For the option:

Models, go to	9.4.1.1 Models
Add model	9.4.1.2 Add Model
Add all models	9.4.1.3 Add All Models
Remove model	9.4.1.4 Remove Model
Remove all models	9.4.1.5 Remove All Models
Add tin models	9.4.1.6 Add Tin Models
Remove tin models	9.4.1.7 Remove Tin Models
Add tagged models	9.4.1.8 Add Tagged Models
Remove tagged models	9.4.1.9 Remove Tagged Models
Model order	9.4.1.10 Model Order
Models to front	9.4.1.11 Models to Front
Models to back	9.4.1.12 Models to Back
Calc extents	9.4.1.13 Calc Extents

Or return to 9 Menus on Views

9.4.1.1 Models

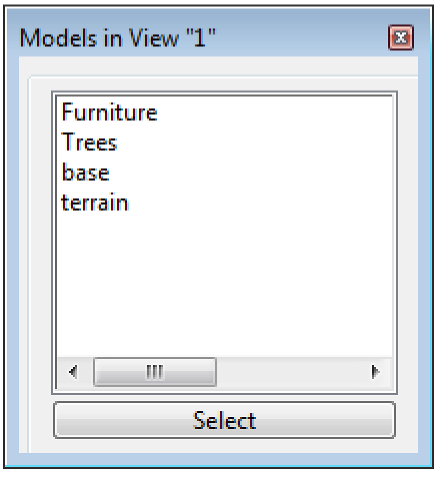
Position of menu: **Plan View Menu** **View => Models =>Models**

Position of menu: **Section View Menu** **View => Models =>Models**

Position of menu: **Perspective View Menu** **View => Models =>Models**

Models is a walk-right option which lists the models currently attached to that view.

If a model is selected from the displayed list, the model will be redrawn on the view. It will also be brought to the top of the display list, *i.e.*, it is in the foreground and all the other models on the view are drawn before it.



Continue to 9.4.1.2 Add Model or return to 9 Menus on Views

9.4.1.2 Add Model

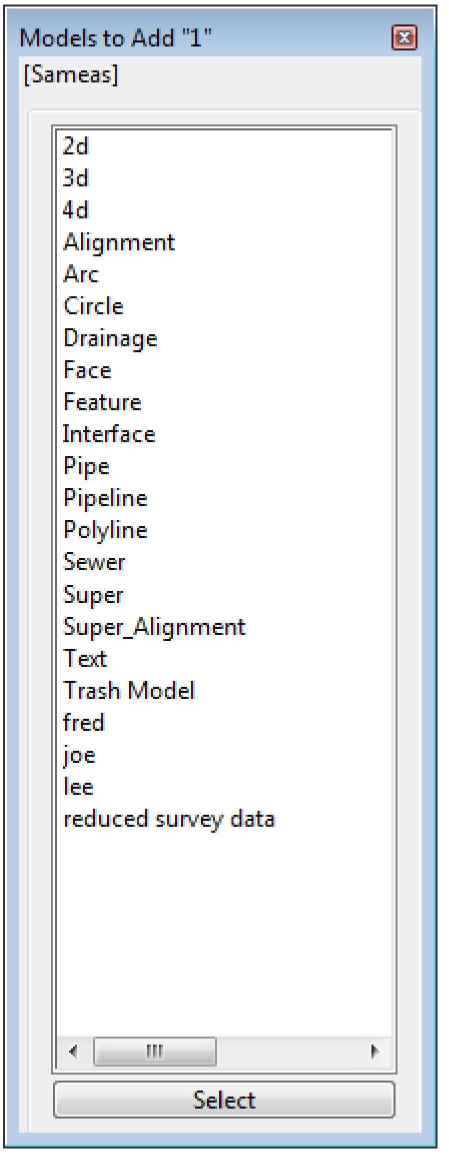
Position of menu: **Plan View Menu** **View => Models =>Add model**

Position of menu: **Section View Menu** **View => Models =>Add model**

Position of menu: **Perspective View Menu** **View => Models =>Add model**

The **Add model** menu item operates two ways.

The **Add model** walk-right brings up the **Models to Add** list which is a list of all the models not currently added to the view.

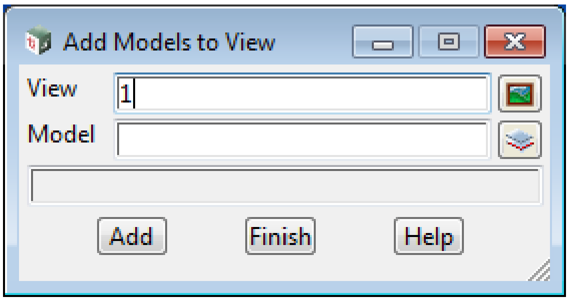


By double clicking on one of the models from the **Models to Add** list, it is added to the view. The list is then removed. To add a number of models from the list to the view, select the models in the list in the standard Microsoft way and then click on **Select**.

If the **Models to Add** list has been moved or pinned, models can be selected from the list and added to the view and the **Models to Add** list will remain with the selected models removed from the list. When all the required models have been added, delete the list using the **[X]** button.

If **Add model** itself is activated (by clicking LB when **Add model** is highlighted), the **Add Model to a**

View panel appears. The **Add Model to a View** panel can be used to create new models as well as add existing models to any view. Wild cards and characters are allowed for adding models.



Any models added to a view are immediately drawn on the view.

Continue to 9.4.1.3 Add All Models or return to 9 Menus on Views

9.4.1.3 Add All Models

Position of option on menu: **Plan View Menu** **View => Models =>Add all models**

Position of option on menu: **Section View Menu** **View => Models =>Add all models**

Position of option on menu: **Perspective View Menu** **View => Models =>Add all models**

The **Add all models** option adds all the models to the view.

Continue to 9.4.1.4 Remove Model or return to 9 Menus on Views

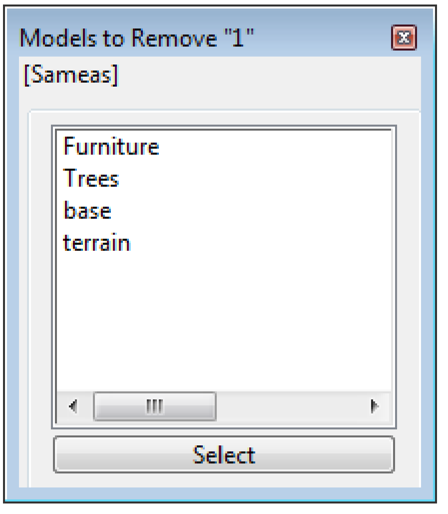
9.4.1.4 Remove Model

Position of menu: **Plan View Menu** **View => Models =>Remove model**

Position of menu: **Section View Menu** **View => Models =>Remove model**

Position of menu: **Perspective View Menu** **View => Models =>Remove model**

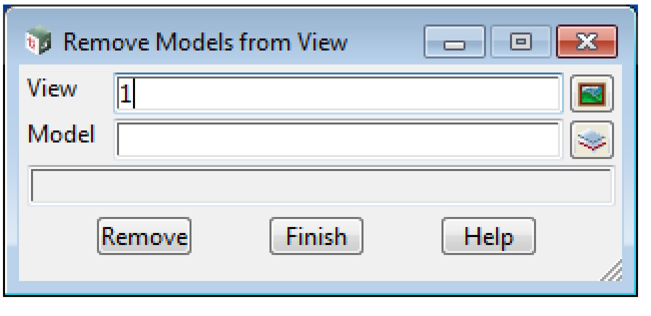
The **Remove model** menu item also operates in two ways. The **Remove model** walk-right brings up the **Models to Remove** list which is a list of all the models currently added to the view.



By double clicking on one of the models from the **Models to Remove** list, it is removed from the view. The list is then removed. To remove a number of models on the list from the view, select the models in the list and then click on **Select**.

If the **Models to Remove** list has been moved or pinned, models can be selected from the list and removed from the view and the **Models to Remove** list will remain with the selected models removed from the list. When all the required models have been removed, delete the list using the **[X]** button.

If **Remove model** itself is activated, the **Remove Model from a View** panel appears. The **Remove Model from a View** panel can be used to remove any models from any view. Wild cards and characters are allowed for removing models.



NOTE
Models still exist after they are removed from a view. Models can only be deleted from 12d Model by using the **Models=>Delete** option.

Continue to 9.4.1.5 Remove All Models or return to 9 Menus on Views

9.4.1.5 Remove All Models

Position of option on menu: **Plan View Menu** **View => Models =>Remove all models**

Position of option on menu: **Section View Menu** **View => Models =>Remove all models**

Position of option on menu: **Perspective View Menu** **View => Models =>Remove all models**

The **Remove all models** option removes all the models from the view and clears the view.

Continue to 9.4.1.6 Add Tin Models or return to 9 Menus on Views

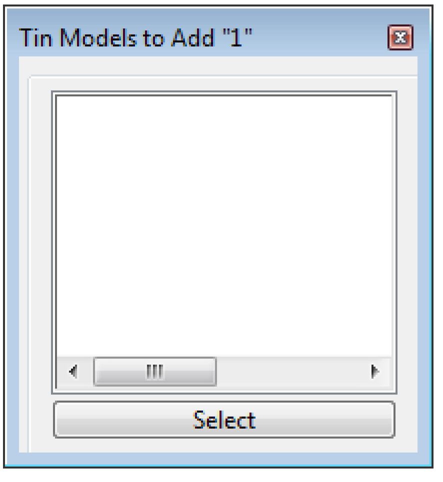
9.4.1.6 Add Tin Models

Position of menu: **Plan View Menu** **View => Models =>Add tin models**

Position of menu: **Section View Menu** **View => Models =>Add tin models**

Position of menu: **Perspective View Menu** **View => Models =>Add tin models**

The **Add tin models** walk-right brings up the **Tin Models to Add** list of all tins in the project whose models have not been added to the view



By double clicking on one of the tins from the **Tin Models to Add** list, all the models in the tin are added to the view. The list is then removed. To add the models from a number of tins from the list to the view, select the tins in the list in the standard Microsoft way and then click on **Select**.

If the **Tin Models to Add** list has been moved or pinned, tins can be selected from the list and their models added to the view and the **Tin Models to Add** list will remain with the selected tins removed from the list. When all the required tins have been added, delete the list using the **[X]** button.

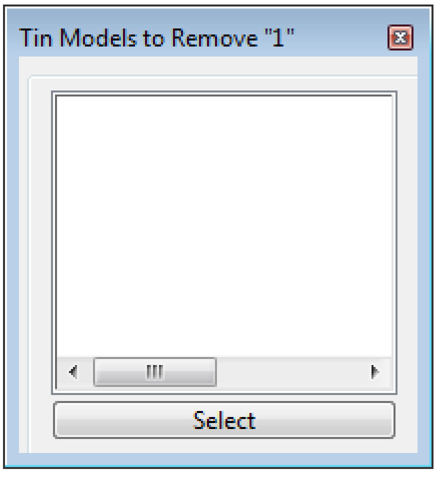
Any models added to a view are immediately drawn on the view.

Continue to 9.4.1.7 Remove Tin Models or return to 9 Menus on Views

9.4.1.7 Remove Tin Models

Position of menu:	**Plan View Menu**	**View => Models =>Remove tin models**
Position of menu:	**Section View Menu**	**View => Models =>Remove tin models**
Position of menu:	**Perspective View Menu**	**View => Models =>Remove tin models**

The **Remove tin models** walk-right brings up the **Tin Models to Remove** list of all tins whose models are currently added to the view.



By double clicking on one of the tins from the **Tin Models to Remove** list, all the models in the tin are removed from the view. The list is then removed. To remove the models from a number of tins on the list from the view, select the tins in the list and then click on **Select**.

If the **Tin Models to Remove** list has been moved or pinned, tins can be selected from the list and removed from the view and the **Tin Models to Remove** list will remain with the selected tins removed from the list. When all the required tins have been removed, delete the list using the **[X]** button.

Continue to 9.4.1.8 Add Tagged Models or return to 9 Menus on Views

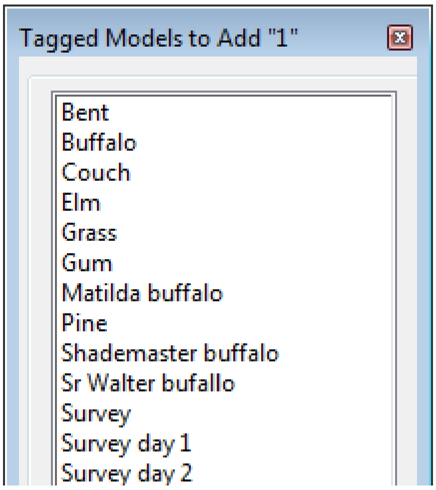
9.4.1.8 Add Tagged Models

Position of menu: **Plan View Menu** **View => Models =>Add tagged models**

Position of menu: **Section View Menu** **View => Models =>Add tagged models**

Position of menu: **Perspective View Menu** **View => Models =>Add tagged models**

The **Add tagged models** walk-right brings up the **Tagged Models to Add** list of all the tags (first level and subtags) defined in the project.



By double clicking on one of the tag names from the **Tagged Models to Add** list, all the models with that tag name, or models whose tag is a subtag of the tag name, are added to the view. The list is then removed. To select a number of tags from the list, select the tags in the standard Microsoft way and then click on **Select**.

If the **Tagged Models to Add** list has been moved or pinned, tags can be selected from the list and their models added to the view and the **Tagged Models to Add** list will remain with the selected tags removed from the list. When all the required tags have been added, delete the list using the **[X]** button.

Any models added to a view are immediately drawn on the view.

Continue to 9.4.1.9 Remove Tagged Models or return to 9 Menus on Views

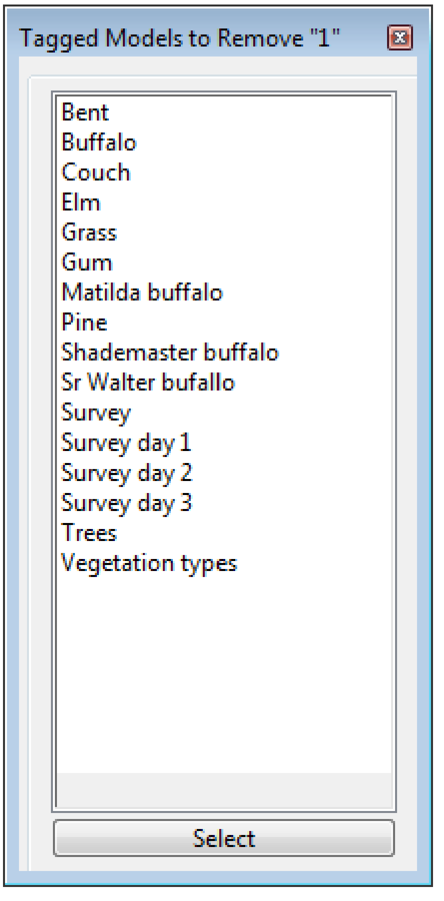
9.4.1.9 Remove Tagged Models

Position of menu: **Plan View Menu** **View => Models =>Remove tagged models**

Position of menu: **Section View Menu** **View => Models =>Remove tagged models**

Position of menu: **Perspective View Menu** **View => Models =>Remove tagged models**

The **Remove tagged models** walk-right brings up the **Tagged Models to Remove** list of all tins whose models are currently added to the view.



By double clicking on one of the tag name from the **Tagged Models to Remove** list, all the models with that tag name, or models whose tag is a subtag of the tag name, are removed from the view. The list is then removed.To select a number of tags from the list, select the tags in the standard Microsoft way and then click on **Select**.

If the **Tagged Models to Remove** list has been moved or pinned, tags can be selected from the list and removed from the view and the **Tagged Models to Remove** list will remain with the selected tags removed from the list. When all the required tags have been removed, delete the list using the **[X]** button.

Continue to 9.4.1.10 Model Order or return to 9 Menus on Views

9.4.1.10 Model Order

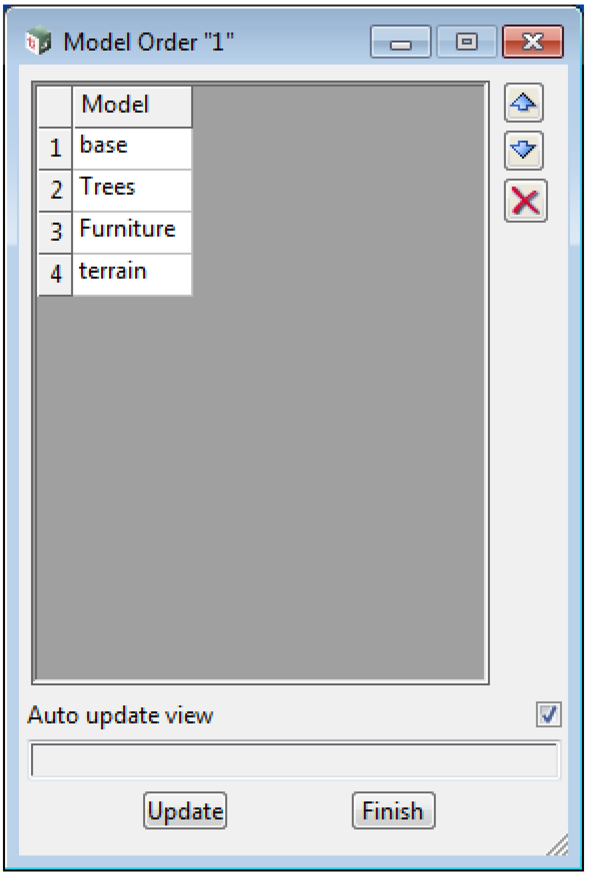
Position of menu: **Plan View Menu** **View => Models =>Model order**

Position of menu: **Section View Menu** **View => Models =>Model order**

Position of menu: **Perspective View Menu** **View => Models =>Model order**

The **Model order** options displays the list of all models on a view in the reverse model drawing order. That is, the first model on the list is the last model drawn and hence the most visible model.

Selecting **Model order** brings up the **Model Order** panel.



The fields and buttons used in this panel have the following functions.

Field Description Type Defaults Pop-Up

Model

list of models on the view in the reverse drawing order. That is, the first model on the list is drawn last and so is the most visible.

Up Arrow, Down Arrow

when a model name is highlighted, clicking the Up/Down arrow will change the order of the model.

Delete

when a model name is highlighted, clicking the Delete icon will remove the model from the view.

when a model name is highlighted, clicking on the Cross will remove the model from the view.

Auto update view tick box tick

if ticked then the view is redrawn each time a model is moved in the list or added/removed from the list.

Update button

redraws the view using the new model order.

Continue to 9.4.1.11 Models to Front or return to 9 Menus on Views

9.4.1.11 Models to Front

Position of menu: **Plan View Menu** **View => Models =>Models to front**

Position of menu: **Section View Menu** **View => Models =>Models to front**

Position of menu: **Perspective View Menu** **View => Models =>Models to front**

Models to front is a walk-right option. When the walk-right is chosen, the list of models currently attached to that view is displayed.

If a model is selected from the displayed list, the model will be the last to be drawn on the view. Hence, it is in the foreground and all the other models on the view are drawn before it.

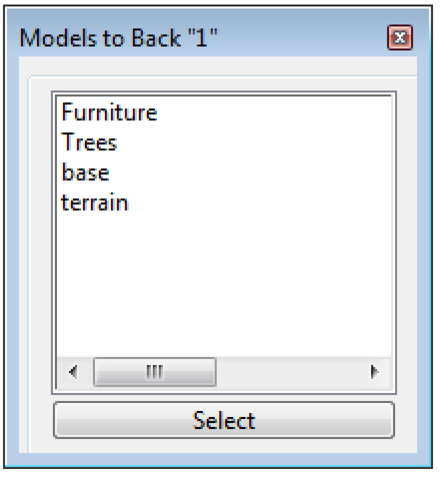
Continue to 9.4.1.12 Models to Back or return to 9 Menus on Views

9.4.1.12 Models to Back

Position of menu: **Plan View Menu** **View => Models =>Models to back**

Position of menu: **Section View Menu** **View => Models =>Models to back**

Position of menu: **Perspective View Menu** **View => Models =>Models to back**



Models to back is a walk-right option. When the walk-right is chosen, the list of models currently attached to that view is displayed.

If a model is selected from the displayed list, the model will be the first to be drawn on the view. Hence, it is in the background and all the other models on the view are drawn after it.

Continue to 9.4.1.13 Calc Extents or return to 9 Menus on Views

9.4.1.13 Calc Extents

Position of option on menu: **Plan View Menu** **View => Models =>Calc extents**

Position of option on menu: **Section View Menu** **View => Models =>Calc extents**

Position of option on menu: **Perspective View Menu** **View => Models =>Calc extents**

For each model on the view, the size of the x, y, z box required to enclose the data in the model is calculated.That is, the option calculates the model bounding box for each model on the view.

Return to 9 Menus on Views

9.4.2 Redraw

Position of option on menu: **Plan View Menu** **View => Models =>Redraw**

Position of option on menu: **Section View Menu** **View => Models =>Redraw**

Position of option on menu: **Perspective View Menu** **View => Models =>Redraw**

As its name implies, this option redraws all the models on the view using the current drawing parameters. This is the same as clicking MB in the view title area.

NOTES

1. When a model is removed from a view, it is “undrawn”, that is, drawn in black. This may also black out important details of other models still attached to the view. If this happens, use the **redraw** option to refresh the view.
2. Clicking MB in the view-title area is the easiest method of redrawing a view.

Return to 9 Menus on Views

9.4.3 Fit

Position of option on menu: **Plan View Menu** **View => Models =>Fit**

Position of option on menu: **Section View Menu** **View => Models =>Fit**

Position of option on menu: **Perspective View Menu** **View => Models =>Fit**

When the **Fit** option is chosen,***12d Model*** calculates viewing parameters which will allow all the models attached to the view to be fully displayed. The view is then redrawn using these new drawing parameters.

Note if the data does not fill the view after a fit, then a **Calc Extents** may be needed to re-calculate the model bounding boxes.

Return to 9 Menus on Views

9.4.4 Previous

Position of option on menu: **Plan View Menu** **View => Models =>Previous**

Position of option on menu: **Section View Menu** **View => Models =>Previous**

Position of option on menu: **Perspective View Menu** **View => Models =>Previous**

Each time a view has its viewing parameters changed, the old set is recorded as the previous parameter set.The previous option sets the viewing parameters back to this previous parameter set.

The view is then redrawn using those settings. The last set then becomes the old set.

Return to 9 Menus on Views

9.4.5 Clone

Position of option on menu: **Plan View Menu** **View => Models =>Clone**

Position of option on menu: **Section View Menu** **View => Models =>Clone**

Position of option on menu: **Perspective View Menu** **View => Models =>Clone**

If LB is clicked on **Clone**, then a new view identical to the original view with all the same models on the new plus and apart form the view name, all the new view setting are identical to the original view.

The view name of the Cloned view is the name of the original view with " Copy" appended to it.

A **Plan/Perspective/Section View Properties** panel for the new view is then brought up so that any of the View properties (for example the view name) can be quickly changed. See 9.4.6 Properties

Return to 9 Menus on Views

9.4.6 Properties

Position of option on menu: **Plan View Menu** **View => Models =>Properties**

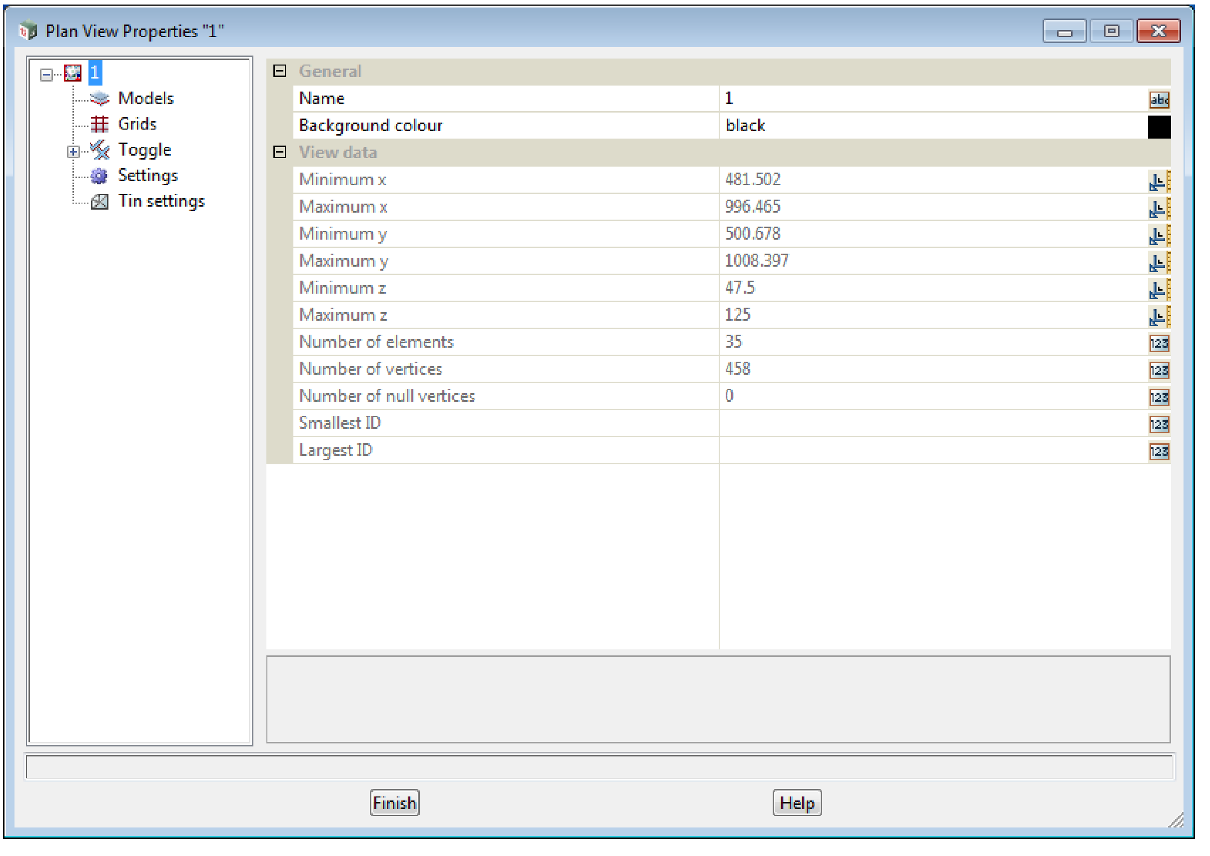
Position of option on menu: **Section View Menu** **View => Models =>Properties**

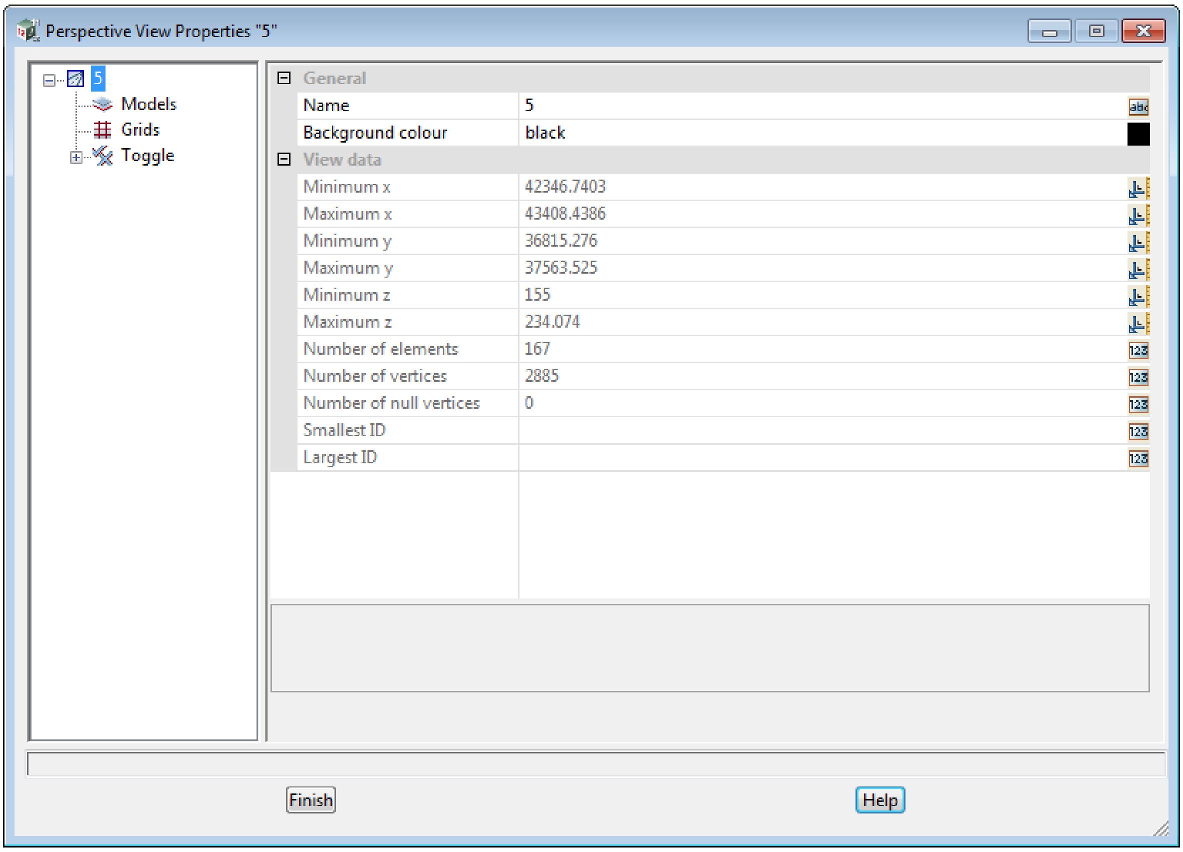
Position of option on menu: **Perspective View Menu** **View => Models =>Properties**

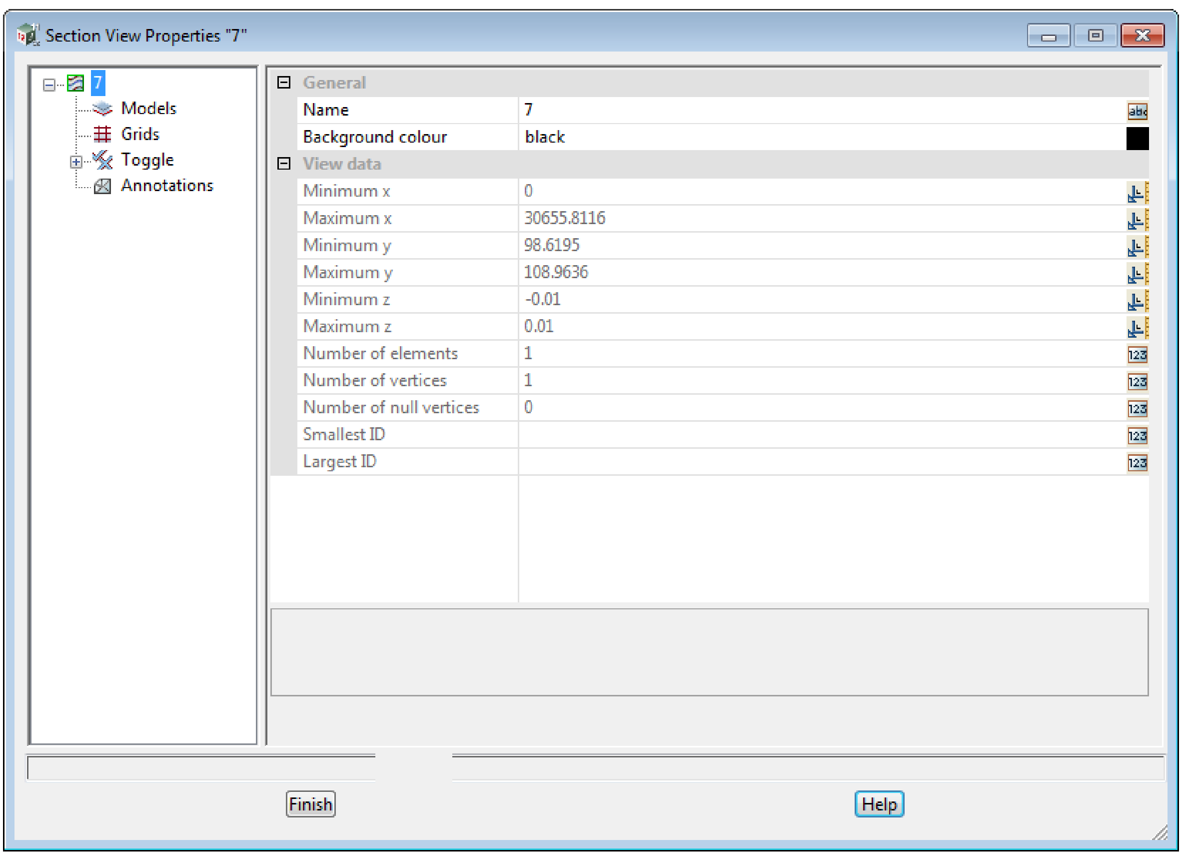
Clicked LB on the on **Properties** button brings up the **Plan View Properties**, **Perspective View Properties**, or **Section View Properties** panel for that view and view type.

The **View Properties** panels display all the settings for the view in a tree structure and clicking on a node brings up various settings on the right hand side of the panel

Many of the settings can then be changed, and the changes take place immediately without having to press another button.







Return to 9 Menus on Views

9.4.7 Delete

Position of option on menu: **Plan View Menu** **View =>Delete**

Position of option on menu: **Section View Menu** **View =>Delete**

Position of option on menu: **Perspective View Menu** **View =>Delete**

This option is used to delete the view and remove it from the screen.

After selecting the **Delete** option, a **Delete View** yes-no panel appears.

If **Yes** is selected, the view is deleted and removed from the screen.

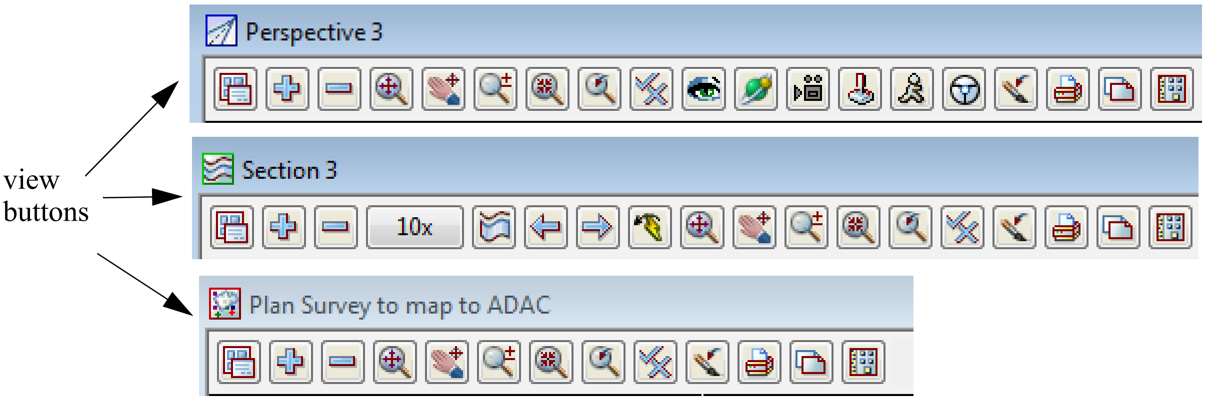
Selecting **No** removes the **Yes-No** pop-up and leaves the view as it is.

Return to 9 Menus on Views

9.5 View Buttons

For each view type, there are a number of selected **View** menu options available as buttons (view buttons) in the *view title area*.

The options on each view type are



To select one of the view buttons, click LB whilst the cursor is over the button.

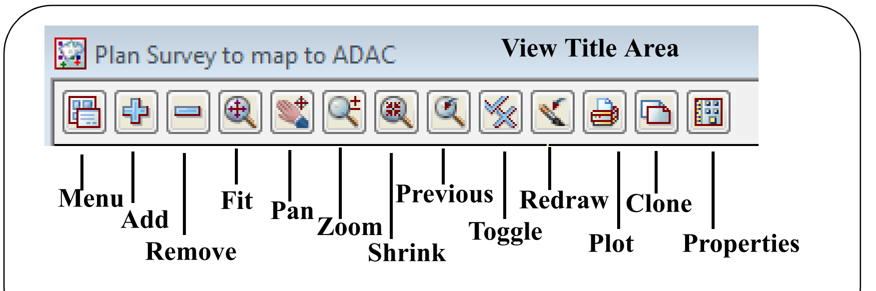
Note that the view buttons do not highlight when the cursor passes over them.

If RB is clicked over any view button other than **Profile** on the section view, the **View** menu for the view type will be displayed.

For documentation on the view buttons see:

9.5.1 Plan View Buttons.
9.5.2 Perspective View Buttons.
9.5.3 Section View Buttons.

9.5.1 Plan View Buttons



Plan View Buttons

Menu

If the **Menu** button is selected in the *view button area* of any view, or if **RB** is clicked in the *view-title area* or in the *view-button area*, a new menu called the **View** menu appears.

Because of the differences between plan, perspective and section views, the options on the **View** menu vary for each view type.

The plan **View** menus is

The **View** menu is removed by selecting the **[X]** button or if the **View** menu hasn't been moved, by simply clicking **RB** again in the *view-title* or *view button* area. If the **View** menu has been moved, clicking **RB** will warp the cursor to the moved View menu.

+ or Add

The **+** view button works in four modes.

- clicking LB whilst the cursor is over the **+** brings up the **Models to Add** list. This list contains all of the models not yet added to the view.
- typing a keyboard character whilst the cursor is over the **+** brings up a **Models to Add** list containing only those models not on the view **with names beginning** with the typed character.
- typing a * character whilst the cursor is over the **+** brings up a **Add Models to View** panel which can then be used with wild cards and characters.
- clicking MB whilst the cursor is over the **+** brings up the **Add Models to View by Pick** panel and starts up a **same as** for a view. Models to add to the view are then selected by simply picking a string from the model. See 4 Tools and Concepts for further documentation on **same as**.
- clicking RB whilst the cursor is over the **+** brings up the **View** panel documented earlier in this

chapter.

For the *Same as* option for the + and - view buttons, go to 9.5.4 Same As for Views.

-or Remove

The **-** view button works in four modes.

- clicking LB whilst the cursor is over the **-** brings up the **Models to Remove** list. This menu lists all of the models on the view.
- typing a keyboard character whilst the cursor is over the **-** brings up a **Models to Remove** list containing only those models on the view with names beginning with the typed character.
- typing a * character whilst the cursor is over the **-** brings up a **Remove Models from View** panel which can then be used with wild cards and characters.
- clicking MB whilst the cursor is over the **-** brings up the **Remove Models from View by Pick** panel and starts up a **Same as** for a view. Models to remove from the view are then selected by simply picking a string from the model. See the next chapter for further documentation on **Same as**.
- clicking RB whilst the cursor is over the **-** brings up the **View** panel documented earlier in this chapter.

For the *Same as* option for the + and - view buttons, go to 9.5.4 Same As for Views.

Fit

This is the same as **Fit** from the **view** menu.
If LB is clicked on the **Fit**, then the **Fit** option is activated.
If RB is clicked on the **Fit**, then the **View** option is activated.

Pan

This is the same as **Pan** from the **View=>Pan** menu.
If LB is clicked on the **Pan**, then the **Pan** option is activated.

Zoom

This is the same as the two point **Zoom** option from the plan **View=>Zoom** menu.
If LB is clicked on the **Zoom**, then the **zoom** option is activated.

Shrink

This is the same as the two point **Shrink** option from the plan **View=>Zoom** menu.
If LB is clicked on the **Shrink**, then the **Shrink** option is activated.

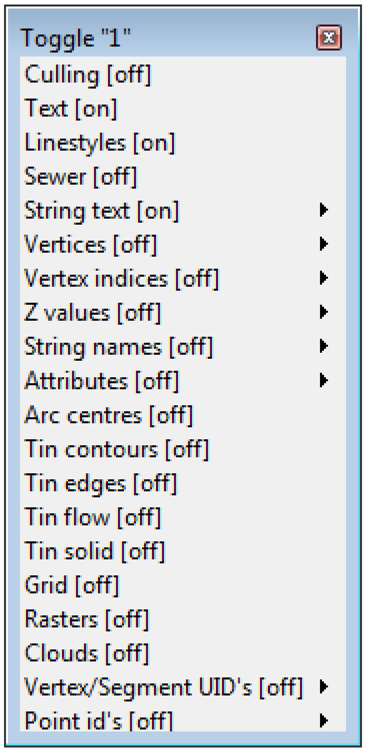
Previous

This is the same as **Previous** from the **view** menu.
If LB is clicked on the **Prev**, then the **Previous** option is activated.
If RB is clicked on the **Prev**, then the **View** option is activated.

Toggle

This is the same as **Toggle** from the **View=>Settings** menu.
If LB is clicked on the **Toggle**, then the **Toggle** menu is activated.
If RB is clicked on the **Toggle**, then the **View** option is activated.

The **Toggle** menu for the plan view types is:

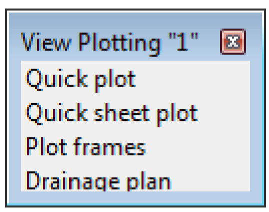


Refresh

As its name implies, this option redraws all the models on the view using the current drawing parameters. This is the same as clicking MB in the view title area.

Plot

If LB is clicked on **Plot**, then the **View Plotting** menu for the plan view is activated.



Clone

See 9.4.5 Clone.

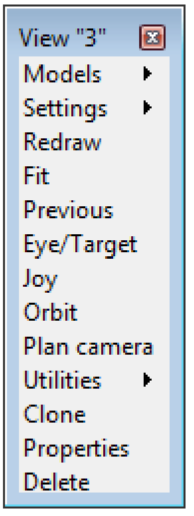
Menu

If the **Menu** button is selected in the *view button area* of any view, or if **RB** is clicked in the *view-title area* or in the *view-button area*, a new menu called the **View** menu appears.

Because of the differences between plan, perspective and section views, the options on the **View** menu vary for each view type.

The **Perspective View** menus is



The **View** menu is removed by selecting the **[X]** button or if the **View** menu hasn't been moved, by simply clicking **RB** again in the *view-title* or *view button* area. If the **View** menu has been moved, clicking **RB** will warp the cursor to the moved View menu.

+ or Add

The **+** view button works in four modes.

- clicking LB whilst the cursor is over the **+** brings up the **Models to Add** list. This list contains all of the models not yet added to the view.
- typing a keyboard character whilst the cursor is over the **+** brings up a **Models to Add** list containing only those models not on the view **with names beginning** with the typed character.
- typing a * character whilst the cursor is over the **+** brings up a **Add Models to View** panel which can then be used with wild cards and characters.
- clicking MB whilst the cursor is over the **+** brings up the **Add Models to View by Pick** panel and starts up a **Same as** for a view. Models to add to the view are then selected by simply picking a string from the model. See 4 Tools and Conceptsfor further documentation on **Same as**.
- clicking RB whilst the cursor is over the **+** brings up the **View** panel documented earlier in this chapter.

For the *Same as* option for the + and - view buttons, go to 9.5.4 Same As for Views.

- or Remove

The **-** view button works in four modes.

- clicking LB whilst the cursor is over the **-** brings up the **Models to Remove** list. This menu lists all of the models on the view.
- typing a keyboard character whilst the cursor is over the **-** brings up a **Models to Remove** list containing only those models on the view with names beginning with the typed character.
- typing a * character whilst the cursor is over the **-** brings up a **Remove Models from View** panel which can then be used with wild cards and characters.
- clicking MB whilst the cursor is over the **-** brings up the **Remove Models from View by Pick** panel and starts up a **Same as** for a view. Models to remove from the view are then selected by simply picking a string from the model. See the next chapter for further documentation on **Same as**.
- clicking RB whilst the cursor is over the **-** brings up the **View** panel documented earlier in this chapter.

For the *Same as* option for the + and - view buttons, go to 9.5.4 Same As for Views.

Fit

This is the same as **Fit** from the **view** menu.
If LB is clicked on the **Fit**, then the **Fit** option is activated.
If RB is clicked on the **Fit**, then the **View** option is activated.

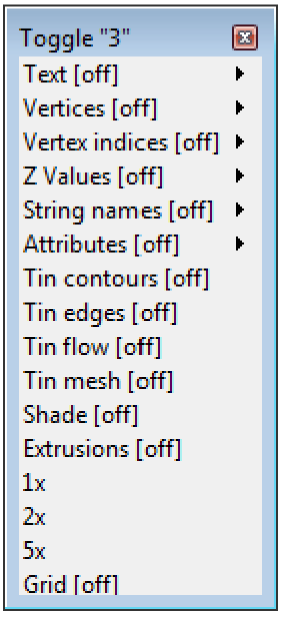
Previous

This is the same as **Previous** from the **View** menu.
If LB is clicked on the **Prev**, then the **Previous** option is activated.
If RB is clicked on the **Prev**, then the **View** option is activated.

Toggle

This is the same as **Toggle** from the **View=>Settings** menu.
If LB is clicked on the **Toggle**, then the **Toggle** menu is activated.
If RB is clicked on the **Toggle**, then the **View** option is activated.

The **Toggle** menu for the perspective view is:



Eye

This is the same as **eye/target** from the **View** menu.
If LB is clicked on the **Eye**, then the **Eye-target** option is activated.
For more information please see 9.2.2 Eye/Target

Orbit

For more information please see 9.2.4 Orbit

Plan Camera

For more information please see 9.2.5 Plan Camera

Joy

This is the same as **Joy** from the **View** menu.
If LB is clicked on the **Joy**, then the **Joy** option is activated.
For more information please see 9.2.3 Joy for View

Walk

This is the same as **String walk =>Along string** from the **View =>Utilities** menu.
If LB is clicked on the **Walk**, then the **Walk along string** option is activated.

Drive

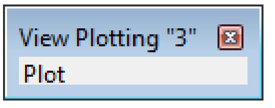
This is the same as **String drive => Along string** from the **View =>Utilities** menu.
If LB is clicked on the **Drive**, then the **Drive along string** option is activated.

Redraw

As its name implies, this option redraws all the models on the view using the current drawing parameters. This is the same as clicking MB in the view title area.

Plot

If LB is clicked on **Plot**, then the **View Plotting** menu for the perspective view is activated.



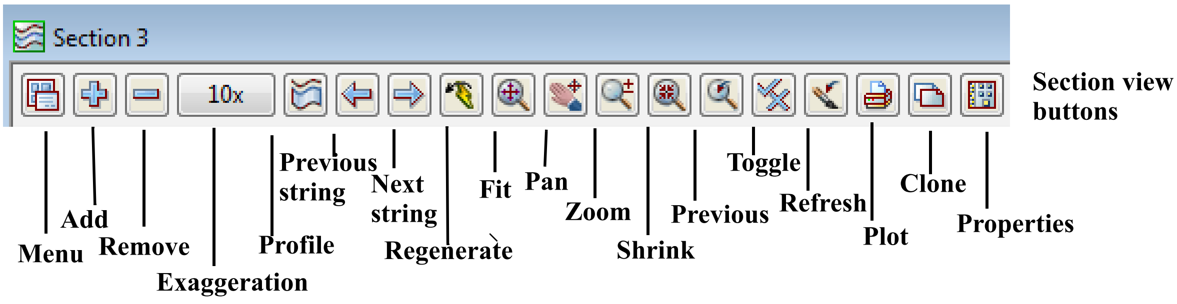
Clone

See 9.4.5 Clone.

Properties

See 9.4.6 Properties.

9.5.3 Section View Buttons

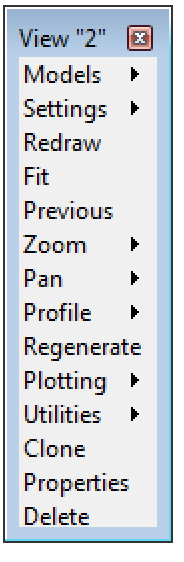


Menu

If the **Menu** button is selected in the *view button area* of any view, or if **RB** is clicked in the *view-title area* or in the *view-button area*, a new menu called the **View** menu appears.

Because of the differences between plan, perspective and section views, the options on the **View** menu vary for each view type.

The **Section View** menus is



The **View** menu is removed by selecting the **[X]** button or if the **View** menu hasn't been moved, by simply clicking **RB** again in the *view-title* or *view button* area. If the **View** menu has been moved, clicking **RB** will warp the cursor to the moved View menu.

+ or Add

The **+** view button works in four modes.

- clicking LB whilst the cursor is over the **+** brings up the **Models to Add** list. This list contains all of the models not yet added to the view.
- typing a keyboard character whilst the cursor is over the **+** brings up a **Models to Add** list containing only those models not on the view **with names beginning** with the typed character.
- typing a * character whilst the cursor is over the **+** brings up a **Add Models to View** panel which can then be used with wild cards and characters.
- clicking MB whilst the cursor is over the **+** brings up the **Add Models to View by Pick** panel and starts up a **Same As** for a view. Models to add to the view are then selected by simply picking a string from the model. See 4 Tools and Concepts for further documentation on **Same As**.
- clicking RB whilst the cursor is over the **+** brings up the **View** panel documented earlier in this

chapter.

For the *Same As* option for the + and - view buttons, go to 9.5.4 Same As for Views.

- or Remove

The **-** view button works in four modes.

- clicking LB whilst the cursor is over the **-** brings up the **Models to Remove** list. This menu lists all of the models on the view.
- typing a keyboard character whilst the cursor is over the **-** brings up a **Models to Remove** list containing only those models on the view with names beginning with the typed character.
- typing a * character whilst the cursor is over the **-** brings up a **Remove Models from View** panel which can then be used with wild cards and characters.
- clicking MB whilst the cursor is over the **-** brings up the **Remove Models from View by Pick** panel and starts up a **Same As** for a view. Models to remove from the view are then selected by simply picking a string from the model. See the next chapter for further documentation on **Same As**.
- clicking RB whilst the cursor is over the **-** brings up the **View** panel documented earlier in this chapter.

For the *Same as* option for the + and - view buttons, go to 9.5.4 Same As for Views.

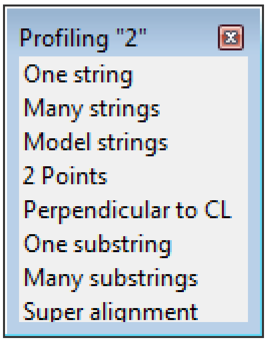
[Exagg]

This is the vertical exaggeration for the view.
If LB is clicked on the exaggeration, then the **Toggle** option for the section view is activated. This has options to quickly change the vertical exaggeration.

Profile

If LB is clicked on **Profile**, then the **Profile** option is activated. This option is the same as **View=>Profiling=>One string**. If a string is being profiled, then the string name is displayed after the Section view name.

If **RB** is clicked on **Profile**, then the **Profiling** menu is activated.



<<

Profile previous string.

>>

Profile next string.

Regen

This is the same as the option **Regenerate** option from the section **view** menu.
If LB is clicked on the **Regen**, then the **regen** option is activated.

Fit

This is the same as **Fit** from the **view** menu.

If LB is clicked on the **Fit**, then the **Fit** option is activated.
If RB is clicked on the **Fit**, then the **View** option is activated.

Pan

This is the same as **Pan** from the **View=>Pan** menu.
If LB is clicked on the **Pan**, then the **Pan** option is activated.

Zoom

This is the same as the two point **Zoom** option from the plan **View=>Zoom** menu.
If LB is clicked on the **Zoom**, then the **Zoom** option is activated.

Shrink

This is the same as the two point **Shrink** option from the plan **View=>Zoom** menu.
If LB is clicked on the **Shrink**, then the **Shrink** option is activated.

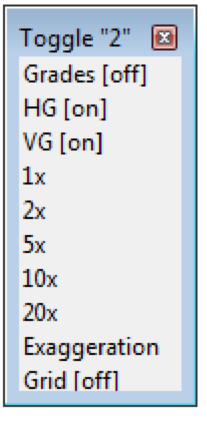
Previous

This is the same as **Previous** from the **View** menu.
If LB is clicked on the **Prev**, then the **Previous** option is activated.
If RB is clicked on the **Prev**, then the **View** option is activated.

Toggle

This is the same as **Toggle** from the **View=>Settings** menu.
If LB is clicked on the **Toggle**, then the **Toggle** menu is activated.
If RB is clicked on the **Toggle**, then the **View** option is activated.

The **Toggle** menu for the section view is:

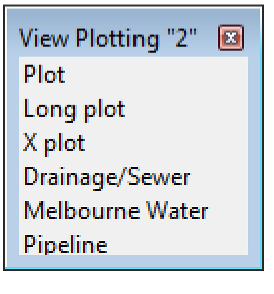


Refresh

As its name implies, this option redraws all the models on the view using the current drawing parameters. This is the same as clicking MB in the view title area.

Plot

If LB is clicked on **Plot**, then the **View Plotting** menu for the section view is activated.



Clone

See 9.4.5 Clone.

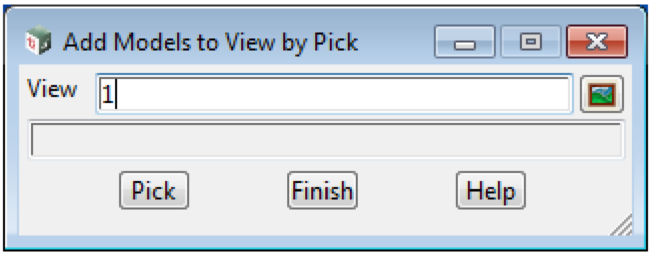
Properties

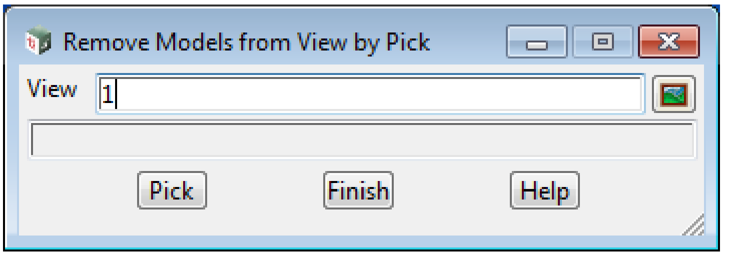
See 9.4.6 Properties.

9.5.4 Same As for Views

Clicking the middle mouse button (MB) over the **+** or **-** view buttons will activate a **Same As** pick which allows the user to select the model to add to (+) or remove from (-) the view by simply picking any string from the model to be added or removed.

After clicking MB over the **+** or **-** view button, the **Add Models to View by Pick** or **Remove Models from View by Pick** panel is brought up.





The option is already running and when a string is picked,. the model containing the string is added to/removed from the view. Further strings can then be selected to add or remove another model.

The option is terminated by selecting **[X]** or **Finish** from the panels, or **Cancel** from the **Pick Ops** menu.

9.6 Displaying Values Text, Vertices and Text on a Plan View

Plan_View_Vertex_Segment_UIDs_Settings_MenuOn ***Plan View =>Settings*** there are a number of options that work in a similar way and control the drawing of string text, drawing crosses at vertices and the labelling of a number of string properties such as vertices, z-values, string name etc.

The first two of these ***Plan View =>Settings*** options are:

1. **Text** for controlling the drawing of *Text strings* and any other text drawn on the view.
2. **Vertices** for drawing crosses at all the vertices in a string. For a text string, a cross is placed at the text justification position.

The other options draw string values as text on the view and are:

3. **Vertex/Segment UID's** for displaying the **Vertex UID's** any **Segment UIDs** for the vertices and segments of super strings.
4. **Point/Vertex IDs** for displaying the **Point/Vertex ID** (a point ID recorded for a vertex) for the vertices of super strings.

   Note - Point/Vertex IDs are not to be confused with *Vertex Indices* which are simply the position of the vertex in the string.
5. **Vertex Indices** for displaying the **Vertex Indices** (position of the vertex in the string) for all the vertices of strings.

   Note - Vertex Indices are not to be confused with *Point/Vertex IDs* which may not even exist for a vertex in the string.
6. **Z values** for displaying the z coordinate to a user specified number of decimal places, for all the vertices of strings.
7. **Names** for displaying the string name at each vertex of a string.
8. **Attributes** for displaying the vertex attributes for all the vertices of super strings.

Vertex/Segment UIDs, ***Point/Vertex Id's***, ***Vertex indices***, ***Z values***, ***Names*** and ***Attributes*** that draw specific values from a string as text on the view.

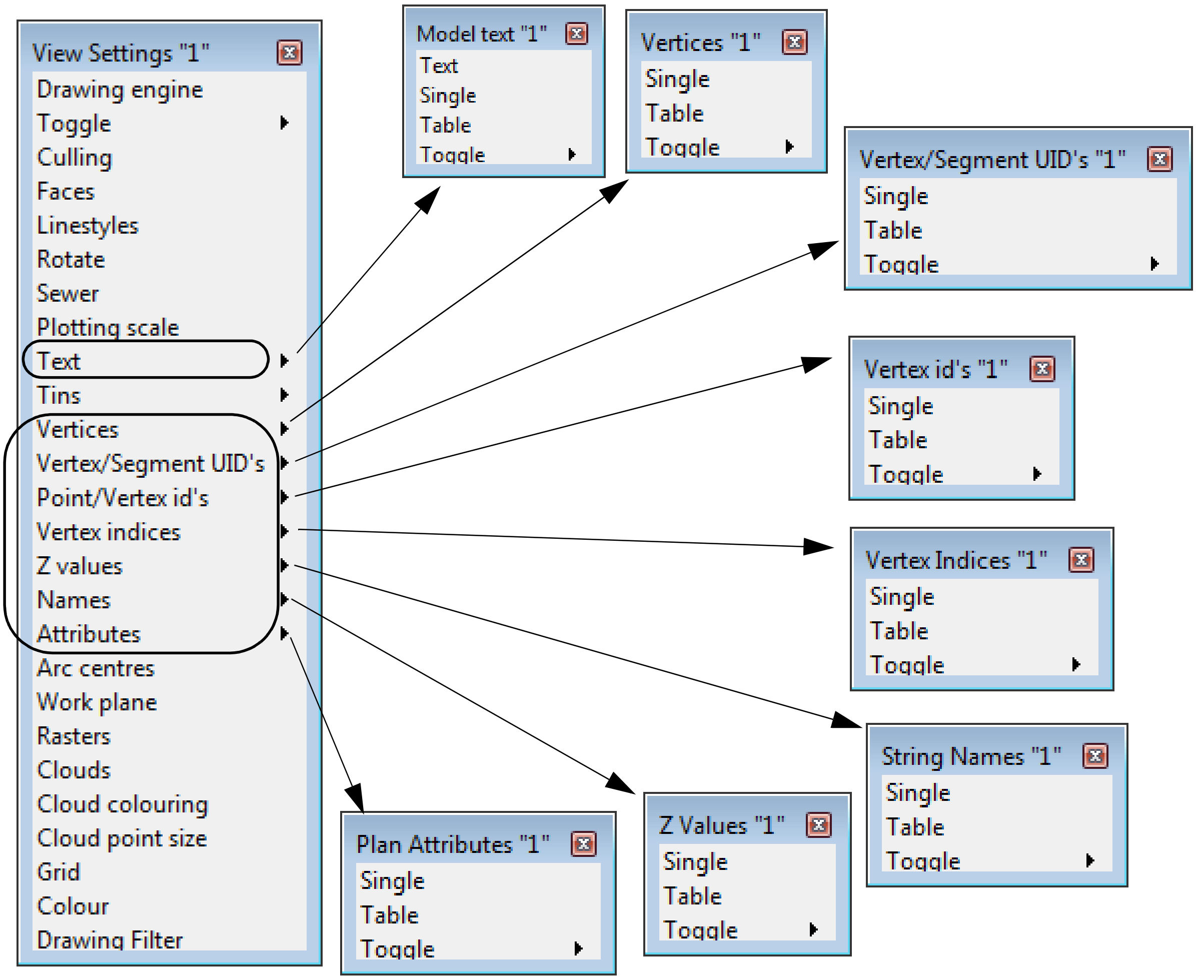
For the options 3 to 8 we refer to the **text** of the **value** that will be drawn as the **Values Text**.

For each of the options there is a setting (the default setting) to say whether the text/crosses are displayed/not displayed and also a table that lists any models that user wants to individually control the draw/don't draw. So each option has a walk-right menu with the items **Single**, **Table** and **Toggle** where

(a) **Single** specifies the ***defaults*** for drawing the ***Value Text/Crosses at Vertices/Text*** for any model on the view.

(b) **Table** contains a list of any models that have their own settings to use instead of the ***defaults***, plus the settings for that model. Each model in the list also has its own ***Draw*** field that overrides the ***Draw*** tick box in **Single**.

If a model is not listed in **Table** then it uses the ***defaults*** set by **Single**.



The **Single** options also have setting so that *Values Text/crosses at vertices/Text* are only drawn if the equivalent world size of the cross/text is not too large. This stops the drawing of *the text/ cross* when the displaying world size is large in proportion to other world units (e.g. when zooming out).

For a description of the options

Single, go to 9.6.1 Single for Values Text, Crosses and Text on Plan Views

Table 9.6.2 Table for Values Text, Crosses and Text on Plan Views

Toggle 9.6.3 Toggle Walk-Right for Value Text, Crosses and Text on Plan Views

Note

Using the environment variable **Env.4d** >***General >Plan table settings*** (see General and PLAN_TABLE_SETTINGS_4D) it is possible to turn off the control by individual models of the ***Values Text/Crosses at Vertices/Text*** drawing. In that case, apart from the Text, there is no walk-right menus. See 9.6.5 Env Var PLAN_TABLE_SETTINGS_4D Set to 0:

9.6.1 Single for Values Text, Crosses and Text on Plan Views

Vertex_Segment_UID_s_for_Plan_View***Plan View =>Settings*** has the option **Text** to draw ***String Text,*** the option **Vertices** to draw ***Crosses at*** all the **Vertices** in a string (often just called ***Crosses***) and the options ***Vertex/Segment UIDs***, ***Point/Vertex Id's***, ***Vertex indices***, ***Z values***, ***Names*** and ***Attributes*** for labelling specific values from a string as text (the **Values Text**). For information on these options see 9.6 Displaying Values Text, Vertices and Text on a Plan View.

All these options work similarly and will be documented together.

The **Single** option is used to set ***default*** parameters for drawing the ***Value Text***/***Crosses at Vertices/Text*** for strings in all models **not mentioned** in the *Table*, or for an individual model on the plan view.

The **Single** options also have setting so that *Values Text/Crosses/Text* are only drawn if the equivalent world size of the cross/text is not too large. This stops the drawing of *the text/cross* when the displaying world size is large in proportion to other world units (for example when zooming out).

Selecting **Single** on the walk-right menu for the **Settings** option brings up the appropriate panel:

Help

The fields and buttons used in these panels have the following functions.

Field Description Type Defaults Pop-Up

View View box - input/output current view available views

name of the view to modify the drawing parameters for Values Text/Crosses/Text.

Model model box

*if **not blank**, then the String Text/Vertices/Values Text will only be displayed for this model.*

*If **blank**, then all models **not mentioned** in the Table option use these parameters for drawing String Text/Vertices/Values Text on a view.*

Note that his field will not be present if PLAN_TABLE_SETTINGS_4D *is zero.*

For Text

Draw text tick box

*If **ticked**, then Text for strings (text strings, vertex text, segment, text, values text etc) will be drawn (as long as it passes the check against* **Height max (w)***).*
*If **not ticked**, then **no** Text is drawn for strings on the plan view.*

For Crosses at Vertices

Draw Crosses tick box

*If **ticked**, then the Crosses at Vertices will be drawn (as long as it passes the check against* **Size max (w)***).*
*If **not ticked**, then **no** Crosses at vertices are drawn for strings on the plan view.*

Colour colour box default pt colour available colours

colour of the crosses at the vertices.

Size (p) real box default text height

size in pixels that the crosses are drawn on a plan view

Size max (w) real box 0

when you have a plan view, then for the current zoom settings of the view, the vertices which are drawn at a screen size (pixels) has an equivalent size in world units.

As you zoom in, the equivalent size in world units decreases. That is, the screen crosses gets smaller in equivalent world units.

As you zoom out, the equivalent size in world units increases. That is, the screen crosses gets larger in equivalent world units.

If **Size max (w)** *is non-zero then when the zoom settings on the plan view is such that the equivalent height of the crosses in world units is **greater** than* **Size max (w)***, then the crosses are not drawn. Consequently as one zooms out, the crosses at the vertices will eventually stop drawing.*

If **Size max (w)** *is zero, the crosses at the vertices are always drawn.*

Summarising:** if non-zero: when the plan view is such that the height of the crosses in world units is greater than* **Size max (w), then the crosses are not drawn. Hence as one zooms out, the crosses will eventually stop drawing.*

Size (w) real box 0

size in world units of the cross when plotted or output.

Angle angle box 0

the angle of rotation of the cross about the (x,y) position of the string vertices.

The angle is measured in a counterclockwise direction from the positive x-axis. The units for angle are degrees minutes and seconds and it is entered in 4.17.1 HP Notation*.*

For Values Text only

Draw Values Text tick box

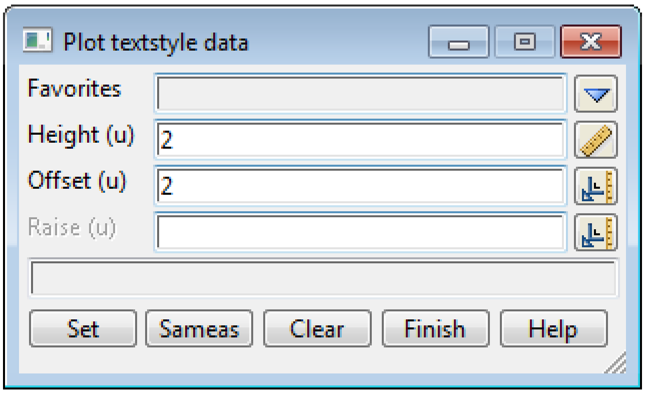
*If **ticked**, then the Values Text will be drawn (as long as it passes the check against* **Height max (w)***).*
*If **not ticked**, then **no** Values Text is drawn for strings on the plan view.*

Draw textstyle data textstyle data box available textstyle datas

textstyle data used when drawing the Values Text on the plan view. The height, offset and raise are given in screen units (pixels).

Plot textstyle data plot textstyle data box available textstyle datas

a special plot textstyle data to define the height, offset and raise values to use when the Values Text is plotted or output (using the File =>Data output options).
When the Values Text is plotted, the units are millimetres (paper size).
When the data is Values Text, the units are world (world size).



For String Text and Values Text

Height max (w) real box 0

when you have a plan view, then for the current zoom settings of the view, the String Text/Values Text which is drawn at a screen size (pixels), has an equivalent size in world units.
As you zoom in, the equivalent size in world units decreases. That is, the screen texts gets smaller in equivalent world units.

As you zoom out, the equivalent size in world units increases. That is, the screen texts gets larger in equivalent world units.

*If **Height max (w)** is non-zero then when the zoom settings on the plan view is such that the equivalent height of the String Text/Values Text in world units is **greater** than* **Height max (w)***, then the Strings Text/Values Text is not drawn. Consequently as one zooms out, the Strings Text/Values Text will eventually stop drawing.*
*If **Height max (w)** is zero, the Strings Text/Values Text is always drawn.*

Summarising:** if non-zero: when the plan view is such that the height of the Strings Text/Values Text in world units is greater than* **Height max (w), then the Strings Text/Values Text is not drawn. Hence as one zooms out, the Strings Text/Values Text will eventually stop drawing.*

For Z Values and Attributes

Decimal places real box 3

number of decimal places when displaying the Values Text for Z values and any real Attributes.

***Note** - this field only appears when the Values are a real number.*

Show null z's tick box

*if **ticked**, null z values and null real attributes values are displayed as null.*

*If **not ticked**, no null z value or null real attributes are displayed.*

***Note** - this field only appears when the Values Text are **z values** or Attributes.*

Buttons at Bottom

Set button

set the values in the panel and then redraw the plan view.

Size max button

*when clicked, the **Size max (w)** or **Height max (w)** field is given the current equivalent world size of the String Text/Crosses at Vertices/Values Text displayed on the given plan view. Hence if any further zoom out is done, the String Text/Crosses at Vertices/Values Text will stop drawing.*

After clicking **Size max***, the* **Set** *button must then be clicked to set the new **Size max (w)** or **Height max (w)** value for the view.*

Reset button

reset all the parameters to the defaults for plan views.

Note

Even though some of the drawing is controlled by the models in **Table**, the drawing for the models that are not controlled by **Table** can be quickly turned **on** and **off** by using the **Toggle** menu. See 9.6.4 Toggle Menu for Values Text, Crosses and Text on Plan Views.

Go to the next section 9.6.2 Table for Values Text, Crosses and Text on Plan Views or return to 9.6 Displaying Values Text, Vertices and Text on a Plan View.

9.6.2 Table for Values Text, Crosses and Text on Plan Views

Vertex_Segment_UID_s_Table_for_Plan_View***Plan View =>Settings*** has the option **Text** to draw ***String Text,*** the option **Vertices** to draw ***Crosses at*** all the **Vertices** in a string (often just called ***Crosses***) and the options ***Vertex/Segment UIDs***, ***Point/Vertex Id's***, ***Vertex indices***, ***Z values***, ***Names*** and ***Attributes*** for labelling specific values from a string as text (the **Values Text**). For information on these options see 9.6 Displaying Values Text, Vertices and Text on a Plan View.

All these options work similarly and will be documented together.

The **Table** option displays a list of models on the view with their ***Values Text/Crosses/Text*** drawing parameters. These parameters can then be modified in the table.

Selecting **Table** brings up the panel appropriate to the **Settings** option:

Help

The fields and buttons used in these panels have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input/output	current view	available views

name of the view to modify the parameters for displaying the Values Text/Crosses/Text.

Grid

Draw	choice box		on, off, view

*If set to **on**, then regardless of the **Single** value, if that model is on the view, the Values Text/Crosses/Text for the model are **drawn** (as long as it passes the check against* **Height max (w)**).

*If set to **off** then regardless of the* **Single** *value, if that model is on the view, the Values Text/Crosses/Text for the model are **not drawn**.*

*If set to **view**, then this row is ignored and if that model is on the view, the Values Text/Crosses/Text for the model **obey** the values set by* **Single**.

*So the **Draw** column in* **Table** *is an **override** for* **Single**.

For information on changing the values of the cells in the Draw column, see Changing the Values in the Draw Column*).*

Model	model box		

*if **not blank**, then the display of String Text/Crosses at Vertices/Values Text for the strings in this model will obey the choice for this row of the* **Draw** *column.*

For Crosses at Vertices

Colour	colour box	default pt colour	available colours

colour of the crosses at the vertices

Height real box default text height

size in pixels that the crosses are drawn on a plan view.

Height max (w) real box 0

*if **non-zero**:*
then if the size of the crosses in world units is greater than **Size max (w)**, *the crosses are not drawn. Hence zooming out will eventually stop the crosses from drawing.*

Angle angle box 0

the angle of rotation of the cross about the (x,y) position of the string vertices.

The angle is measured in a counterclockwise direction from the positive x-axis. The units for angle are degrees minutes and seconds and it is entered in 4.17.1 HP Notation.

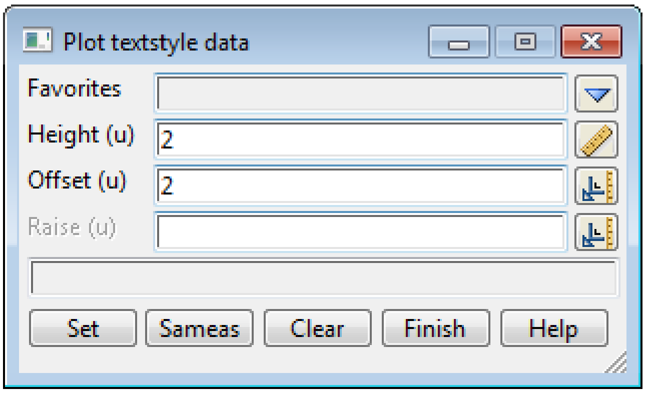
For Values Text

Textstyle draw data textstyle data box available textstyle datas

textstyle data to define the drawing on the view of the Values Text in this model. The height, offset and raise are given in screen units (pixels).

Textstyle plot data plot textstyle data box available textstyle datas

a plot textstyle data to define the height, offset and raise values to use when the Values Text in the model is plotted or output (using the File =>Data output options).
When the Values Text in the model is plotted, the units are millimetres (paper size).
When the Values Text in the model is output, the units are world (world size).



Height max (w) real box 0

when you have a plan view then for the current settings for the Values Text, the Values Text which is drawn at a screen size (pixels), will have an equivalent size in world units.
As you zoom in, the equivalent size in world units will decreases. That is, the screen texts gets smaller in equivalent world units.

As you zoom out, the equivalent size in world units increases. That is, the screen texts gets larger in equivalent world units.

If **Height max (w)** *is non-zero then when the zoom settings on the plan view is such that the equivalent height of the Values Text in world units is* ***greater*** *than* **Height max (w)**, *then the Values Text is not drawn. Consequently as one zooms out, the Values Text will eventually stop drawing.*
If **Height max (w)** *is zero, the Values Text is always drawn.*

Summarising: *if non-zero: when the plan view is such that the height of the Values Text in world units is greater than* **Height max (w)**, *then the Values Text is not drawn. Hence as one zooms out, the Values Text will eventually stop drawing.*

Precision real box 3

number of decimal places when displaying the Values Text.

***Note** - this column only appears when the Values are a real number.*

Nulls tick box

*if **ticked**, null z values are displayed as null.*
*If **not ticked**, no z value is displayed at null z-values.*

***Note** - this column only appears when the Values Text are **z values**.*

Buttons at Bottom

Set button

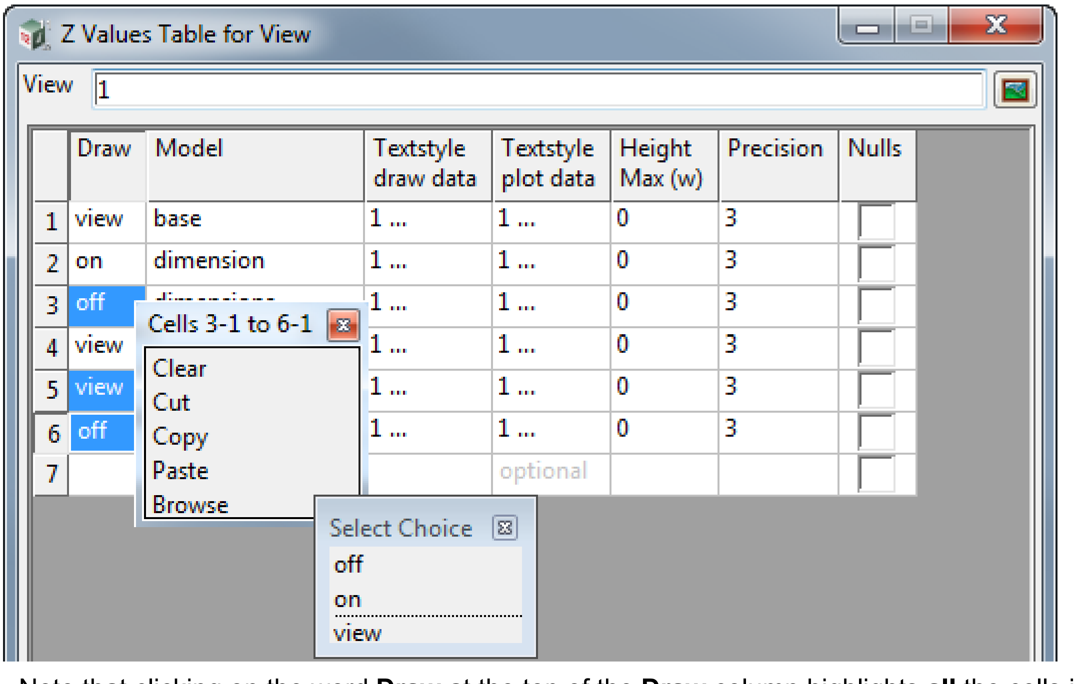
set the values in the panel and then redraw the plan view.

Changing the Values in the Draw Column

To change the values in a cell in the **Draw** column, you can type into the cell, or it is better (and safer if you can't type very well) to click **RB** over the cell and bring up the **Select Choice** menu and select **off**, **on** or **view** from the menu.

If for some reason you do not get the menu with the choices on it coming up, the menu you do get will have **Browse** on it and clicking on **Browse** will bring up the choices.**off**, **on** and **view**.

To set all, or a number of the values in the **Draw** column at once, highlight the ones to change and click **RB** to bring up the **Cells** menu and select **Browse**. The choice of **off**, **on** and **view** will be made to all the highlighted cells.



Note that clicking on the word **Draw** at the top of the **Draw** column highlights **all** the cells in the column. Holding down **<Ctrl>** and clicking **LB** when over a cell highlights/unhighlights individual cells.

If for some reason you do not get the menu with the choices on it coming up, the menu you do get will have **Browse** on it and clicking on **Browse** will bring up the choices **Draw**, **Don't draw** and **Ignore**.

Go to the next section 9.6.3 Toggle Walk-Right for Value Text, Crosses and Text on Plan Views or return to 9.6 Displaying Values Text, Vertices and Text on a Plan View.

9.6.3 Toggle Walk-Right for Value Text, Crosses and Text on Plan Views

Plan_View_Toggle_Vertex_Segment_UID_s

Plan View =>Settings has the option **Text** to draw ***String Text,*** the option **Vertices** to draw ***Crosses at*** all the **Vertices** in a string (often just called ***Crosses***) and the options ***Vertex/ Segment UIDs***, ***Point/Vertex Id's***, ***Vertex indices***, ***Z values***, ***Names*** and ***Attributes*** for labelling specific values from a string as text (the **Values Text**). For information on these options see 9.6 Displaying Values Text, Vertices and Text on a Plan View.

All these options work similarly and will be documented together.

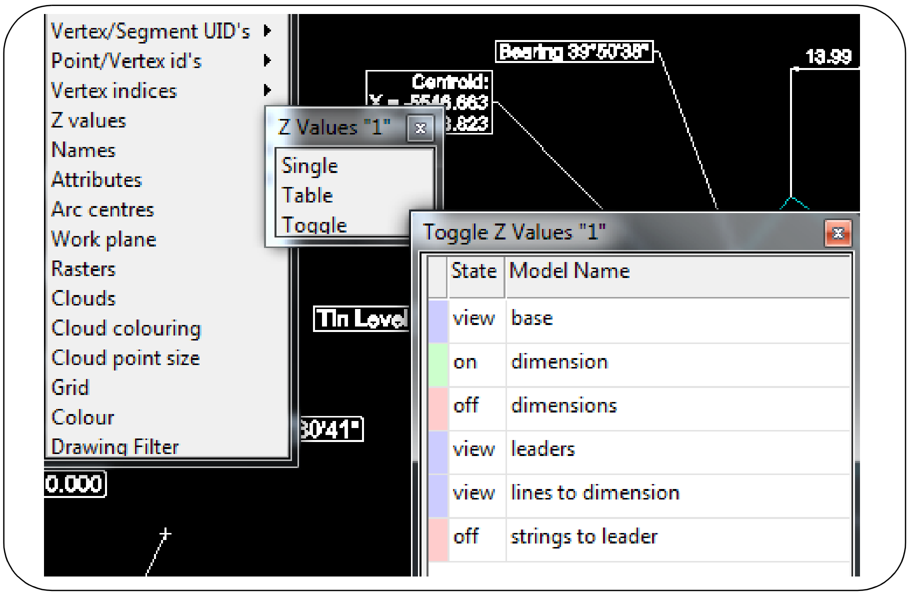
Walking-right on the **Toggle** option displays a list of models on the view with their ***Value Text/ Crosses***/***Text*** *Draw* flag from the **Table** for that **Setting**.

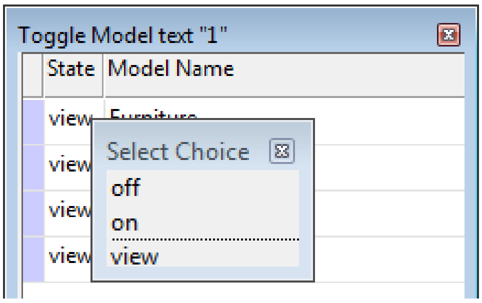
The **String Text/Crosses at Vertices/Values** ***Text*** *Draw* flag can be set to **yes**, **no** or **view** for the model by selecting the model on the list, where

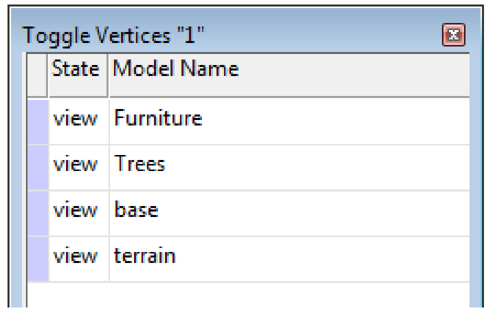
If **State** is set to **on**, then if that model is on the view, the Values Text/Crosses/Text for the model are **drawn regardless** of the **Single** value. Green is displayed beside the state when it is **on**

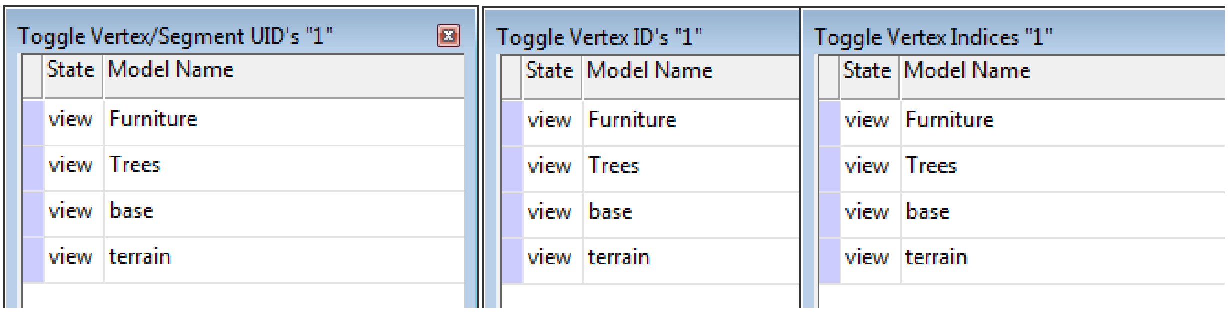
If **State** is set to **off**, then if that model is on the view, the Values Text/Crosses/Text for the model are **not drawn regardless** of the **Single** value. Red is displayed beside the state when it is **off.**

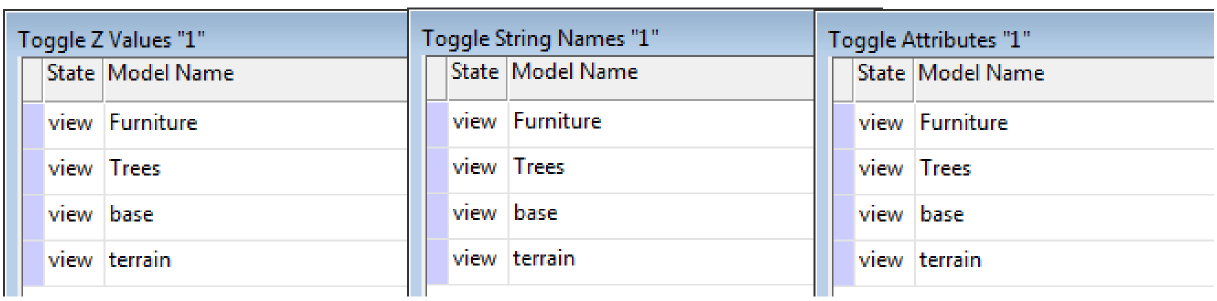
If **State** is set to **view**, then this row is ignored and if that model is on the view, Values Text/ Crosses/Text for the model **obey** the **Single** value. Green is displayed beside the state when it is **view**



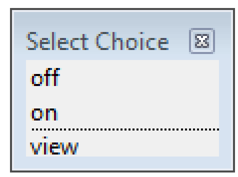








Clicking **RB** in a row in the **State** column will bring up a **Select Choice** menu.



Selecting **on**, **off** or **view** changes the value for the appropriate row in the associated **Table** and also redraws the view using the modified values.

Go to the next section 9.6.4 Toggle Menu for Values Text, Crosses and Text on Plan Views or return to 9.6 Displaying Values Text, Vertices and Text on a Plan View.

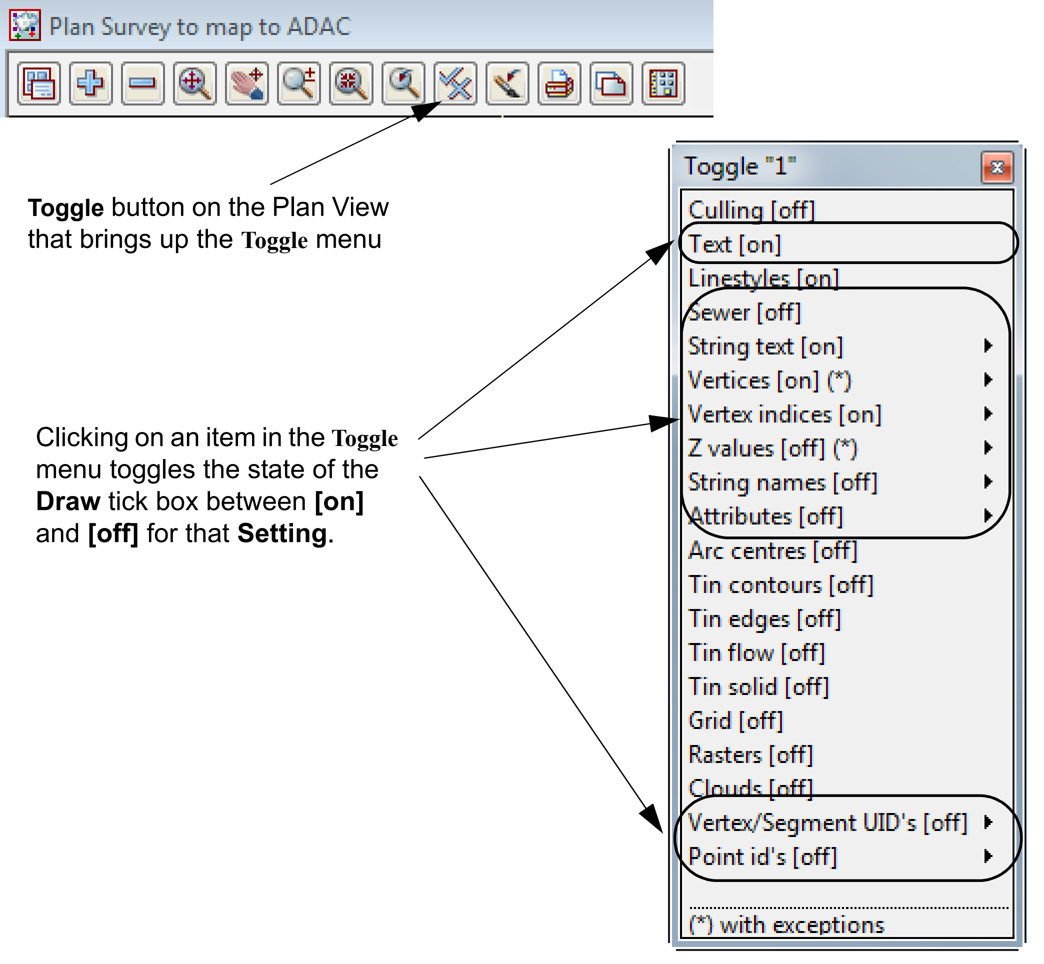
9.6.4 Toggle Menu for Values Text, Crosses and Text on Plan Views

Plan View =>Settings has the option **Text** to draw ***String Text,*** the option **Vertices** to draw ***Crosses at*** all the **Vertices** in a string (often just called **Vertices** or ***Crosses***) and the options ***Vertex/Segment UIDs***, ***Point/Vertex Id's***, ***Vertex indices***, ***Z values***, ***Names*** and ***Attributes*** for labelling specific values from a string as text (the **Values Text**). For information on these options see 9.6 Displaying Values Text, Vertices and Text on a Plan View.

All these options work similarly and will be documented together.

To make it easy to toggle the ***Draw*** tick box in the **Single** panel for any of the **Setting** without having to bring the **Single** panel up, there is a **Toggle** button on the **Plan View** to bring up the **Toggle** menu for the view.

Each item on the **Toggle** menu can be clicked to toggle the **Draw** tick box for that particular **Setting**.



On the **Toggle** menu there is an **[on]** and **[off]** after the menu item to indicate the default state for the view (the value of **Single**). And if there is also a **(*)** after the **[on]** or **[off]** to indicate there are models in Table is that are different to the **Single** state (an **exception**).

That is:

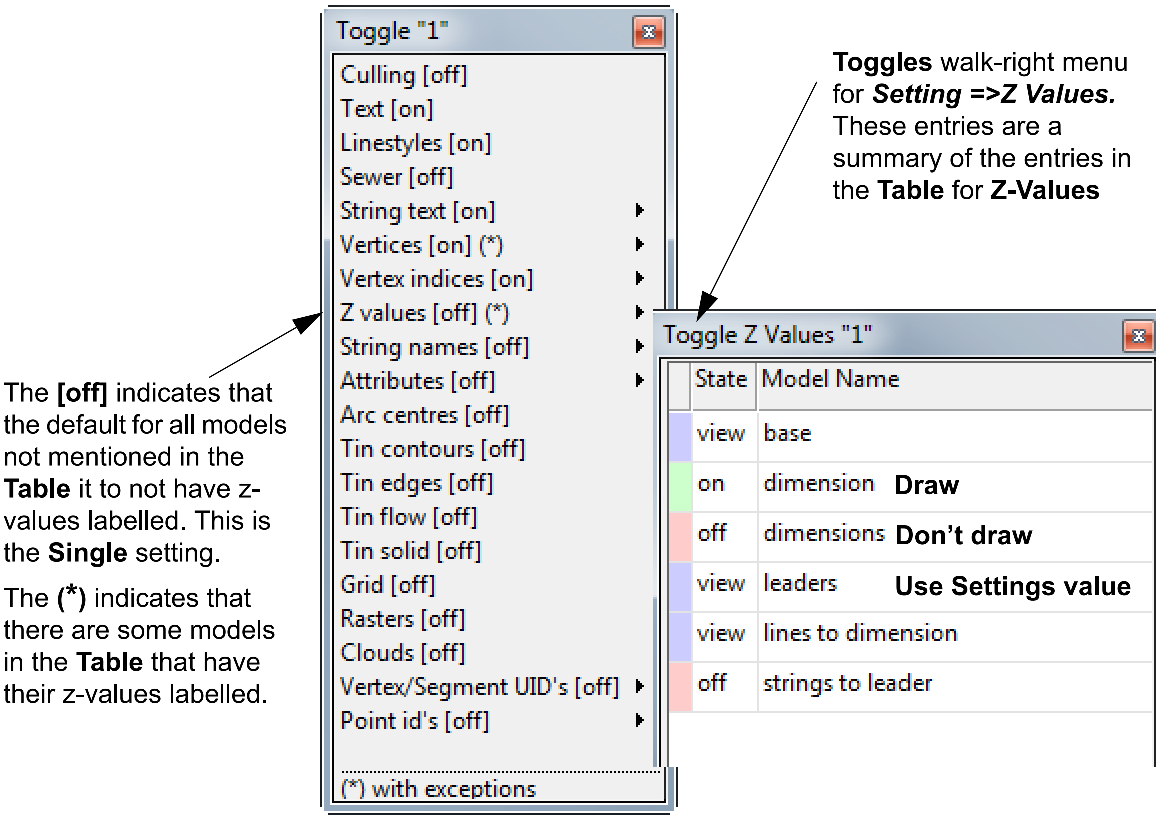
[on] means that the default for all models on the view is to draw the value, and that the default is applying to all the models currently on the view.

[on] (*) means that the default for all models on the view is to draw the value, BUT there are some models in Table that **will not** draw the value.

[off] means that the default for all models on the view is to not draw the value, and that the default is applying to all the models currently on the view.

[off] (*) means that the default for all models on the view is to not draw the value, BUT there are some models in Table that **will** draw the value.

There are also walk-right on each of the appropriate menu items and the walk-right menu is the **Toggles** walk-right menu for that **Setting**.



Unlike the **Toggle** walk-right menus where there a walk-right menu for each of the **Settings** and they toggle the **Draw** mode for the models in the **Table** for that **Setting**, the **Toggle** menu has **one line** on the menu for each of the **Settings**. And the walk-rights on the **Toggle** menu are the individual **Toggle walk-right** menus.

So the **Toggle** menu toggles the **Draw** mode in the **Single** panel for each **Setting**, and the **Toggle walk-rights** toggle the **Draw** modes for each model in the **Table** for that **Setting**.

Warning for the Toggle Menu

Although clicking on an item in the **Toggles** menu immediately reverses the **[on]**/**[off]** state of the view and updates the view accordingly, the **[on]/[off]** on the **Toggles** menu does **NOT** dynamically change.

So if the **Toggles** menu is pinned up, it does not refresh itself and show the change in the [**on]/[off]** state. You only see the change if you close the **Toggle** menu and then bring it up again.

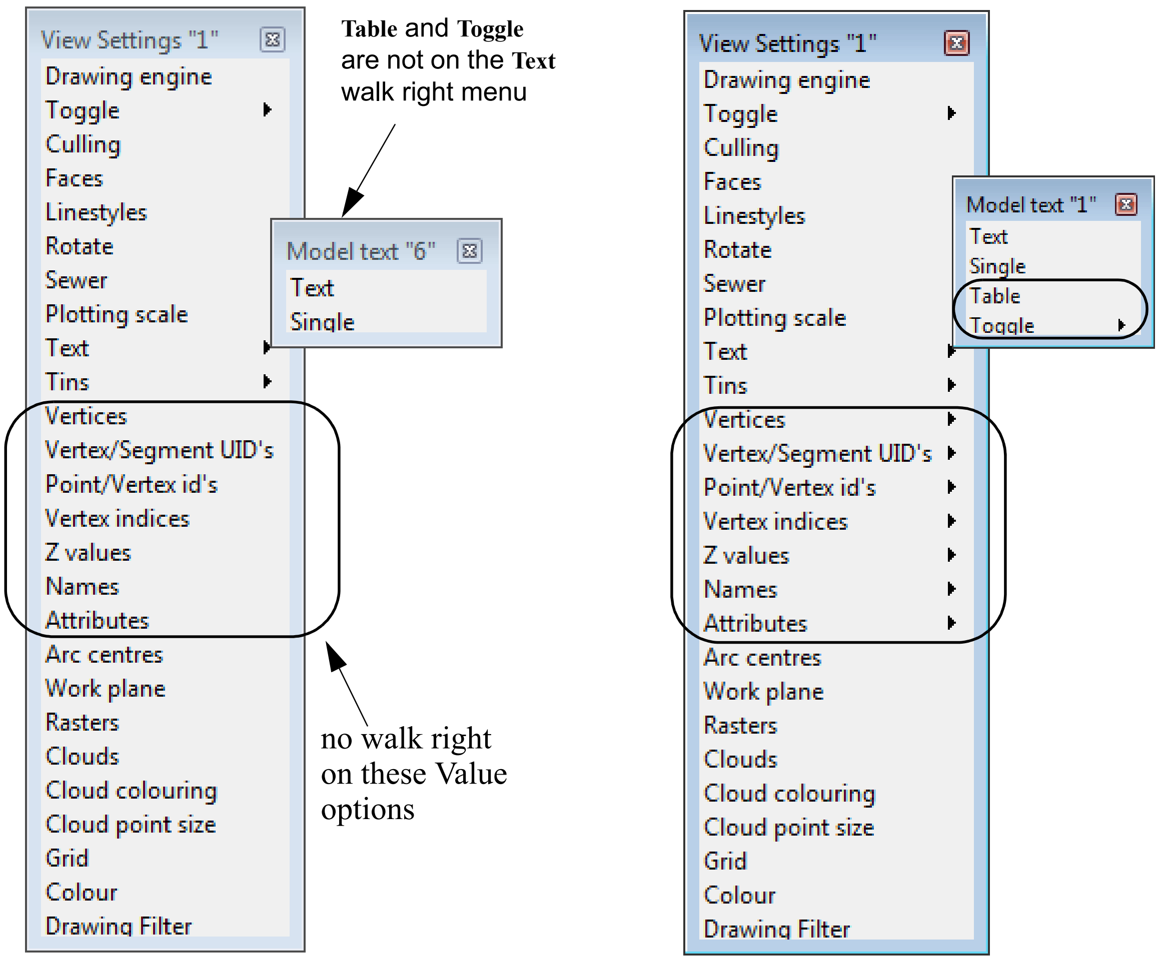
9.6.5 Env Var PLAN_TABLE_SETTINGS_4D Set to 0:

Plan View =>Settings has an option **Text** to draw ***String Text,*** an option **Vertices** to draw ***Crosses at*** all the **Vertices** in a string (often just called ***Vertices***) and the options ***Vertex/ Segment UIDs***, ***Point/Vertex Id's***, ***Vertex indices***, ***Z values***, ***Names*** and ***Attributes*** for labelling specific values from a string as text (for these options we call the **text** of the **value**, the **Values Text**.).

Normally the drawing of the ***Values Text/Crosses/Text*** is controlled by a setting with optional model overrides but it is possible to turn off the control for individual models by setting the environment variable PLAN_TABLE_SETTINGS_4D to 0. This is done in **Env.4d** > ***General >Plan table settings*** (see General and PLAN_TABLE_SETTINGS_4D).

When individual model control is turned off, in the **Plan View Setting** menu there are no options **Table** or **Toggle** on the **Text** walk right menu, and **no walk right menu** on the ***Values*** menu items.

PLAN_TABLE_SETTINGS_4D = 0 **PLAN_TABLE_SETTINGS_4D = 1**



Also when PLAN_TABLE_SETTINGS_4D is 0, clicking on **Vertices/Values** item brings up the **Model Text for Plan View**, **Crosses at String Vertices for Plan View** or **Values for Plan View** panels, **without** the **Model** field. The fields in the panels then apply to the strings in ***all models*** on the view.

These panels are identical to those when PLAN_TABLE_SETTINGS_4D is non zero except that there is no **Model** field. The fields in these panels then apply to the strings in ***all models*** on the view.

So the documentation for these panels is only given in the case where PLAN_TABLE_SETTINGS_4D is non zero and the **Model** field needs to be ignored. See 9.6.1 Single for Values Text, Crosses and Text on Plan Views.

10 ADAC

ADAC - Asset Design and As Constructed

The **ADAC XML Schema** is a vendor independent XML format introduced to help solve the problems of collecting and exchanging Asset data.

The purpose of ADAC XML is to allow many different Authorities to work with one standardised file format. The format is fully defined and accessible to everyone.

The ADAC XML schema is controlled by the **Institute of Public Works Engineering Australasia** (**IPWEA**). More information on ADAC at IPWEA can be found at www.engicom.com.au/products/adac2/

See

10.1 ADAC.XML Overview
10.2 12d Approach to ADAC XML
10.4 12d ADAC Menu

10.1 ADAC.XML Overview

See

10.1.1 ADAC XML Structure
10.1.2 ADAC Assets
10.1.3 ADAC Geometry Element
10.1.4 Guidelines from an Authority Requesting ADAC.XML

10.1.1 ADAC XML Structure

The ADAC Schema is fully described by the *ADAC XSD* (**X**ML **S**chema **D**efinition), which formally defines the structure and all the elements inside an ADAC XML file. That means that any ADAC.XML can be **validated** against the ADAC Schema XSD to see that it conforms to the Schema.

The **ADAC.XML Schema** and the ADAC.XSD are controlled and published by the IPWEA.

ADAC Version 4.1.0 is the latest version and IPWEA publishes the *ADAC Schema Help Files* for Version 4.1 (and also the earlier 4.0) (*see* www.engicom.com.au/products/adac2/).

The **ADAC XML Schema** is best thought of as a root or folder structure where the **Project** element encloses all data that is common to the whole project. So it is the root element or top folder.

The ADAC standard currently says there can only be **one** Project in an ADAC.XML file.

Elements inside the **Project** element can be single values or multi-levelled structures (nodes) containing other single elements and substructures.

At the first level inside **Project**, the elements are:

Version, ExportDateTime, Name, Owner, Receiver, DrawingNumber, Drawing Revision, ConstructionDate, CoordinageSystem, Drawing Extents, Description, Status, Software, Surveyor, Engineer and ProjectData.

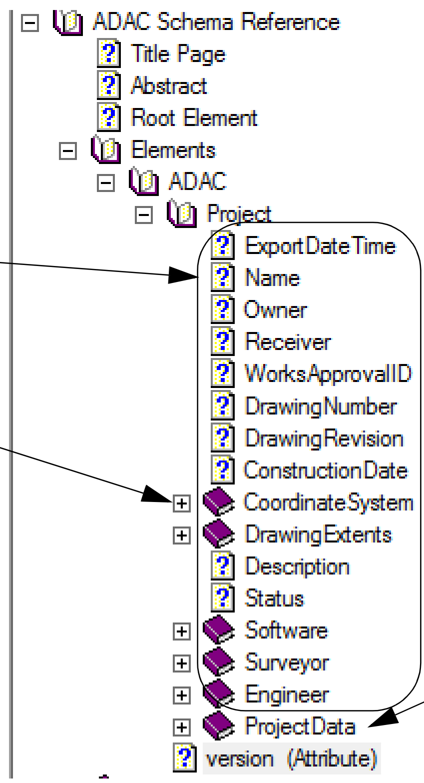
Some of these element are just single values (for example, *ExportDateTime* and *Owner*, and others, contain multi-levelled substructures of data (for example, *Surveyor*, *Engineer and ProjectData*).

Single values are shown with **?** before them

The **+** indicates that the element is not a single value but contains a multi-levelled substructure of values

NOTE:

The image is from the ADAC Version: 4.1.0 Schema Help File



Header Data - common to all the elements under *Project Data*

ProjectData - common to all the elements under Project Data values

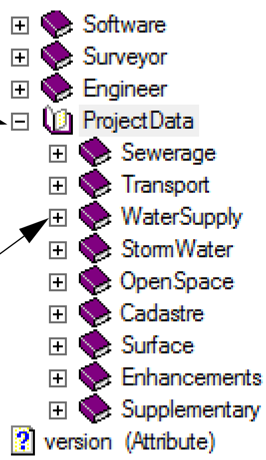
We will refer to all of these elements except **ProjectData** as **Header Data**.

The **Header Data** occurs only once and is at the beginning of the ADAC file.

The **ProjectData** element may appear insignificant in the expansion of the first level of **Project**, **BUT** it is the element that contains **all** the **physical items** covered by ADAC.

Expanding the **ProjectData** node shows it has the nine subelements *Sewerage, Transport, WaterSupply, OpenSpace, Cadastre, Surface, Enhancements* and *Supplementary.*

The **-** indicates that the element contains a multi-levelled substructure and it has been expanded in the diagram

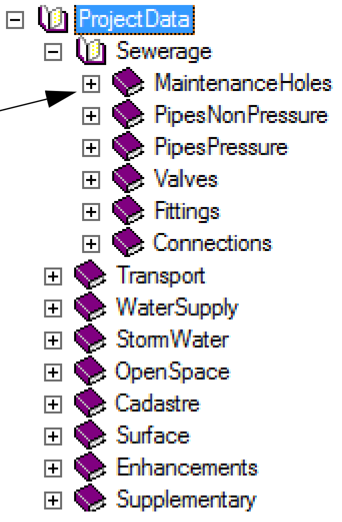


The **+** indicates that the element contains a multi-levelled substructure and it has not been expanded in the diagram

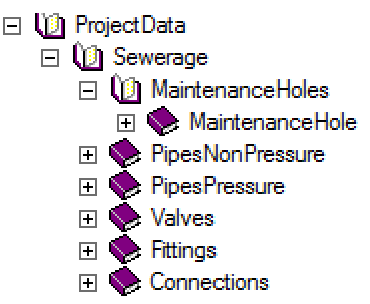
And each of the nine subelements have their own substructures

For example, **Sewerage** has the sub elements *MaintenanceHoles, PipesNonPressure, PipesPressure, Valves, Fittings* and *Connections*

The **+** indicates that the element **MaintenanceHoles** contains a multi-levelled substructure

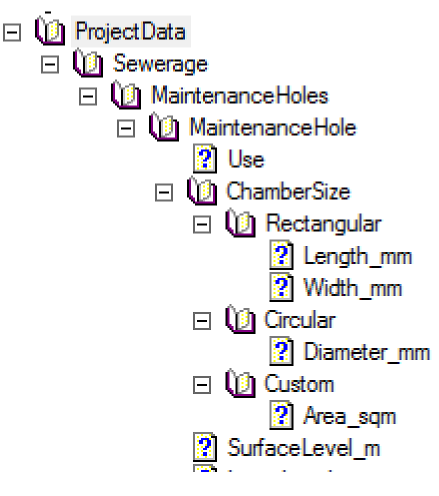


And **MaintenanceHoles** has a substructure that can be expanded out although it has only the one substructure, **MaintenanceHole**.



MaintenanceHole itself can be further expanded and part of **MaintenanceHole** is

.



All the structures and substructures are totally defined in the **ADAC XML Schema** and the structures must be strictly adhered to.

The **ADAC XML Schema** not only completely defines all the structures and substructures, but also has the **full definition** of all the elements, including the elements that can't be expanded any further (the **final** elements).

For the final elements, the ADAC Schema specifies everything. For example,

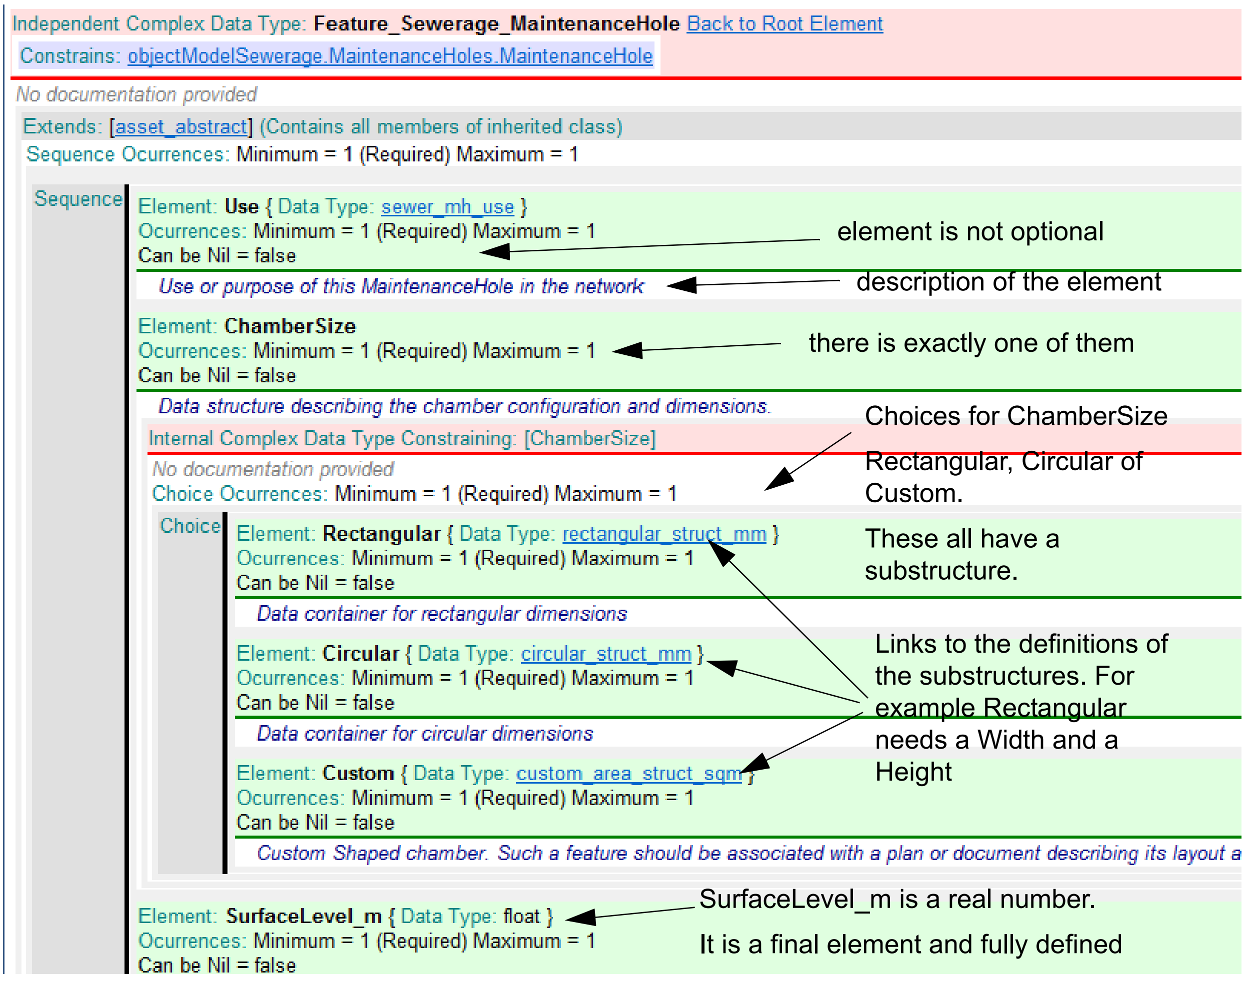
(a) their type - text, integer, real (float) or choices of these.

(b) what ranges the values may, or may not have

(c) if choices, then the list of possible choices (enumerations)

(d) if the item is optional (nillable = true) or mandatory (compulsory nillable = false)

For example, for the expansion of **MaintenanceHole,** the extract from the *ADAC XML 4.1.0 Schema* is



Hence this is how the **ADAC Schema** defines the **structure** of an ADAC.XML file and the definition of every element in the **ADAC Schema**.

If an XML file does not obey all the rules in the **ADAC Schema**, then the file is an **invalid XML file with respect to the ADAC Schema**.

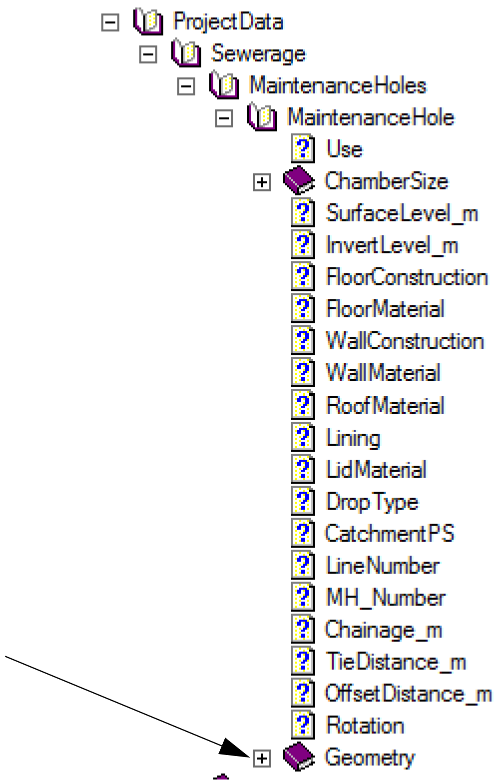
Continue to the next section 10.1.2 ADAC Assets or return to 10.1 ADAC.XML Overview or to 10 ADAC .

10.1.2 ADAC Assets

Expanding substructures can go on at every level until no more expansions can occur.

But there is one important time to stop further expanding an element and that is when **one** of the substructures is **Geometry**.

The presence of **Geometry** indicates that the element is a **fundamental** ADAC element that represents an **ADAC Asset** or **ADAC Feature**.



The presence of **Geometry** indicates that this element **MaintenanceHole** is a fundamental ADAC element representing an **ADAC Asset**

So although **MaintenanceHole** has the substructure **ChamberSize** that can be further expanded, the presence of the **Geometry** element says that **MaintenanceHole** is a fundamental ADAC element representing an **ADAC Asset**.

For the ADAC 4.1.0 Schema, there are sixty-eight (68) such **ADAC Assets** including MaintenanceHole, PipeNonPressure, Pavement, RoadEdge, SubSoilDrain, Hydrant, RetainingWall, ElectricalConduit, Tree, Sign, Lot, Easement, SpotHeight and Contour.

Everything that is being recorded in an ADAC.XML file must be classified as one of the 68 ADAC Assets.

To further define what an ADAC Asset is, most of the ADAC Asset elements have a **Use** or **Type** which provides further information about that particular instance of an ADAC Asset.

For example, **MaintenanceHole** has a **Use** which **must exist** and must have one of the values (enumerations):

ıdependent Simple Data Type: **sewer_mh_use** Back to Root Element
Constrains: Feature_Sewerage_MaintenanceHole.Use

Allowed uses for a Maintenance Hole

Restriction of: [String_32]

Enumeration:	Overflow	*Overflow Maintenance Hole*
Enumeration:	Blank End	*Blank End*
Enumeration:	Pump Station	*Pit housing a sewer pump station*
Enumeration:	Valve Pit	*Access Pit for a Sewer Valve*
Enumeration:	Grit Collector MH	*Grit Collector Maintenance Hole*
Enumeration:	Outlet	*Outlet*
Enumeration:	Rising Main Discharge MH	*Rising Main Discharge Maintenance Hole*
Enumeration:	Vacuum Sewerage Pump Station	*Vacuum Sewerage Pump Station*
Enumeration:	Vacuum Sewerage MH	*Vacuum Sewer Maintenance Hole*
Enumeration:	Vacuum Lift	*Vacuum Lift*
Enumeration:	Storage Tank	*Storage Tank*
Enumeration:	Maintenance Hole	*Maintenance Hole*
Enumeration:	Maintenance Shaft	*Maintenance Shaft*

Continue to the next section 10.1.3 ADAC Geometry Element or return to 10.1 ADAC.XML Overview or 10 ADAC .

10.1.3 ADAC Geometry Element

Like everything in ADAC, the ADAC **Geometry** element is fully defined, but it is **different** for each of the **ADAC Assets**.

An **ADAC Geometry** can only be one of:

1. a **Point**. That is, an (x,y,z) coordinate.

   For example, ADAC Assets with a Point Geometry include Sewer/MaintenanceHoles/MaintenanceHole, WaterSupply/Hydrants/Hydrant, OpenSpace/Barbecues/Barbecue.

2. a **Polyline**. That is, a string made up of (x,y,z) points with straights and/or arcs between them (segments).

   How many segments can be in the string, and whether arcs are allowed, can be different for each ADAC Asset with a Polyline Geometry. This can also vary with ADAC versions.

   For example, in ADAC 4.0, Sewerage/PipesNonPressure/PipeNonPressure can only have one segment, and that segment must be a straight.

   In ADAC 4.1, Transport/PipesNonPressure/PipeNonPressure can have any number of segments, and they can be straights or arcs.

3. a **Polygon**. That is, a closed polyline.

   Whether arcs are allowed as segments of the polygon is specified for each ADAC Asset with a Polygon Geometry. This can also vary with ADAC versions.

   ADAC Assets with a **Polygon Geometry** include *Transport/PavementAreas/Pavement* and *OpenSpace/LandscapeAreas/LandscapeArea.* Both of these can have any number of segments, and the segments can be straights or arcs.

If in an ADAC XML file, the Geometry written out for an ADAC Asset does not match the definition of the Geometry for that ADAC Asset, then it is breaking the rules and is an **invalid XML file with respect to the ADAC Schema**.

Continue to the next section 10.1.4 Guidelines from an Authority Requesting ADAC.XML or return to 10.1 ADAC.XML Overview or 10 ADAC .

10.1.4 Guidelines from an Authority Requesting ADAC.XML

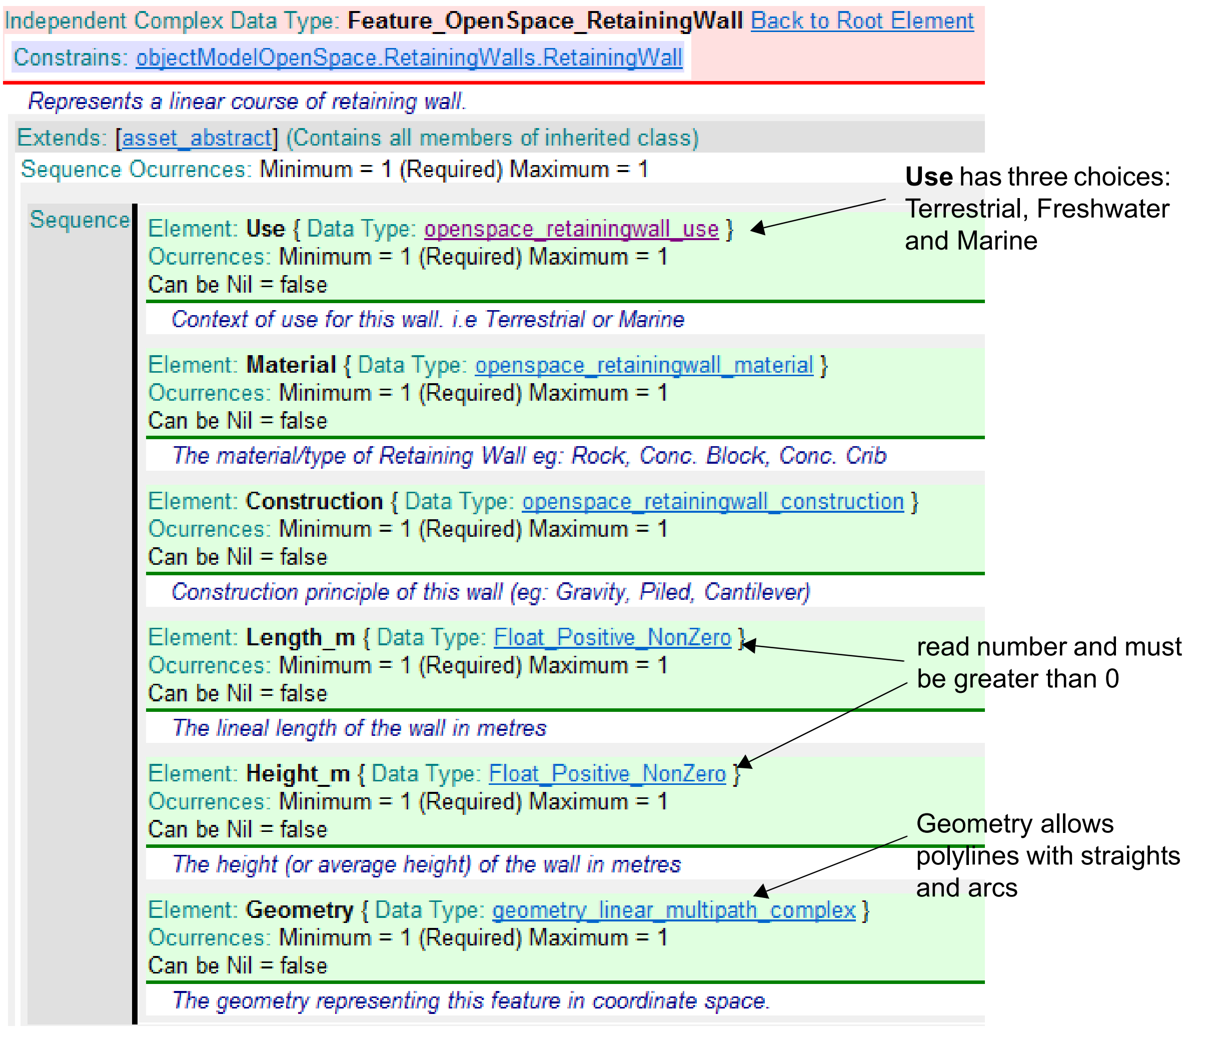
Although ADAC XML has **sixty-eight** Assets, which extends to hundreds of different objects once **Use** and **Type** are considered, not every ADAC Asset is required by every Authority.

Even when an ADAC Asset is required by an Authority, not every element within that ADAC Asset may be wanted by that Authority.

Also for any ADAC Assets that are required for a particular Authority, what exactly does that **Geometry** represent?

For example, in the ADAC version 4.1.0 Schema, an OpenSpace/RetainingWalls/RetainingWall is defined as

"Represents a continuous retaining wall feature. Includes terrestrial, freshwater and marine revetment walls."



Independent Complex Data Type: **Feature_OpenSpace_RetainingWall** Back to Root Element
Constrains: objectModelOpenSpace.RetainingWalls.RetainingWall

Represents a linear course of retaining wall.

Extends: [asset_abstract] (Contains all members of inherited class)
Sequence Ocurrences: Minimum = 1 (Required) Maximum = 1

Sequence

Element: **Use** { Data Type: openspace_retainingwall_use }
Ocurrences: Minimum = 1 (Required) Maximum = 1
Can be Nil = false
Context of use for this wall. i.e Terrestrial or Marine

Element: **Material** { Data Type: openspace_retainingwall_material }
Ocurrences: Minimum = 1 (Required) Maximum = 1
Can be Nil = false
The material/type of Retaining Wall eg: Rock, Conc. Block, Conc. Crib

Element: **Construction** { Data Type: openspace_retainingwall_construction }
Ocurrences: Minimum = 1 (Required) Maximum = 1
Can be Nil = false
Construction principle of this wall (eg: Gravity, Piled, Cantilever)

Element: **Length_m** { Data Type: Float_Positive_NonZero }
Ocurrences: Minimum = 1 (Required) Maximum = 1
Can be Nil = false
The lineal length of the wall in metres

Element: **Height_m** { Data Type: Float_Positive_NonZero }
Ocurrences: Minimum = 1 (Required) Maximum = 1
Can be Nil = false
The height (or average height) of the wall in metres

Element: **Geometry** { Data Type: geometry_linear_multipath_complex }
Ocurrences: Minimum = 1 (Required) Maximum = 1
Can be Nil = false
The geometry representing this feature in coordinate space.

And so the Geometry is a polyline with straights and arc segments.

But for, say, a *Terrestrial* RetainingWall, are the (x,y,z) coordinates of the Geometry the top of the retaining wall, the bottom of the retaining wall, or it doesn't matter?

So when asked to provide an ADAC XML file to an Authority, you need to ascertain from the Authority the following:

1. What ADAC Version is required. It will be either 4.0 or 4.1.
2. What ADAC Assets are required.

For example, Unity Water in Queensland is a Water Authority using ADAC 4.1 but they only require the ADAC Assets in *WaterSupply*.

3. What elements inside the required ADAC Assets are required.
4. What the geometry represents for the required ADAC Asset.

For example

StormWater

From the ADAC.XML Guidelines from Bundaberg, Gladstone and Rockhampton Regional Councils

EndStructure

Asset Capture: Simple point feature representing the top of the headwall.

Spatial Relationship: Headwall "floats" adjacent to the end of a StormWater pipe feature.

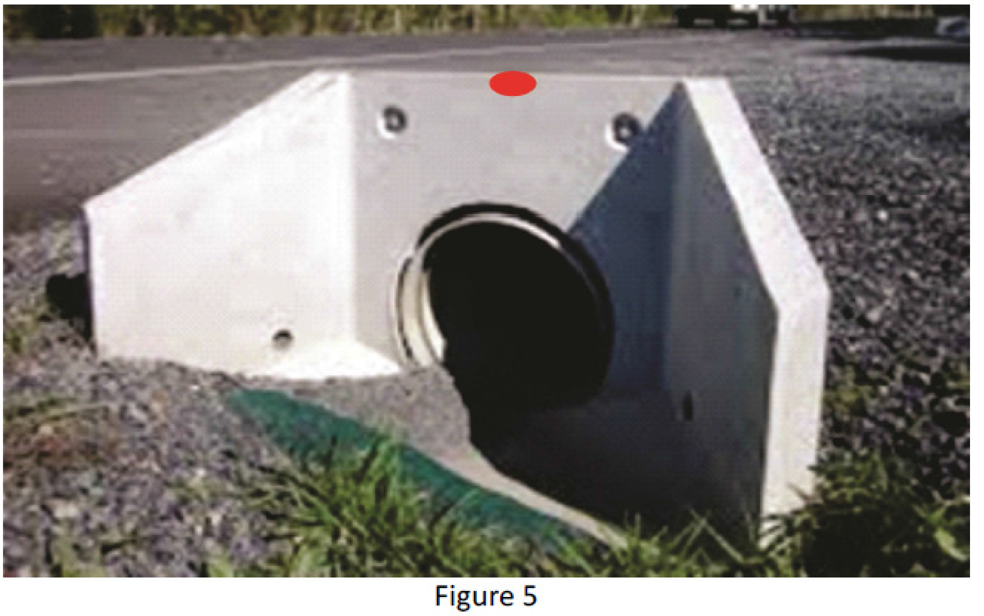


Figure 5

Transport

From the ADAC.XML Guidelines from Moreton Bay Regional Council

- **Roadways, including seals and pavement** to be captured from "Nominal kerb line to Nominal kerb line" as a closed polyline as per "red-dashed" example pictured in figures 1 & 2 below. Note: Separate polygons will be required at changes in pavement and/or surfacing.
- **Kerb line** is captured on the nominal kerb line (invert of kerb and channel, face of kerb only) as shown by "yellow-dashed" line shown in figures 1 and 2 shown below.
- **Sub-soil drains**, where installed, are to be captured at kerb/seal junction as per the "blue-dashed" examples shown in figures 1 and 2.
- **Road islands** are captured as closed polyline/object from back of kerb. Individual sub-sections of traffic islands to be identified by different material types (i.e. paving, concrete, grassed) as per "green-dashed" line in figure 1.

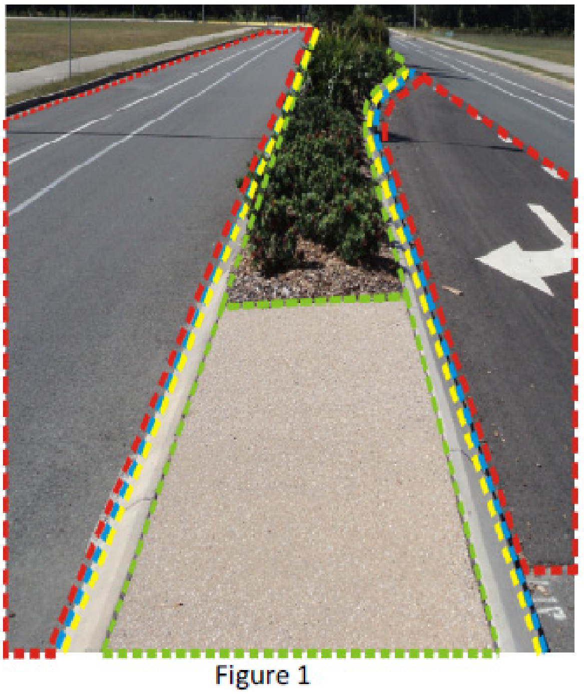

Figure 1

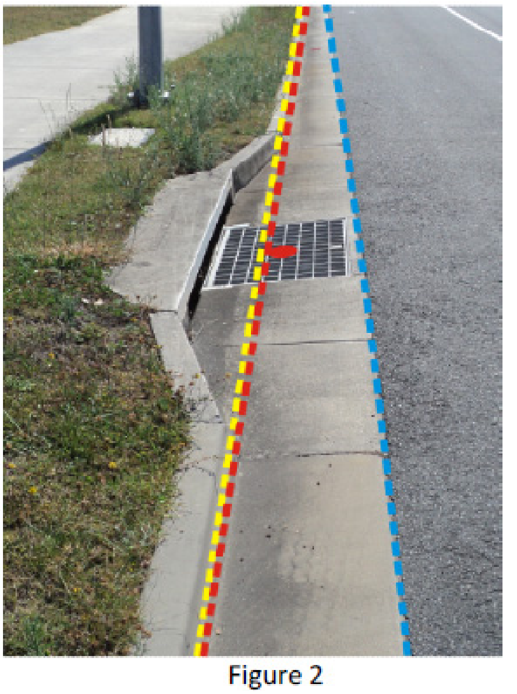

Figure 2

Return to 10.1 ADAC.XML Overview or 10 ADAC .

10.2 12d Approach to ADAC XML

Creating an ADAC XML file could be approached as a spreadsheet type exercise where you type the values into a document, but this is little more than a manual data collection exercise, performed (usually as an extra expense) after the design or as-built surveys are completed.

This is **NOT** the ***12d Model*** approach.

The guiding principles to the ***12d Model*** approach are:

1. ADAC Data Fidelity

   The ADAC Schema needs to be completely reflected inside ***12d Model*** so there is no ADAC data loss when writing and reading ADAC XML files.

2. 3D Engineering Data

   All data is held as 3D Engineering data.

3. Round Tripping of Data

   12d Model must be able to write out and read in ADAC data.

   That is

   WRITE OUT an ADAC XML file from data in ***12d Model***

   and

   READ IN an ADAC XML file to ***12d Model***.

4. Data Reuse

   Data reuse must be maximised. That is, wherever possible, any required ADAC data that is already part of the ***12d Model*** data should NOT have to be re-entered for the ADAC XML.

   So manual editing is to be minimised.

5. Integrated Work Flow

   The creation/collection of the ADAC data must be **integrated** into the normal ***12d Model*** design-construct-as built workflow so that there is minimal extra work involved in producing ADAC XML files.

Continue to the next section 10.3 12d ADAC Workflow or return to 10 ADAC .

10.3 12d ADAC Workflow

In ***12d Model***, the **source** of the data to write out to an ADAC XML is usually from either a **design** or a **survey**.

1. For **Design** - the design has been created in ***12d Model*** and it is some of the data from the Design that is to be written out as an ADAC XML file.
2. For **Survey** - the assets have been constructed and surveyed, and the survey data has been read into ***12d Model***. And it is some of the survey data that is to be written out as an ADAC XML file.

Although the type of data from a Design or a Survey can be totally different, the approach and steps inside ***12d Model*** for producing the ADAC XML file are very similar.

Step 0.Before Doing any ADAC Projects - this is only done once, by one or two people

Before doing any 12d-ADAC processing, the first thing to do is set up the Company procedures that everyone will use for ADAC Design or ADAC Survey project. This is usually done once, by one or two people, **before** a company starts doing ADAC work with ***12d Model***.

It involves:

(a) deciding what **Data Preparation** is needed for your company's survey or design before it is ready to produce an ADAC XML file.

(b) setting up the Company **User ADAC** menu.

(c) to allow for fast **bulk** processing, set up an ADAC ***12d Map File*** **for Design** and/or an ADAC ***12d Map File*** **for Survey** to assign the ADAC Asset type to a string from design or survey.

This is not essential and can be done, or added to, as you get more ADAC experience. But using an ADAC Map File is where the big benefits come from on most projects.

For information on each of these activities, see 10.6 Setting Up for ADAC.

Step 1.Setting Up a New ADAC Project - this is done once for each new ADAC project

For a new ***12d Model*** project, the first step is to set it up as either an ADAC Design or an ADAC Survey project.

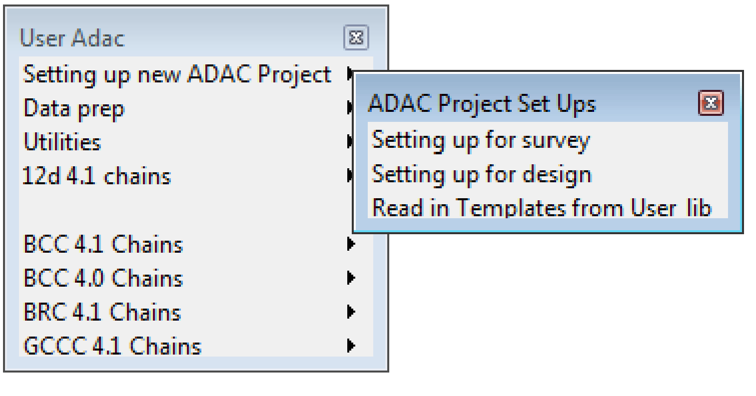
This is done **once for a new project** and only involves clicking a menu item:

File I/O =>ADAC =>User =>Setting up for survey - for surveys

For more information on what this option does, see 10.4.9.1.1 Setting Up for Survey.

File I/O =>ADAC =>User =>Setting up for design - for designers.

For more information on what this option does, see 10.4.9.1.2 Setting Up for Design.



Step 2.Creating the ADAC Header Data - only done once for each ADAC project.

The *ADAC Header Data* is only entered once for a project. This requires only a small amount of information such as the ADAC project name, the Owner and Receiver, the coordinate system used and (optionally) the Surveyor and the Engineer. See 10.4.1 Create Header .

If a *Header template* is used then most of the Header Data is automatically loaded.

Step 3.Preparing the Data to go to ADAC - done as required in each ADAC project

The design or survey data may need some preparation before it can go out to an ADAC XML file.

There is a variety of tools provided in ***12d Model*** ranging from setting Lot numbers, Plan Numbers and Areas, to splitting up a road edge into separate kerb types as required by ADAC.

See 10.4.9.2 Data Prep

Step 4.For Some Items, Assigning the ADAC Asset Type by Hand

Some data may be selected by hand to assign its ADAC Asset type using the **Create ADAC Asset** option. See 10.4.2 Create ADAC Asset

As your ***ADAC Map Files*** are created and extending, less data will need to be selected by hand. Instead the ADAC Asset type it will be automatically assigned.

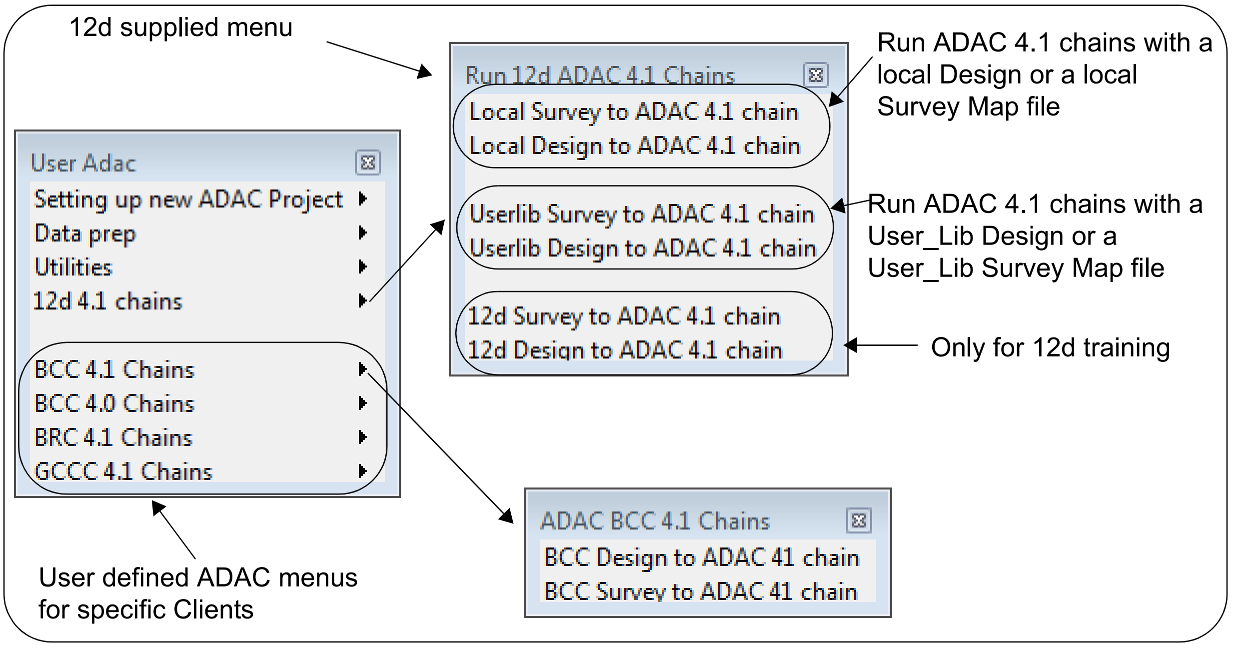
Step 5.Running a Design or Survey Chain - run regularly in an ADAC project

All the hard work for ADAC is done by either running an ADAC Design Chain or an ADAC Survey Chain. And to do that only involves clicking a menu item such:

File I/O =>ADAC =>User =>Appropriate Client Survey chain - for surveys

File I/O =>ADAC =>User =>Appropriate Client Design chain - for designers.

For more information on these chains, see 10.5 ADAC Design and Survey Chains .



In summary, what the *ADAC Design* or *ADAC Survey* chain does is:

(a) Uses the ADAC Map File to Assign the ADAC Asset Type

Any data going out to ADAC must be one of the ADAC Assets.

So either the ADAC Asset type has been assigned by hand, or the assignment is automatically done using an ***ADAC Map File*** that has already been set up.

(b) Sets ADAC values from the 12d String Geometry and User Attributes.

Much of the required ADAC data is already contained within the 12d strings or in User Attributes.

For example, if the Drainage or Sewer was designed with ***12d Model***, then much of the ADAC data can come directly from the drainage and sewer strings. For example, maintenance holes and chambers, depths, and pipe dimensions come directly from the drainage string, and any required 2D and 3D lengths are calculated from the drainage string.

User attributes picked up in the field by the surveyors, or added in the **Data Prep** step, are also loaded into the specified ADAC attributes.

(c) Creates the ADAC Geometry.

For each ADAC Asset, the ADAC Geometry is automatically generated from the 12d string geometry.

For example, if the ADAC Asset has Polyline Geometry, the (x,y,z) coordinates for each vertex of the string are loaded into the ADAC Geometry.

Step 6.Validating the Data, Generating Reports, Generating the ADAC Geometry - done as required

A Validation option checks the data against the ADAC Schema, and any errors are flagged and are easily found using ***12d Model's*** Intelligent logs lines. This is a simple process and is done by running only one panel. See 10.4.4 Validate .

A report of the ADAC Data can be produced in HTML, Text or PDF format. This could be for your records or used as another checking tool. This is a simple process and is done by running only one panel. See 10.4.5 Report

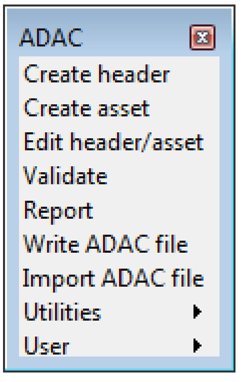
Step 7.Writing the Data out to ADAC XML - done as required

This is a simple process and is done by running just the one panel. See 10.4.6 Write ADAC XML File

Continue to the next section 10.4 12d ADAC Menu or return to 10 ADAC .

10.4 12d ADAC Menu

Position of menu: **File I/O =>ADAC**



See

[10.4.1 Create Header](#)

[10.4.2 Create ADAC Asset](#)

[10.4.3 Edit ADAC Header/Asset](#)

[10.4.4 Validate](#)

[10.4.5 Report](#)

[10.4.6 Write ADAC XML File](#)

[10.4.7 Import ADAC XML File](#)

[10.4.8 ADAC Utilities](#)

[10.4.9 User ADAC](#)

10.4.1 Create Header

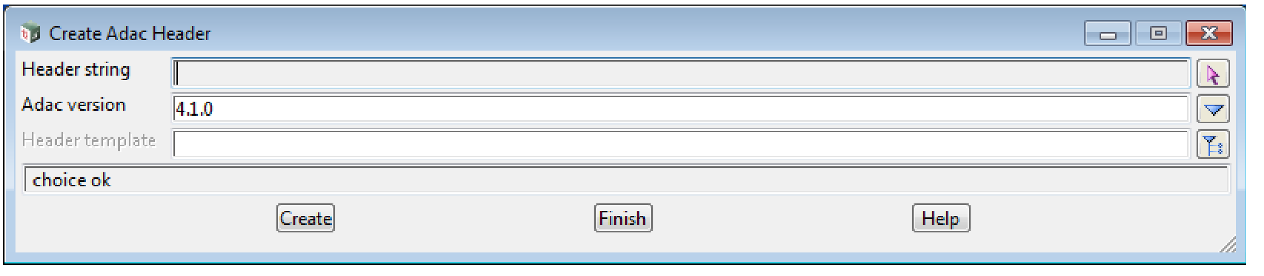
Position of option on menu: **File I/O =>ADAC =>Create header**

To produce an ADAC XML file, ***12d Model*** needs exactly one string with the ADAC Header data, and zero or more strings representing ADAC Asset data.

The **Create header** option takes a one vertex string, and creates as string attributes, the attributes needed to make it an ADAC Header. A user selected ADAC Header Template can be used to set the values for any of the ADAC attributes in the ADAC Header.

The ***ADAC Header Editor*** is then brought up so any of the created ADAC Header attributes can be edited.

Selecting **Create header** brings up the **Create ADAC Header** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Header string	string select		

select a one vertex string to set up with the ADAC Header Data attributes.

ADAC version	choice box	from env.4d	4.0.0, 4.1.0

the version of ADAC to use when creating the ADAC Header data.

The default value is set by the environment variable ADAC_VERSION_4D which is set in the **Edit Environment Variables** *panel at* **External Apps >ADAC**. *See* 7.6.3 env.4d.

Header template	ADAC Header box		available ADAC Header templates

the name of an ADAC Header template that is used to fill in some of the ADAC Header information for the Header string.

Create	button		

clicking **Create** *creates an ADAC Header structure as 12d ADAC attributes for the string, and if there is a* **Header template**, *it loads the string's ADAC attributes with values from the Header Template.*

The 10.4.2 Create ADAC Asset *panel is then brought up so that the ADAC Header data can be create/edited.*

Continue to the next section 10.4.2 Create ADAC Asset or return to 10.4 12d ADAC Menu or 10 ADAC .

10.4.2 Create ADAC Asset

Position of option on menu: **File I/O =>ADAC =>Create Asset**

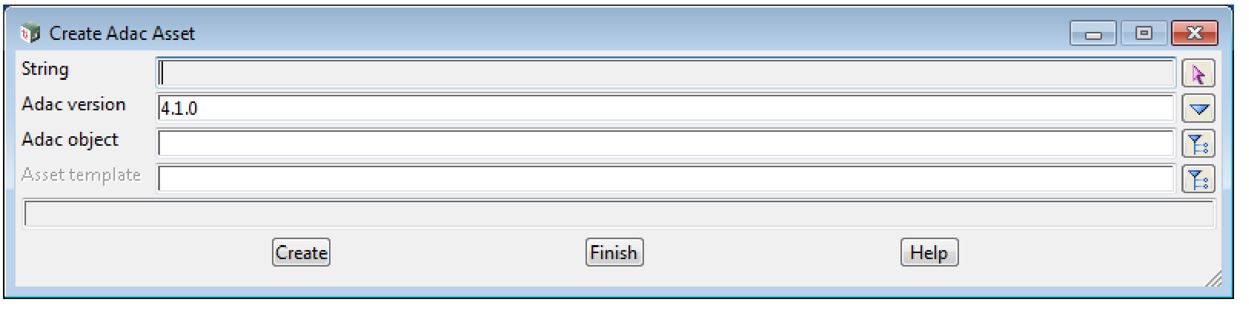
To produce an ADAC XML file, ***12d Model*** needs one string with the ADAC Header data, and zero or more strings with ADAC Asset data.

The **Create ADAC Asset** option takes a string with the appropriate geometry and creates as string attributes the ADAC Asset attributes for the user selected ADAC Asset type. This is referred to as **assigning the ADAC Asset type**, or **assigning the ADAC type**, to the string.

Also, a user selected ADAC Asset Template can be used to set the values for any of the ADAC attributes.

After creating the appropriate ADAC Asset attributes, the ADAC Asset Editor for the particular ADAC Asset is then brought up so any of the created ADAC Asset attributes can be edited.

Selecting **Create asset** brings up the **Create ADAC Asset** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
String	string select		

select a string that is to be set up with the ADAC Asset.

ADAC version	choice box	from env.4d	4.0.0, 4.1.0

the version of ADAC to use when creating the ADAC Header data.

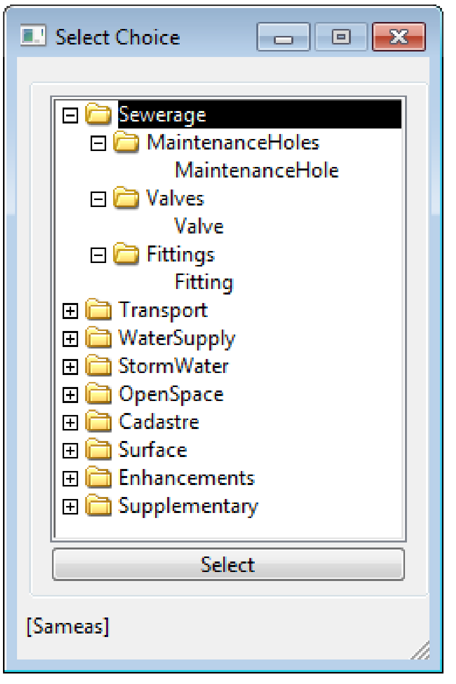
The default value is set by the environment variable ADAC_VERSION_4D which is set in the env.4d editor at **External Apps >ADAC**.

ADAC Asset	choice box	depends on the string geometry

If the geometry of the string selected is a:

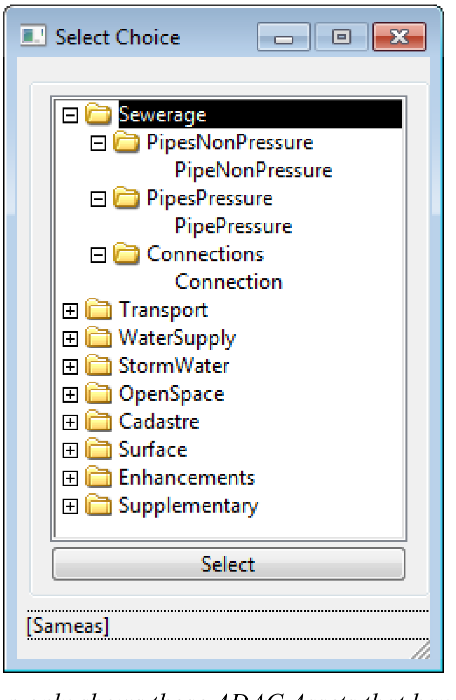
Point *(a one vertex string), then the pop-up only shows those ADAC Assets that have a Point Geometry.*

For example, for ADAC 4.1, the only ADAC Assets in Sewerage with a Point Geometry are Sewerage>MaintenanceHoles>MaintenanceHole, Sewerage>Valves>Valve and Sewerage>Fittings>Fitting



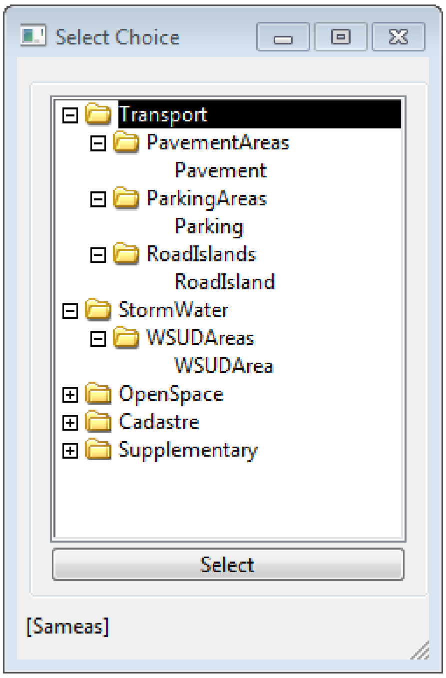
Polyline *then the pop-up only shows those ADAC Assets that have Polyline Geometry.*

For example, for ADAC 4.1, the only ADAC Assets in Sewerage with a Polyline Geometry are Sewerage>PipesNonPressure>PipeNonPressure, Sewerage>PipesPressure>PipePressure and Sewerage>Connections>Connection



Polygon *then the pop-up only shows those ADAC Assets that have Polygon Geometry.*

For example, for ADAC 4.1, there are NO ADAC Assets in Sewerage with a Polygon Geometry. In Transport there are Transport>PavementAreas>Pavement, Transport>ParkingAreas>Parking and Transport>RoadIslands>RoadIsland



Asset template ADAC Asset box available ADAC Asset templates

the name of an ADAC Asset template that if selected, is used to fill in some of the ADAC Asset attributes for the string.

The pop-up looks at the **ADAC Asset** *and only displays the templates for that type of ADAC Asset and for the ADAC version.*

Create button

clicking **Create** *creates an ADAC Asset structure as 12d ADAC attributes and if there is an* **Asset template,** *it loads the string's attributes with values from the Asset Template.*

The 10.4.3 Edit ADAC Header/Asset *panel is then brought up so that the ADAC Header data can be create/edited.*

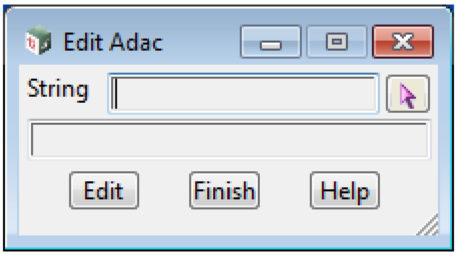
Continue to the next section 10.4.3 Edit ADAC Header/Asset or return to 10.4 12d ADAC Menu or 10 ADAC .

10.4.3 Edit ADAC Header/Asset

Position of option on menu: **File I/O =>ADAC =>Edit header/asset**

The ***ADAC* Editor** edits a string and looks at its ADAC attributes and determines whether it is an ADAC ***Header*** string or an ADAC ***Asset*** string (and then which ***Asset* type**), or is not an ADAC string at all.

Selecting **Edit** brings up the **Edit ADAC** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
String	string select		

select a string to have its ADAC attributes edited.

Edit	button		

if the selected string is a ADAC Header string, then the 10.4.2 Create ADAC Asset *is brought up.*

If the selected string is an ADAC Asset string, the 10.4.3 Edit ADAC Header/Asset *panel is brought up for its ADAC Asset type.*

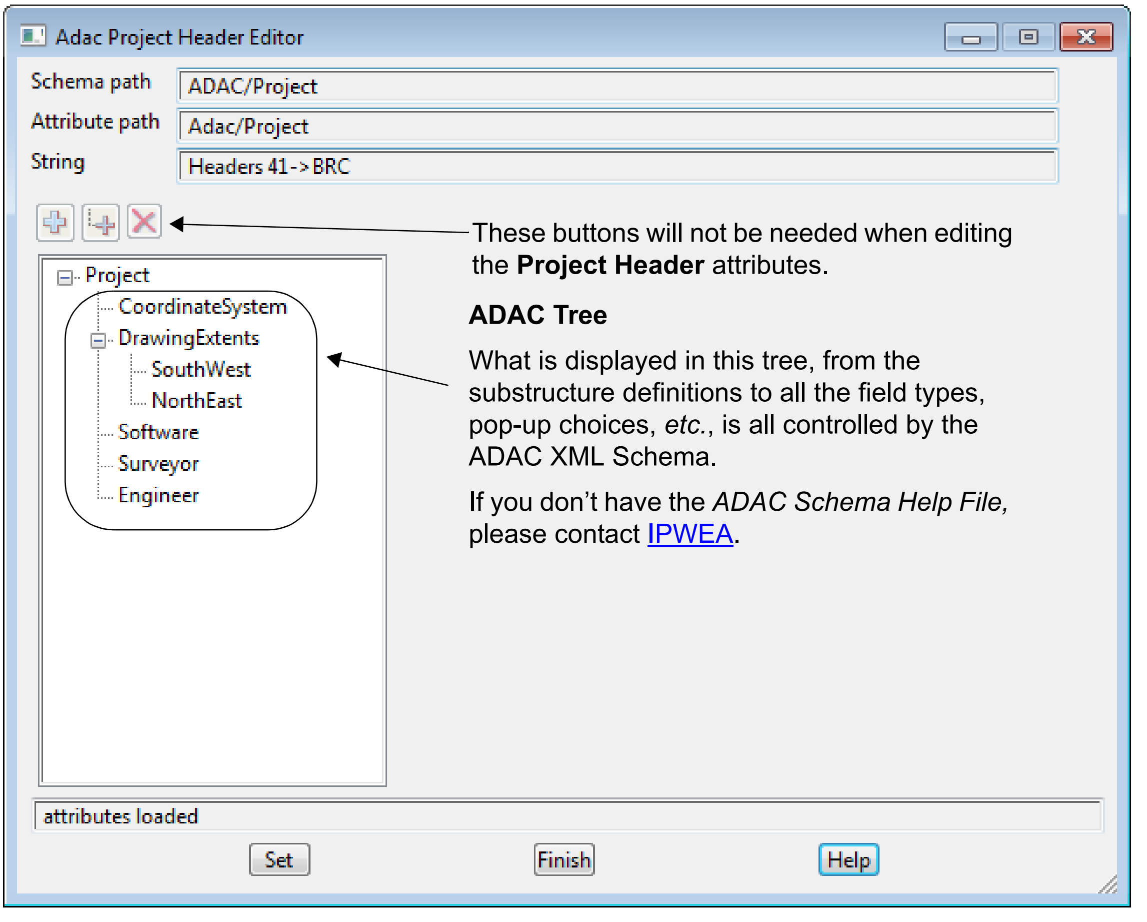
If the selected string is not an ADAC Header or an ADAC Asset string, then an error message is written to the panel message area.

Continue to the next section 10.4.3.1 ADAC Header Editor or return to 10.4.3 Edit ADAC Header/Asset, 10.4 12d ADAC Menu or 10 ADAC.

10.4.3.1 ADAC Header Editor

Position of option on menu: File I/O =>ADAC =>Edit

When a string is selected with the *ADAC Editor* and the string has **ADAC Header Data** attributes, then the **ADAC Project Header Editor** panel is brought up with any ADAC Header Data already with the string loaded into the Editor.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Schema path	output only		

*the path to the ADAC Schema that is used to generate all the items under **Project**.*

Attribute path output only

the path in the ADAC Schema to the ADAC element being edited. In this case it is the ADAC Project element.

String output only

displays the string that has the ADAC Header Data attributes that are being displayed and edited. This will already be set when the panel is brought up by the ADAC Editor or the ADAC Create Header panel.

ADAC Tree

What is displayed in this tree, from the substructure definitions to all the field types, pop-up choices, etc., is all controlled by the ADAC XML Schema.

Even what is shown in these images may vary with the ADAC Version.

If you don't have the ADAC Schema Help File for the ADAC Version you are creating, please contact IPWEA.

*The **Drawing extents** and **Software** do not have to be filled out because they are updated by **12d Model**.*

*For information about all the other ADAC elements in the **ADAC Tree**, please see the ADAC XML Schema Help file.*

Drawing extents these do not have to be filled in

these fields do not have to be filled in. The drawing extents will be calculated and updated when the data is written out to an ADAC XML file.

Software these do not have to be filled in

these fields do not have to be filled in. The **Software product** *and* **Version** *will be updated when the data is written out to an ADAC XML file.*

Buttons at Bottom

Set button

clicking **Set** *updates the ADAC Header attributes for the string being edited, using the values in this panel.*

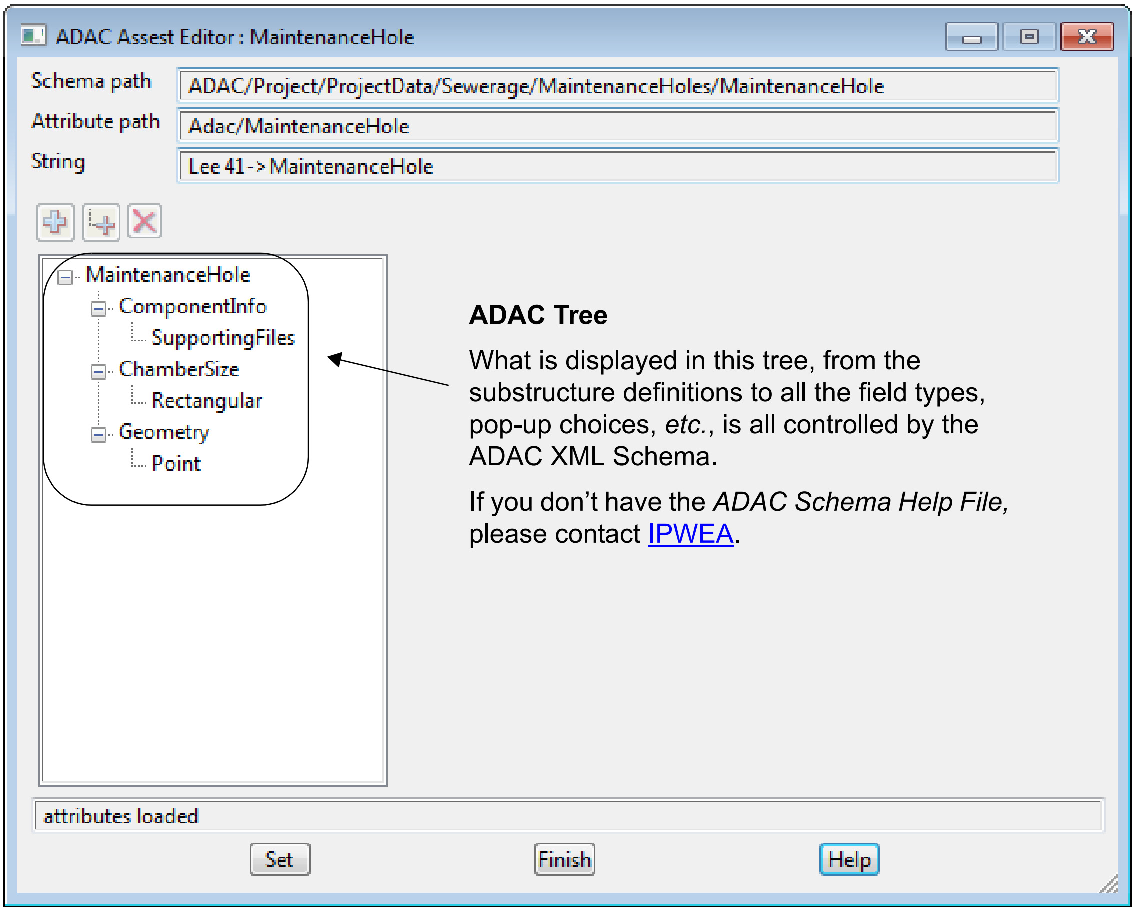
Continue to the next section 10.4.3.2 ADAC Asset Editor or return to 10.4.3 Edit ADAC Header/ Asset , 10.4 12d ADAC Menu or 10 ADAC .

10.4.3.2 ADAC Asset Editor

Position of option on menu: **File I/O =>ADAC =>Edit**

When a string is selected with the *ADAC Editor* and the string has **ADAC Asset Data** attributes, then the **ADAC Asset Editor** for that particular ADAC Asset is brought up, with any ADAC Asset Data already on the string, loaded into the Editor.

For example, for the ADAC Asset Sewerage>MaintenanceHoles>MaintenanceHole, the **Editor** panel is



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Schema path output only

the path to the ADAC Schema that is used to generate all the items for this ADAC Asset.

Attribute path output only

the path in the ADAC Schema to the ADAC element being edited. In this case it is the ADAC Sewerage MaintenanceHole element.

String output only

displays the string that has the ADAC Asset Data attributes that are being displayed and edited. This will already be set when the panel is brought up by the ADAC Editor or the ADAC Create Asset panel.

ADAC Tree

What is displayed in this tree, from the substructure definitions to all the field types, pop up choices, etc., is all controlled by the ADAC XML Schema.

Even what is shown in these images may vary with the ADAC Version.

If you don't have the ADAC Schema Help File for the ADAC Version you are creating, please contact IPWEA.

For information about all the ADAC elements in the ***ADAC Tree*** for an ***ADAC Asset****, please see the ADAC XML Schema Help file.*

Geometry this do not have to be filled in

the Geometry is generated by 12d Model from the strings geometry.

Buttons at Bottom

Set button

clicking **Set** *updates the ADAC Asset attributes for the string being edited, with the values in this panel.*

Continue to the next section 10.4.3.3 Common Features of ADAC Editors or return to 10.4.3 Edit ADAC Header/Asset , 10.4 12d ADAC Menu or 10 ADAC .

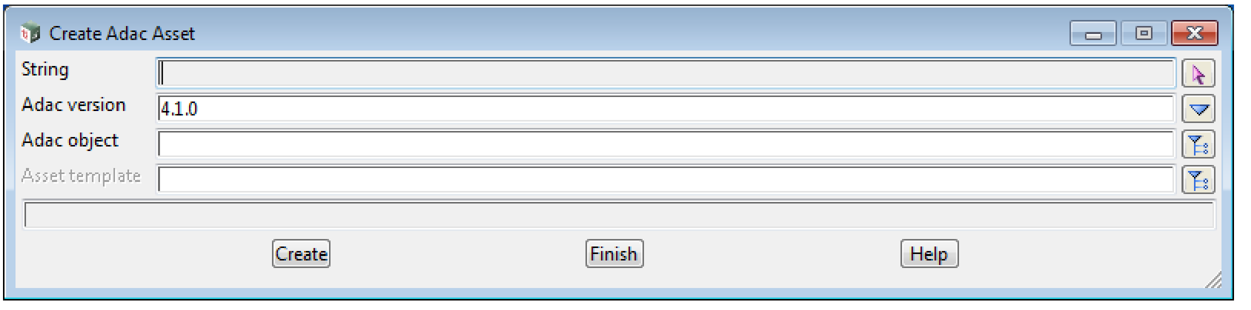
10.4.3.3 Common Features of ADAC Editors

The *ADAC Schema* is fully described by the *ADAC XSD* (**X**ML **S**chema **D**efinition), which formally defines the structure and all the elements inside an *ADAC XML* file.

And the ***ADAC Header Editor*** and the ***ADAC Asset Editors*** for each of the different *ADAC Assets*, are also fully defined by the *ADAC Schema XSD*.

What that means is that everything in the *ADAC Editors*, and how they behave, follows the *ADAC XSD*.

That starts with **Create ADAC Asset** panel:



where once a string is selected, the choice of ***ADAC Asset*** choices is totally determined by which *ADAC Assets* in the *ADAC XSD* have that geometry.

Once in the **Editors** (*ADAC Asset* or *ADAC Header*), every item in the *Editor* is again controlled by the *ADAC XSD*.

So to know why each items exists, and what it is, you need to refer to the *ADAC Schema*.

What we'll now do is look at how the Editor is structured, navigated and used.

See

10.4.3.3.1 Editor Tree, Nodes and Elements

10.4.3.3.2 Delete Icon

10.4.3.3.3 Add Sibling and Add Child Icons

10.4.3.3.4 Nillable Elements and Nodes

10.4.3.3.5 Nodes with Choices for Subnodes

10.4.3.3.1 Editor Tree, Nodes and Elements

When the ADAC **Editors** start up, they have a tree structure on the left hand side.

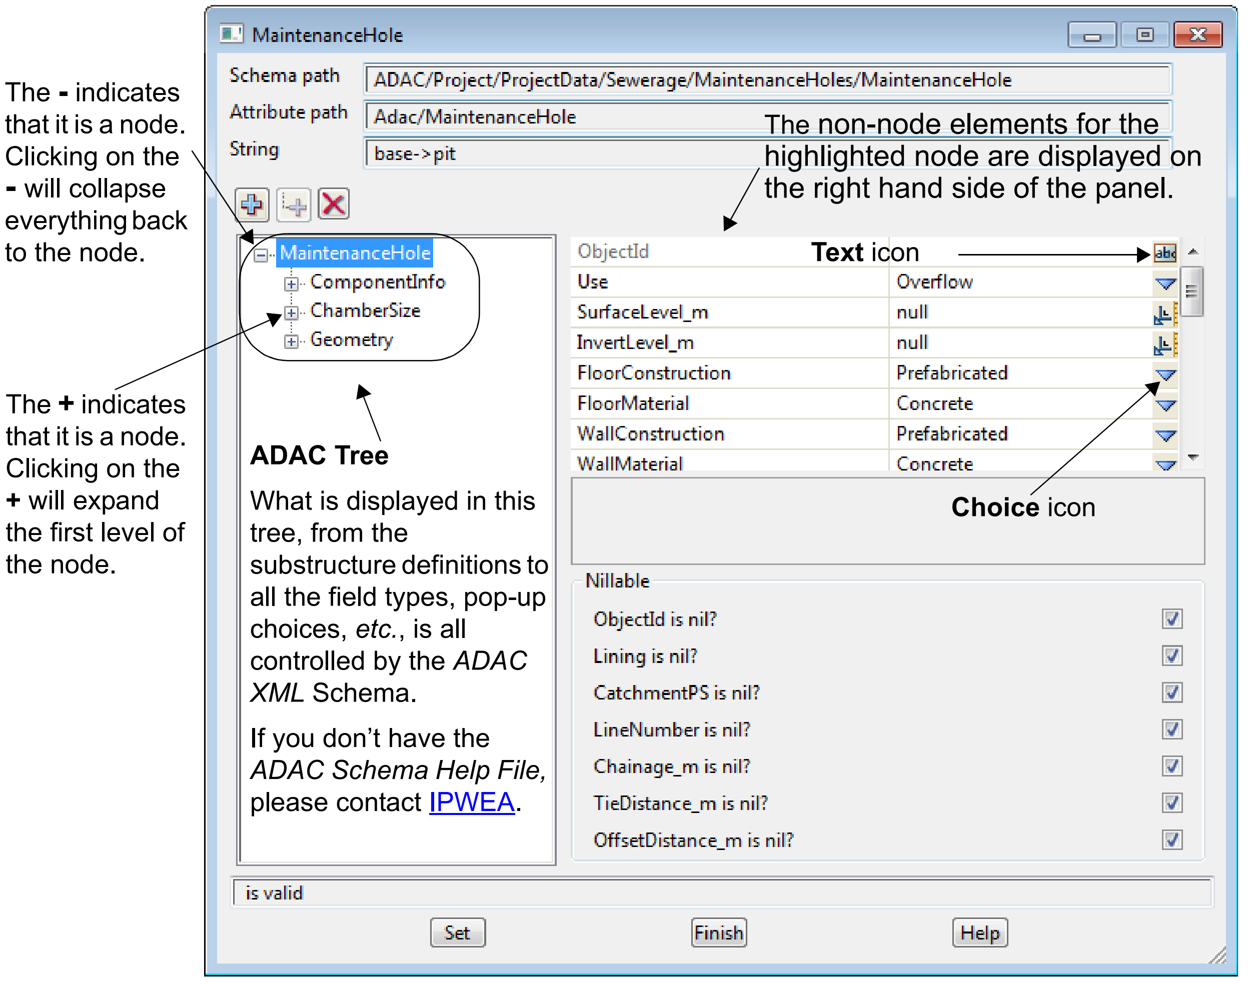
Each item in the tree are known as nodes and **nodes** contain ADAC elements or can have their own substructure of nodes and elements. A node with a substructure is identified by having either a **+** or a **-** to the left of it.

The **+** indicates that the node has a substructure that has not been expanded and by clicking on the **+**, the first level of the sub structure is displayed.

The **-** indicates that the node contains a substructure and it has been expanded in the tree. Clicking on the **-** will collapse the expansion back into just the node.

When a node is clicked on and hence highlighted, all the element that belong to the first level of the node that are not other nodes, are displayed on the right hand side of the panel.

It is the non-node elements displayed on the right that hold the data about the *ADAC Asset*.



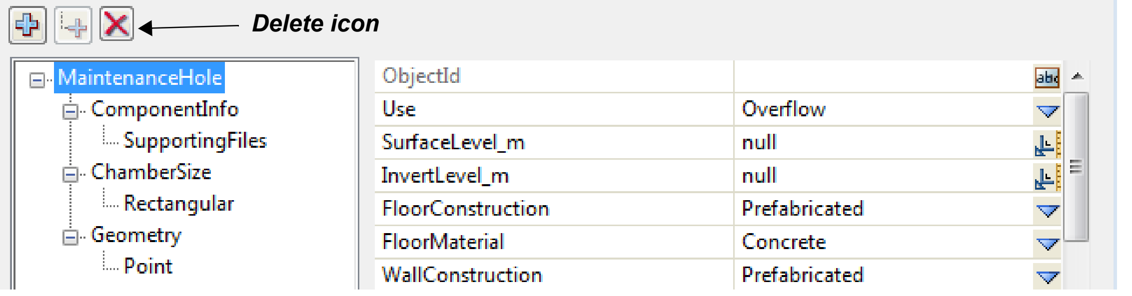
The elements on the right hand side of the panel mainly consist of choice, text, real, integer and date boxes and they are all defined in the ***ADAC XSD***. Where ever possible, the icons at the end of each field are the same as those used in ***12d Model*** panels.

Where it is a **Choice** box, the allowable choices (which are in the pop up) are all defined in the ***ADAC XSD*** where they are known as **Enumerations**.

Continue to the next section 10.4.3.3.2 Delete Icon or return to 10.4.3.3 Common Features of ADAC Editors , 10.4.3 Edit ADAC Header/Asset , 10.4 12d ADAC Menu or 10 ADAC .

10.4.3.3.2 Delete Icon

There is a **Delete** icon on the ADAC **Editors** but most of the time is disabled because there are only a few places in the *ADAC Schema* that data can be deleted.



If a node in the tree is selected and highlighted, and the **Delete** icon is enabled and then clicked, the node is deleted.

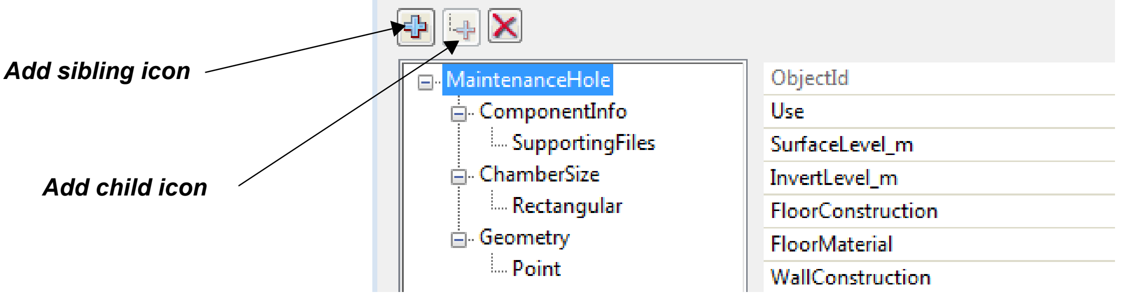
The **Delete** icon is enabled when the *ADAC Asset* itself has been selected as in the image above but deleting the *ADAC Asset* itself is rarely done.

The one time when the **Delete** is usable is when a node has choices for one of its subnodes (for example, ChamberSize). In that case to change the choice of subnode, the existing subnode needs to be deleted and then a new one created. replaced by a new one. This process is documented in the section 10.4.3.3.5 Nodes with Choices for Subnodes .

Continue to the next section 10.4.3.3.3 Add Sibling and Add Child Icons or return to 10.4.3.3 Common Features of ADAC Editors , 10.4.3 Edit ADAC Header/Asset , 10.4 12d ADAC Menu or 10 ADAC .

10.4.3.3.3 Add Sibling and Add Child Icons

There is are two Add icons - **Add** a sibling and **Add** a child.



The **Add a sibling** icon adds a new item at **the same level** (a sibling) as the highlighted node.

The **Add a child** icon adds a node as a **subnode** of the highlighted node.

As in the **Delete** icon case, most of the time the **Add a sibling** and **Add a child** icons are disabled because there are only a few places in the *ADAC Schema* that it makes sense to add a new sibling or child node.

The **Add a sibling** icon is enabled when the *ADAC Asset* itself has been selected as in the image above but adding a second *ADAC Asset* is not useful because a second or subsequent ADAC Asset on the one string will be ignored in the 12d-ADAC process.

One time when the **Add a child** is usable is when a node has choices for one of its subnodes (for example, ChamberSize). In that case to change the choice of subnode, the existing subnode needs to be deleted and then a new one created. replaced by a new one using **Add a child**. This process is documented in the section 10.4.3.3.5 Nodes with Choices for Subnodes.

Continue to the next section 10.4.3.3.4 Nillable Elements and Nodes or return to 10.4.3.3 Common Features of ADAC Editors, 10.4.3 Edit ADAC Header/Asset, 10.4 12d ADAC Menu or 10 ADAC.

10.4.3.3.4 Nillable Elements and Nodes

One concept used in the *ADAC XSD* that has not been expressed in the same way in other ***12d Model*** panels, is **nillable**.

In the ADAC XSD, if a *node* or *element* is **nillable** (i.e. has **nil** set to true in the XSD), then the node or element may or may not have a value. So it is optional.

If a *node* or *element* is **not nillable** (i.e. has **nil** set to **false** in the XSD) then the node or element is not optional and must have values.

See

10.4.3.3.4.1 Nillable Elements

10.4.3.3.4.2 Nillable Node

Or return to 10.4.3.3 Common Features of ADAC Editors , 10.4.3 Edit ADAC Header/Asset , 10.4 12d ADAC Menu or 10 ADAC .

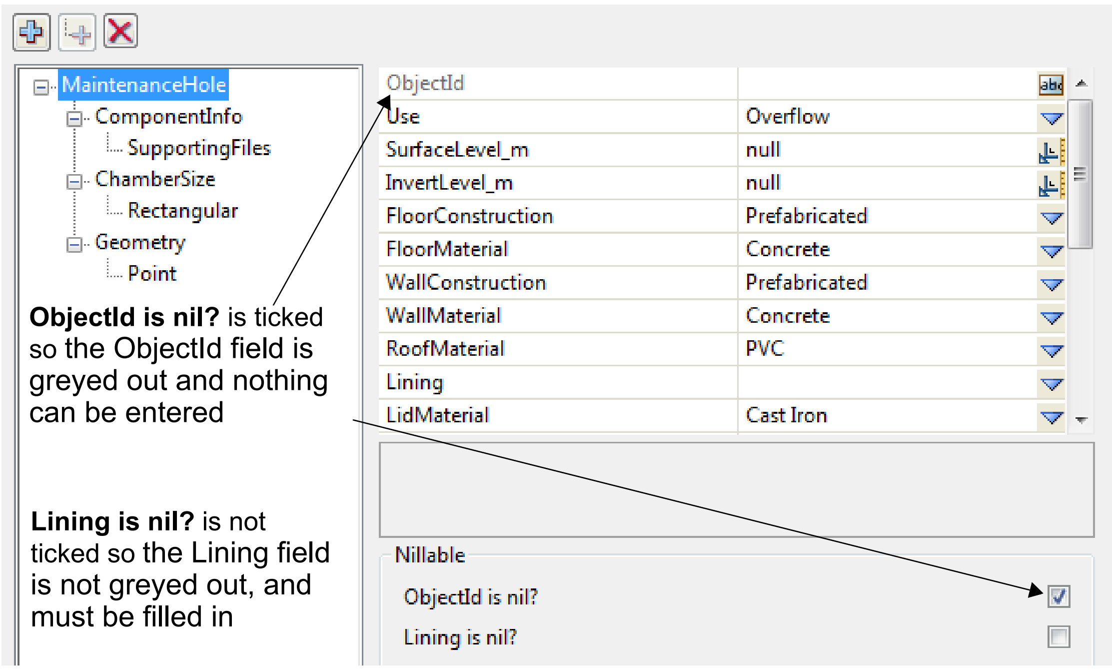
10.4.3.3.4.1 Nillable Elements

In the ADAC **Editor**, if an element **is nillable** (and hence optional) then it is listed on the right hand side of the panel under the title **Nillable** and with a tick box beside its name.

If the tick box is **ticked** then the item is not to be filled in and the panel field for it is greyed out so nothing can be entered.

If the tick box is **not ticked** then the item is to be filled in and the panel field is no longer greyed out. In this is the case a value must be entered.

All elements not mentioned in the Nillable area are **not nillable** and must always be filled in.



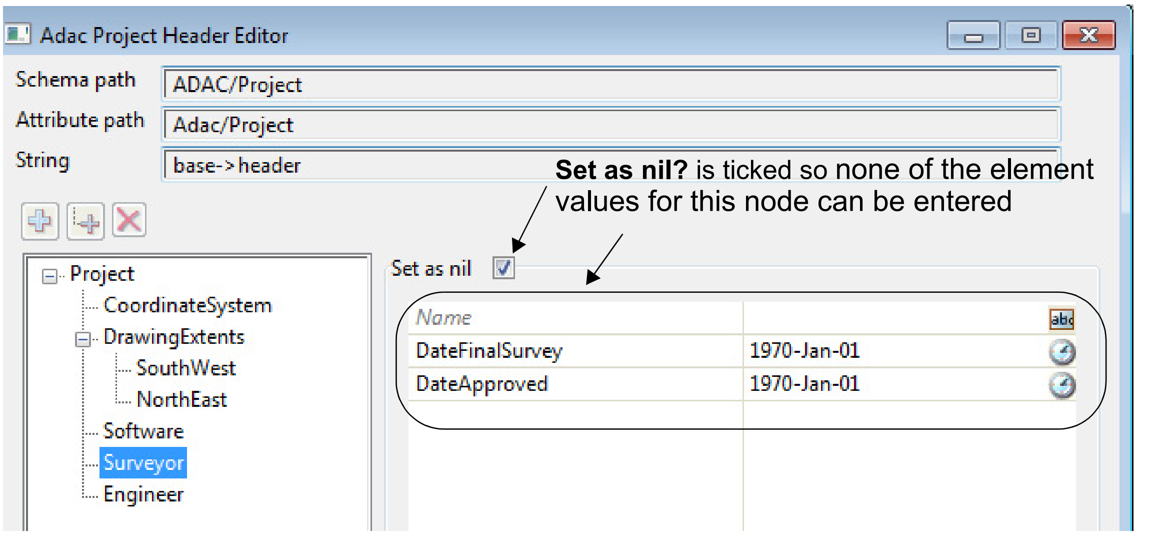
Continue to the next section 10.4.3.3.4.2 Nillable Node or return to 10.4.3.3.4 Nillable Elements and Nodes .

10.4.3.3.4.2 Nillable Node

In the ADAC **Editor**, if an node **is nillable** (and hence optional) then on top of the listing of the elements for the node is a tick box **Set as nil.**

If the tick box is **ticked** then none of the elements can be filled in.

If the tick box is **not ticked** then the element have the potential of being filled it. Whether they are to be filled in depends on if the individual element is nillable or not.

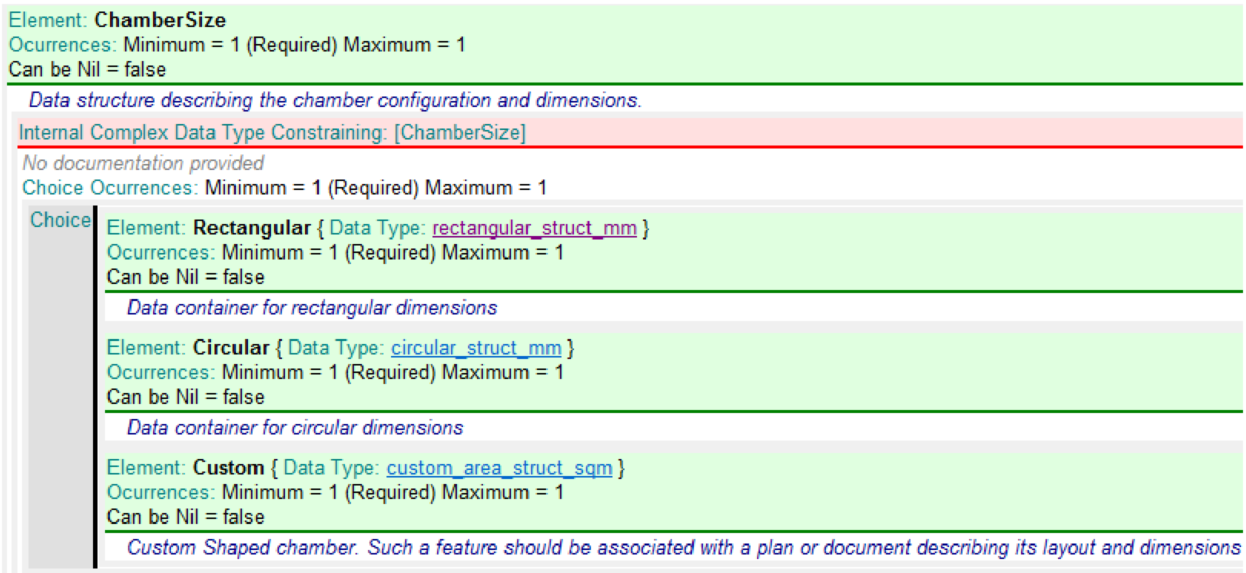


Return to 10.4.3.3.4 Nillable Elements and Nodes .

10.4.3.3.5 Nodes with Choices for Subnodes

In the *ADAC Schema*, there are some nodes that have choices for subnodes.

For example, ***Sewerage>MaintenanceHoles>MaintenanceHole>ChamberSize*** is not just a since value but is a choice of subnodes - *Rectangular*, *Circular* and *Custom* - which each contain one or more elements.



Element: **ChamberSize**
Ocurrences: Minimum = 1 (Required) Maximum = 1
Can be Nil = false

Data structure describing the chamber configuration and dimensions.

Internal Complex Data Type Constraining: [ChamberSize]

No documentation provided
Choice Ocurrences: Minimum = 1 (Required) Maximum = 1

Choice

Element: **Rectangular** { Data Type: rectangular_struct_mm }
Ocurrences: Minimum = 1 (Required) Maximum = 1
Can be Nil = false

Data container for rectangular dimensions

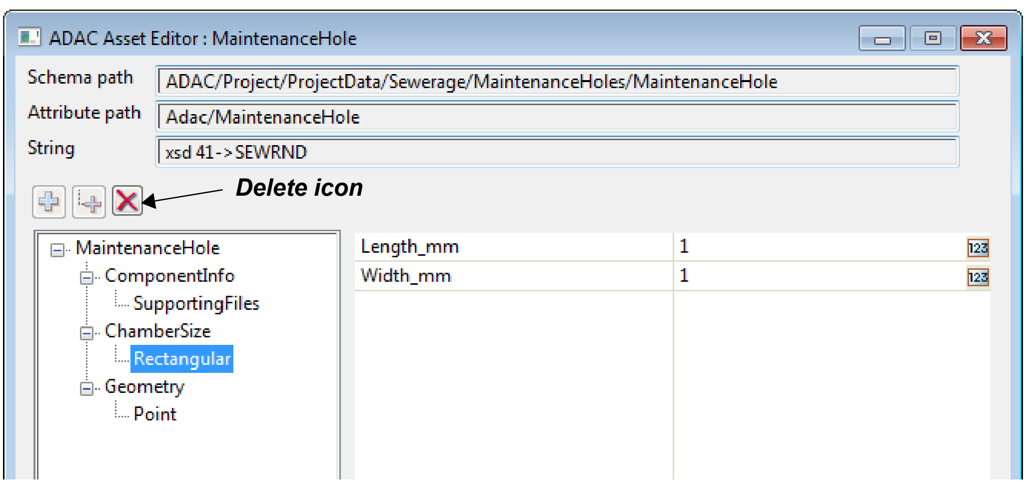
Element: **Circular** { Data Type: circular_struct_mm }
Ocurrences: Minimum = 1 (Required) Maximum = 1
Can be Nil = false

Data container for circular dimensions

Element: **Custom** { Data Type: custom_area_struct_sqm }
Ocurrences: Minimum = 1 (Required) Maximum = 1
Can be Nil = false

Custom Shaped chamber. Such a feature should be associated with a plan or document describing its layout and dimensions

-

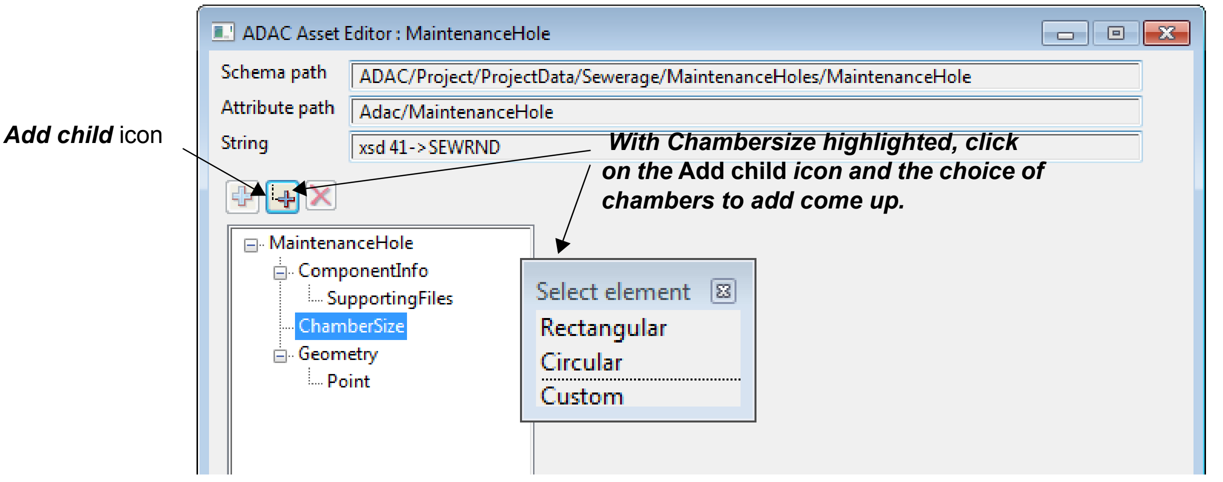


To change the subnode choice, you need to click on the **subnode** to highlight it and then click on the **Delete** icon.

To create a new subnode now that one no longer exists, click on the **node** to highlight it and then click on the **Add Child** icon. A **Select Element** panel will then appear with the available choices.

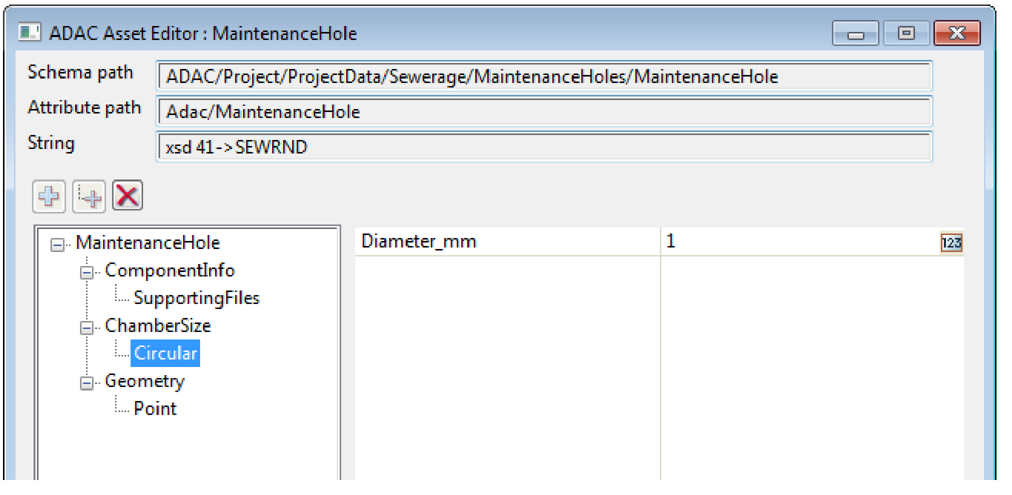
For example, for the ***Sewerage>MaintenanceHoles>MaintenanceHole>ChamberSize***, the choices are *Rectangular*, *Circular* and *Custom*.

-



Select the choice from the **Select Element** panel and the new **subnode** is created for the highlighted node.

For example, if *Circular* is chosen as the choice of subnode of *ChamberSize*



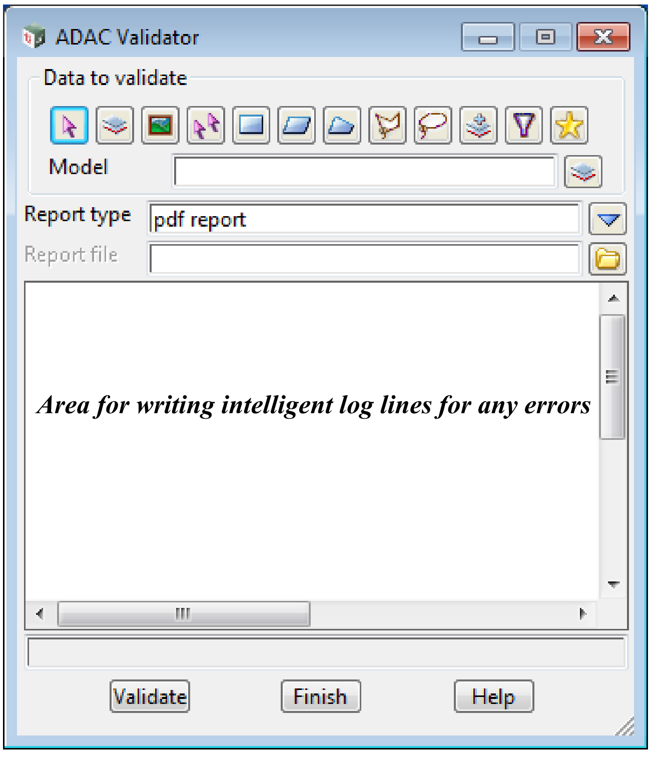
Return to 10.4.3.3 Common Features of ADAC Editors .

10.4.4 Validate

Position of option on menu: **File I/O =>ADAC =>Validate**

The **ADAC Validator** validates a *Data Source* of string against the ADAC XML Schema.

Selecting **Validate** brings up the **ADAC Validator** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source .

Data source	input	

source of data to be validated against the ADAC Schema.

Report type	choice box	ADAC pdf, ADAC html, original xml, custom

output format for the report. An XML file will be produced and then if required, converted to the selected report.

For information on setting up custom reports from the generated XML file using xslts, see 4.30 Setting Up XML Reports .

Report file	file box	

*if **not blank**, an XML file will be created and a report of this name, and of the type given by* **Report type** *will be generated from the XML file.*

*If **blank**, no report is created but errors are still written to the panel's message area.*

Validate	button	

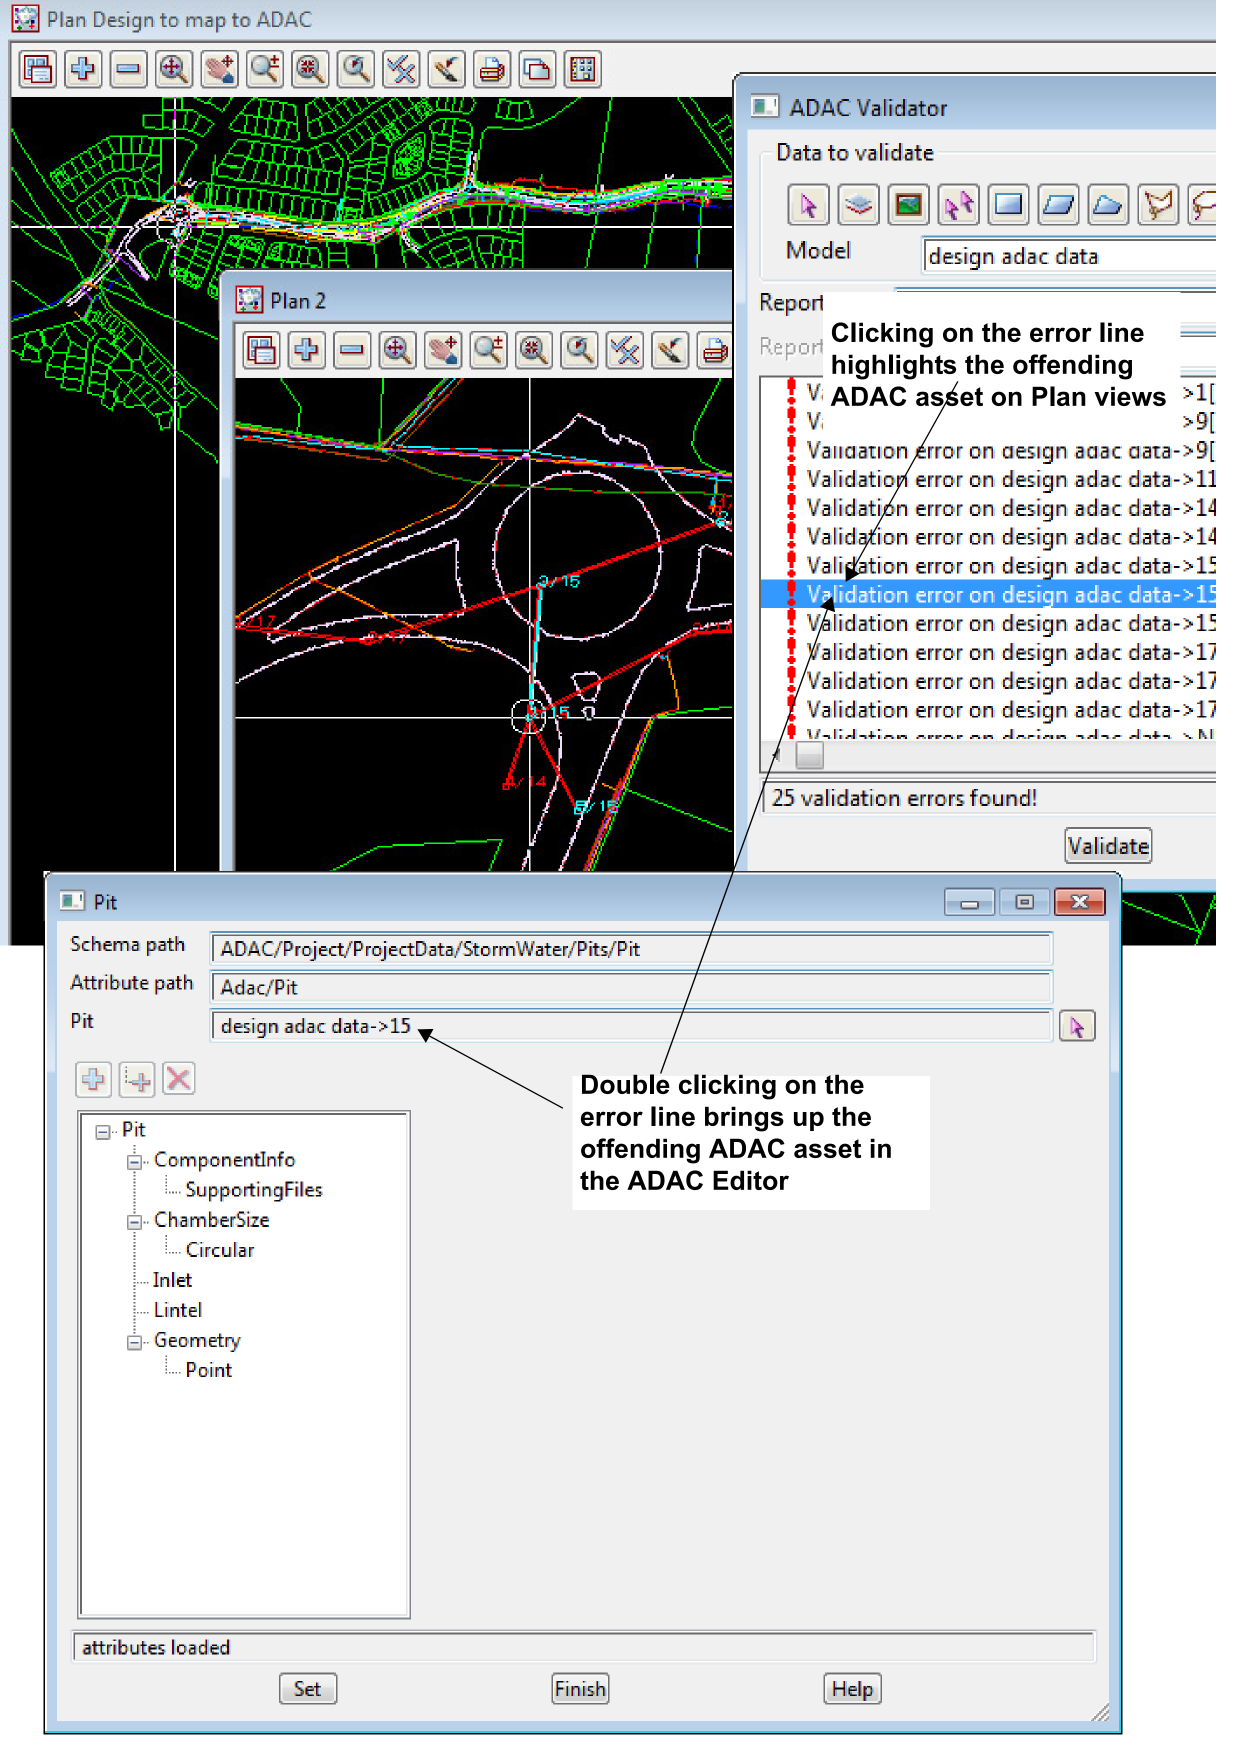
when **Validate** *is pressed, the string in the Data Source is validated against the ADAC XML Schema.*

*If no errors are found, then **No errors found!** is written to the panel's message area.*

For each error found, an error message is written to the area on the panel for error messages as an intelligent log line, and if **Report file** *is not blank, written in XML to the report file.*

Clicking on an error line will highlight and pan to the offending ADAC Asset in any Plan view the asset is on.

Double clicking on the log line, brings up the ADAC Asset Editor with the data for the string loaded into it.



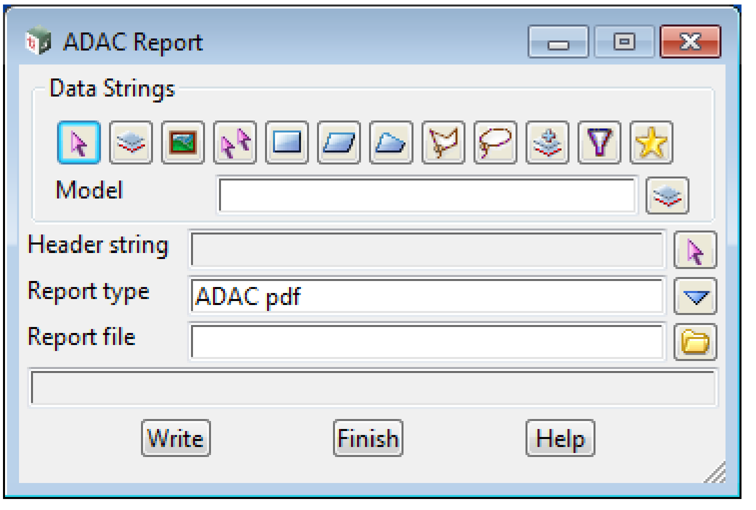
Continue to the next section 10.4.5 Report or return to 10.4 12d ADAC Menu .

10.4.5 Report

Position of option on menu: **File I/O =>ADAC =>Report**

Report produces a report in a variety of formats of a ADAC Header string and a user selection of ADAC Asset strings.

Selecting **Report** brings up the **ADAC Report** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source .

Data source	input		

source of data to be included in the ADAC report.

Header string	string select		

select the string that has the ADAC Header information for this report.

Report type	choice box	ADAC pdf, ADAC html, original xml, custom	

output format for the report. An XML file will be produced and then if required, converted to the selected report.

For information on setting up custom reports from the generated XML file using xslts, see 4.30 Setting Up XML Reports .

Report file	file box		

*if **not blank**, an XML file will be created and a report of this name, and of the type given by* **Report type** *will be generated from the XML file.*
*If **blank**, no report is created.*

Write	button		

writes out the report.

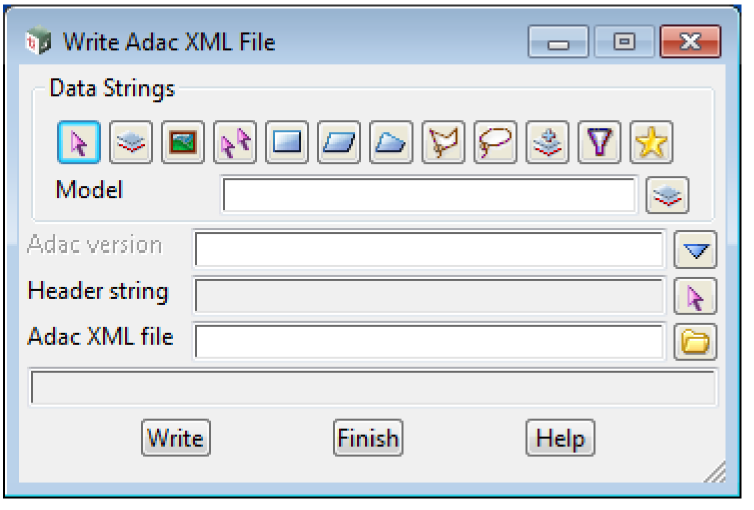
Continue to the next section 10.4.6 Write ADAC XML File or return to 10.4 12d ADAC Menu .

10.4.6 Write ADAC XML File

Position of option on menu: **File I/O =>ADAC =>Write ADAC file**

Write ADAC file produces an ADAC XML file using a user selected ADAC Header string and a user selection of ADAC Asset strings.

Selecting **Write ADAC file** brings up the **Write ADAC XML file** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source .

Data source input

source of ADAC Asset data to write out to an ADAC XML file.

Header string string select

select the string that has the ADAC Header information for this ADAC.XML file

Report file file box

name of the file to write the ADAC XML data to.

Write button

write out the ADAC XML file using the Header string as the ADAC Header data and the Data source of ADAC Asset strings.

Continue to the next section 10.4.7 Import ADAC XML File or return to 10.4 12d ADAC Menu .

10.4.7 Import ADAC XML File

Position of option on menu: **File I/O =>ADAC =>Import ADAC file**

Import ADAC file reads in an ADAC XML file and

(a) For the ***ADAC Header Information***, creates a ***12d Model*** one vertex string with an identical attribute structure to an ADAC Header string created in ***12d Model***. All the ADAC Header data in the ADAC XML file is placed in the attribute structure.

(i) The string is given the ***string name*** *header.*

(ii) This string is placed in the model ***adac project header*** with a **Pre*postfix for models** from the panel applied to the model name.

(b) For each ***ADAC Asset*** in the file, creates a ***12d Model*** string with the same geometry as the *ADAC Asset* has in the ADAC XML file.

(i) The ***12d Model*** string is given an identical attribute structure to an *ADAC Asset* created within ***12d Model***. All the *ADAC Asset* data in the ADAC XML file for that asset is read in and placed in the attribute structure.

(ii) The created string is given the **final** part of the ADAC Asset name as a ***string name***. For example, A *Transport>RoadEdges>RoadEdge* is given the name *RoadEdge*.

(iii) The string is placed in the model ***adac project data*** with a **Pre*postfix for models** from the panel applied to the model name.

It is unfortunate that with only sixty-eight ADAC Assets, there is a double up in such names because it is much easier to refer to *MaintenanceHole* than *Sewerage>MaintenanceHoles>MaintenanceHole*.

In *ADAC 4.1*, the double ups are:

MaintenanceHole - in both *Sewerage* and *WaterSupply*

Valve - in both *Sewerage* and *WaterSupply*

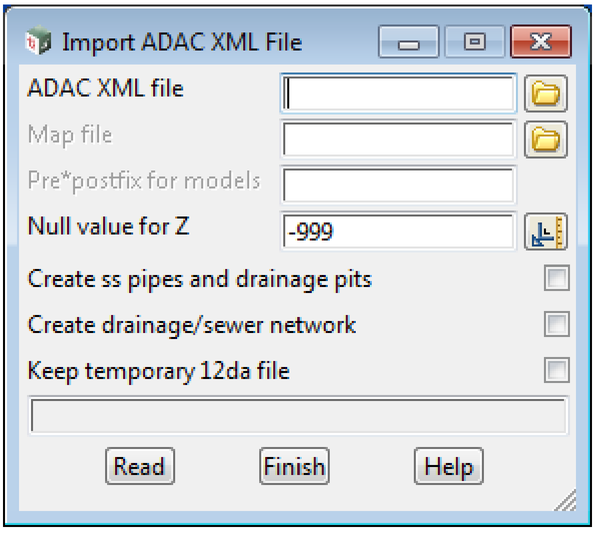
Fitting - in all three of *Sewerage*, *WaterSupply* and *StormWater*

Pipe - in both *WaterSupply* and *StormWater*

Connection - in both *Sewerage* and *Cadastre*.

To allow them to be distinguished, when ***12d Model*** reads the *ADAC Asset* data, the ***full name of the ADAC Asset*** is stored in the string text attribute ***Adac>Path***. So if a *Map File* is used when ***reading in*** the ADAC.MXL file, using this attribute as the **Att Key** in the **Basic** node allows the string's *ADAC Asset* type to be uniquely identified, and the string ***renamed***.

Selecting **Import ADAC file** brings up the **Import ADAC XML file** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
ADAC XML file to import	file box		available .XML files

name of the ADAC XML file to import.

*The default model names (with the **Pre*postfix for models** applied) to hold the data read in are:*

adac project header *for the string containing the ADAC Header data.*

adac project data *for the strings for each ADAC Asset*

Field Description	Type	Defaults	Pop-Up
Map file	file box		*.mapfile, *.mf files

*if **blank**, no **12d Map File** is used*

*If **not blank**, the name of the **Map File** to be used when importing data from the ADAC.XML file.*

*When using a **Map File**, the short **ADAC Asset** name in the ADAC XML file is used as the entity-name for matching with the key in the Map File. For example, a* Transport>RoadEdges>RoadEdge *is given the name* RoadEdge.

*That is, when the ADAC Asset is read in, it can be mapped by having an entry in the **Base** node of the Map File with short ADAC Asset name as the* **Key**.

For example, RoadEdge, *or* RoadEdge* *as the* **Key** *will map all the* Transport>RoadEdges>RoadEdge *that are read in.*

*When importing, all the ADAC elements associated with the ADAC Asset are placed in a 12d attribute structure identical to that used when ADAC Assets are created within **12d Model**. So the ADAC Asset attributes are also available to use in the **Base** node of the Map File as an* **Att Key** *when importing the ADAC XML file.*

*Note that the **full** ADAC Asset name is stored in the string attribute **Adac>Path** so this is available to use as the* **Att Key** *to distinguish between ADAC Assets with the same short name.*

See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Field Description	Type	Defaults	Pop-Up
Pre*postfix for models	pre*postfix box	name of xml file (without the XML)	

*When an XML is selected, the file name (without the .xml) plus " * " is written to this field as the default.*

*if **not blank**, a prefix and a postfix applied to the default model names that are created.*

If there is a 12d Map File then this will also be applied to any models created by the map file.

Go to the section 4.19.2 Pre*Postfix in Panel Fields *for information on using pre*postfix.*

Field Description	Type	Defaults	Pop-Up
Null value for Z	real box	-999	

if in the ADAC geometry there is no z-coordinate, then the coordinate is given this value in 12d Model.

Create ss pipes and drainage pits tick box

*if **not ticked**, the string created by ADAC are super strings with no diameters.*

*If **ticked**, ADAC pipes are created as super strings with round or box sections.*

*If **ticked and you have the drainage module**, Sewerage MaintenanceHoles and Stormwater Pits create a pit on a one vertex drainage string, and the pit geometry is defined by the ADAC elements.*

Create drainage network tick box

*If **ticked and you have the drainage module**, 12d Model will try to join the Sewerage MaintenanceHoles and NonPressurePipes into Sewer lines, and the Stormwater Pits and Pipes into drainage lines.*

However, ADAC has no information about which Pits/MaintenanceHoles go with which Pipes, so the results can only be a best guess.

If the ADAC XML file was created by 12d Model from 12d Model drainage and sewer strings, then extra information is added to the ADAC XML data so that the original networks can be reconstructed.

When drainage strings are created, they are given a name starting with StormWater *so to map them when reading in the data you will need an entry in the **Base** node of the Map File with* StormWater* *as the* **Key**.

When sewer strings are created, they are given a name starting with Sewerage *so to map them when reading in the data you will need an entry in the **Base** node of the Map File with* Sewerage* *as the* **Key**.

Keep temporary 12da file tick box

when an ADAC XML file is being imported, a temporary 12da file is created.

*If **not ticked**, the temporary 12da file is deleted.*

*If **ticked**, the temporary 12da file is not deleted.*

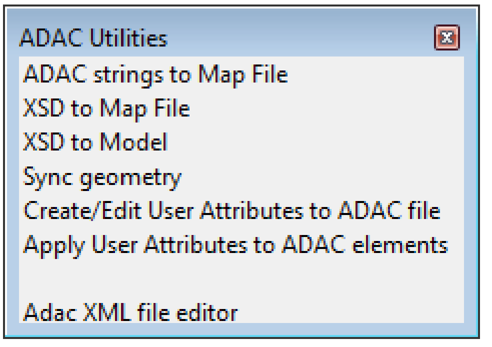
Import button

when clicked, the ADAC XML file is processed and the ADAC data imported into 12d Model.

Continue to the next section 10.4.8 ADAC Utilities or return to 10.4 12d ADAC Menu .

10.4.8 ADAC Utilities

Position of menu: **File I/O =>ADAC =>Utilities**



See

- 10.4.8.1 ADAC Strings to Map File
- 10.4.8.2 XSD to Map File
- 10.4.8.3 XSD to Model
- 10.4.8.4 Sync Geometry
- 10.4.8.5 Create/Edit User Attributes to ADAC File
- 10.4.8.6 Apply User Attributes to ADAC Elements
- 10.4.8.7 ADAC XML File Editor

10.4.8.1 ADAC Strings to Map File

Position of option on menu: **File I/O =>ADAC =>Utilities =>ADAC strings to Map File**

ADAC strings to Map File takes the selected strings representing *ADAC Assets* and creates a **Map File** from them in the following way:

For applications that **don't** have ***12d Model*** drainage or sewer strings:

each ADAC string creates a row in the *Attributes>String* grid of the ***Map File*** with the **string name** followed by a * placed in the **Name** column. The first string attribute's name, type and value is placed in the **Att Key** column, and the **ADAC attribute group** placed in the **Map Attributes** column.

For applications that **do** have ***12d Model*** drainage or sewer strings then have the **User Vertex and segment attributes** tick box **ticked** and

(a) each ADAC *Sewerage>MaintenanceHoles>MaintenanceHole* string creates a row in the *Attributes>Vertex/Pit* grid of the ***Map File*** with * placed in the **Name** column, an Integer attribute named **sewertype** with value **1**, placed in the **Att Key** column. The first string attribute's name, type and value is placed in the **Vertex Att Key** column and the **ADAC attribute group** placed in the **Map Attributes** column. The string name is written to **Comment** column.

(b) each ADAC *StormWater>Pits>Pit* string creates a row in the *Attributes>Vertex/Pit* grid of the ***Map File*** with * placed in the **Name** column, an Integer attribute named **sewertype** with value **0**, placed in the **Att Key** column. The first string attribute's name, type and value is placed in the **Vertex Att Key** column and the **ADAC attribute group** placed in the **Map Attributes** column. The string name is written to **Comment** column.

(c) each ADAC *Sewerage>PipesNonPressure>PipeNonPressure* string creates a row in the *Attributes>Segment/Pipe* grid of the ***Map File*** with * placed in the **Name** column, an Integer attribute named **sewertype** with value **1**, placed in the **Att Key** column. The first string attribute's name, type and value is placed in the **Segment Att Key** column and the **ADAC attribute group** placed in the **Map Attributes** column. The string name is written to **Comment** column

(d) each ADAC *StormWater>Pipes>Pipe* string creates a row in the *Attributes>Segment/Pipe* grid of the ***Map File*** with * placed in the **Name** column, an Integer attribute named **sewertype** with value **0**, placed in the **Att Key** column. The first string attribute's name, type and value is placed in the **Segment Att Key** column and the **ADAC attribute group** placed in the **Map Attributes** column. The string name is written to **Comment** column.

(e) all other ADAC strings create a row in the *Attributes>String* grid of the ***Map File*** with the **string name** followed by a * placed in the **Name** column, and the first string attribute's name, type and value placed in the **Att Key** column, and the **ADAC attribute group** placed in the **Map Attributes** column.

For example, if you had a model with three ADAC Assets in it

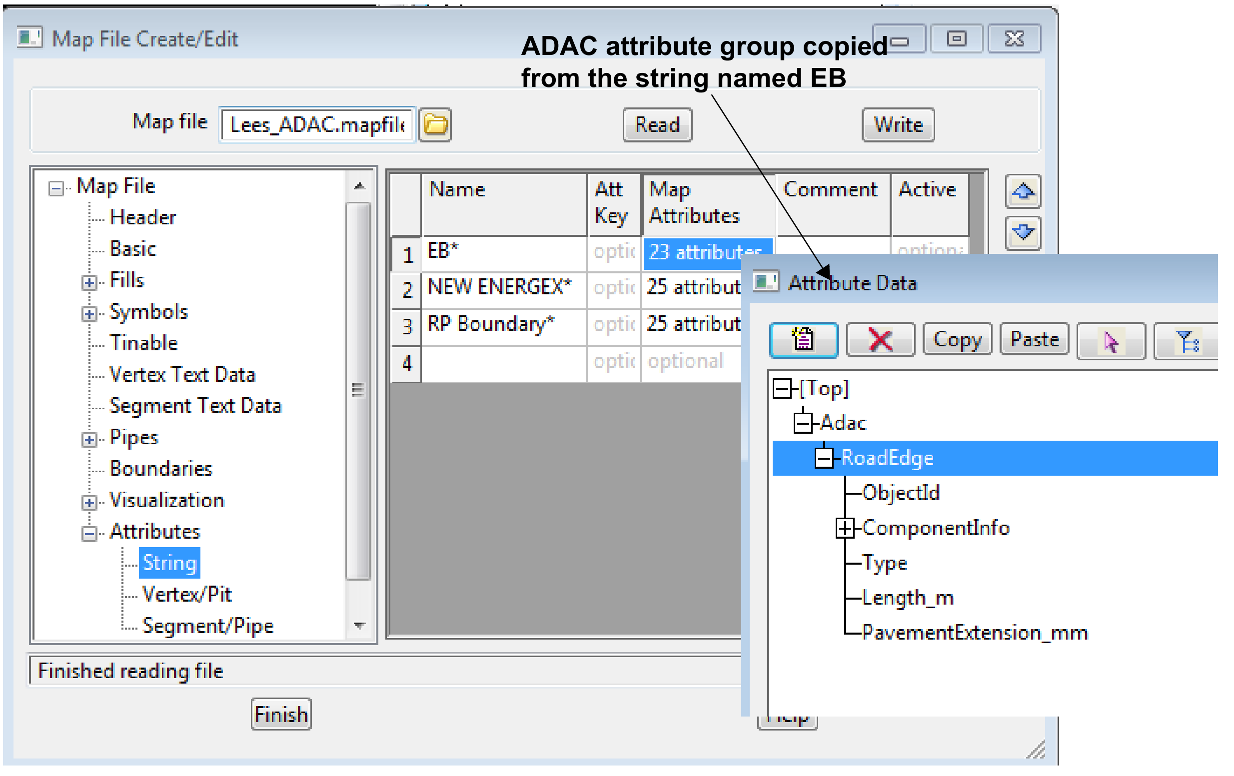
(a) a Road Edge with the string name EB

(b) an ElectricalConduit with string name NEW ENERGEX

and

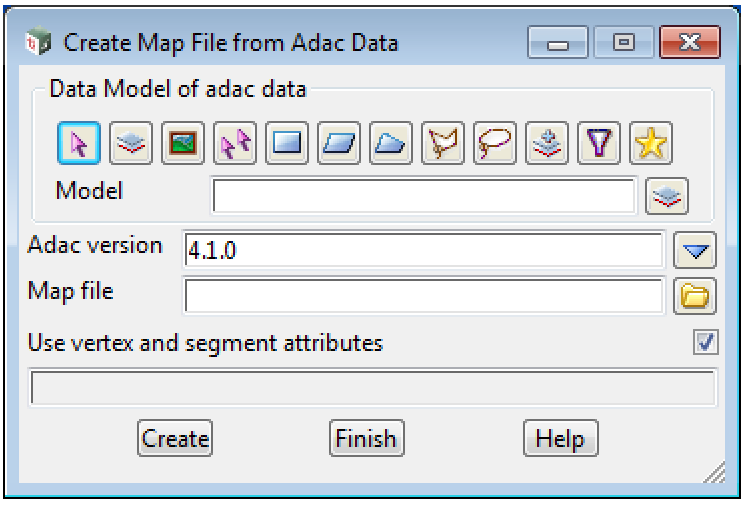
(c) a Lot with string name RP Boundary

then running the option **Assets to Map File** creates a ***Map File*** with three entries in the *Attributes >Strings* section:



Assets to Map File is the best method for creating a **12d Map File** to be used in the ADAC Survey and Designers Chains.

Selecting **Assets to Map file** brings up the **Create Map File from ADAC Data** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source *.*

Data source	input		

source of ADAC Asset data to create a 12d Map File from.

ADAC version choice box from env.4d 4.0.0, 4.1.0

this field is optional, but if it is set, then only strings representing ADAC Assets of this version of the ADAC XML Schema will have entries created in the Map File.

Map file file box *.mapfile, *.mf files

*the name of the **12d Map File** that is created and has the **Attributes >String** section.*

For each string that is an ADAC Asset of the ADAC version given in the **Version** *field, create a row in the Attributes >String section of the this **Map File** with the name of the string followed by an * in the **Name** column, and in the same row, all the string's string attributes in the Adac group are copied to the **Map Attributes** column*

See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

User vertex and segment attributes tick box not ticked

*if **not ticked**, each ADAC string creates an entry in the Attributes >String section of the Map File.*

*If **ticked,** ADAC Sewerage>MaintenanceHoles>MaintenanceHole and StormWater>Pits>Pit create entries in the Attributes>Vertex/Pit section of the Map File, ADAC Sewerage>PipesNonPressure>PipeNonPressure and StormWater>Pipes>Pipe create entries in the Attributes>Segment/Pipe section of the Map File, and all other ADAC strings create entries in the Attributes >String section of the Map File.*

Create button

*when clicked, the **Map File** is created.*

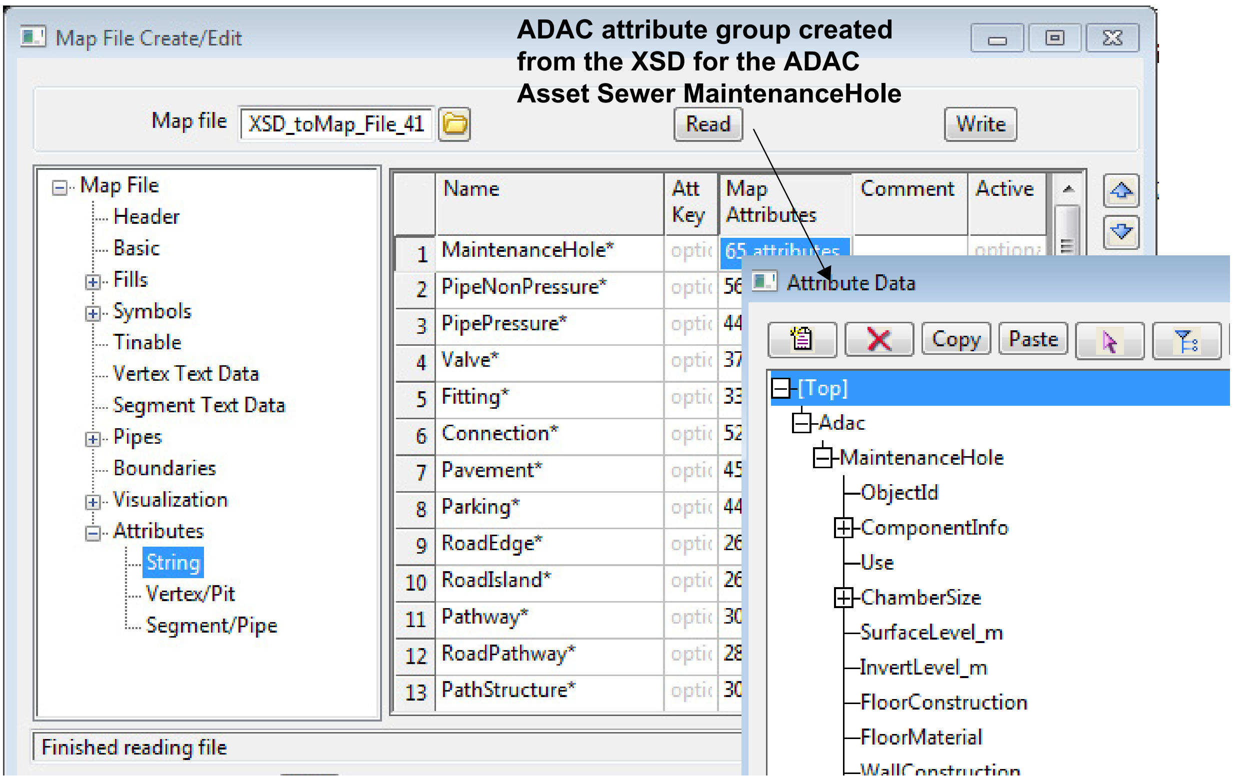
Continue to the next section 10.4.8.2 XSD to Map File or return to 10.4.8 ADAC Utilities .

10.4.8.2 XSD to Map File

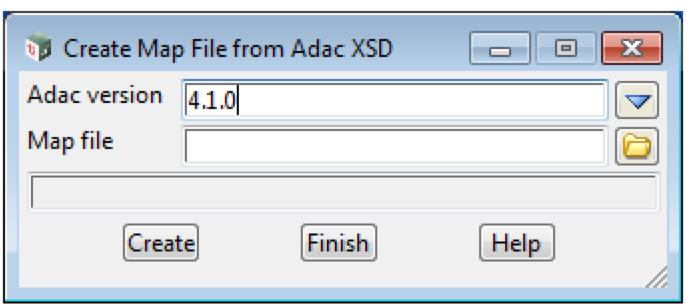
Position of option on menu: **File I/O =>ADAC =>Utilities =>XSD to Map File**

XSD to Map File takes the *ADAC XML Schema* XSD for a given version and creates a **12d Map File** (or just **Map file**), and in the *Attributes >String section*, creates a row for each Asset type in the XSD (sixty-eight of them) with the short name of the ADAC Asset followed by an * in the **Name** column, and in the same row, creates an ADAC group of attributes for that Asset type in the **Map Attributes** column with default values for each of the ADAC elements in the ADAC group.

For example, running the **XSD to Map File** option for ADAC XML version 4.1.0 Schema, creates the **Map File**:



Selecting **XSD to Map file** brings up the **Create Map File from ADAC XSD** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
ADAC version	choice box	from env.4d	4.0.0, 4.1.0

this is the ADAC XML XSD to create the 12d Map File from.

Map file file box *.mapfile, *.mf files

*the name of the **Map File** that is created. And in the **Attributes >String** section, for each ADAC Asset in the XSD a row is created with the short name for the ADAC asset followed by an * in the **Name** column, and in the same row, an ADAC group is created in the **Map Attributes** column of the type, and all the elements in the XSD for that ADAC Asset are copied as attributes into the ADAC group.*

See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Create button

*when clicked, the **Map File** is created.*

Continue to the next section 10.4.8.3 XSD to Model or return to 10.4.8 ADAC Utilities .

10.4.8.3 XSD to Model

Position of option on menu: **File I/O =>ADAC =>Utilities =>XSD to model**

XSD to Model takes a given version of the *ADAC XML Schema* XSD and, for each ADAC Asset in the XSD, creates a super string using:

(a) the short name of the ADAC Asset as the string name

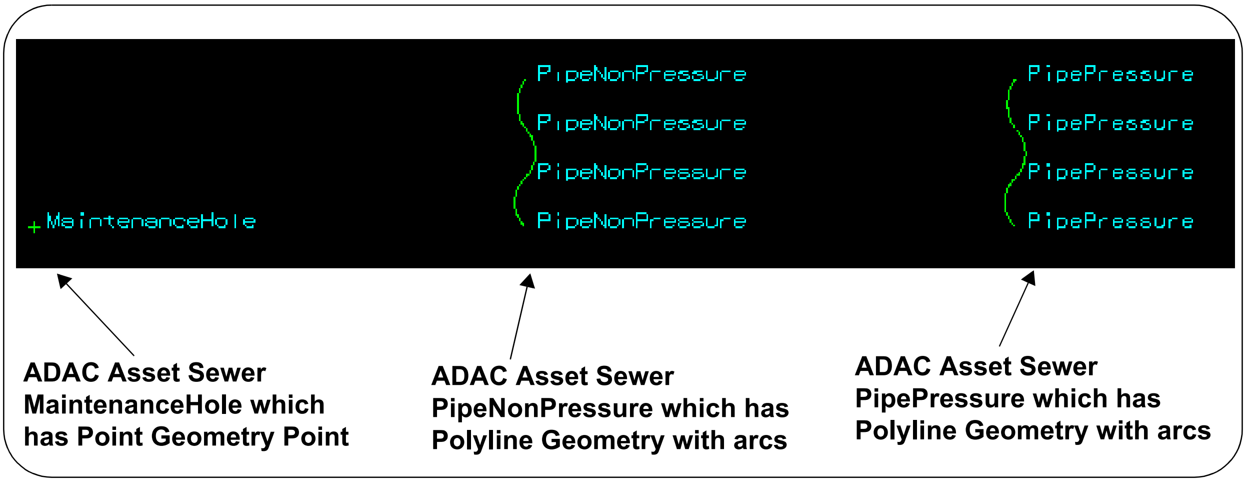
(b) in the string attributes, an ADAC group with default values for each of the ADAC elements

(c) the ADAC Asset Geometry with default values as the string geometry

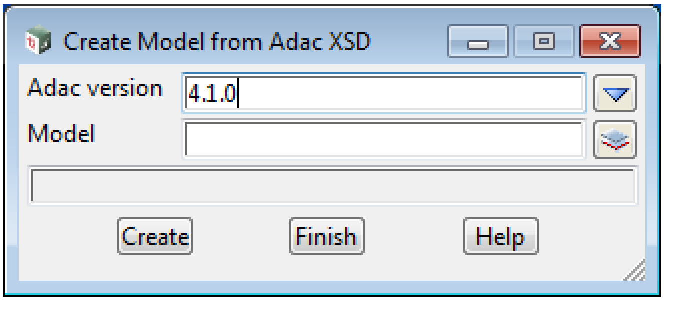
(d) green for the string colour.

So there will be sixty-eight strings created for ADAC versions 4.1 or 4.0.

For example, running the **XSD to model** option for ADAC XML version 4.1.0 Schema creates a **model**, and the first three strings in that model are:



Selecting **XSD to model** brings up the **Create Model from ADAC XSD** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
ADAC version	choice box	from env.4d	4.0.0, 4.1.0

this is the ADAC XML XSD to create the strings for.

Field Description	Type	Defaults	Pop-Up
Model	model box		available models

for each ADAC Asset in the XSD, a super string is created using:

(a) the short name of the ADAC Asset as the string name

(b) in the string attributes, an ADAC group with default values for each of the ADAC elements

(c) the ADAC Asset Geometry with default values as the string geometry

(d) green for the string colour.

These ADAC strings are added to this model.

See the section 8.8.1 Create/Edit a Map File *for information about 12d map files.*

Create button

when clicked, the model of strings for ADAC Assets in the XSD is created.

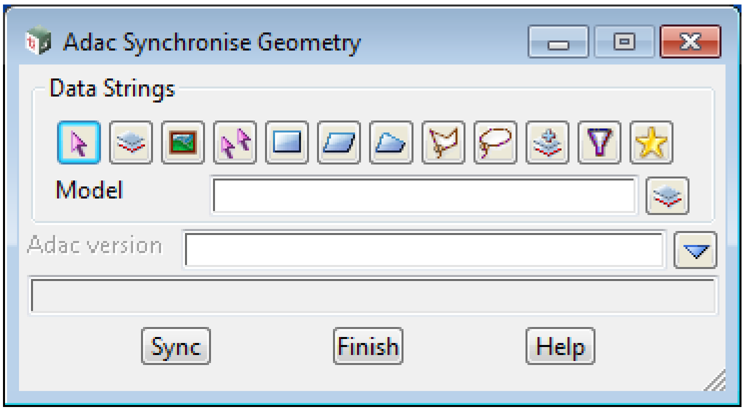
Continue to the next section 10.4.8.4 Sync Geometry or return to 10.4.8 ADAC Utilities .

10.4.8.4 Sync Geometry

Position of option on menu: **File I/O =>ADAC =>Utilities =>Sync geometry**

Sync geometry takes selected strings representing ADAC Assets and updates the Geometry section of the ADAC attributes for the string with the actual geometry of the string.

Selecting **Sync geometry** brings up the **ADAC Synchronise Geometry** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source .

Data source	input		

source of data to process. The ADAC Asset strings will have their ADAC Geometry attributes updated.

ADAC version	choice box	from env.4d	4.0.0, 4.1.0

this field is optional but if it is set, then only strings representing ADAC Assets of this version of the ADAC XML Schema will have their ADAC Geometry updated.

Sync	button		

when clicked, the selected data will have its ADAC Geometry attributes updated from the actual string geometry.

Continue to the next section 10.4.8.5 Create/Edit User Attributes to ADAC File or return to 10.4.8 ADAC Utilities .

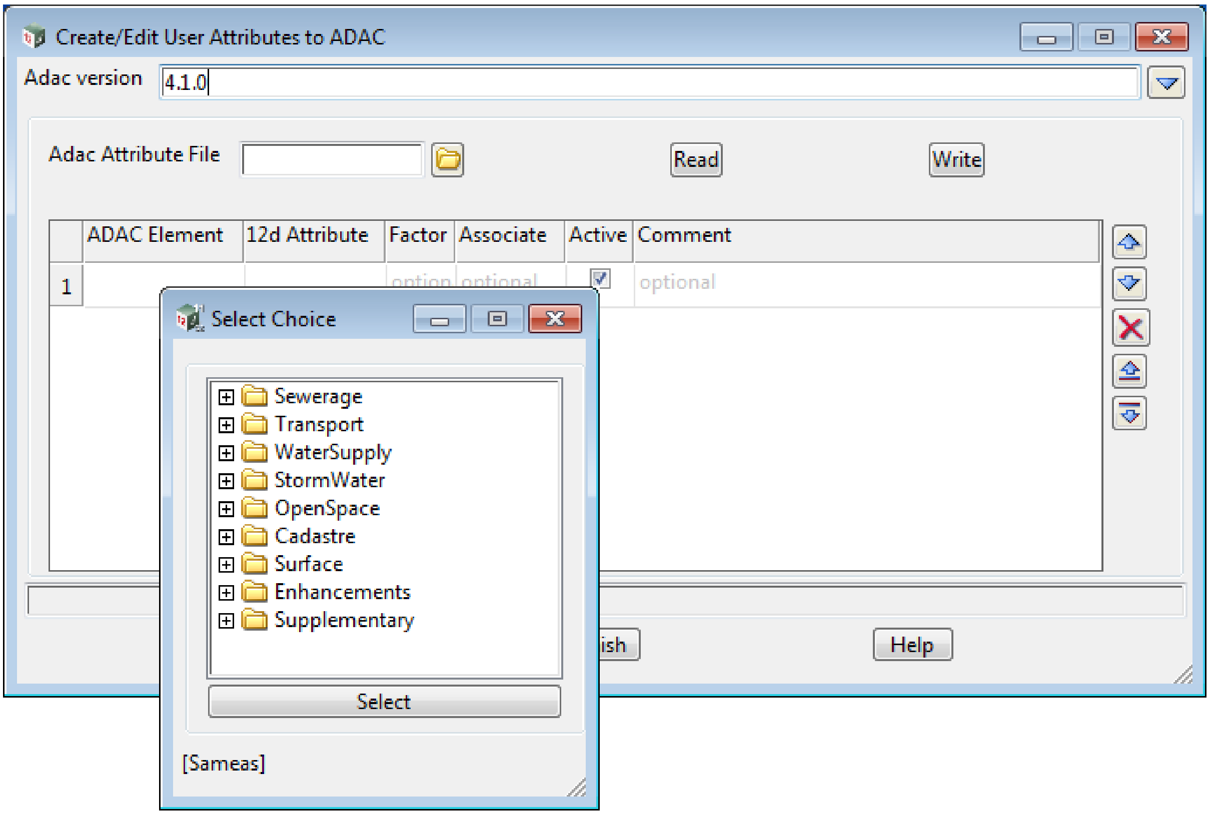
10.4.8.5 Create/Edit User Attributes to ADAC File

Position of option on menu: **File I/O =>ADAC =>Utilities =>Create/Edit User Attributes to ADAC file**

This option creates and edits a **12duaf** file which defines what 12d string, vertex or segment User attributes are used to update user specified ADAC Asset element values.

The **12duaf** file is used to update the values in ADAC Assets by the **Apply User Attributes to ADAC** panel (see 10.4.8.6 Apply User Attributes to ADAC Elements).

Selecting **Create/Edit User Attributes to ADAC file** brings up the **Create/Edit User Attributes to ADAC** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
ADAC version	choice box	from env.4d	4.0.0, 4.1.0

the version of the ADAC XML Schema that the ADAC Asset elements are from. The version is necessary because the names can change between versions.

Field Description	Type	Defaults	Pop-Up
ADAC Attributes file	file box		*.12duaf files

name of the 12d User Attribute to ADAC file to read or write.

Read button

click on this button and the file given in the **ADAC Attribute file** *field is read in and loaded into the editor.*

Write button

writes out the data in the editor to the file given in the **ADAC Attribute file** *field.*

12duaf File Grid

when an 12duaf file is read in, it is displayed in the 12duaf tree.

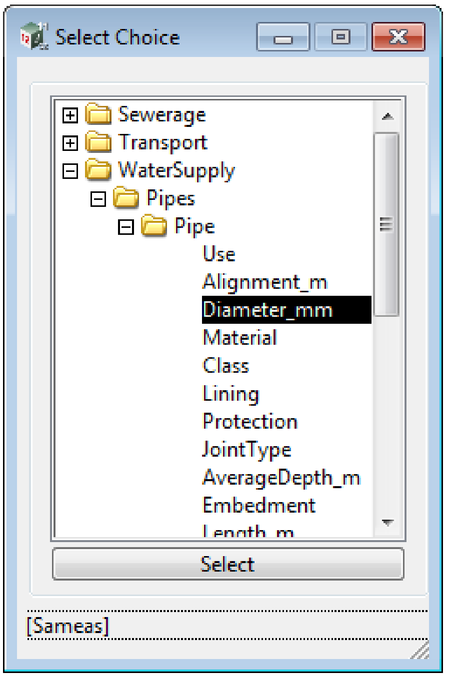
ADAC Element text column

the full name of the ADAC element to have its value updated.

For example,

WaterSupply/Pipes/Pipe/Diameter_mm

*The name can be typed in but it is easiest to select it from the ADAC Schema by clicking RB in the **ADAC Element** row and expanding the tree and double clicking on the required ADAC element.*



*This ADAC element is given the value from the same row of the following **12d Attribute**, **multiplied**, when appropriate, by **Factor** when Factor is non zero.*

12d Attribute text column

*the full path name of the **12d User Attribute** with*

String/ *preceding the name if it is a **String Attribute**.*

Vertexn/ *preceding the name if it is a **Vertex Attribute** on the **n**'th vertex.*

Segmentn/ *preceding the name if it is a **Segment Attribute** on the **n**'th segment.*

For example,

Vertex1/Survey/Diameter

*is the Vertex attribute called **Survey/Diameter** on vertex 1*

*Note that **case** is important in **User Attribute** names.That is, upper and lower case characters are considered different.*

Factor real column

*for a row where **Factor** is non zero, the value of the* **ADAC Element** *column is set equal to the value in the* **12d Attribute** *column multiplied by the value in the* **Factor** *column.*

*For example, **Factor** would be set to 1000 if the **12d Attribute** was in metres and the **ADAC Element** was in millimetres.*

Active tick box tick

*if **ticked**, use this row of the grid.*
*If **not ticked**, do not use this row of the grid.*

Comment text

a comment for this row of the grid

Buttons at Bottom

Validate button

when clicked, check that the ADAC Element names against the appropriate ADAC Schema.

Continue to the next section 10.4.8.6 Apply User Attributes to ADAC Elements or return to 10.4.8 ADAC Utilities .

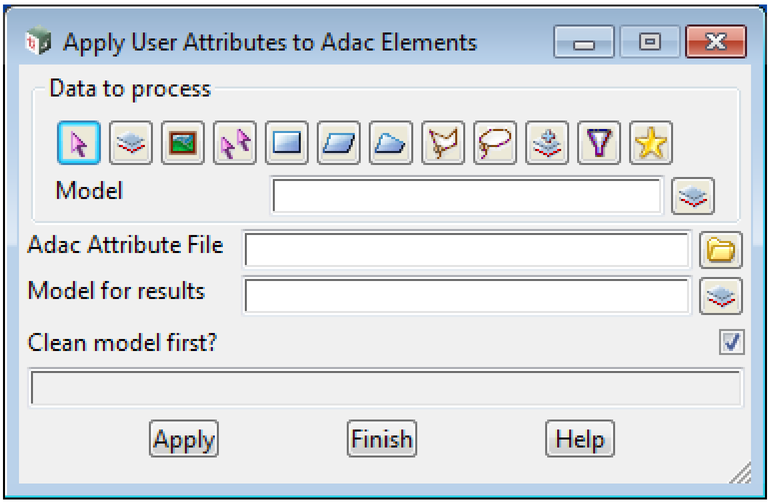
10.4.8.6 Apply User Attributes to ADAC Elements

Position of option on menu: **File I/O =>ADAC =>Utilities =>Apply User Attributes to ADAC elements**

This option applies a **12duaf** file to ADAC Assets to update the *ADAC elements* with values from the 12d *User Attributes* of the ADAC Asset string.

The **12duaf** file is created and edited by the **Create/Edit User Attributes to ADAC** panel (see 10.4.8.5 Create/Edit User Attributes to ADAC File).

Selecting **Apply User Attributes to ADAC elements** brings up the **Apply User Attributes to ADAC Elements** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to process. The ADAC Asset strings will have the ADAC Elements updated by User Attributes.

ADAC Attributes file	file box		*.12duaf files

name of the 12d User Attribute to ADAC file to use.

Model for results	model box		available models

model that the processed strings are added to.

Clean model first ?	tick box		

*if **ticked**, the model* **Model for results** *is cleaned before any strings are added to it.*
*If **not ticked**, the model* **Model for results** *is NOT cleaned.*

Apply	button		

when clicked, the selected data will have any ADAC Elements updated by User Attributes according to the selected 12duaf file.

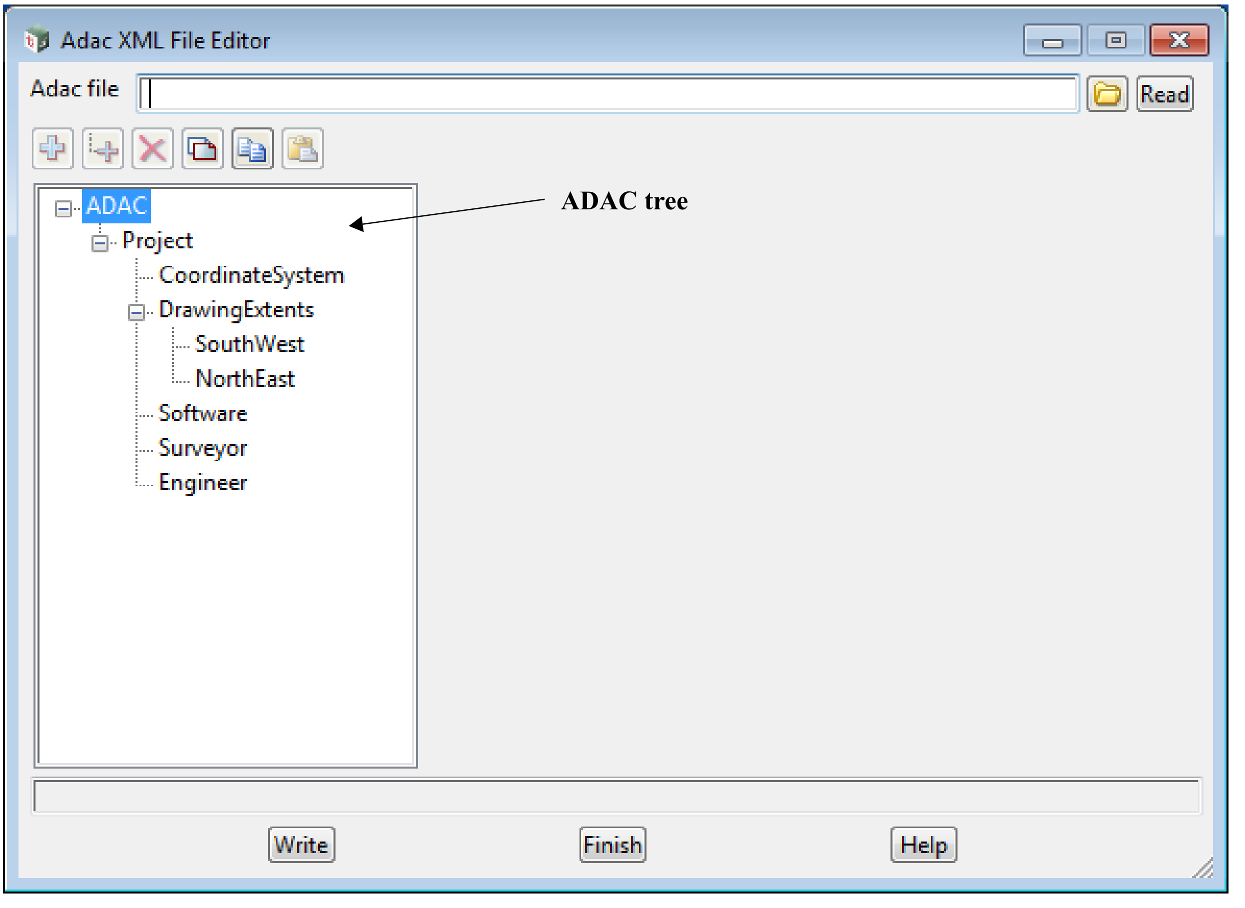
Continue to the next section 10.4.8.7 ADAC XML File Editor or return to 10.4.8 ADAC Utilities .

10.4.8.7 ADAC XML File Editor

Position of option on menu: **File I/O =>ADAC =>Utilities =>ADAC file editor**

ADAC XML file editor reads an ADAC XML file and loads it into the **ADAC XML File Editor**.

Selecting **ADAC file editor** brings up the **ADAC XML File Editor** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
ADAC XML file	file box		*.XML files

name of the XML file to read or write.

Read button

click on this button and the file given in the **ADAC XML file** *field is read in and loaded into the editor.*

ADAC tree

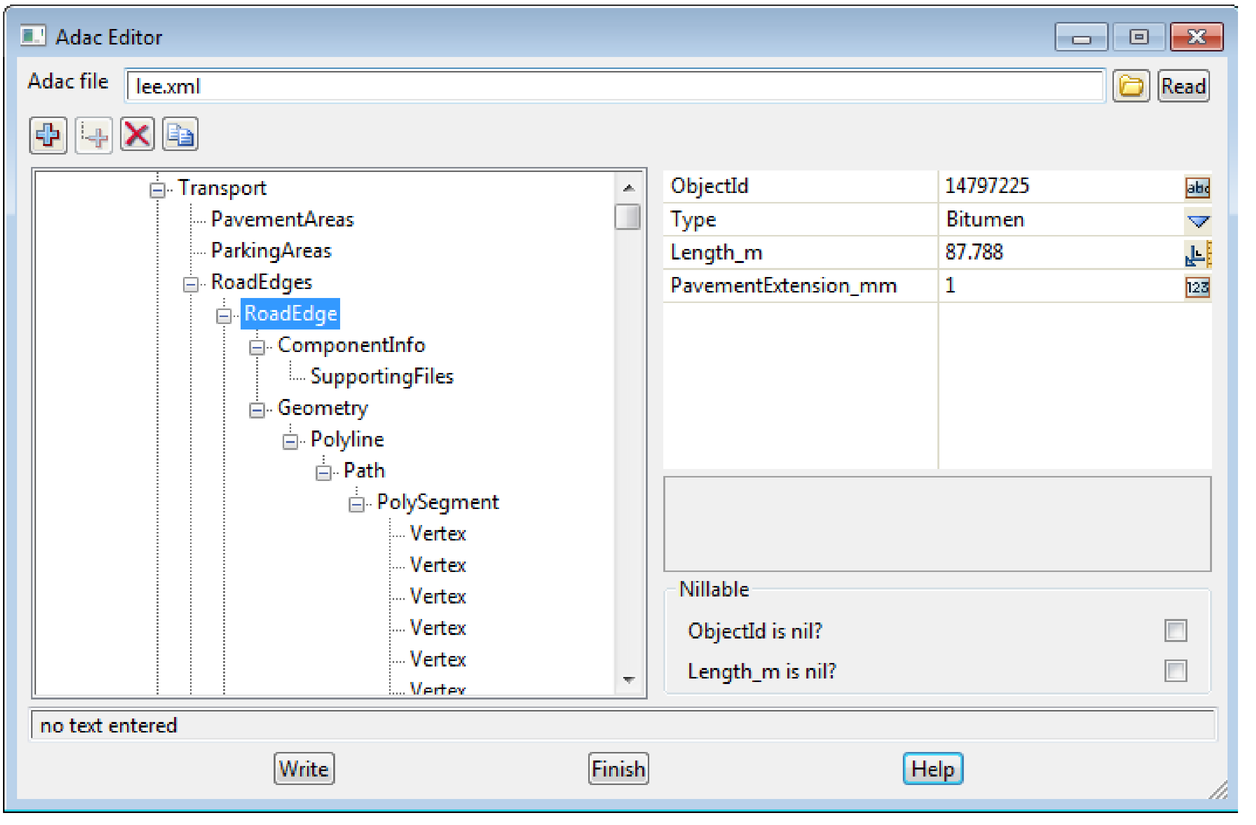
when an ADAC XML file is read in, it is displayed in the ADAC tree.

Elements in the tree can be edited according to the ADAC XSD. New ADAC Assets can also be added.

Write button

writes out the data in the editor to the file given in the **ADAC XML file** *field.*

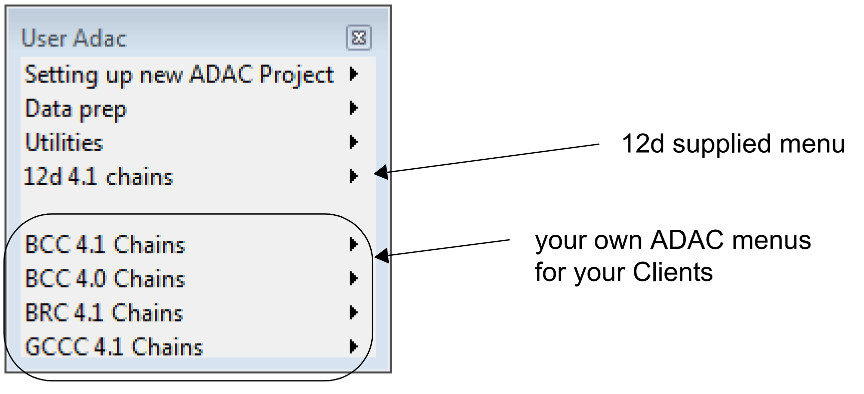
As an example,



Return to 10.4.8 ADAC Utilities .

10.4.9 User ADAC

Position of menu: **File I/O =>ADAC =>User**



See

10.4.9.1 Setting Up a New ADAC Project
10.4.9.2 Data Prep
10.4.9.3 User ADAC Utilities

The easiest way to run the ADAC *Survey* or *Design* chains with specific pvf files is to run them from a menu. This can be done in two ways:

(a) Running Specific Map and 12duaf files from Local and User_Lib

12d Model provides options on the walk right menu **Run 12d ADAC 4.1 Chains** on the option **12d 4.1 chains** to run ADAC *Survey* or *Design* chains for ADAC 4.1 with specially named Map and 12duaf files in the working folder for the project (local), or User_Lib or Library.

See 10.4.9.4 12d 4.1 Chains.

(b) Running Client Specific Map and 12duaf files

Once you are producing ADAC files for different Clients, you may need to produce different ADAC versions, or need different Map or 12duaf files.

For example you may need to use a different naming convention, or the information required in the ADAC assets is different.

For these situations, you can add your own options to **User Adac** menu.

The user options can run either the ADAC Base Survey or Design chains with Client specific chain pvf files.

For information on setting up your own options on the **User ADAC** menu, see 10.4.9.5 Client Specific ADAC Design & Survey Menus.

Or return to 10.4.8 ADAC Utilities.

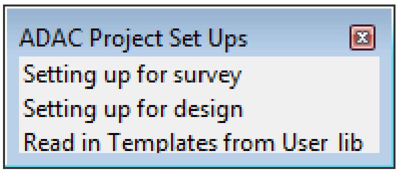
10.4.9.1 Setting Up a New ADAC Project

Position of menu: **File I/O =>ADAC =>User =>Setting up a new ADAC Project**

A new project for producing ADAC XML needs to be set up a certain way for the ADAC Chains to work.

There is a different setup for a **Survey** Project to that for a **Design** Project.

ADAC Header and Asset templates can also be read in from the file **ADAC_Templates.12da** in User_Lib.



See

10.4.9.1.1 Setting Up for Survey
10.4.9.1.2 Setting Up for Design
10.4.9.1.3 Reading in Templates from User_Lib

10.4.9.1.1 Setting Up for Survey

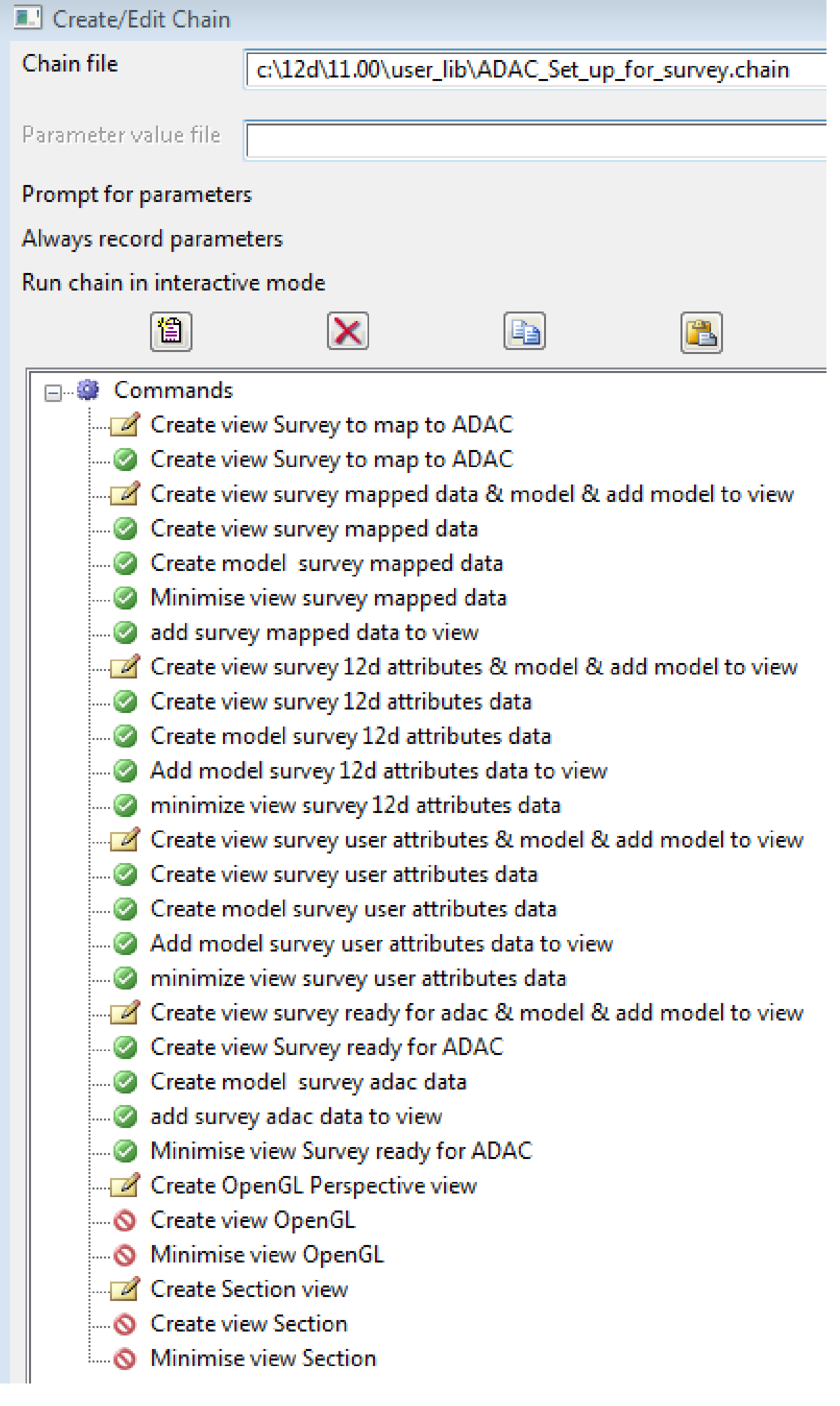
Position of option on menu:

File I/O =>ADAC =>User =>Setting up a new ADAC Project =>Setting up for survey

Setting up for survey runs the Chain ***ADAC_Set_up_for_survey.chain***, which is in *$LIB.*

This chain creates some new Plan views and some models which are added to the views, and the views then minimised.

The Plan views and models are used by the ADAC Survey Chain.



Continue to the next section 10.4.9.1.2 Setting Up for Design or return to 10.4.9.1 Setting Up a New ADAC Project.

10.4.9.1.2 Setting Up for Design

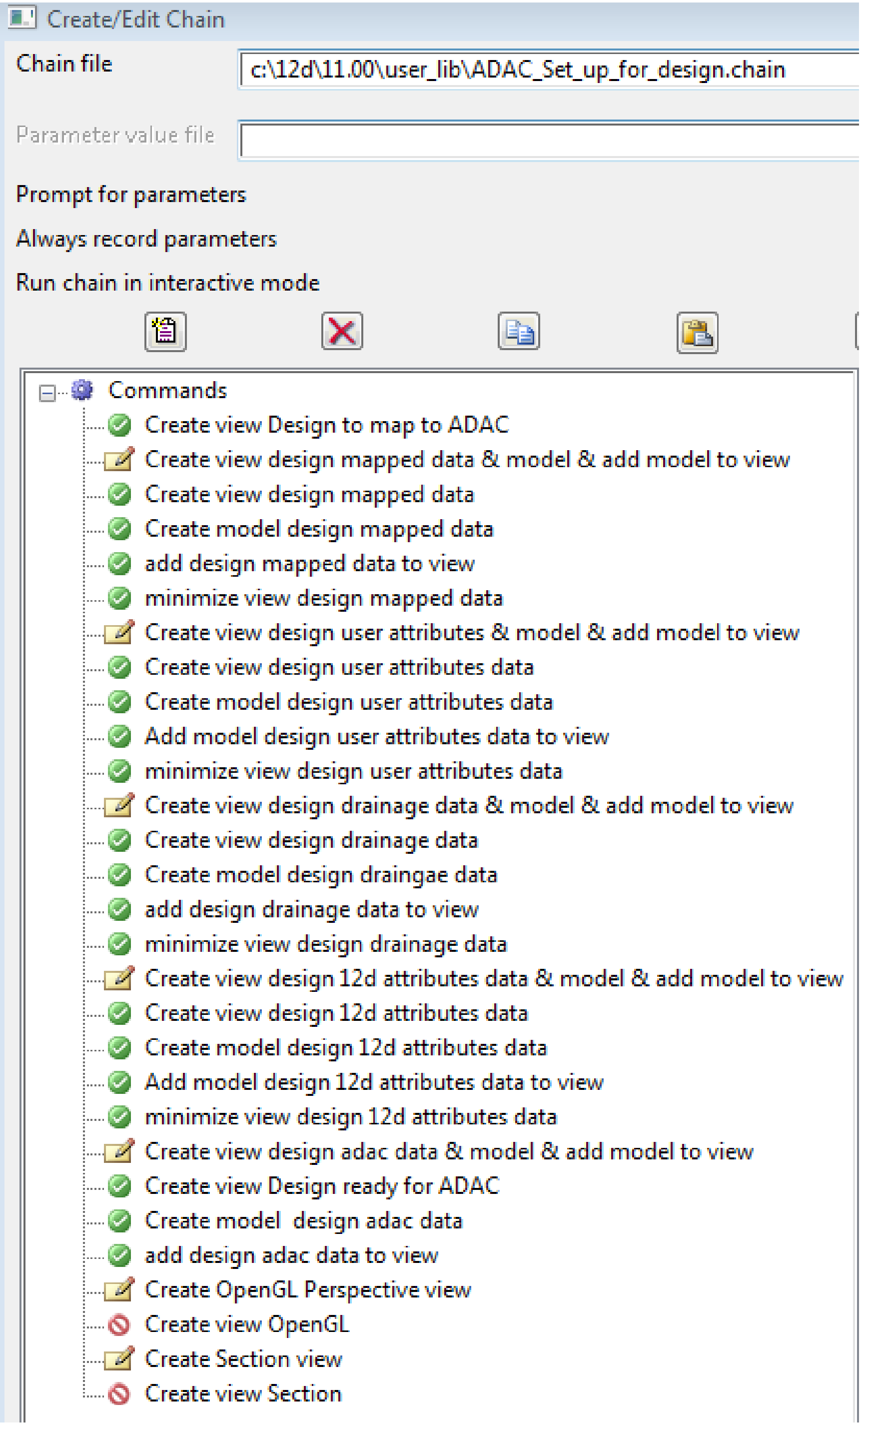
Position of option on menu:

File I/O =>ADAC =>User =>Setting up a new ADAC Project =>Setting up for design

Setting up for design runs the Chain ***ADAC_Set_up_for_design.chain***.which is in *$LIB*

This chain creates some new Plan views and some models which are added to the views, and the views then minimised.

The Plan views and models are used by the ADAC Design Chain.



Continue to the next section 10.4.9.1.3 Reading in Templates from User_Lib or return to 10.4.9.1 Setting Up a New ADAC Project.

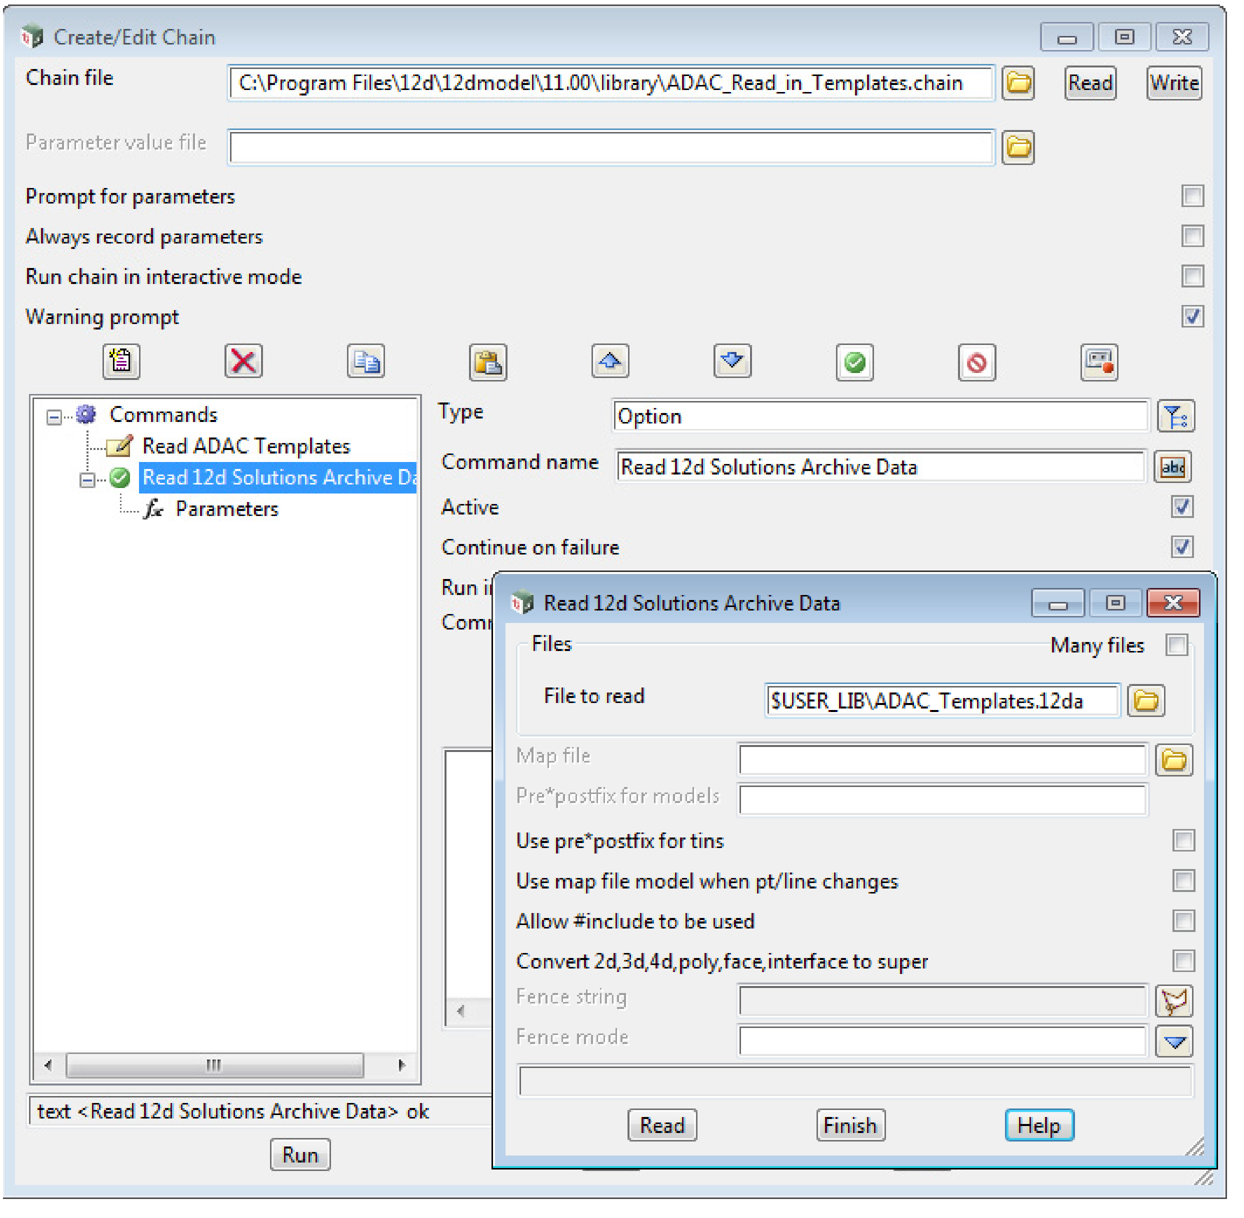
10.4.9.1.3 Reading in Templates from User_Lib

Position of option on menu:

File I/O =>ADAC =>User =>Setting up a new ADAC Project =>Read in templates from User_Lib

Reading Templates from User_Lib runs the Chain ***ADAC_Read_in_Templates.chain*** which is in *Library.*

This chain reads in the file ***ADAC_Templates.4da*** from *User_Lib*.



So if you have created Header and Assets Templates then by writing the models ***ADAC Header Templates*** and ***ADAC Asset Templates*** which contain the Templates out to this then this option can be used to read them into a new project.

For information on ADAC Header and Asset Templates, see 10.6.4 Setting Up ADAC Templates .

Return to 10.4.9.1 Setting Up a New ADAC Project .

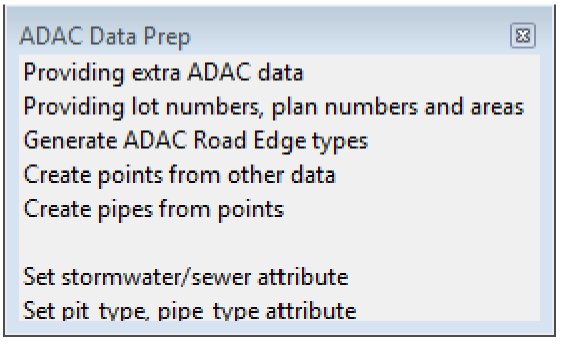
10.4.9.2 Data Prep

Position of menu: **File I/O =>ADAC =>User =>Data prep**

When you start with a Survey and Design in ***12d Model***, not all the information required for ADAC will necessarily be there. In fact, some of the ADAC information may even be added at a later stage by someone other than the Surveyor or Designer.

Similarly, some of the strings may not be of the correct type to become an ADAC Asset. For example, a string may not have the correct geometry as defined for the ADAC Asset in the *ADAC XML Schema XSD*.

So before running an ADAC Survey or ADAC Design chain, one or more of the **ADAC Data Prep** options may need to be run to prepare the strings that will become ADAC Assets.



See

10.4.9.2.1 Providing Extra Data for ADAC

10.4.9.2.2 Providing Lot and Plan Numbers and Areas for ADAC

10.4.9.2.3 Generate ADAC Road Edge Types

10.4.9.2.4 Create Points from Other Data

10.4.9.2.5 Create Pipes from Points

10.4.9.2.6 Set Stormwater/Sewer Property

10.4.9.2.7 Set a Drainage-Sewer Pit and Pipe Type Attribute

10.4.9.2.1 Providing Extra Data for ADAC

Position of option on menu: File I/O =>ADAC =>User =>Data prep =>Providing extra ADAC data

This option creates, as string attributes, information that is required for ADAC but is not normally part of a survey or a design.

The extra information is stored as attributes with the string, but not as ADAC attributes. A macro in the *ADAC Survey* or *ADAC Design* chain moves them into ADAC attributes. See (10.5.1.2.4 Update ADAC Elements from 12d Created Attributes on the String - Survey)

A major reason not to create ADAC attributes straightaway is that although this option allows you to enter the values, in the future the values might already exist in another form and routines written to automatically get them. In this case it will be much easier for anyone to put them into a simpler attribute structure and not have to know anything about the complex ADAC attribute structure.

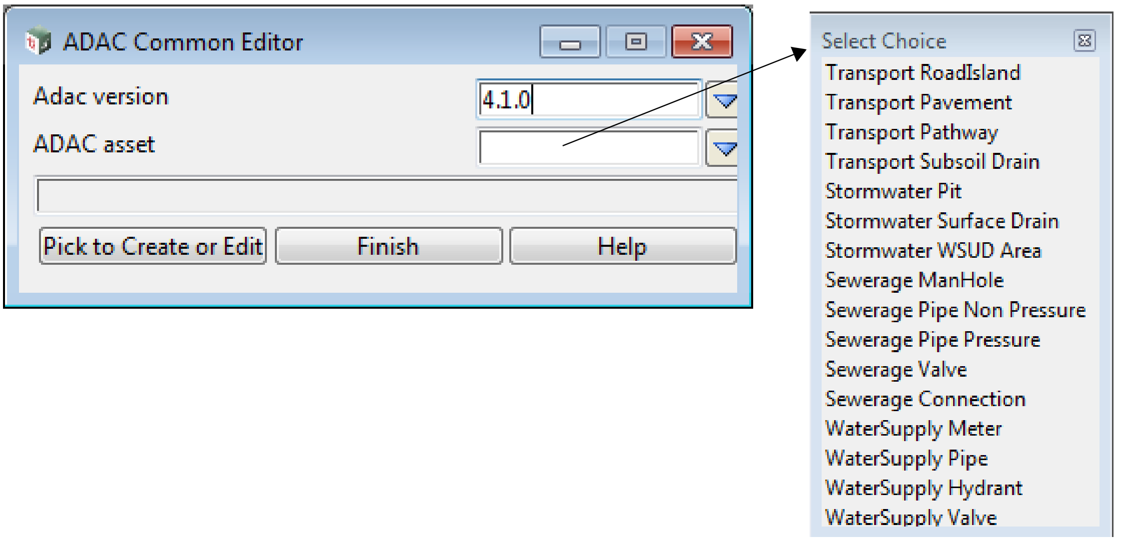
Another reason is that at this stage the *ADAC Survey* and *Design* chains have not been run to mark strings as ADAC Assets and set up the ADAC attributes group.

And when the *ADAC Survey* and *Design* chains are run, at each step in the chain they work with copies of the original data and clean out the models from a previous run rather than updating the original data. This is for safety so that it is easy to see that each step in the chain has worked, and if there is a problem, the chains can be run again and again.

So placing the attributes on the original data ensures they will still be there when the *ADAC Survey* or *Design* chains are rerun.

One important thing to keep in mind when running this option is that although you are using it to set up attributes that will go to ADAC, when you are picking the strings they are not yet marked as ADAC Assets. So you have to know **what ADAC Asset** the string is **going to become**.

Selecting **Providing extra data for ADAC** brings up the **ADAC Common Editor** panel

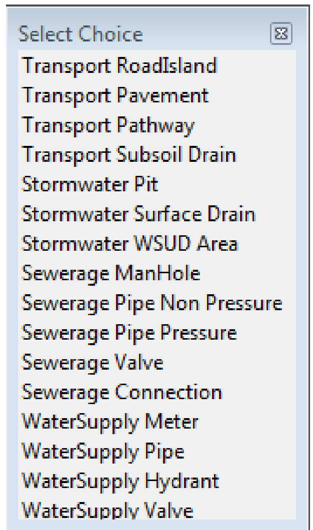


The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
ADAC version	choice box	from env.4d	4.0.0, 4.1.0

because the strings to be picked have not yet been marked as ADAC Assets, you need to let the option know what the ADAC version is going to be. This is required so that the correct ADAC Schema XSD is used to get information for the choices.

ADAC asset choice box



the ADAC Asset that this string will become.

Pick to Create or Edit button

click on the button and then pick a string.

If the picked string already has attributes set by this option then those values will be displayed and can be edited.

If the picked string has not yet had attributes set by this option AND **ADAC asset** *has a value, then a panel with the attributes that this option can set for the given* **ADAC asset** *is displayed and then created for the picked string.*

10.4.9.2.1.1 Transport RoadIsland
10.4.9.2.1.2 Transport Pavement
10.4.9.2.1.3 Transport Pathway
10.4.9.2.1.4 Transport Subsoil Drain
10.4.9.2.1.5 Stormwater Pit
10.4.9.2.1.6 Stormwater Surface Drain
10.4.9.2.1.7 Stormwater WSUD Area
10.4.9.2.1.8 Sewerage Maintenance Hole

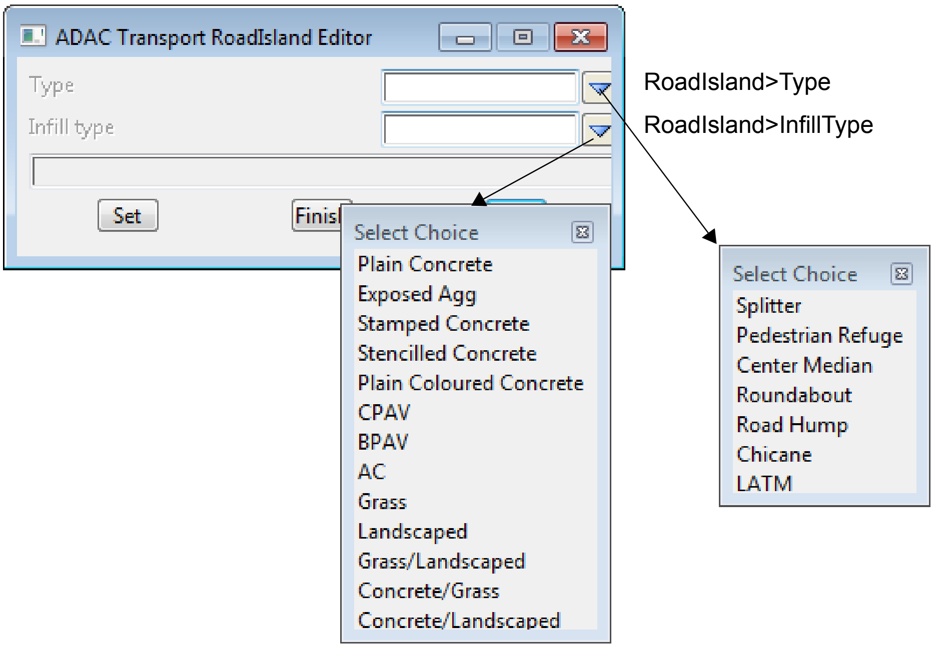
10.4.9.2.1.15 Water Supply Hydrant Editor
10.4.9.2.1.16 Water Supply Valve Editor

10.4.9.2.1.1 Transport RoadIsland

The choice of ***Transport RoadIsland*** brings up a panel for setting parameters that will become the values for the ADAC attributes **Type** and **InfillType** for the ADAC Asset ***Transport>RoadIslands>RoadIsland.***

Because the option knows the *ADAC Schema* version and the *ADAC Asset,* the choices for **Type** and **InfillType** come from the *ADAC XSD*.

The selected string must be a Polygon with straight or arc segments.



Set writes the values in the panel as string attributes.

Clicking **Finish** removes the panel and replaces it with the ADAC Common Editor panel so another value of ADAC Asset can be chosen.

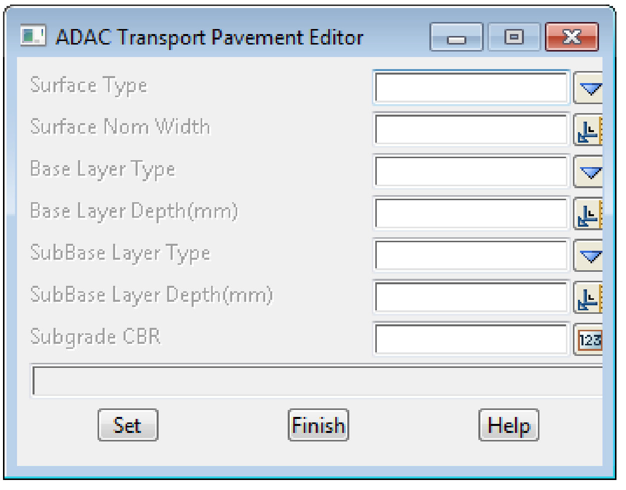
Continue to the next section 10.4.9.2.1.2 Transport Pavement or return to 10.4.9.2.1 Providing Extra Data for ADAC .

10.4.9.2.1.2 Transport Pavement

The choice of ***Transport Pavement*** brings up a panel for setting some of the parameters for the ADAC Asset ***Transport>Pavement Areas>Pavement.***

Because the option knows the ADAC version and the ADAC Asset, the types for the attributes and any pop-up choices all come from the ADAC XSD.

The selected string must be a Polygon with straight or arc segments.



Surface>SurfaceType
Surface>SurfaceNomWidth_m
PavementStructure>BaseLayer>LayerType
PavementStructure>BaseLayer>LayerDepth_mm
PavementStructure>SubBaseLayer>LayerType
PavementStructure>SubBaseLayer>LayerDepth_mm
Subgrade>CBR

Set writes the values in the panel as string attributes.

Clicking **Finish** removes the panel and replaces it with the ADAC Common Editor panel so another value of ADAC Asset can be chosen.

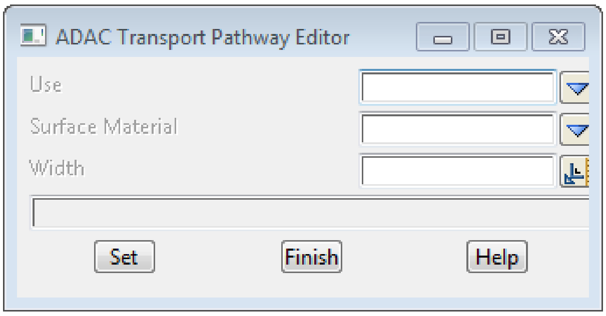
Continue to the next section 10.4.9.2.1.3 Transport Pathway or return to 10.4.9.2.1 Providing Extra Data for ADAC .

10.4.9.2.1.3 Transport Pathway

The choice of ***Transport Pathway*** brings up a panel for setting some of the parameters for the ADAC Asset ***Transport>Pathways>Pathway.***

Because the option knows the ADAC version and the ADAC Asset, the types for the attributes and any pop-up choices all come from the ADAC XSD.

The selected string must be a Polyline with straight or arc segments.



Pathway>Use

Pathway>SurfaceMaterial

Pathway>Width_m

Set writes the values in the panel as string attributes.

Clicking **Finish** removes the panel and replaces it with the ADAC Common Editor panel so another value of ADAC Asset can be chosen.

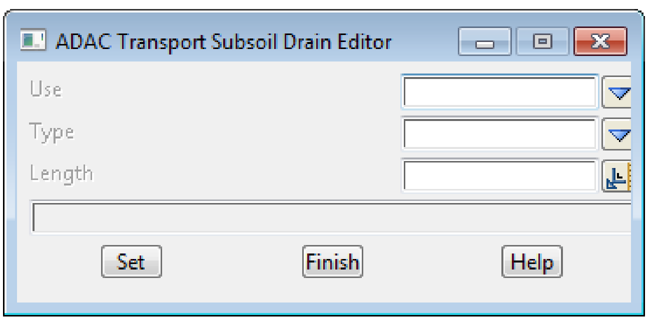
Continue to the next section 10.4.9.2.1.4 Transport Subsoil Drain or return to 10.4.9.2.1 Providing Extra Data for ADAC .

10.4.9.2.1.4 Transport Subsoil Drain

The choice of ***Transport Subsoil Drain*** brings up a panel for setting some of the parameters for the ADAC Asset ***Transport>SubSoilDrains>SubSoilDrain***

Because the option knows the ADAC version and the ADAC Asset, the types for the attributes and any pop-up choices all come from the ADAC XSD.

The selected string must be a Polyline with only straight segments.



SubSoilDrain>Use

SubSoilDrain>Type

SubSoilDrain>Lenght_m

Set writes the values in the panel as string attributes.

Clicking **Finish** removes the panel and replaces it with the ADAC Common Editor panel so another value of ADAC Asset can be chosen.

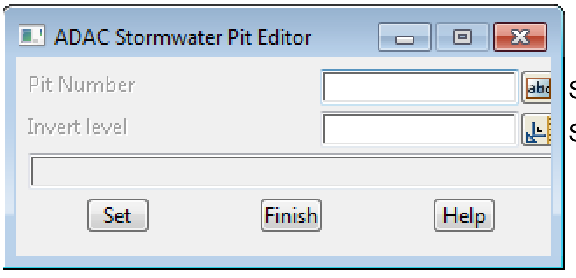
Continue to the next section 10.4.9.2.1.5 Stormwater Pit or return to 10.4.9.2.1 Providing Extra Data for ADAC .

10.4.9.2.1.5 Stormwater Pit

The choice of ***Stormwater Pit*** brings up a panel for setting some of the parameters for the ADAC Asset ***StormWater>Pits>Pit***

Because the option knows the ADAC version and the ADAC Asset, the types for the attributes and any pop-up choices all come from the ADAC XSD.

The selected string must be a one vertex string.



StormWater>Pits>PitNumber

StormWater>Pits>dimensions_point_levels_m>InvertLevel_m

Set writes the values in the panel as string attributes.

Clicking **Finish** removes the panel and replaces it with the ADAC Common Editor panel so another value of ADAC Asset can be chosen.

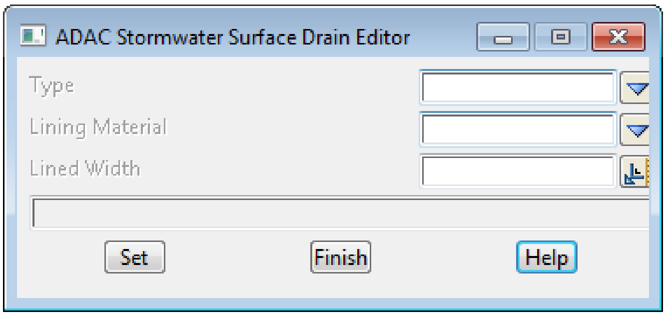
Continue to the next section 10.4.9.2.1.6 Stormwater Surface Drain or return to 10.4.9.2.1 Providing Extra Data for ADAC .

10.4.9.2.1.6 Stormwater Surface Drain

The choice of ***Stormwater Surface Drain*** brings up a panel for setting some of the parameters for the ADAC Asset ***StormWater>SurfaceDrains>SurfaceDrain***

Because the option knows the ADAC version and the ADAC Asset, the types for the attributes and any pop-up choices all come from the ADAC XSD.

The selected string must be a Polyline with only straight segments.



StormWater>SubSurfaceDrain>Type

StormWater>SubSurfaceDrain>LiningMaterial

StormWater>SubSurfaceDrain>LinedWidth_m

Set writes the values in the panel as string attributes.

Clicking **Finish** removes the panel and replaces it with the ADAC Common Editor panel so another value of ADAC Asset can be chosen.

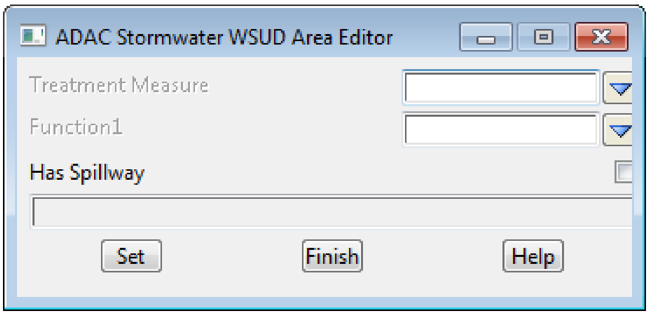
Continue to the next section 10.4.9.2.1.7 Stormwater WSUD Area or return to 10.4.9.2.1 Providing Extra Data for ADAC .

10.4.9.2.1.7 Stormwater WSUD Area

The choice of ***Stormwater WSUD Area*** brings up a panel for setting some of the parameters for the ADAC Asset ***StormWater>WSUDAreas>WSUDArea.***

Because the option knows the ADAC version and the ADAC Asset, the types for the attributes and any pop-up choices all come from the ADAC XSD.

The selected string must be a Polyline with straight or arc segments.



StormWater>WSUDArea>TreatmentMeasure

StormWater>WSUDArea>Function1

StormWater>WSUDArea>HasSpillway

Set writes the values in the panel as string attributes.

Clicking **Finish** removes the panel and replaces it with the ADAC Common Editor panel so another value of ADAC Asset can be chosen.

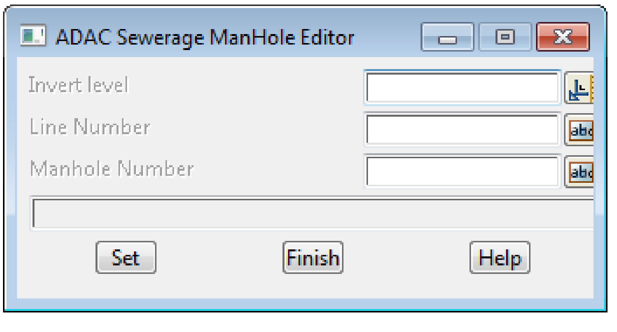
Continue to the next section 10.4.9.2.1.8 Sewerage Maintenance Hole or return to 10.4.9.2.1 Providing Extra Data for ADAC .

10.4.9.2.1.8 Sewerage Maintenance Hole

The choice of ***Sewerage Maintenance Hole*** brings up a panel for setting some of the parameters for the ADAC Asset ***Sewerage>MaintenanceHoles>MaintenanceHole***

Because the option knows the ADAC version and the ADAC Asset, the types for the attributes and any pop-up choices all come from the ADAC XSD.

The selected string must be a one vertex string.



MaintenanceHole>InvertLevel_m

MaintenanceHole>LineNumber

MaintenanceHole>MH_Number

Set writes the values in the panel as string attributes.

Clicking **Finish** removes the panel and replaces it with the ADAC Common Editor panel so another value of ADAC Asset can be chosen.

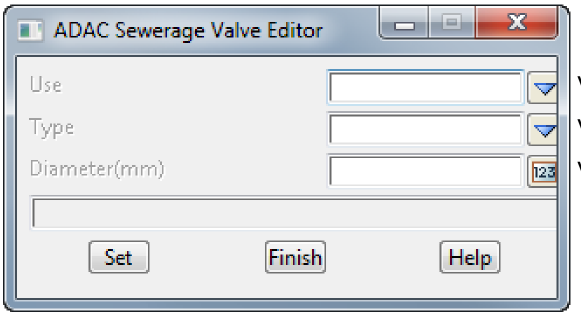
10.4.9.2.1.11 Sewerage Valve Editor

The choice of ***Sewerage Valve*** brings up a panel for setting some of the parameters for the ADAC Asset ***Sewerage>Valves>Valve***

Because the option knows the ADAC version and the ADAC Asset, the types for the attributes and any pop-up choices all come from the ADAC XSD.

The selected string must be a one vertex string.



Valve>Use

Valve>Type

Valve>Diameter_mm

Set writes the values in the panel as string attributes.

Clicking **Finish** removes the panel and replaces it with the ADAC Common Editor panel so another value of ADAC Asset can be chosen.

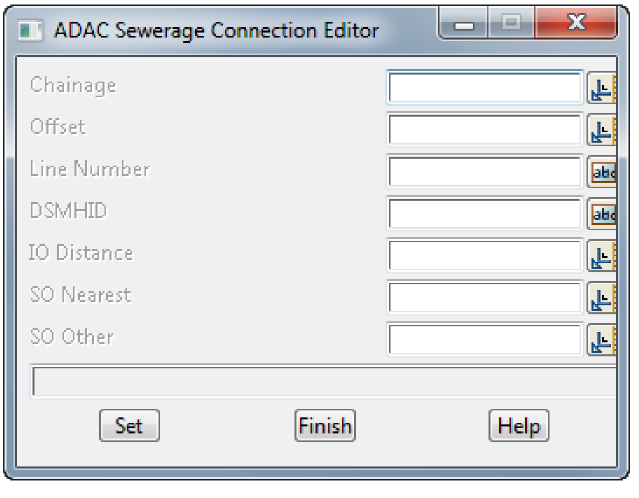
Continue to the next section 10.4.9.2.1.12 Sewerage Connection Editor or return to 10.4.9.2.1 Providing Extra Data for ADAC .

10.4.9.2.1.12 Sewerage Connection Editor

The choice of ***Sewerage Connection*** brings up a panel for setting some of the parameters for the ADAC Asset ***Sewerage>Connections>Connection***

Because the option knows the ADAC version and the ADAC Asset, the types for the attributes and any pop-up choices all come from the ADAC XSD.

The selected string must be a polyline which may include arcs.



Connection>Chainage_m

Connection>Offset_m

Connection>LineNumber

Connection>DSMHID

Connection>IO_Distance_m

Connection>SO_Nearest_m

Connection>SO_Other_m

Set writes the values in the panel as string attributes.

Clicking **Finish** removes the panel and replaces it with the ADAC Common Editor panel so another value of ADAC Asset can be chosen.

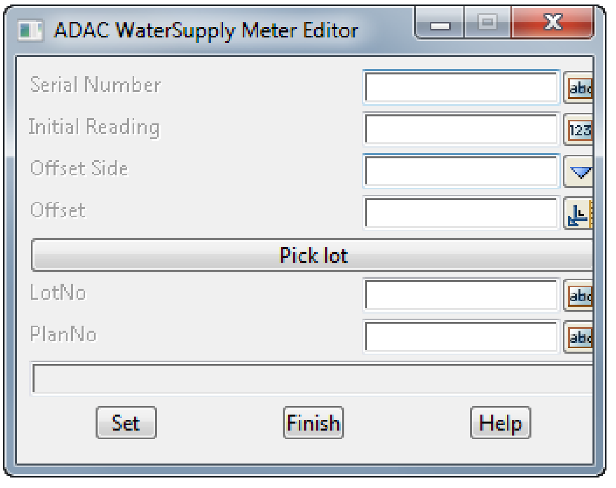
Continue to the next section 10.4.9.2.1.13 Water Supply Meter Editor or return to 10.4.9.2.1 Providing Extra Data for ADAC .

10.4.9.2.1.13 Water Supply Meter Editor

The choice of ***WaterSupply Meter*** brings up a panel for setting some of the parameters for the ADAC Asset ***WaterSupply>Meters>Meter***

Because the option knows the ADAC version and the ADAC Asset, the types for the attributes and any pop-up choices all come from the ADAC XSD.

The selected string must be a one vertex string.



Meter>SerialNumber

Meter>InitialReading

Meter>OffsetSide

Meter>Offset_m

Meter>Group: lot_plan_details>LotNo

Meter>Group: lot_plan_details>PlanNo

Pick lot - after clicking on **Pick lot,** if a polygon is selected that has Lot and Plan attributes set using the **Provide lot numbers, plan numbers and areas** option (see 10.4.9.2.2 Providing Lot and Plan Numbers and Areas for ADAC), then the values for LotNo and PlanNo are written into the **LotNo** and **PlanNo** fields.

Set writes the values in the panel as string attributes.

Clicking **Finish** removes the panel and replaces it with the ADAC Common Editor panel so another value of ADAC Asset can be chosen.

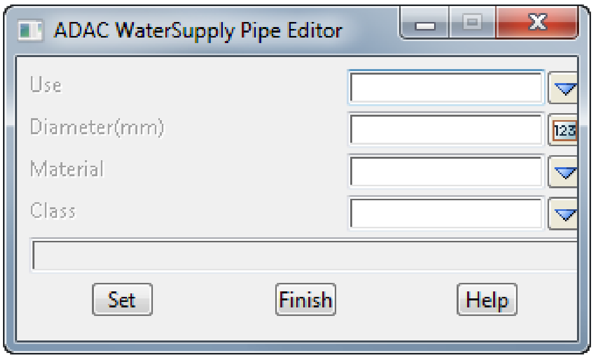
Continue to the next section 10.4.9.2.1.14 Water Supply Pipe Editor or return to 10.4.9.2.1 Providing Extra Data for ADAC .

10.4.9.2.1.14 Water Supply Pipe Editor

The choice of ***WaterSupply Pipe*** brings up a panel for setting some of the parameters for the ADAC Asset ***WaterSupply>Pipes>Pipe***

Because the option knows the ADAC version and the ADAC Asset, the types for the attributes and any pop-up choices all come from the ADAC XSD.

The selected string must be a polyline but only with straight segments.



Pipe>Use

Pipe>Diameter_mm

Pipe>Material

Pipe>Class

Set writes the values in the panel as string attributes.

Clicking **Finish** removes the panel and replaces it with the ADAC Common Editor panel so another value of ADAC Asset can be chosen.

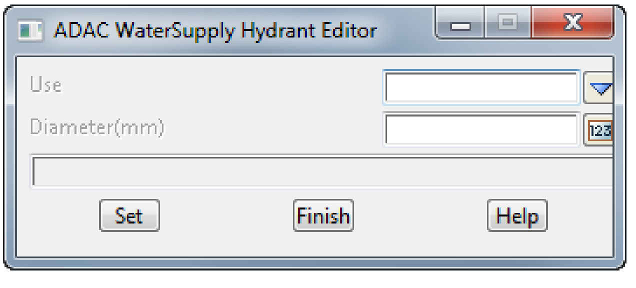
Continue to the next section 10.4.9.2.1.15 Water Supply Hydrant Editor or return to 10.4.9.2.1 Providing Extra Data for ADAC .

10.4.9.2.1.15 Water Supply Hydrant Editor

The choice of ***WaterSupply Hydrant*** brings up a panel for setting some of the parameters for the ADAC Asset ***WaterSupply>Hydrants>Hydrant***

Because the option knows the ADAC version and the ADAC Asset, the types for the attributes and any pop-up choices all come from the ADAC XSD.

The selected string must be a one vertex string.



Hydrant>Use

Hydrant>Diameter_mm

Set writes the values in the panel as string attributes.

Clicking **Finish** removes the panel and replaces it with the ADAC Common Editor panel so another value of ADAC Asset can be chosen.

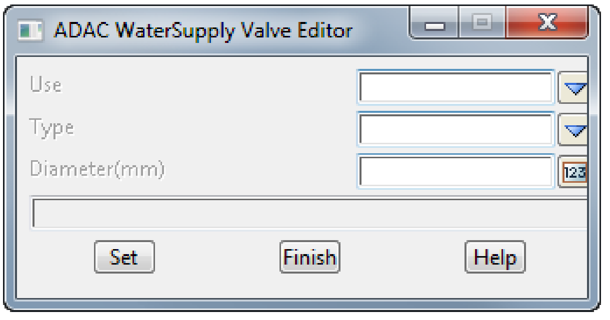
Continue to the next section 10.4.9.2.1.16 Water Supply Valve Editor or return to 10.4.9.2.1 Providing Extra Data for ADAC .

10.4.9.2.1.16 Water Supply Valve Editor

The choice of ***WaterSupply Valve*** brings up a panel for setting some of the parameters for the ADAC Asset ***WaterSupply>Valves>Valve***

Because the option knows the ADAC version and the ADAC Asset, the types for the attributes and any pop-up choices all come from the ADAC XSD.

The selected string must be a one vertex string.



Valve>Use

Valve>Type

Valve>Diameter_mm

Set writes the values in the panel as string attributes.

Clicking **Finish** removes the panel and replaces it with the ADAC Common Editor panel so another value of ADAC Asset can be chosen.

Continue to the next section 10.4.9.2.2 Providing Lot and Plan Numbers and Areas for ADAC or return to 10.4.9.2 Data Prep .

10.4.9.2.2 Providing Lot and Plan Numbers and Areas for ADAC

Position of menu:

File I/O =>ADAC =>User =>Data prep =>Providing lot numbers, plan numbers and areas

This option creates as string attributes: Plan numbers, Lot numbers and areas of lots. The area is calculated from the lot polygon, but that can be manually changed. However, having the actual area there to start with usually means that only the last couple of digits need to be entered.

The extra information is stored as attributes with the string, but not as ADAC attributes. A macro in the *ADAC Survey* or *ADAC Design* chain moves them into ADAC attributes. See (10.5.1.2.4 Update ADAC Elements from 12d Created Attributes on the String - Survey)

A major reason not to create ADAC attributes straightaway is that although this option allows you to enter the values, in the future the values might already exist in another form and routines written to automatically get them. In this case it will be much easier for anyone to put them into a simpler attribute structure and not have to know anything about the complex ADAC attribute structure.

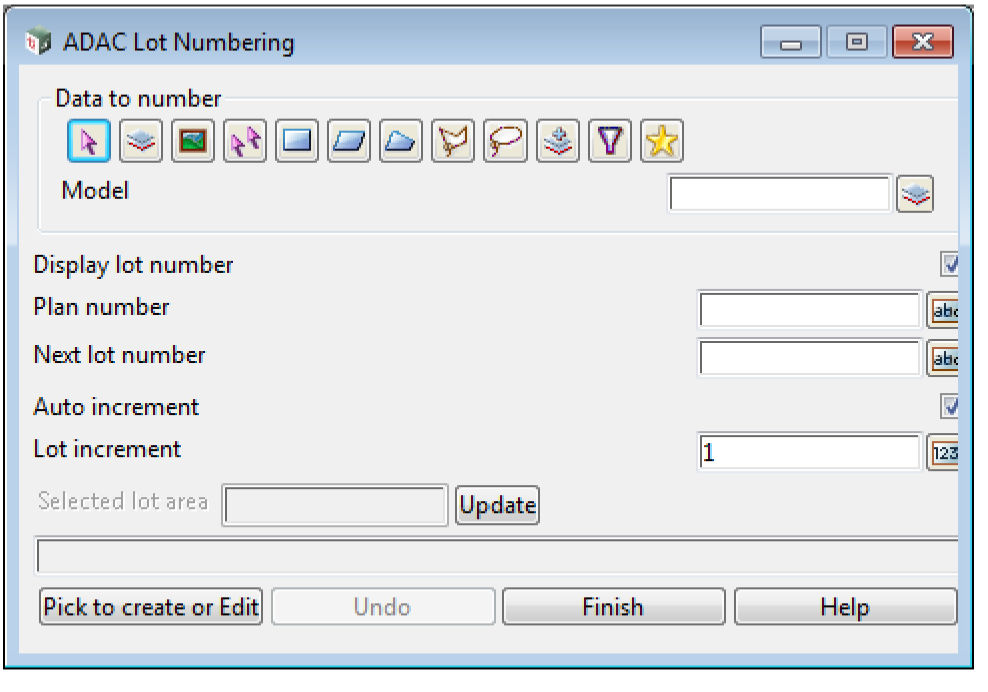
Another reason is that at this stage the *ADAC Survey* and *Design* chains have not been run to mark strings as ADAC Assets and set up the ADAC attributes group.

Also, when the *ADAC Survey* and *Design* chains are run, at each step in the chain they work with copies of the original data and clean out the models from a previous run rather than updating the original data. This is for safety so that it is easy to see that each step in the chain has worked, and if there is a problem, the chains can be run again and again.

So placing the attributes on the original data ensures they will still be there when the *ADAC Survey* or *Design* chain is rerun.

One important thing to keep in mind when running this option is that although you are using it to set up Lot attributes that will go to ADAC, when you are picking the strings they are not yet marked as ADAC *Cadastre>LandParcels>Lot* Assets. So you have to know **what ADAC Asset** that the string is **going to become** in ADAC *Cadastre>LandParcels>Lot***.**

Selecting **Providing lot number, plan numbers and areas** brings up the **Lot Numbering and Areas** panel:



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source .

Data source input

source of data that is be searched for any existing lot numbers and if they exist, the minimum and maximum existing lot numbers are written to the panel's message area and the highest lot number plus the **Lot increment** *is written to the* **Next lot no.** *field.*

If a Model is selected by MB same as, you need to type <Enter> after it for the search to go ahead.

Display lot number tick box tick

if ***ticked****, the lot numbers for existing lots are temporarily displayed on the view.*

If ***not ticked,*** *the lot numbers are not temporarily displayed on the view.*

Plan number text box

number of the plan the lots are from.

Next lot number text box

the next lot number to use.

Auto increment tick box tick

if ***ticked****, as each lot number is labelled, the* **Next lot number** *is incremented by the* **Lot increment**

If ***not ticked,*** *the* **Next lot number** *field is not incremented.*

Lot increment number box 1

the amount to increment the **Next lot number** *by.*

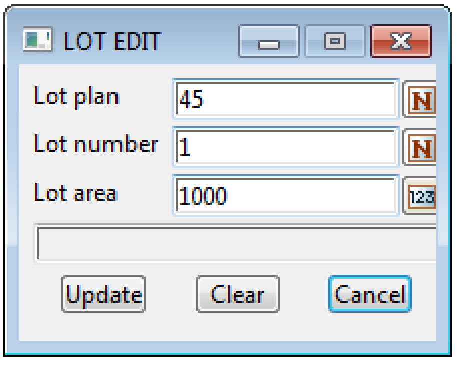
Selected lot area real box

when a string that is not already a lot is selected, the area of the string is calculated and written to this field. If a different area is required, change the value in this field and click **Update**.

Pick to Create or Edit button

click on the button and then pick a string.

If the picked string already has Lot attributes set by this option (or other options) then those values will be displayed in the **Lot Edit** *panel, and modified and saved by clicking* **Update** *on that panel.*



If the picked string has not yet had Lot attributes set by this option then the string will be given Lot attributes using the **Plan number**, **Next lot number** *and* **Selected lot area** *fields.*

Continue to the next section 10.4.9.2.3 Generate ADAC Road Edge Types or return to 10.4.9.2 Data Prep .

10.4.9.2.3 Generate ADAC Road Edge Types

Position of menu:

File I/O =>ADAC =>User =>Data prep =>Generate ADAC Road Edge types

There is an ADAC Asset *Transport>RoadEdges>RoadEdge* and it has the element **Type** with the choices

Independent Simple Data Type: **transport_edge_type** Back to Root Element

Constrains: Feature_Transport_RoadEdge.Type

Type of Road Edge - As per DMR drawing 1033

Restriction of: [String_32]

Enumeration:	B1	*Barrier Kerb Type 5*
Enumeration:	B2	*Barrier Kerb with Channel Type 6*
Enumeration:	B3	*Barrier Kerb with Channel Type 7*
Enumeration:	B4	*Barrier Kerb with Tray Type 23*
Enumeration:	B5	*Barrier Kerb with Tray Type 24*
Enumeration:	SM1	*Semi-Mountable Kerb Type 8*
Enumeration:	SM2	*Semi-Mountable Kerb Type 10*
Enumeration:	SM3	*Semi-Mountable Kerb Type 12*
Enumeration:	SM4	*Semi-Mountable Kerb with Channel Type 14*
Enumeration:	SM5	*Semi-Mountable Kerb with Channel Type 15*
Enumeration:	M1	*Mountable Kerb and Channel*
Enumeration:	M2	*Mountable Kerb and Channel*
Enumeration:	M3	*Mountable Kerb and Channel*
Enumeration:	M4	*Mountable Kerb*
Enumeration:	M5	*Mountable Kerb*
Enumeration:	M6	*Mountable Kerb*
Enumeration:	ER1	*Edge Restraint*
Enumeration:	ER2	*Edge Restraint*
Enumeration:	ER3	*Edge Restraint*
Enumeration:	ER4	*Edge Restraint*
Enumeration:	ER5	*Edge Restraint*
Enumeration:	INV600	*Concrete Channel Type 22*
Enumeration:	INV900	*Concrete Channel Type 28*
Enumeration:	Bitumen	*Bitumen Road Edge treatment*
Enumeration:	Concrete	*Concrete Road Edge treatment*

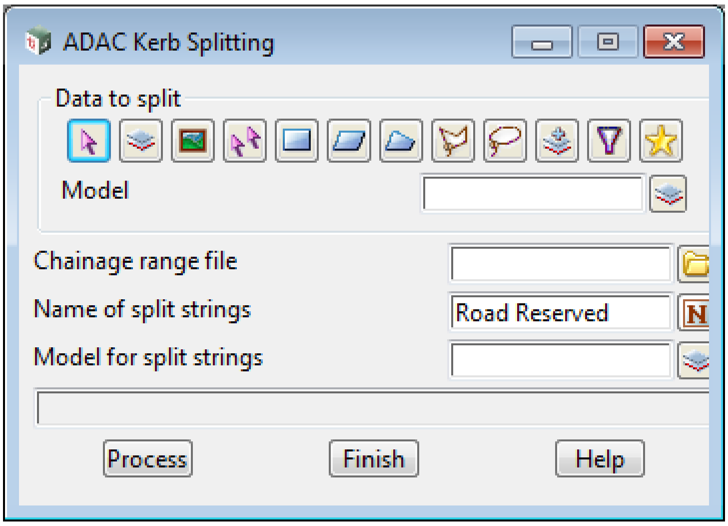
However, many companies do not have a naming convention that differentiates between the choices and may use just the one string name for all of them. So there is no way to automatically know the **Type** which is **mandatory** for an ADAC *Transport>RoadEdges>RoadEdge* Asset.

To help get over this problem, this option takes a file which contains any number of string names and for each string, a list of chainage ranges and kerb types.

For each string listed in this file, the option creates new strings for each of the chainage ranges. The new strings also have a User string attribute called **RoadEdge_Type** created, and it is given the value of **Type**.

It is the strings produced by this 12dPL, and not the original strings, that ADAC requires, and they are the ones added to the ***Design to map to ADAC*** or view ***Survey to map to ADAC*** for processing.

Selecting **Generate ADAC Road Edge types** brings up the **ADAC Kerb Splitting** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source .

Data source	input		

source of strings that is searched for strings to split.

Chainage range file	file box		

the file giving the names of the strings to be split and the chainage ranges to split the string into and the Type that goes with that chainage range. Each new string is given a text string attribute called RoadEdge_Type *which has the given kerb_type_i.*

In the file, the format for giving the chainage ranges and kerb types for a string is:

STRING *model_name ->string_name*
start_chainage_1 end_chainage_1 kerb_type_1
start_chainage_2 end_chainage_2 kerb_type_2
start_chainage_i end_chainage_i kerb_type_i

For example,

STRING MC01 DESIGN->KIR
0 100 M1
100 9999 B1

Name of split strings	text box		

*if **blank**, the original string name is used for the new strings.*
*If **not blank**, the created split strings will be given this name.*

Model for split strings	model box		available models

the model for the created split strings.

Process	button		

go and create the split strings.

Continue to the next section 10.4.9.2.4 Create Points from Other Data or return to 10.4.9.2 Data Prep .

10.4.9.2.4 Create Points from Other Data

Position of menu:

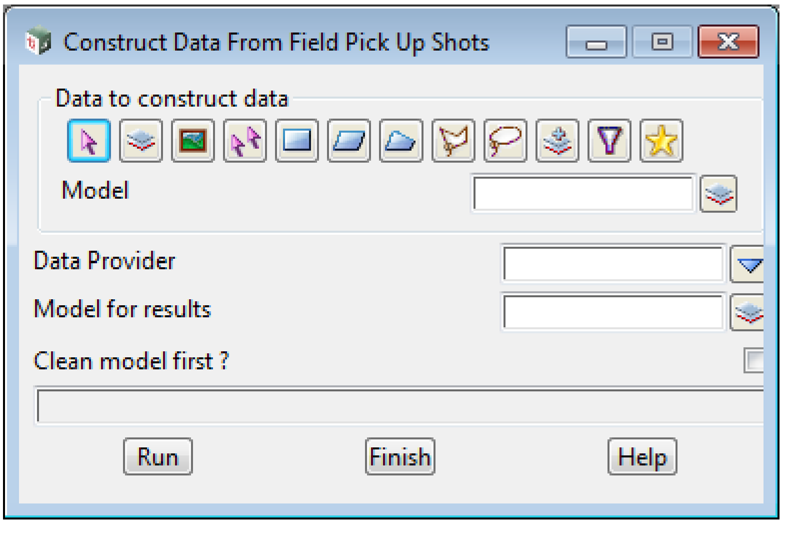
File I/O =>ADAC =>User =>Data prep =>Create points from other data

Sometimes strings are not suitable to go straight to ADAC but can be used to create suitable strings without the user having to do anything manually.

For example, ADAC only has a one point object for signs and a user picks up large signs as a two vertex string. This option takes the two vertex large sign and creates a new one vertex string that **can** be mapped to ADAC as an ADAC sign.

This option has various methods of creating ADAC suitable data.

Selecting **Create points from other data** brings up the **Construct Data from Field Pick Up Shots** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source .

Data source	input		

source of strings that is process to generate strings suitable for ADAC.

Data Provider	choice box		available data providers

selects the table of modifications to make.

Model for results	model box		available models

model that the processed strings are added to.

Clean model first ?	tick box		

*if **ticked**, the model* **Model for results** *is cleaned before any strings are added to it.*
*If **not ticked**, the model* **Model for results** *is NOT cleaned.*

Run	button		

process the data.

Continue to the next section 10.4.9.2.5 Create Pipes from Points or return to 10.4.9.2 Data Prep
.

10.4.9.2.5 Create Pipes from Points

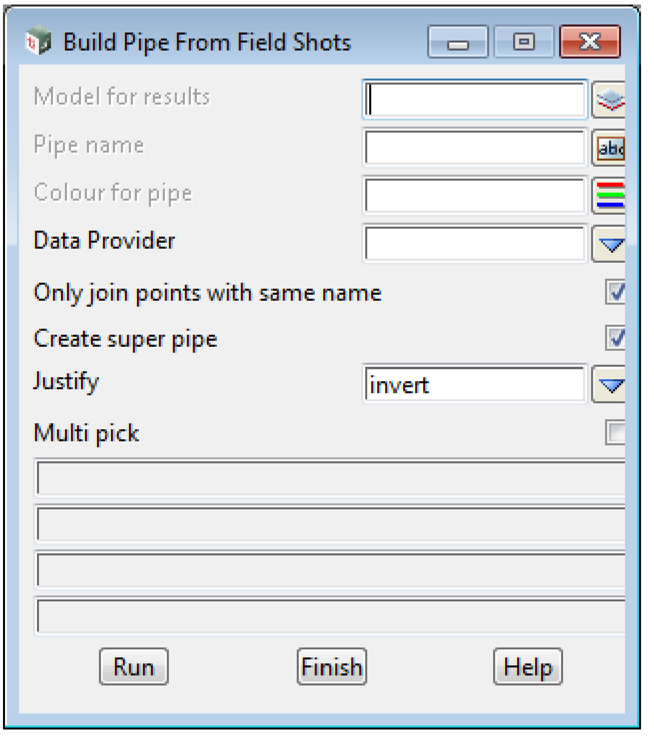
Position of menu:

File I/O =>ADAC =>User =>Data prep =>Create pipes from points

Sometimes pipes can not be picked up as string in the field and only one vertex strings are picked up at say the ends of the pipes.

This option joins two selected one vertex strings to create a two vertex pipe string.

Selecting **Create pipes from points** brings up the **Build Pipe from Field Shots** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Model for results	model box		available models

model that the create pipes are added to.

Pipe name	text box		

*if **not blank**, the created string is given this name.*
If blank,

Colour for pipe	colour box		available colours

*if **not blank**, the created string is given this colour.*
If blank,

Data Provider	choice box		available data providers

selects the table of attributes to use for diameter etc.

Only join points with same name tick box

*if **ticked**, after picking the first one vertex string, the second one vertex string must have the same name as the first picked string.*

Create super pipe tick box

*if **ticked**, and there is an attribute specified in the selected* **Data provider** *for diameter, then a super string pipe with the given diameter is created.*

Justify	choice box	invert, centre, obvert

justification to use if a super pipe is created.

Multi pick	tick box

*if **ticked**, once one pipe is created, the option starts asking for the first point of a new pipe.*

Run	button

start the option.

Continue to the next section 10.4.9.2.6 Set Stormwater/Sewer Property or return to 10.4.9.2 Data Prep .

10.4.9.2.6 Set Stormwater/Sewer Property

Position of menu:

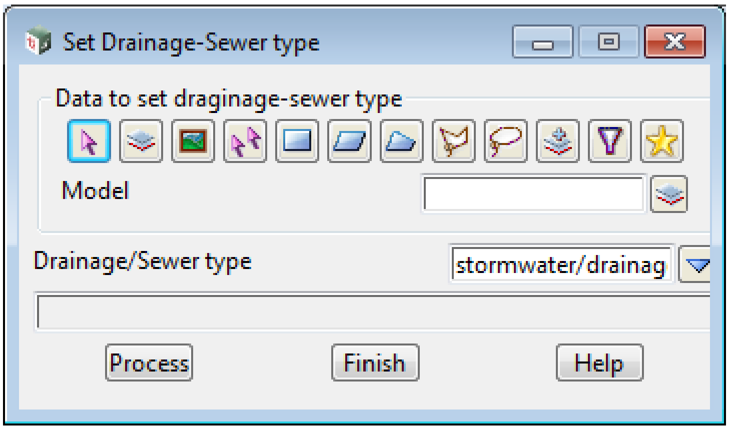
File I/O =>ADAC =>User =>Data prep =>Set stormwater/sewer purpose

Up to ***12d Model 10***, there was no way of easily differentiating between a drainage or sewer string. Users normally kept them in different models.

In ***12d Model 11***, there is a string property (called **Purpose** on the **Create Drainage String** menu) which is set to either **stormwater/drainage** or **wastewater/sewer**. So the string itself now knows if it is a drainage or a sewer string.

This option sets the **Purpose** for drainage/sewer strings that have come from ***12d Model 10*** and so do not have a **Purpose** already set, or may have it defaulted to **stormwater/drainage**.

Selecting **Set stormwater/sewer purpose** brings up the **Set Drainage/Sewer Purpose** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	
data selection type - for a full description go to 4.19.3 Data Source .			
Data source	input		
source of strings to process.			
Drainage/Sewer purpose	choice box	stormwater/drainage, wastewater/sewer	
the Purpose property of the selected strings are set to this value.			
Run	button		
set the Purpose property of the selected strings.			

Continue to the next section 10.4.9.2.7 Set a Drainage-Sewer Pit and Pipe Type Attribute or return to 10.4.9.2 Data Prep .

10.4.9.2.7 Set a Drainage-Sewer Pit and Pipe Type Attribute

Position of menu:

File I/O =>ADAC =>User =>Data prep =>Set pit type, pipe type attribute

When drainage and sewer strings are created, the vertices can have a **Pit Type** and the segments a **Pipe Type**.

When the Drainage Network Editor (DNE) is used, for each vertex, a vertex attribute called **pit_type** is created with the vertex value of **Pit Type**. Similarly for each segment, a segment attribute called **pipe_type** is created with the segment value of **Pipe Type**.

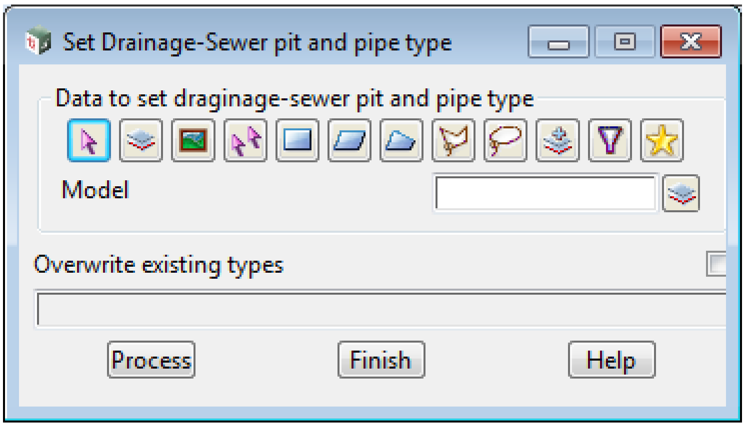
So after using the DNE, the attributes pit_type and pipe_type are available to be used in the ADAC ***Map File***. However if the DNE is not run, the attributes pit_type and pipe_type will not exist.

This option does the same thing as the DNE for creating the **pit_type** and **pipe_type** attributes.

That is, for each vertex, a vertex attribute called **pit_type** is created with the vertex value of **Pit Type** and for each segment, a segment attribute called **pipe_type** is created with the segment value of **Pipe Type**.

So in case th DNE has not been run, this option creates the attributes **pit_type** and **pipe_type** so they can be used in the ***Map File***.

Selecting **Set pit type, pipe type attribute** brings up the **Set Attribute for Drainage/Sewer Pit and Pipe Types** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source .

Data source input

source of strings to process.

Overwrite existing type tick box

*if **ticked** and a pit_type/pipe_type already exists for a vertex/segment, then it is over written by the value of Pit type/Pipe Type for the vertex/segment.*

*if **not ticked** then if a pit_type/pipe_type already exists for a vertex/segment, then it is **not** modified.*

Run button

set the pit_type and pipe_type's of the selected strings vertices and segments.

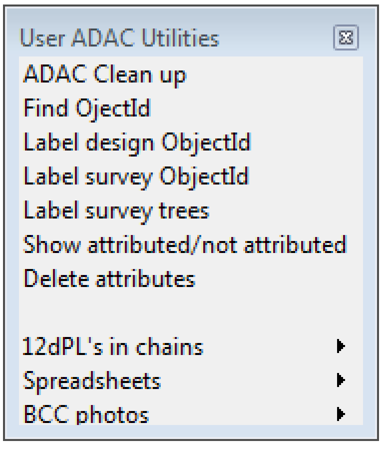
Return to 10.4.9.2 Data Prep or 10.4.9 User ADAC .

10.4.9.3 User ADAC Utilities

Position of menu: **File I/O =>ADAC =>User =>Utilities**

A new project to be set up for producing ADAC XML needs to be set up a certain way for the ADAC Chains to work.

There is a different setup for a **Survey** Project than for a **Design** Project.



See

10.4.9.3.1 ADAC Clean Up

10.4.9.3.2 Find Object Id

10.4.9.3.3 Label Design/Survey Object Id

10.4.9.3.4 Show Attributed/Not Attributed

10.4.9.3.5 Delete ADAC Attributes

10.4.9.3.6 12dPL's in Chains

10.4.9.3.1 ADAC Clean Up

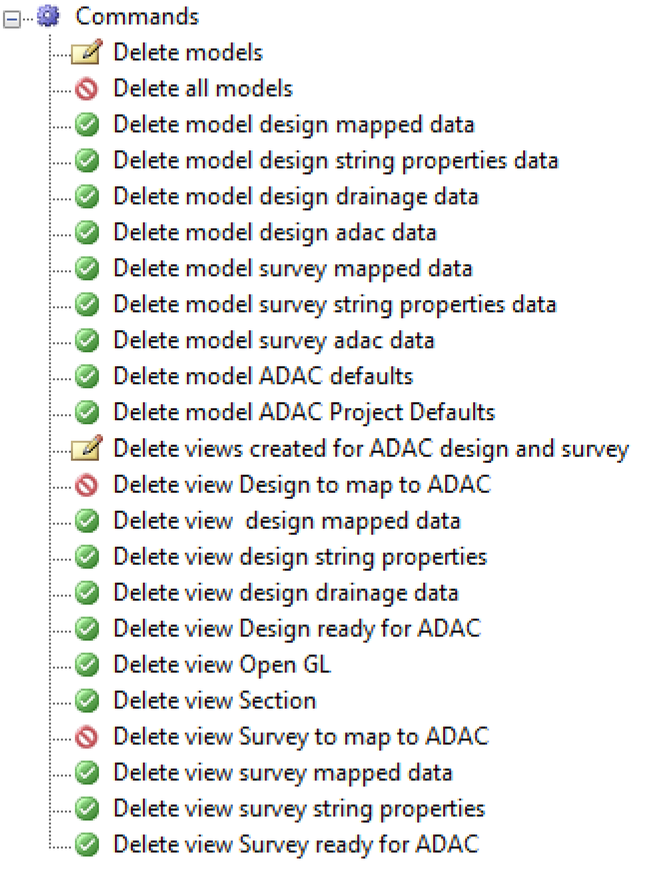
Position of option on menu: **File I/O =>ADAC =>User =>Utilities =>ADAC clean up**

This option runs a chain that deletes all the models created by the **Setting up for survey** and **Setting up for design** options.

The chain also deletes all the views, except for the views *Design to map to ADAC* and *Survey to map to ADAC*, created by the **Setting up for survey** and **Setting up for design** options.

Selecting **ADAC clean up** runs the chain

$LIB/ADAC_clean_up.chain



The chain needs no interaction with the user; it just runs and ends.

Continue to the next section 10.4.9.3.2 Find Object Id or return to 10.4.9.3 User ADAC Utilities .

10.4.9.3.2 Find Object Id

Position of option on menu: **File I/O =>ADAC =>User =>Utilities =>Find Objectid**

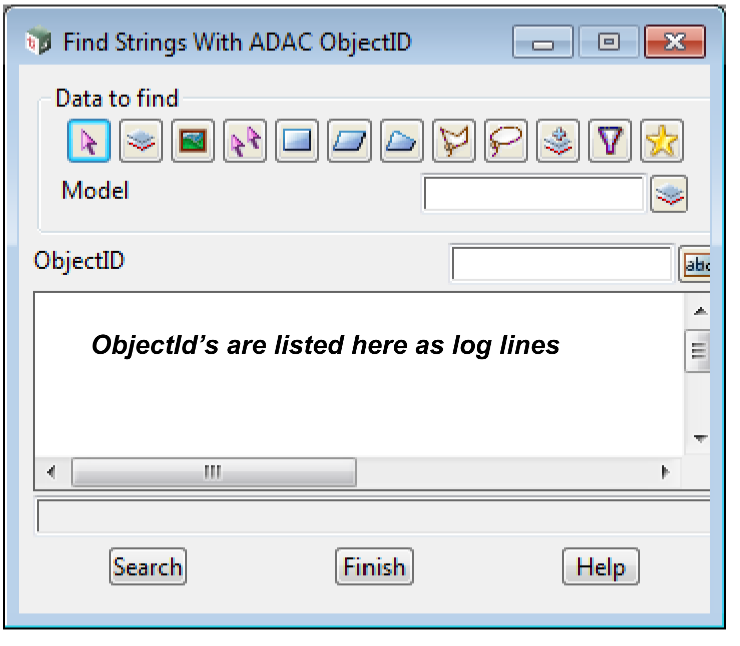
From the *ADAC XML Schema, the* **Objectid**

> *Represents a place for an object identifier, usually generated by the data creation software. Also useful as a placeholder for record ID generated by back-end databases or GIS*
> *The ObjectId is permitted to be nil because the capturing system may not have the capacity to generate one. If features are exported from a GIS or Asset Management system, however, it is highly recommended to carry them out into this element.*

When the *ADAC Survey* and *ADAC Design* chains are run, the ADAC Assets are all given a unique ADAC Objectid by ***12d Model*** and this is given in the ADAC Report (see 10.4.5 Report) and any ADAC XML file that is created (see 10.4.6 Write ADAC XML File).

The **Find Objectid** option lists as log lines the ObjectId of all ADAC Assets whose ObjectIds start with given text. Clicking on an ObjectId in the list highlights it in any Plan view that it is on.

Selecting **Find Objectid** brings up the **Find Strings with ADAC ObjectId** panel:



Data source type Model

> *data selection type - for a full description go to* 4.19.3 Data Source .

Data source input

> *source of data to be searched for any with ObjectIds that start with the characters in* **ObjectId start characters**.

ObjectId start characters text box

> *the characters the ObjectIDs of the strings must start with.*

List Area

> *the ObjectID of each string that starts with the characters in the* **ObjectId start characters** *is listed in this area as a log line. Clicking on an ObjectId in the list will pan to and highlight the string in any Plan views that the string is on.*

Search button

> *search for all ADAC strings that start with the characters in* **ObjectId start characters**.

Continue to the next section 10.4.9.3.3 Label Design/Survey Object Id or return to 10.4.9.3 User ADAC Utilities .

10.4.9.3.3 Label Design/Survey Object Id

[check why it is not working]

Position of option on menu: **File I/O =>ADAC =>User =>Utilities =>Label design Objectid**

Position of option on menu: **File I/O =>ADAC =>User =>Utilities =>Label survey Objectid**

From the *ADAC XML Schema, the* **Objectid**

> *Represents a place for an object identifier, usually generated by the data creation software. Also useful as a placeholder for record ID generated by back-end databases or GIS*
> *The ObjectId is permitted to be nil because the capturing system may not have the capacity to generate one. If features are exported from a GIS or Asset Management system, however, it is highly recommended to carry them out into this element.*

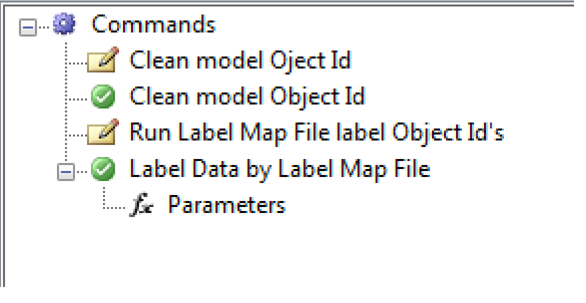
This option runs an Interactive chain that includes a **Label Data by Label Map File** panel that creates labels for all the ADAC assets in the model **design adac data** or **survey adac data** and cleans and adds them to the model **ObjectId**.

Note: the model **design adac data/survey adac data** is the model that the *ADAC Design/ Survey* chain puts all the ADAC Assets in.

Selecting **Label design/survevObjectid** runs the Interactive chain

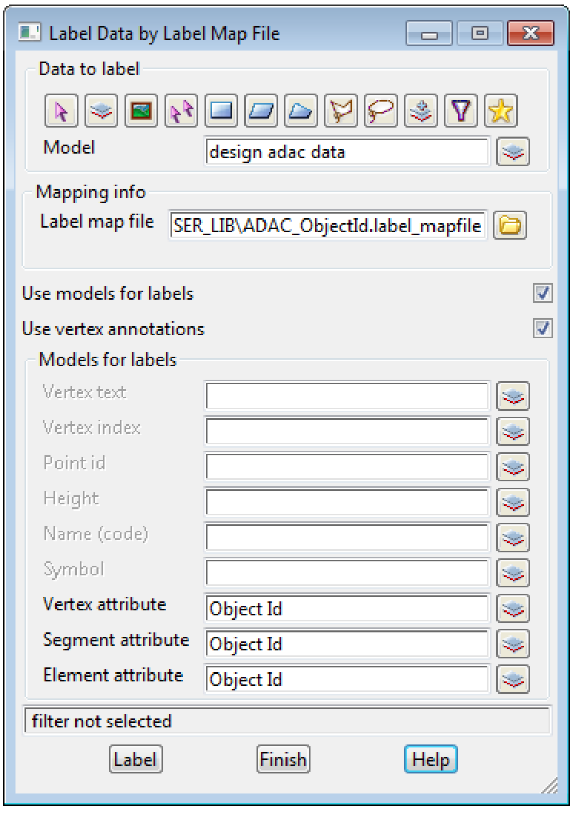
$LIB/ADAC_Label_design_ObjectId.chain

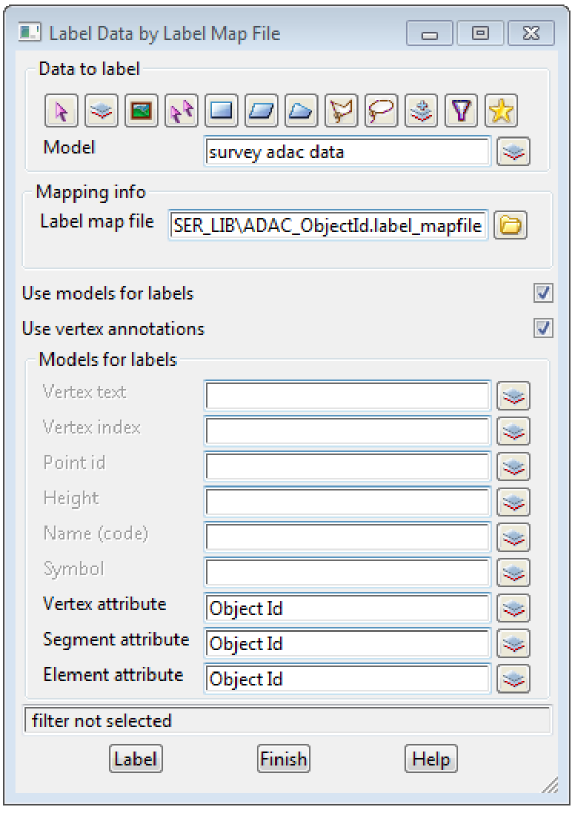
$LIB/ADAC_Label_survey_ObjectId.chain



The chain first cleans out the model **ObjectId**

It then runs a **Label Data by Label Map File** panel in Interactive mode so the panel is placed on the screen.





Click on **Label** and when the labelling is finished, click on **Finish**.

The chain then ends.

Continue to the next section 10.4.9.3.4 Show Attributed/Not Attributed or return to 10.4.9.3 User ADAC Utilities .

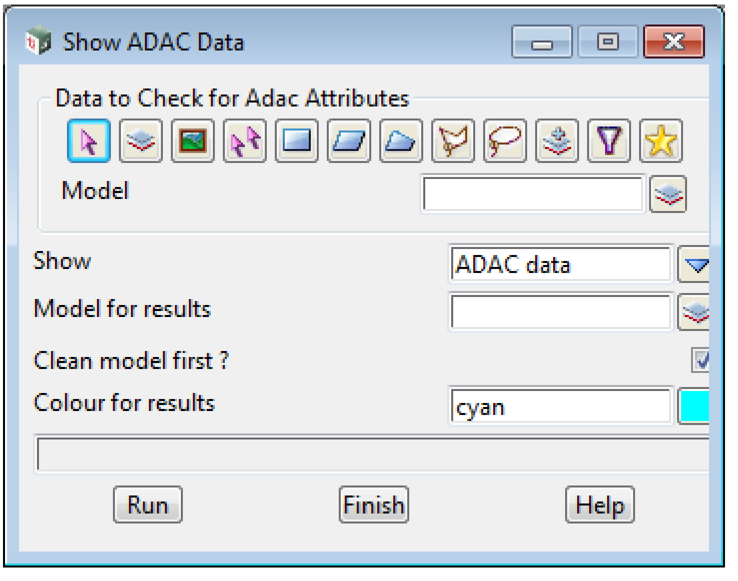
10.4.9.3.4 Show Attributed/Not Attributed

Position of option on menu: **File I/O =>ADAC =>User =>Utilities =>Show attributed/not attributed**

When checking whether your 12d Map File is doing the correct thing, it is often necessary to know which strings have been given an ADAC attribute group and hence represent an ADAC Asset, and which ones weren't.

This option searches for all strings that are either ADAC Assets, or are not ADAC Assets, and make copies of the string and adds them to a given model.

Selecting **Show attributes/not attributes** brings up the **Show ADAC Attributed Data** panel



Data source type Model

data selection type - for a full description go to 4.19.3 Data Source .

Data source input

source of data to be check if it has/doesn't have ADAC attributes.

Show choice box ADAC data ADAC data, non ADAC data

if ***ADAC data****, for each string in the data source that is an ADAC Asset (i.e. has the ADAC attributes), a copy of the string is made in the colour given in* **Colour for results** *and is added to the model in* **Model for results.**

if ***non ADAC data****, for each string in the data source that is NOT an ADAC Asset (i.e. doesn't have the ADAC attributes), a copy of the string is made in the colour given in* **Colour for results** *and is added to the model in* **Model for results.**

Model for results model box available models

the model for the created strings.

Clean model first tick box

if ***ticked****, the model* **Model for results** *is cleaned before any strings are added to it.*
If ***not ticked****, the model* **Model for results** *is NOT cleaned.*

Colour for results colour box cyan available colours

the colour to give the created strings.

Run button

finds all the ADAC/not ADAC strings.

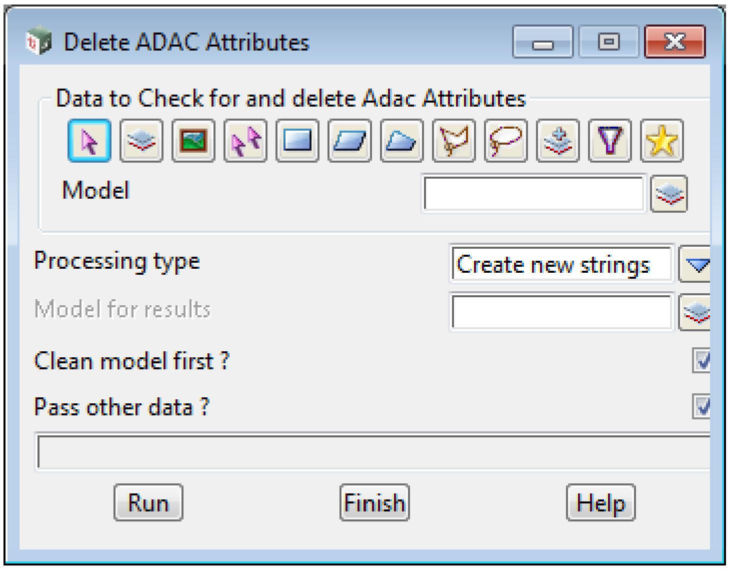
Continue to 10.4.9.3.5 Delete ADAC Attributes or return to 10.4.9.3 User ADAC Utilities .

10.4.9.3.5 Delete ADAC Attributes

Position of option on menu: **File I/O =>ADAC =>User =>Utilities =>Delete attributes**

This option removes the ADAC attributes from strings (and only those attributes).

Selecting **Delete attributes** brings up the **Delete ADAC Attributes** panel:



Data source type Model

data selection type - for a full description go to 4.19.3 Data Source .

Data source input

source of data to process for deleting ADAC attributes.

Processing type choice box Create new strings Use existing strings
Create new strings

*if **Create new strings**, for each string in the data source that is an ADAC Asset (i.e. has the ADAC attributes), a copy of the string is made and the ADAC attributes deleted from the **copy** of the string and added to the model* **Model for results.**

*if **Use existing strings**, for each string in the data source that is an ADAC Asset (i.e. has the ADAC attributes), the ADAC attributes are deleted from the string.*

Model for results model box available models

when **Processing type** *is **Create New Strings** this is the model for the created strings.*

Clean model first ? tick box

*if **ticked**, the model* **Model for results** *is cleaned before any strings are added to it.*
*If **not ticked**, the model* **Model for results** *is NOT cleaned.*

Pass other data ? tick box

*if **ticked** and* **Processing type** *is **Create new strings**, then any strings that are not ADAC Assets are also copied and added to the model* **Model for results.**
Otherwise nothing is done with strings that are not ADAC Assets.

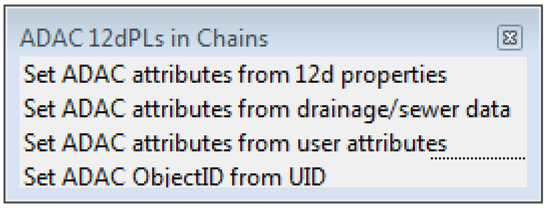
Run button

removed the ADAC attributes from the selected strings.

Continue to 10.4.9.3.6 12dPL's in Chains or return to 10.4.9.3 User ADAC Utilities .

10.4.9.3.6 12dPL's in Chains

Position of menu: **File I/O =>ADAC =>User =>Utilities**



There are the options used in the ADAC Design and Survey chains.

See

10.4.9.3.6.1 Separate Assigned/Unassigned ADAC Data

10.4.9.3.6.2 Set ADAC Attributes from String Properties

10.4.9.3.6.3 Set ADAC Attributes from Drainage & Sewer Data

10.4.9.3.6.4 Set ADAC Attributes from User Attributes

10.4.9.3.6.5 Set ADAC ObjectId from String UID

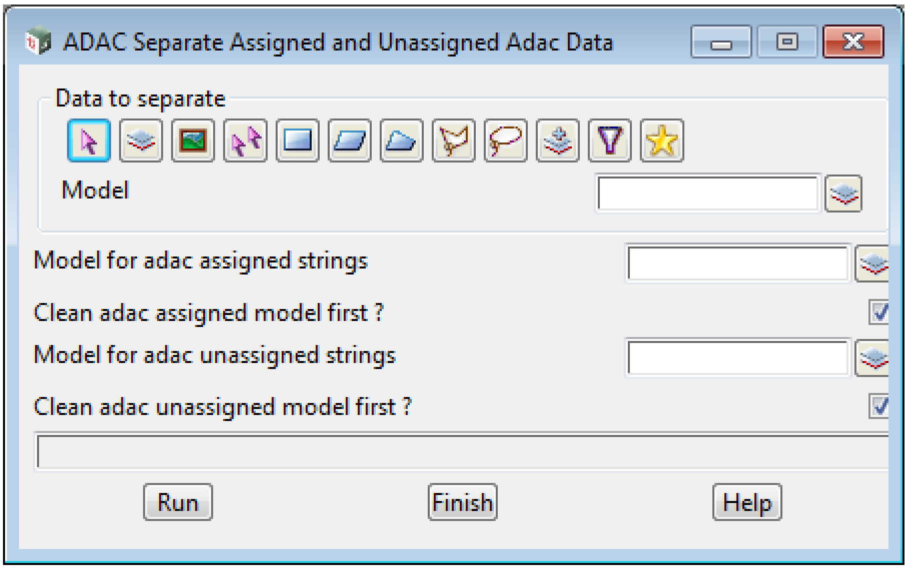
10.4.9.3.6.1 Separate Assigned/Unassigned ADAC Data

Position of option on menu:

File I/O =>ADAC =>User =>Utilities =>12dPLs in chains =>Separate assigned data

This option looks at the data in the given Data Source and copies the strings that have been assigned (marked) as ADAC Assets to one model and all the data that has not yet been assigned to another model.

Selecting **Separate Assigned data** brings up the **ADAC Separate Assigned and Unassigned Data** panel.



Data source type Model

data selection type - for a full description go to 4.19.3 Data Source .

Data source input

source of data to process.

Model for ADAC assigned strings model box available models

any strings that have been assigned (marked) as ADAC assets are copied to this model.

Clean ADAC assigned model first ? tick box

if ***ticked****, the model* **Model for ADAC assigned strings** *is cleaned before any strings are added to it.*
If ***not ticked****, the model* **Model for ADAC assigned strings** *is NOT cleaned.*

Model for ADAC unassigned strings model box available models

any strings that have NOT been assigned (marked) as ADAC assets are copied to this model.

Clean ADAC unassigned model first ? tick box

if ***ticked****, the model* **Model for ADAC unassigned strings** *is cleaned before any strings are added to it.*
If ***not ticked****, the model* **Model for ADAC assigned strings** *is NOT cleaned.*

Run button

separate the strings that have been assigned/unassigned as ADAC Assets into separate models.

The copied strings are added to the model ***Model for results****.*

Continue to the next section 10.4.9.3.6.2 Set ADAC Attributes from String Properties or return to 10.4.9.3.6 12dPL's in Chains

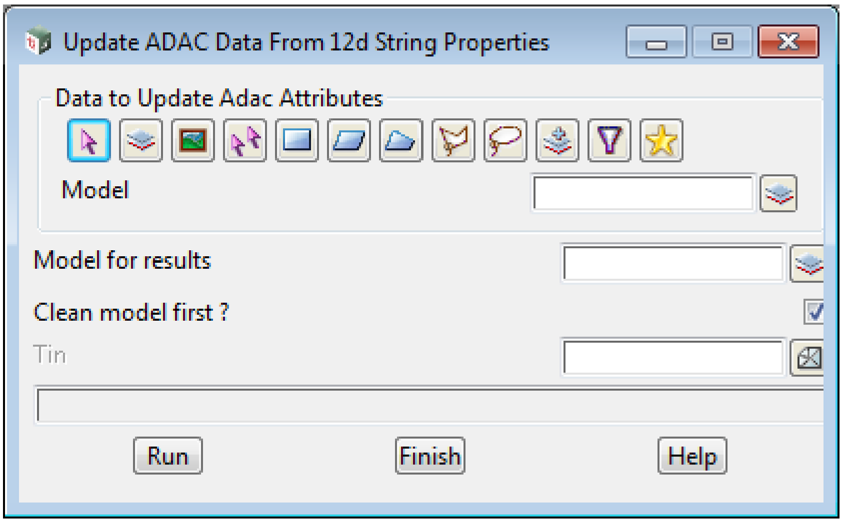
10.4.9.3.6.2 Set ADAC Attributes from String Properties

Position of option on menu:

File I/O =>ADAC =>User =>Utilities =>12dPLs in chains =>Set ADAC attributes from string properties

Many of the ADAC entities can be calculated directly from the 12d strings and some z values may be taken from a tin.

Selecting **Set ADAC attributes from 12d properties** brings up the **Update ADAC Data from 12d String Properties** panel.



Data source type Model

data selection type - for a full description go to 4.19.3 Data Source .

Data source input

source of data to process.

Model for results model box available models

model that the processed strings are added to.

Clean model first ? tick box

*if **ticked**, the model* **Model for results** *is cleaned before any strings are added to it.*
*If **not ticked**, the model* **Model for results** *is NOT cleaned.*

Tin tin box available tins

tin that can be used to get z-values from.

Run button

update the ADAC Asset attributes with values from the 12d string's properties.

If the string has been marked as an ADAC Asset then it is copied and then for the copied string, any relevant ADAC elements updated from the properties of the 12d string and the tin.

Strings that are not marked as ADAC Assets are NOT copied

*The copied strings are added to the model **Model for results**.*

ADAC Attributes Generated from 12d String Geometry

4.0.0 & 4.1.0	Adac/SurfaceDrain/Length_m	calculate 3d length of string	Storm\
4.0.0 & 4.1.0	Adac/Annotation/Text	get the actual text of the text string	Enhance
4.0.0 & 4.1.0	Adac/Annotation/Justification	get justification of text string	Enhance
4.0.0 & 4.1.0	Adac/Annotation/Type	get text type of text string	Enhance
4.0.0 & 4.1.0	Adac/Annotation/Font	get text font of text string	Enhance
4.0.0 & 4.1.0	Adac/Annotation/Height_m	get text height of text string	Enhance
4.0.0 & 4.1.0	Adac/Annotation/Width_m	get text width of text string	Enhance
4.0.0 & 4.1.0	Adac/Annotation/Rotation	get text rotation of text string	Enhance

In the *ADAC Survey* and *Design* chains, this option is called and passed arguments for all the panel field and so runs without needing to display a panel.

See 10.5.1.2.3 Update ADAC Elements from Non Drainage/Sewer String Properties - Survey *and* 10.5.2.2.3 Update ADAC Elements from Non Drainage/Sewer String Properties - Design .

Continue to the next section 10.4.9.3.6.3 Set ADAC Attributes from Drainage & Sewer Data or return to 10.4.9.3.6 12dPL's in Chains .

10.4.9.3.6.3 Set ADAC Attributes from Drainage & Sewer Data

Position of option on menu:

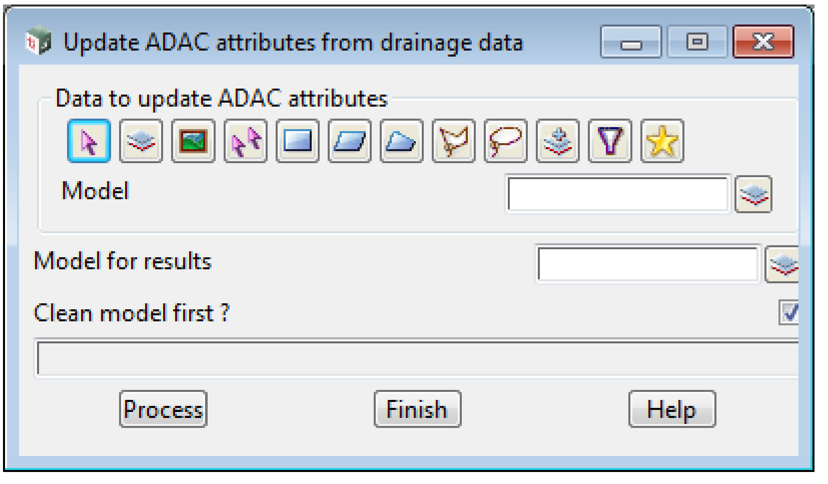
File I/O =>ADAC =>User =>Utilities =>12dPLs in chains =>Set ADAC attributes from drainage/ sewer data

The documentation for this section is a work in progress.

Drainage and sewer strings have an incredible amount of data that can go directly into the ADAC *StormWater Pits* and *Pipes* and the *Sewerage MaintenanceHoles* and *NonPressurePipes*.

Many of the ADAC entities can be calculated directly from the 12d strings and some values may be taken from the tins **survey_finished_tin** or **design_finished_tin**.

Selecting **Set ADAC attributes from Drainage & Sewer Data** brings up the **Update ADAC Data from Drainage Data** panel:



Data source type Model

data selection type - for a full description go to 4.19.3 Data Source .

Data source input

source of data to process.

Model for results model box available models

model that the processed strings are added to.

Clean model first ? tick box

*if **ticked**, the model* **Model for results** *is cleaned before any strings are added to it.*
*If **not ticked**, the model* **Model for results** *is NOT cleaned.*

Process button

update the ADAC Asset attributes with values from the 12d strings properties.

If the string has been marked as an ADAC Asset then it is copied and then for the copied string, any relevant ADAC elements updated from the properties of the 12d string and the tin.

Strings that are not marked as ADAC Assets are NOT copied

*The copied strings are added to the model **Model for results**.*

In the *ADAC Design* chain, this option is called and passed arguments for all the panel field and so runs without needing to display a panel.

See 10.5.2.2.4 Update ADAC Elements from Drainage/Sewer String Properties .

Continue to the next section 10.4.9.3.6.5 Set ADAC ObjectId from String UID or return to 10.4.9.3.6 12dPL's in Chains .

10.4.9.3.6.4 Set ADAC Attributes from User Attributes

NO LONGER USED

Position of option on menu:

File I/O =>ADAC =>User =>Utilities =>12dPLs in chains =>Set ADAC attributes from user attributes

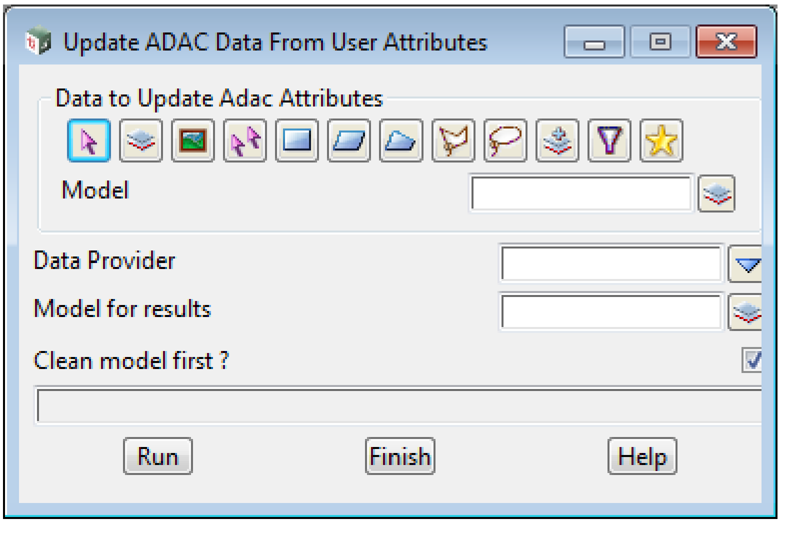
The option is no longer used and had been replaced by a 12d supplied **12duaf file**. See 10.4.8.5 Create/Edit User Attributes to ADAC File and 10.4.8.6 Apply User Attributes to ADAC Elements .

There are a number of 12d options, mainly in the **ADAC =>User =>Data prep** menu, that create User attributes that are to pass data to ADAC Assets. These 12d created user attributes update the ADAC Assets by running this option with the **Data Provider** set to **12d**.

Similarly a user can crate their own user attributes by running their own *12dPLs,* or collecting attributes in the field, or even by hand editing and entering them.

However because these attributes are not know known to *12d Solutions*, the user must set up a **Data Provider** table so the option knows what user attributes to use and what ADAC Assets to update.

Selecting **Set ADAC attributes from user attributes** brings up the **Update ADAC Data from User Attributes** panel.



Data source type Model

data selection type - for a full description go to 4.19.3 Data Source .

Data source input

source of data to process.

Data Provider choice box available data providers

selects the table of User Attributes to use.

Model for results model box available models

model that the processed strings are added to.

Clean model first ? tick box

if ***ticked****, the model* **Model for results** *is cleaned before any strings are added to it.*
If ***not ticked****, the model* **Model for results** *is NOT cleaned.*

Run button

update the ADAC Asset attributes with values from User attributes.

If the string has been marked as an ADAC Asset then it is copied and then for the copied string, any relevant ADAC elements updated from the user attributes.

Strings that are not marked as ADAC Assets are NOT copied

*The copied strings are added to the model **Model for results**.*

Continue to 10.4.9.3.6.5 Set ADAC ObjectId from String UID or return to 10.4.9.3.6 12dPL's in Chains .

10.4.9.3.6.5 Set ADAC ObjectId from String UID

Position of option on menu:
File I/O =>ADAC =>User =>Utilities =>12dPLs in chains =>Set ADAC ObjectId from UID

From the *ADAC XML Schema, the* **Objectid**

Represents a place for an object identifier, usually generated by the data creation software. Also useful as a placeholder for record ID generated by back-end databases or GIS
The ObjectId is permitted to be nil because the capturing system may not have the capacity to generate one. If features are exported from a GIS or Asset Management system, however, it is highly recommended to carry them out into this element.

Every string in ***12d Model*** has a unique identifier called a UID, so ***12d Model*** creates a unique ObjectId by:

(a) for drainage and sewer strings, creating ObjectIds for

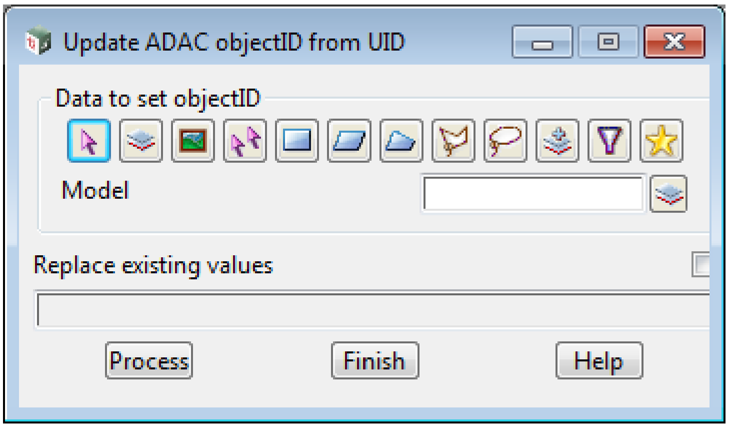
(i) each pit/manhole. The ObjectId is made up of the string UID, the pit/manhole vertex index and information about the to help connect the string together.

(ii) each pipe. The ObjectId is made up of the string UID, the pipe segment index and information about which pits are at the ends of the pipe.

This is only relevant for designers and not surveyors.

(b) for all other strings, setting the ObjectId to the string UID.

Selecting **Set ADAC ObjectID from UID** brings up the **Update ADAC objectID from UID** panel:



Data source type Model

data selection type - for a full description go to 4.19.3 Data Source .

Data source input

source of data to process.

Replace existing values tick box

if ***ticked****, the model* **Model for results** *is cleaned before any strings are added to it.*
If ***not ticked****, the model* **Model for results** *is NOT cleaned.*

Process button

update the ADAC Asset attributes with values from the 12d string's properties.

If the string has been marked as an ADAC Asset then it is copied and then for the copied string, any relevant ADAC elements updated from the properties of the 12d string and the tin.

Strings that are not marked as ADAC Assets are NOT copied

The copied strings are added to the model ***Model for results****.*

In the *ADAC Survey* and *Design* chains, this option is called and arguments are passed from the chain for all the panel fields and so the option runs in the chain without needing to display a panel.

See 10.5.1.2.6 Update ADAC ObjectId - Survey *and* 10.5.2.2.7 Update ADAC ObjectId - Design .

Return to 10.4.9.3.6 12dPL's in Chains .

10.4.9.4 12d 4.1 Chains

Position of menu: **File I/O =>ADAC =>User =>12d 4.1 chains**

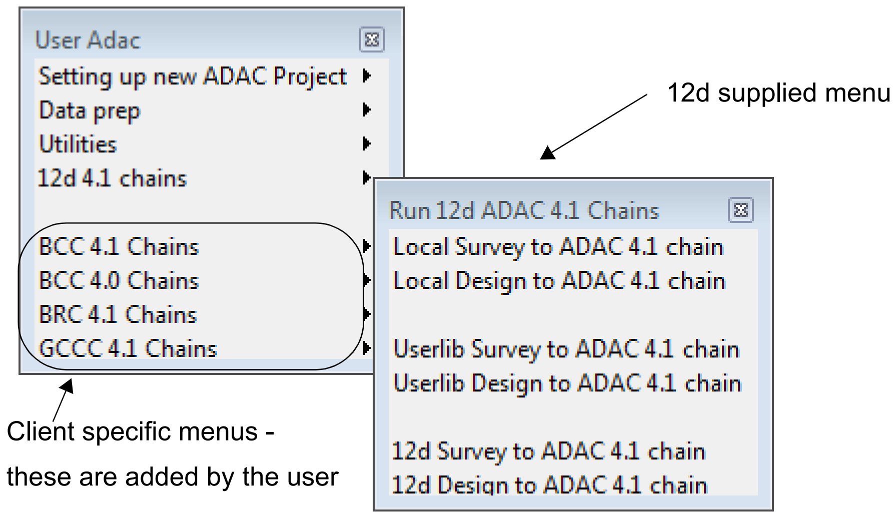
There is a base *ADAC Design* chain and a base *ADAC Survey* chain that does all the work of taking ***12d Model*** strings and producing ADAC Assets ready to be validated, reported on, or written out to an ADAC XML file.

12d Model provides options on the walk right menu **Run 12d ADAC 4.1 Chains** to run the base *ADAC Survey* or *Design* chains for ADAC 4.1 with specially named Map and *12duaf* files in either:

(a) the working folder for the project (local)

(b) User_Lib

(c) Library.



See

10.4.9.4.1 Local Survey to ADAC 41 chain
10.4.9.4.2 Local Design to ADAC 41 chain

10.4.9.4.3 Userlib Survey to ADAC 41 chain
10.4.9.4.4 Userlib Design to ADAC 41 chain

10.4.9.4.5 Lib Survey to ADAC 41 chain
10.4.9.4.6 Lib Design to ADAC 41 chain

Note: **Client Specific ADAC Design and Survey Menus**

The above options are to make it easy to get up and running with ADAC when you have only one or two different Map files.

However, different Clients may do some things differently. For example each company may have its own survey and/or design naming convention or different Authorities may require different information in the ADAC Assets.

For these situations, you can add your own options to **User Adac** menu.

The user options can run either the ADAC Base Survey or Design chains with specific chain pvf files.

For information on setting up your own options on the **User ADAC** menu, see 10.4.9.5 Client Specific ADAC Design & Survey Menus .

10.4.9.4.1 Local Survey to ADAC 41 chain

Position on menu:
File I/O =>ADAC =>User =>12d 4.1 chains =>Local Survey to ADAC 41 chain

The option **Local Survey to ADAC 41 chain** runs *ADAC_Survey_Base* chain but with a pvf file that looks in the **working folder for the project** (local) for the files:

ADAC_Local_Map_Survey_to_ADAC_41.mapfile

Local_41.12duaf *this file is optional*

and uses the a **tin** called **ground** to get surface levels.

So to use this menu item, you only need to create the two files and have them in the folder containing the project. This means they are only available for that project.

Continue to 10.4.9.4.2 Local Design to ADAC 41 chain or return to 10.4.9.4 12d 4.1 Chains .

10.4.9.4.2 Local Design to ADAC 41 chain

Position on menu
File I/O =>ADAC =>User =>12d 4.1 chains =>Local Design to ADAC 41 chain

The option **Local Design to ADAC 41 chain** runs *ADAC_Design_Base Base* chain but with a pvf file that looks in the **working folder for the project** (local) for the files:

ADAC_Local_Map_Design_to_ADAC_41.mapfile

Local_41.12duaf

and uses the a **tin** called **ground** to get surface levels.

So to use this menu item, you only need to create the two files and have them in the folder containing the project. This means they are only available for that project.

Continue to 10.4.9.4.3 Userlib Survey to ADAC 41 chain or return to 10.4.9.4 12d 4.1 Chains .

10.4.9.4.3 Userlib Survey to ADAC 41 chain

Position on menu:
File I/O =>ADAC =>User =>12d 4.1 chains =>Userlib Survey to ADAC 41 chain

The option **Userlib Survey to ADAC 41 chain** runs *ADAC_Survey_Base* chain but with a pvf file that looks in the User_Lib folder for the files:

ADAC_Userlib_Map_Survey_to_ADAC_41.mapfile

Userlib_41.12duaf *this file is optional*

and uses the a **tin** called **ground** to get surface levels.

So to use this menu item, you only need to create the two files and have them in the User_Lib folder. This means they can be used with any project.

Note the word Userlib and not User_Lib in the name of the Map and 12duaf files.

Continue to 10.4.9.4.4 Userlib Design to ADAC 41 chain or return to 10.4.9.4 12d 4.1 Chains .

10.4.9.4.4 Userlib Design to ADAC 41 chain

Position on menu:
File I/O =>ADAC =>User =>12d 4.1 chains =>Userlib Design to ADAC 41 chain

The option **Userlib Design to ADAC 41 chain** runs *ADAC_Design_Base* chain but with a pvf file that looks in the User_Lib folder for the files:

ADAC_Userlib_Map_Design_to_ADAC_41.mapfile

Userlib_41.12duaf *this file is optional*

and uses the a **tin** called **ground** to get surface levels.

So to use this menu item, you only need to create the two files and have them in the User_Lib folder. This means they can be used with any project.

Note the word Userlib and not User_Lib in the name of the Map and 12duaf files.

Continue to 10.4.9.4.5 Lib Survey to ADAC 41 chain or return to 10.4.9.4 12d 4.1 Chains .

10.4.9.4.5 Lib Survey to ADAC 41 chain

Position on menu:
File I/O =>ADAC =>User =>12d 4.1 chains =>12d Survey to ADAC 41 chain

The option **12d Survey to ADAC 41 chain** runs *ADAC_Survey_Base* chain but with a pvf file that looks in the Library folder that is installed with ***12d Model*** for the files:

ADAC_12d_Map_Survey_to_ADAC_41.mapfile

12d_41.12duaf *this file is optional*

and uses the a **tin** called **ground** to get surface levels.

WARNING: This option is for demonstration and training purposes only because the files will be overwritten whenever a new version of ***12d Model 11*** is installed.

Note the word 12d and not Library or Lib in the name of the Map and 12duaf files.

Continue to 10.4.9.4.6 Lib Design to ADAC 41 chain or return to 10.4.9.4 12d 4.1 Chains .

10.4.9.4.6 Lib Design to ADAC 41 chain

Position on menu:
File I/O =>ADAC =>User =>12d 4.1 chains =>Lib Design to ADAC 41 chain

The option **12d Design to ADAC 41 chain** runs *ADAC_Design_Base* chain but with a pvf file that looks in the Library folder that is installed with ***12d Model*** for the files:

ADAC_12d_Map_Design_to_ADAC_41.mapfile

12d_41.12duaf *this file is optional*

and uses the a **tin** called **ground** to get surface levels.

WARNING: This option is for demonstration and training purposes only because the files will be overwritten whenever a new version of ***12d Model 11*** is installed.

Note the word 12d and not Library or Lib in the name of the Map and 12duaf files.

Return to 10.4.9.4 12d 4.1 Chains .

10.4.9.5 Client Specific ADAC Design & Survey Menus

Position of menu: **File I/O =>ADAC =>User =>Client chains**

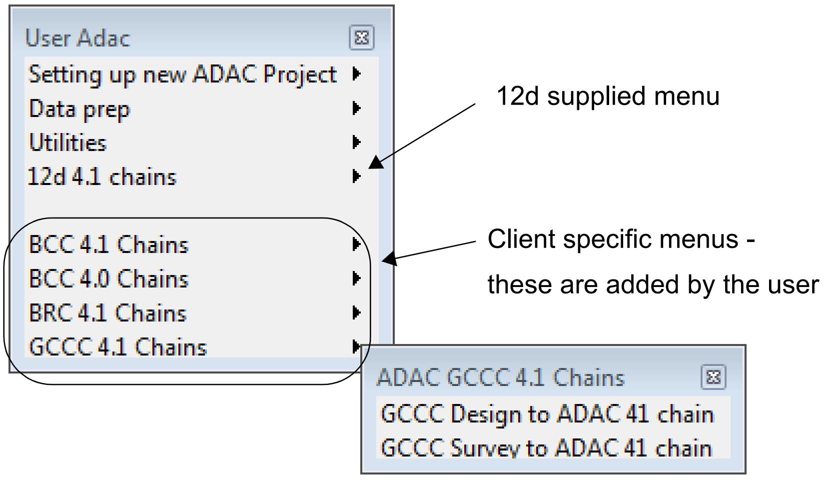
There is a base ADAC Design chain and a base ADAC Survey chain that does all the work of taking ***12d Model*** strings and producing ADAC Assets ready to be validated, reported on, or written out to an ADAC XML file.

However different Clients may do things differently. For example some Clients may have their own survey or design naming convention and some Clients may need ADAC 4.1 data whilst others want ADAC 4.0.

To allow for such variations, the base ADAC Design chain and Survey chains have parameters passed down to them via a chain pvf file. And you can add your **own** items to the **User Adac** menu that use the base ADAC Survey or Design chains with different chain pvf files.

For these situations, you can add your own options to **User Adac** menu.

A **User ADAC** menu with extra Client specific items would then look like:



How to set up these user defined ADAC menus for your company is described in 10.6.3.2 Setting Up Your User ADAC Menu .

Note: **12d Supplied ADAC 4.1 Design and Survey Menu**

If you are only have one or two different Map files, ***12d Model*** supplies options on the walk right menu **Run 12d ADAC 4.1 Chains** of the option **12d 4.1 chains**, to run the base *ADAC Survey* or *Design* chains for ADAC 4.1 with specially named Map and *12duaf* files in either the working folder for the project (local), User_Lib or Library.

For information on the 12d supplied walk-right menu **Run 12d ADAC 4.1 Chains**, see 10.4.9.4 12d 4.1 Chains .

Return to 10.4.9.3 User ADAC Utilities .

10.5 ADAC Design and Survey Chains

The full explanation of the ADAC Design and ADAC Survey chains is usually only needed for the one or two people in a company who are **setting up** the **ADAC procedures** in the company.

Other users do not need to read it but may find it interesting to read.

In the steps outlined in 12d ADAC Workflow (see 10.3 12d ADAC Workflow) it states that the *ADAC Design and ADAC Survey* chains:

(a) Assign the ADAC Asset Type

Any data going out to ADAC must be one of the ADAC Assets.

The assignment may already have been done by the user with the **Create ADAC Asset** option (see 10.4.2 Create ADAC Asset) but it can also be done automatically using a ***12d Map File.*** This ADAC Map File must have already been set up for the company.

(b) Sets ADAC attribute values from the 12d String Geometry and User Attributes

Much of the required ADAC data is already contained within the 12d strings or in User Attributes.

For example, if the Drainage or Sewer was designed with ***12d Model*** then much of the ADAC data can come directly from the drainage and sewer strings. For example, maintenance holes and chambers, depths, and various pipe dimensions are used, required 2D and 3D lengths and areas are calculated.

User attributes picked up in the field by the surveyors, or added in the Data Prep Step, are also loaded into the required ADAC attributes.

(c) Creates the ADAC Geometry

For each ADAC Asset, the ADAC Geometry is automatically generated from the 12d string geometry.

For example, if the ADAC Asset has Polyline Geometry, the (x,y,z) coordinates for each vertex of the string are loaded into the ADAC Geometry.

To go through the workings of the ADAC Design and ADAC Survey chains, see

10.5.1 Survey to ADAC Chains

10.5.2 Design to ADAC Chains

10.5.1 Survey to ADAC Chains

The **ADAC Survey Chain** takes all the string on the view **Survey to map to adac** and produces ADAC Asset strings in a model **survey adac data** which is added to the view **Survey ready for ADAC**.

So the user simply adds all the strings that are to go into the ADAC XML file onto the view called **Survey to map to adac** and clicks on the appropriate button on a walk right menu on the **User ADAC** menu, to run the chain for a particular customer and ADAC version.

There is actually no **Survey to ADAC Chain** and what the menu option does is run the chain **ADAC_survey_base.chain** with a particular chain parameter value file (**pvf** file).

So to fully understand the process, you first need to look at the **pvf** file for the chain ADAC_survey_base.chain, and then examine in detail the *ADAC_survey_base.chain* itself.

See

10.5.1.1 ADAC Survey Base Chain pvf File

10.5.1.2 ADAC Survey Base Chain

10.5.1.1 ADAC Survey Base Chain pvf File

The **pvf** file for the *ADAC_survey_base* chain passes **nine** parameters to the chain - **five** that the user must set and four that are constructed from these five parameters.

1. The text parameter **company** which has as its value an abbreviated customer name. For example, **BCC**.

   This is used to build up the name of the **ADAC 12d Map File** to use.
2. The text parameter **adac_version_by_ten**, which has the value **41** if you are generating ADAC 4.1.0 files, or **40** if you are generating ADAC 4.0 files.

   This is used to build up the name of the **ADAC 12d Map File** to use.
3. The text parameter **user_attributes_conversion_type**
4. The text parameter **survey_finished_tin**
5. The text parameter **design_finished_tin** is not used in the ADAC_survey_base chain and can be left blank.

There are two parameters to define which ***12d Map Files*** to use but they are fully determined once *company* and *adac_version_by_ten* have values.

6. The text parameter **survey_map_file** has the value $USER_LIB\ADAC_[company]_Map_Survey_to_ADAC_[adac_version_by_ten].mapfile
7. The text parameter **design_map_file** has the value $USER_LIB\ADAC_[company]_Map_Design_to_ADAC_[adac_version_by_ten].mapfile

   design_map_file is not actually used in the ADAC_survey_base chain.

There are two parameters to define which ***12d User Adac to ADAC Elements Files*** to use and again they are fully determined once *company* and *adac_version_by_ten* have values.

8. The text parameter **adac_attribute_file** has the value $USER_LIB\[company]_[adac_version_by_ten].12duaf

   This file is different for each company and must exist (it can contain no information).
9. The text parameter **adac_12d_attribute_file** has the value $USER_LIB\ADAC_12d_[adac_version_by_ten].12duaf

   This file is the same for each company and is for user attributes that *12d Solutions* has created.

The **pvf** file is passed to the **ADAC_survey_base.chain** by having the chain run as a menu option on one of the walk right menus on the **User ADAC** menu.

```
Menu "ADAC BCC 4.1 Chains" {
  Button "BCC Design to ADAC 41 chain" {
    Command "chain  -pvf $USER/BCC/ADAC_BCC_41.pvf   $LIB/ADAC_design_base.chain"
  }
  Button "BCC Survey to ADAC 41 chain" {
    Command "chain  -pvf $USER/BCC/ADAC_BCC_41.pvf  $LIB/ADAC_survey_base.chain"
  }
}
```

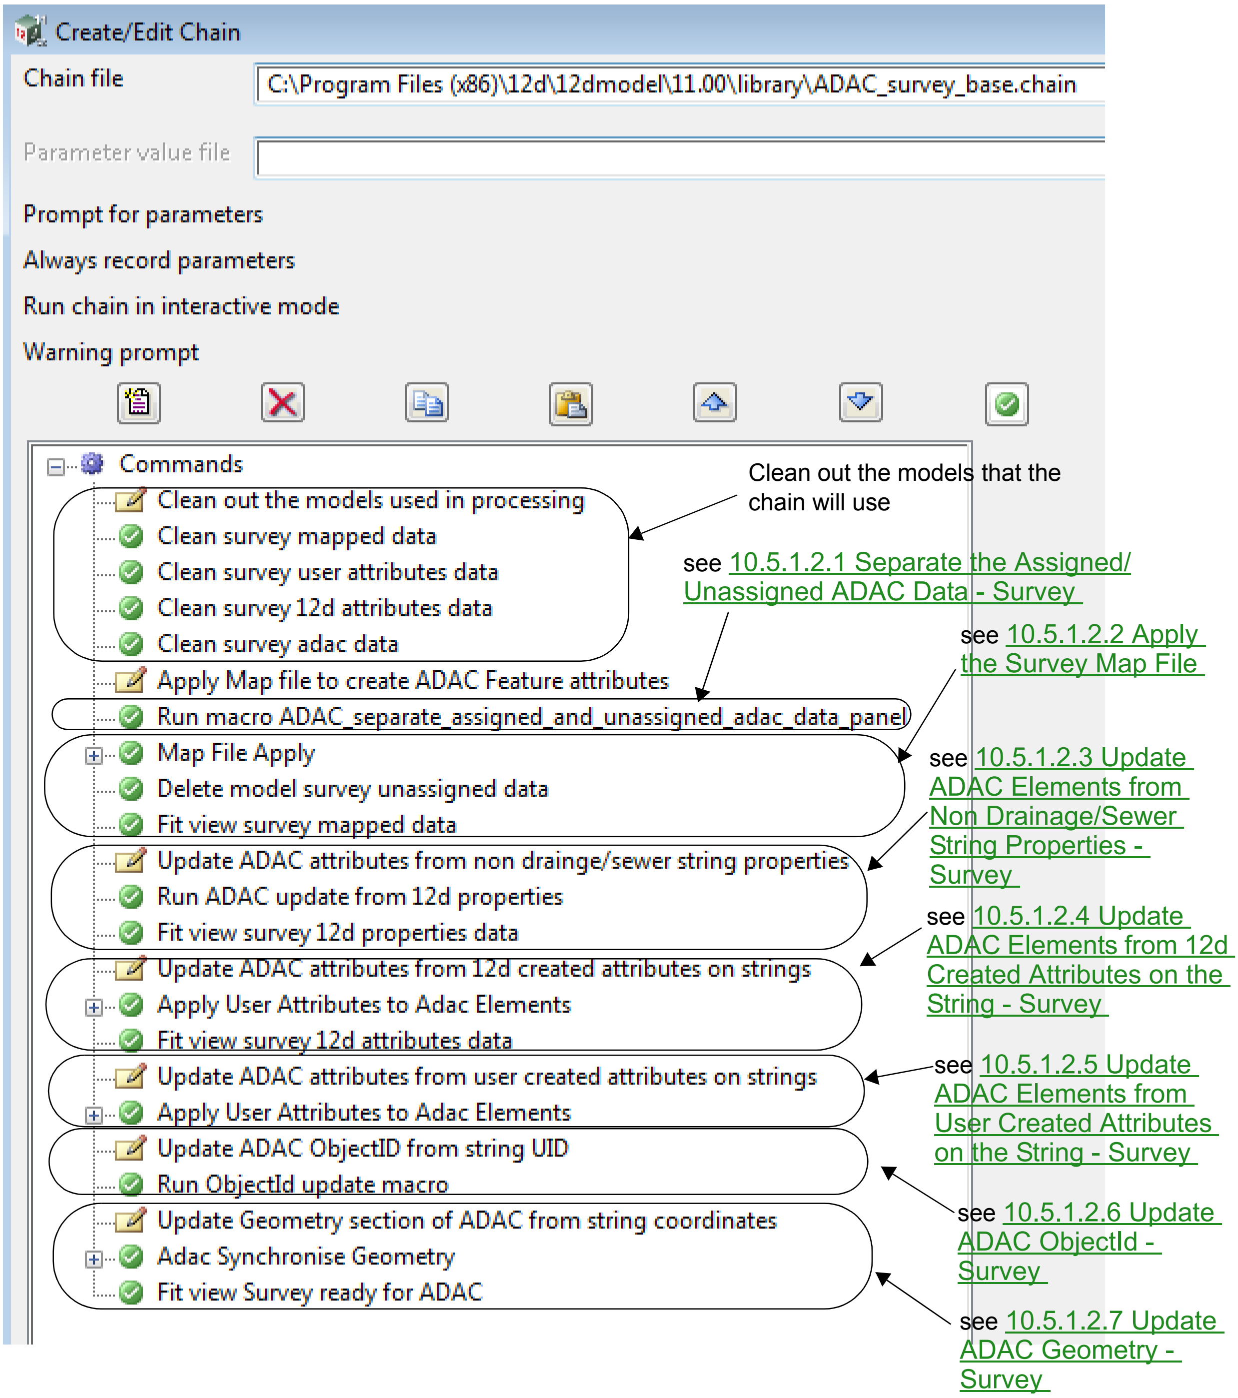
pvf file to set the parameters for customer BCC and ADAC 4.1

base chain

ADAC_Survey_base.chain is discussed in detail in 10.5.1.2 ADAC Survey Base Chain

10.5.1.2 ADAC Survey Base Chain

The chain *ADAC_survey_base.chain* takes all the data on the view **Survey to map to adac** and ends up producing ADAC Assets in a model **survey adac data** which is added to the view **Survey ready for ADAC**.



10.5.1.2.1 Separate the Assigned/Unassigned ADAC Data - Survey

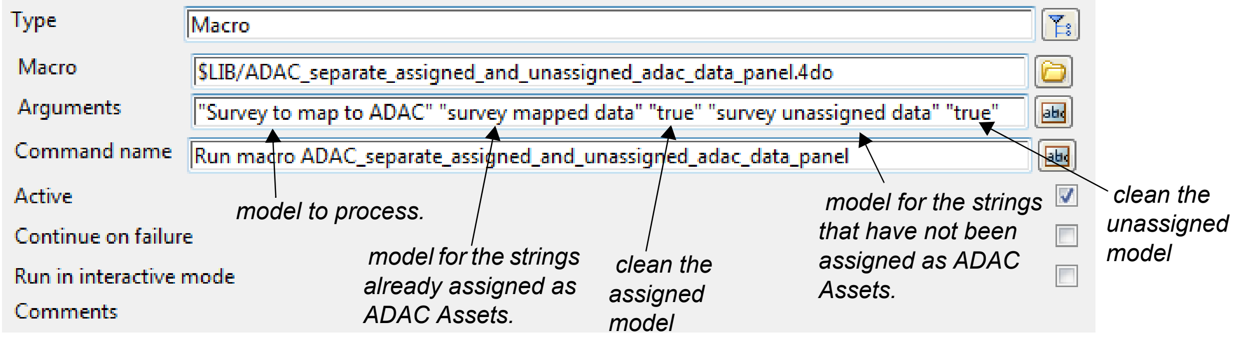
Some strings on the **View** called **Survey to map to ADAC** may have already been assigned (marked) as ADAC Assets and so should not have the ADAC Map file applied to them.

So the data is first processed to separate the assigned and unassigned data into separate models.

This is achieved by running the 12dPL (macro)

$LIB/ADAC_separate_assigned_and_unassigned_adac_data_panel.4do

which looks at all the data on the **View** called **Survey to map to ADAC** and copies the strings that have been assigned as ADAC Assets to the model **survey mapped data** and all the data that has not yet been assigned to the model **survey unassigned data**.



The model **survey mapped data** is on the view called **survey ready for adac**.

Note - this 12d PL program is described in more detail in 10.4.9.3.6.1 Separate Assigned/ Unassigned ADAC Data

Continue to the next section 10.5.1.2.2 Apply the Survey Map File or return to 10.5.1.2 ADAC Survey Base Chain or 10.5.1 Survey to ADAC Chains .

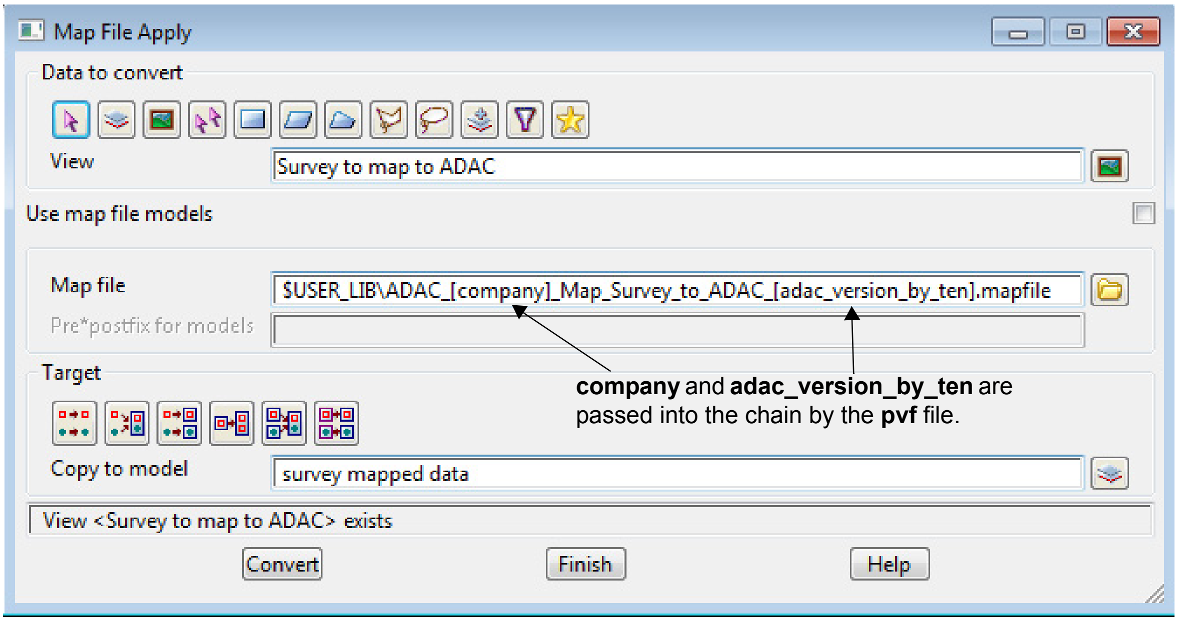
10.5.1.2.2 Apply the Survey Map File

This section of the chain applies the ***12d Map File***

$USER_LIB\ADAC_[company]_Map_Survey_to_ADAC_[adac_version_by_ten].mapfile

to the data in the model **survey unassigned data** and copies all of the string to the model **survey mapped data**.

Most importantly, the **12d Map File** also assigns (marks) some strings as ADAC Assets by giving them ADAC Attributes as defined by the **12d Map File**.



The model **survey mapped data** is on the view called **survey mapped data** and a fit is done on the view.

The model **survey unassigned data** is deleted.

Continue to the next section 10.5.1.2.3 Update ADAC Elements from Non Drainage/Sewer String Properties - Survey or return to 10.5.1.2 ADAC Survey Base Chain or 10.5.1 Survey to ADAC Chains.

10.5.1.2.3 Update ADAC Elements from Non Drainage/Sewer String Properties - Survey

Many of the ADAC entities can be calculated directly from the 12d strings and some values may be taken from the tin **survey_finished_tin** that is passed into the chain by the **pvf** file.

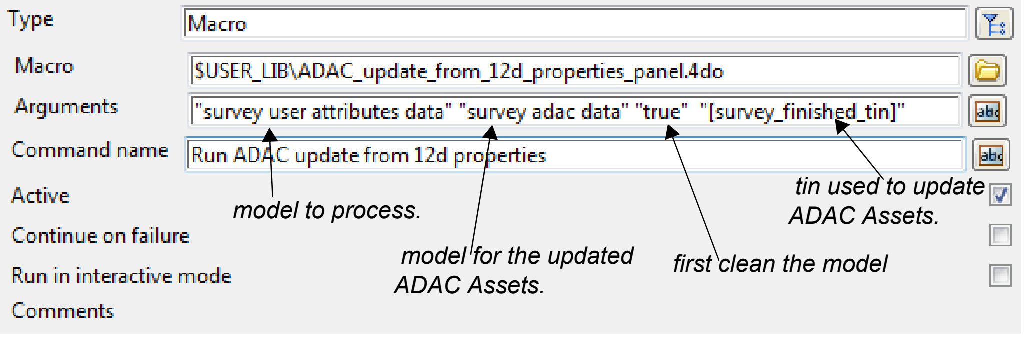
This is achieved by running the 12dPL (macro)

$LIB\ADAC_update_from_12d_properties_panel.4do

which looks at all the data in the model produced in the previous step and if a string has been marked as an ADAC Asset, then it is copied and any relevant ADAC elements updated from the properties of the12d string itself and the tin **survey_finished_tin**.

The copied string is added to the model **survey adac data**.

Only ADAC Assets are added to the model **survey adac data.**



The model **survey adac data** is on the view called **survey ready for adac**.

Note - this 12d PL program is described in more detail in 10.4.9.3.6.2 Set ADAC Attributes from String Properties

Continue to the next section 10.5.1.2.4 Update ADAC Elements from 12d Created Attributes on the String - Survey or return to 10.5.1.2 ADAC Survey Base Chain or 10.5.1 Survey to ADAC Chains .

10.5.1.2.4 Update ADAC Elements from 12d Created Attributes on the String - Survey

Some of the values for ADAC elements can be taken from attributes that 12d options have placed on the string. For example, using the ADAC Common Editor panel documented in the section 10.4.9.2.1 Providing Extra Data for ADAC.

This is achieved by running the panel

ADAC User Attributes to ADAC Element

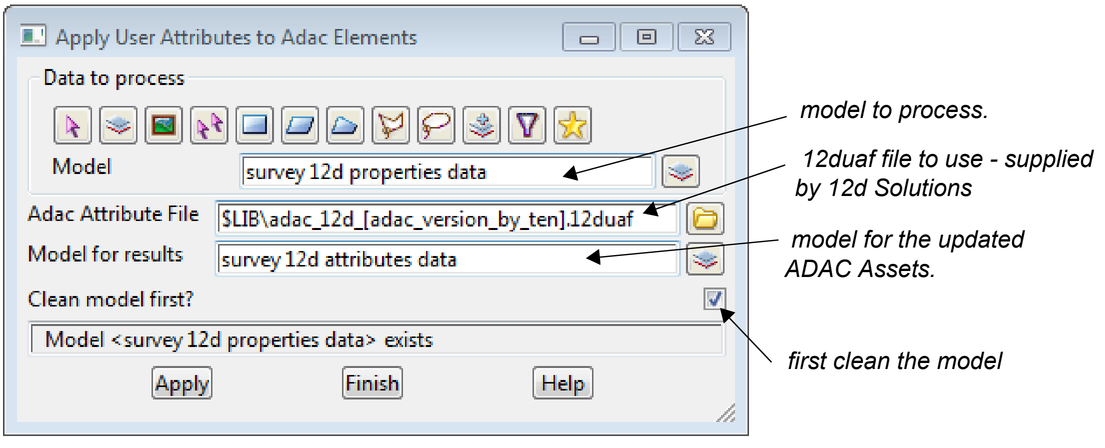
with a *12d Solutions* supplied *12duaf* file for the required version of ADAC.

(this is the option ADAC =>Utilities =>Apply User Attributes to ADAC elements).

The option looks at all the data in the model produced in the previous step and each string is copied and then any relevant ADAC elements updated from User attributes of the string according to the given *12duaf* file.

Note that these User attributes have been created by ***12d Model*** options that 12d Solutions knows about and hence can provide the *12duaf* file.

The copied strings are added to the model **survey 12d attributes data**.



The model **survey 12d attributes data** is on the view called **survey 12d attributes data** and a fit is done on the view.

Note - this option is described in more detail in 10.4.8.6 Apply User Attributes to ADAC Elements

Continue to the next section 10.5.1.2.5 Update ADAC Elements from User Created Attributes on the String - Survey or return to 10.5.1.2 ADAC Survey Base Chain or 10.5.1 Survey to ADAC Chains.

10.5.1.2.5 Update ADAC Elements from User Created Attributes on the String - Survey

Some of the values for ADAC elements can be taken from attributes that users have placed on the string. For example, from attributes picked up by surveyors in the field.

Because these User attributes are defined by the user, *12d Solutions* has no idea of what they are so the user must set up their own *12duaf* file that can be used to updated the appropriate ADAC elements from these user created User Attributes.

This user supplied *12duaf* file is placed in the users User_Lib.

The user supplied *12duaf* file is used by running the panel

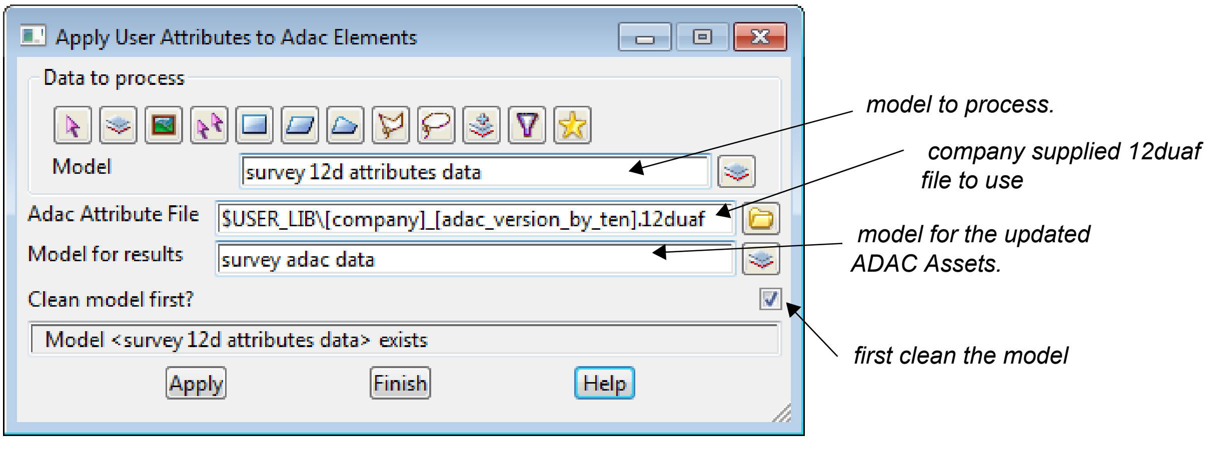
ADAC User Attributes to ADAC Element

with the user supplied 12duaf file for the required version of ADAC.

(this is the option ADAC =>Utilities =>Apply User Attributes to ADAC elements).

The option looks at all the data in the model produced in the previous step and each string is copied and then any relevant ADAC elements updated from User attributes of the string according to the given *12duaf* file.

The copied strings are added to the model **survey user attributes data**.



The model **survey user attributes data** is on the view called **survey string properties data.**

Note - this option is described in more detail in 10.4.8.6 Apply User Attributes to ADAC Elements

Continue to the next section 10.5.1.2.6 Update ADAC ObjectId - Survey or return to 10.5.1.2 ADAC Survey Base Chain or 10.5.1 Survey to ADAC Chains .

10.5.1.2.6 Update ADAC ObjectId - Survey

From the *ADAC XML Schema, the* **Objectid**

> *Represents a place for an object identifier, usually generated by the data creation software. Also useful as a placeholder for record ID generated by back-end databases or GIS*
> *The ObjectId is permitted to be nil because the capturing system may not have the capacity to generate one. If features are exported from a GIS or Asset Management system, however, it is highly recommended to carry them out into this element.*

Every string in ***12d Model*** has a unique identifier called a UID, so ***12d Model*** creates a unique ObjectId by:

(a) for drainage and sewer strings, creating ObjectIds for

(i) each pit/manhole. The ObjectId is made up of the string UID, the pit/manhole vertex index and information about them to help connect the string together.

(ii) each pipe. The ObjectId is made up of the string UID, the pipe segment index and information about which pits are at the ends of the pipe.

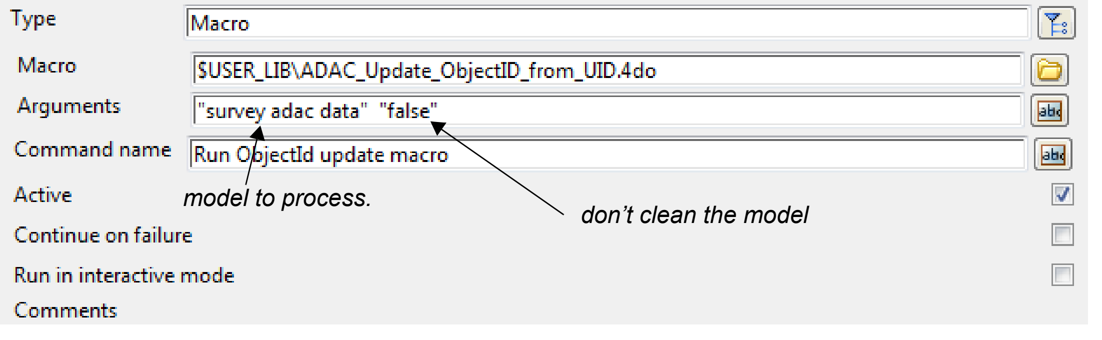
This is only relevant for designers and not surveyors.

(b) for all other strings, setting the ObjectId to the string UID.

The *ObjectId* is created by running the 12dPL (macro)

$LIB\ADAC_update_ObjectId_from_UID_panel.4do

The *12dPL* looks at all the strings in the model produced in the previous step, **survey adac data,** and updates the string's own ADAC ObjectId attribute. So unlike the previous sections, the string is not copied.



The model **survey adac data** is on the view called **survey ready for adac.**

Note - this *12dPL* program is described in more detail in 10.4.9.3.6.5 Set ADAC ObjectId from String UID

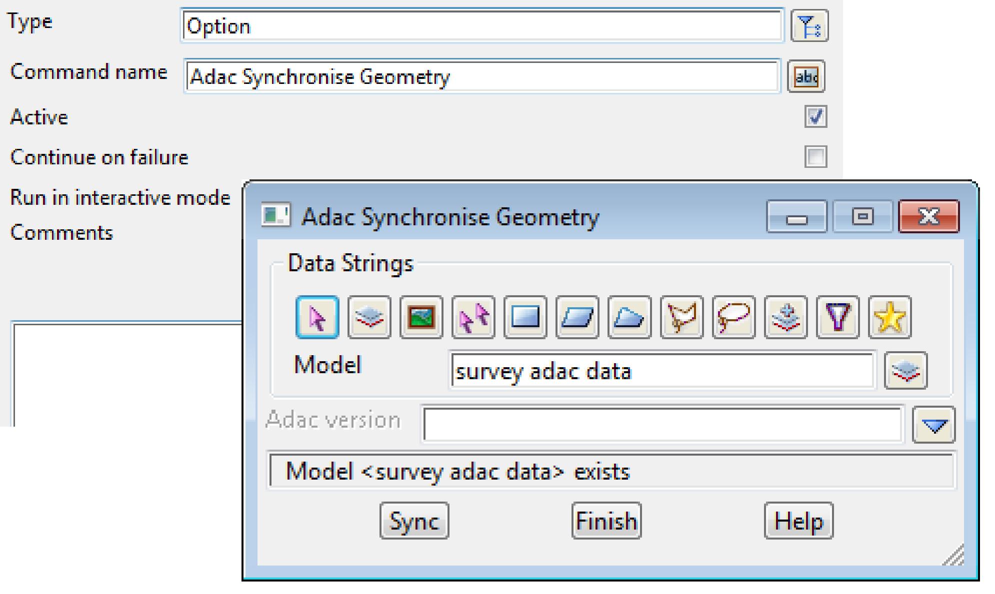
Continue to the next section 10.5.1.2.7 Update ADAC Geometry - Survey or return to 10.5.1.2 ADAC Survey Base Chain or 10.5.1 Survey to ADAC Chains .

10.5.1.2.7 Update ADAC Geometry - Survey

The final step is for every ADAC Asset, updating its ADAC Geometry attributes from the string geometry.

This is done by running in the chain, the option in 12d

File I/O =>ADAC =>Utilities =>Sync geometry



The model **survey adac data** is on the view called **survey ready for adac** and a fit is done on the view**.**

Note - this 12d PL program is described in more detail in 10.4.8.4 Sync Geometry

Return to 10.5.1.2 ADAC Survey Base Chain or 10.5.1 Survey to ADAC Chains .

10.5.2 Design to ADAC Chains

The **ADAC Design Chain** takes all the strings on the view **Design to map to adac** and produces ADAC Asset strings in a model **design adac data** which is added to the view **Design ready for ADAC**.

So the user simply adds all the strings that are to go into the ADAC XML file onto the view called **Design to map to adac** and clicks on the appropriate button on a walk right menu on the **User ADAC** menu, to run the chain for a particular customer and ADAC version.

There is actually no **Design to ADAC Chain** and what the menu option does is run the chain **ADAC_design_base.chain** with a particular chain parameter value file (**pvf** file).

So to fully understand the process, you first need to look at the **pvf** file for the chain ADAC_design_base.chain, and then examine in detail the *ADAC_design_base.chain* itself.

See

10.5.2.1 ADAC Design Base Chain pvf File

10.5.2.2 ADAC Design Base Chain

10.5.2.1 ADAC Design Base Chain pvf File

The **pvf** file for the *ADAC_design_base* chain passes **nine** parameters to the chain - **five** that the user must set and four that are constructed from these five parameters.

1. The text parameter **company** which has as its value an abbreviated customer name. For example, **BRC**.

   This is used to build up the name of the **ADAC 12d Map File** to use.

2. The text parameter **adac_version_by_ten**, which has the value **41** if you are generating ADAC 4.1.0 files, or **40** if you are generating ADAC 4.0 files.

   This is used to build up the name of the **ADAC 12d Map File** to use.

3. The text parameter **user_attributes_conversion_type**
4. The text parameter **survey_finished_tin**
5. The text parameter **design_finished_tin** is not used in the ADAC_survey_base chain and can be left blank.

There are two parameters define which ***12d Map Files*** to use but they are fully determined once *company* and *adac_version_by_ten* have values.

6. The text parameter **survey_map_file** has the value $USER_LIB\ADAC_[company]_Map_Survey_to_ADAC_[adac_version_by_ten].mapfile

   survey_map_file is not actually used in the ADAC_design_base chain.

7. The text parameter **design_map_file** has the value $USER_LIB\ADAC_[company]_Map_Design_to_ADAC_[adac_version_by_ten].mapfile

There are two parameters to define which ***12d User Adac to ADAC Elements Files*** to use and again they are fully determined once *company* and *adac_version_by_ten* have values.

8. The text parameter **adac_attribute_file** has the value $USER_LIB\[company]_[adac_version_by_ten].12duaf

   This file is different for each company and must exist (it can contain no information).

9. The text parameter **adac_12d_attribute_file** has the value $USER_LIB\ADAC_12d_[adac_version_by_ten].12duaf

   This file is the same for each company and is for user attributes that *12d Solutions* has created.

The **pvf** file is passed to the **ADAC_design_base.chain** by having the chain run as a menu option on one of the walk right menus on the **User ADAC** menu.

```
Menu "ADAC BRC 4.1 Chains" {
  Button "BCC Survey to ADAC 41 chain" {
    Command "chain  -pvf $USER/BRC/ADAC_BRC_41.pvf   $LIB/ADAC_survey_base.chain"
  }
  Button "BRC Survey to ADAC 41 chain" {
    Command "chain  -pvf $USER/BRC/ADAC_BRC_41.pvf  $LIB/ADAC_design_base.chain"
  }
}
```

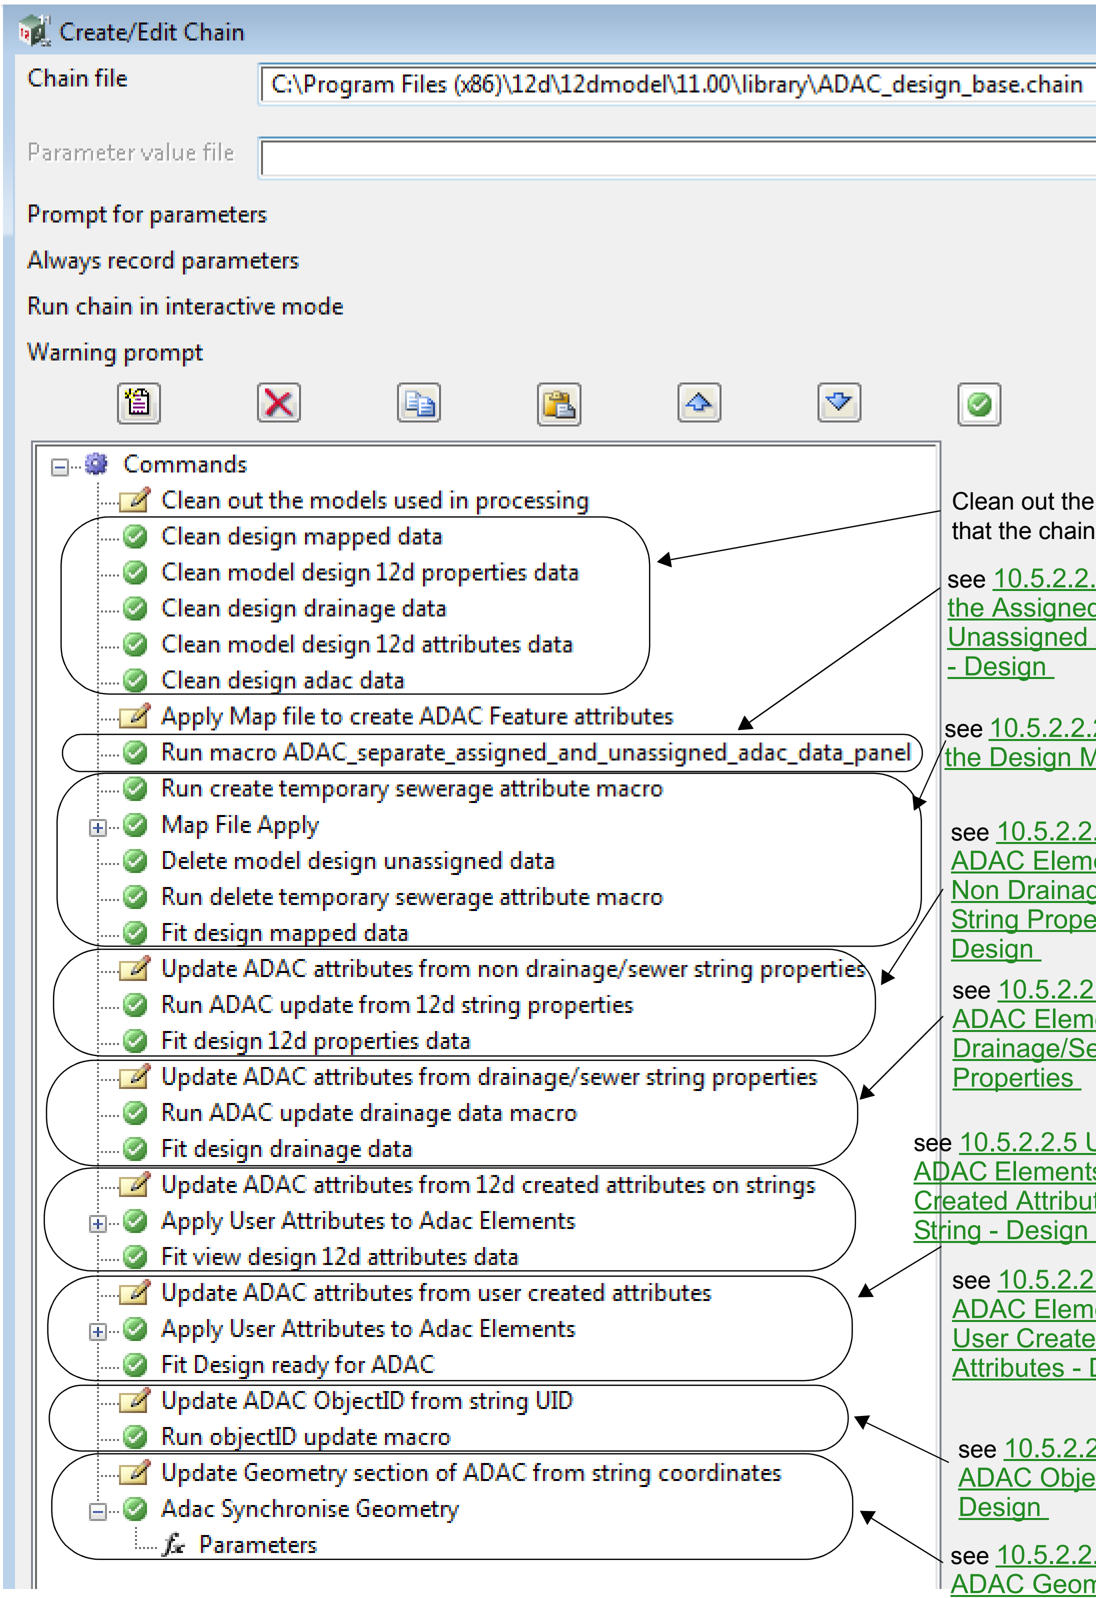
pvf file to set the parameters for customer BRC and ADAC 4.1

base chain

ADAC_Design_base.chain is discussed in detail in 10.5.2.2 ADAC Design Base Chain

10.5.2.2 ADAC Design Base Chain

The chain *ADAC_design_base.chain* takes all the data on the view **design to map to adac** and ends up producing ADAC Assets in a model **design adac data** which is add to the view **Design ready for ADAC**.



Clean out the models that the chain will use

see 10.5.2.2.1 Separate the Assigned/ Unassigned ADAC Data - Design

see 10.5.2.2.2 Applying the Design Map File

see 10.5.2.2.3 Update ADAC Elements from Non Drainage/Sewer String Properties - Design

see 10.5.2.2.4 Update ADAC Elements from Drainage/Sewer String Properties

see 10.5.2.2.5 Update ADAC Elements from 12d Created Attributes on the String - Design

see 10.5.2.2.6 Update ADAC Elements from User Created Attributes - Design

see 10.5.2.2.7 Update ADAC ObjectId - Design

see 10.5.2.2.8 Update ADAC Geometry - Design

10.5.2.2.1 Separate the Assigned/Unassigned ADAC Data - Design

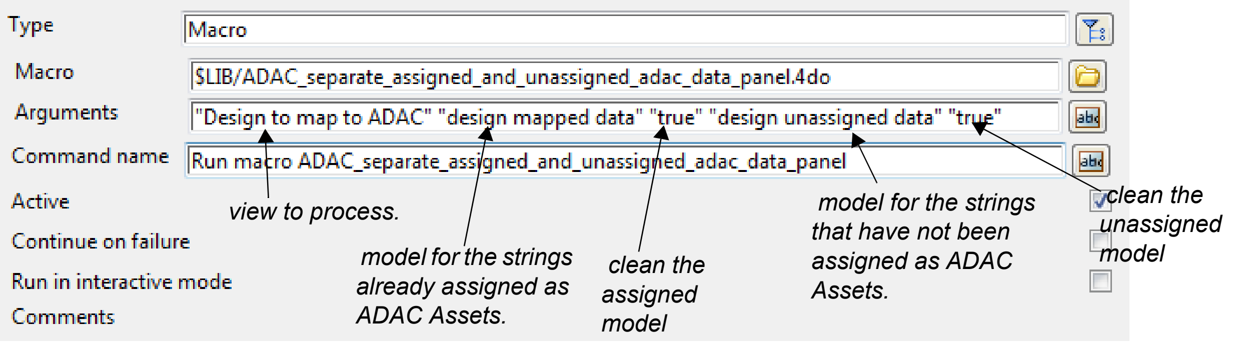
Some strings on the **View** called **Survey to map to ADAC** may have already been assigned (marked) as ADAC Assets and so should not have the ADAC Map file applied to them.

So the data is first processed to separate the assigned and unassigned data into separate models.

This is achieved by running the 12dPL (macro)

$LIB/ADAC_separate_assigned_and_unassigned_adac_data_panel.4do

which looks at all the data on the **View** called **Design to map to ADAC** and copies the strings that have been assigned as ADAC Assets to the model **design mapped data** and all the data that has not yet been assigned to the model **design unassigned data**.



The model **design mapped data** is on the view called **deign ready for adac**.

Note - this 12d PL program is described in more detail in 10.4.9.3.6.1 Separate Assigned/ Unassigned ADAC Data

Continue to the next section 10.5.2.2.2 Applying the Design Map File or return to 10.5.2.2 ADAC Design Base Chain or 10.5.2 Design to ADAC Chains .

10.5.2.2.2 Applying the Design Map File

First the 12dPL option *Create_or_delete_temporary_sewerage_attribute_panel.4do* is run on the data in the model called **design unassigned data** and for each

(a) **drainage string**, creates a **string attribute** called **sewertype** of type Integer with 0.

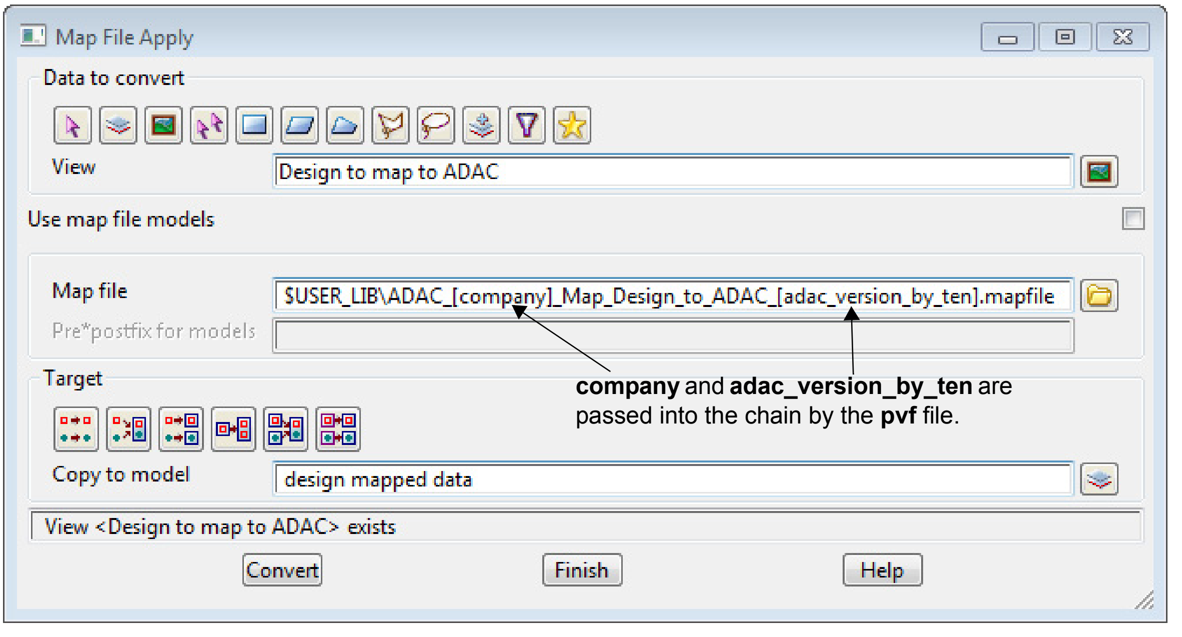
(b) **sewer string**, create a **string attribute** called **sewertype** of type Integer with value 0.

Next the chain applies the ***Map File***

$USER_LIB\ADAC_[company]_Map_Design_to_ADAC_[adac_version_by_ten].mapfile

to the data on the **View** called **Design to map to ADAC** and copies all of the string and adds to the model **design mapped data**.

Most importantly the ***Map File*** marks some strings, and the vertices and segments for drainage and sewer strings, as ADAC Assets by giving them ADAC Attributes as defined by the ***Map File***.



Next the model **design unassigned data** is deleted.

The 12dPL option *Create_or_delete_temporary_sewerage_attribute_panel.4do* is then run on the data on the view called **Design to map to ADAC** and on the model **design mapped data** to remove the string attribute **sewertype**.

The model **design mapped data** is on the view called **design mapped data** and a fit is done on that view.

Continue to the next section 10.5.2.2.3 Update ADAC Elements from Non Drainage/Sewer String Properties - Design or return to 10.5.2.2 ADAC Design Base Chain or 10.5.2 Design to ADAC Chains .

10.5.2.2.3 Update ADAC Elements from Non Drainage/Sewer String Properties - Design

Many of the ADAC entities can be calculated directly from the 12d strings, and some values may be taken from the tin **design_finished_tin** that is passed into the chain by the **pvf** file.

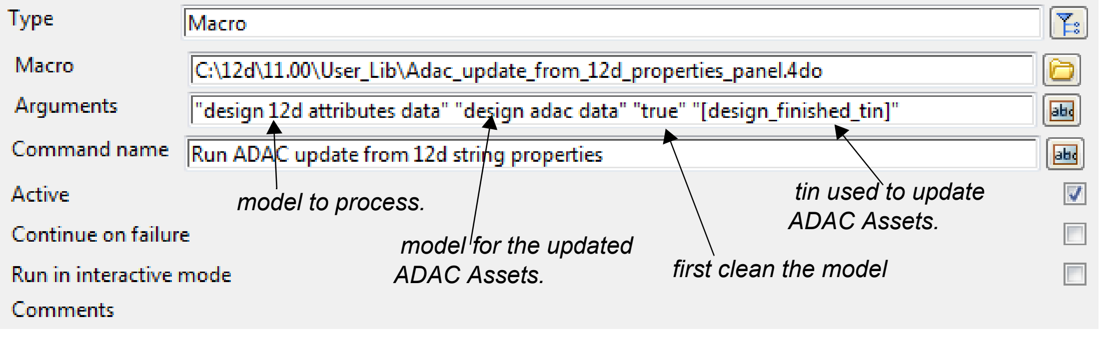
This is achieved by running the 12dPL (macro)

$LIB\ADAC_update_from_12d_properties_panel.4do

which looks at all the data in the model produced in the previous step and if a string has been marked as an ADAC Asset, then it is copied and any relevant ADAC elements updated from the properties of the12d string itself and the tin **design_finished_tin**.

The copied string is added to the model **design string properties data**.

Only ADAC Assets are added to the model **design string properties data.**



The model **design adac data** is on the view called **design ready for adac**.

Note - this 12d PL program is described in more detail in 10.4.9.3.6.2 Set ADAC Attributes from String Properties

Continue to the next section 10.5.2.2.4 Update ADAC Elements from Drainage/Sewer String Properties or return to 10.5.2.2 ADAC Design Base Chain or 10.5.2 Design to ADAC Chains .

10.5.2.2.4 Update ADAC Elements from Drainage/Sewer String Properties

Many of the ADAC entities can be calculated directly from the maintenance holes/pits and pipes from the 12d drainage and sewer strings.

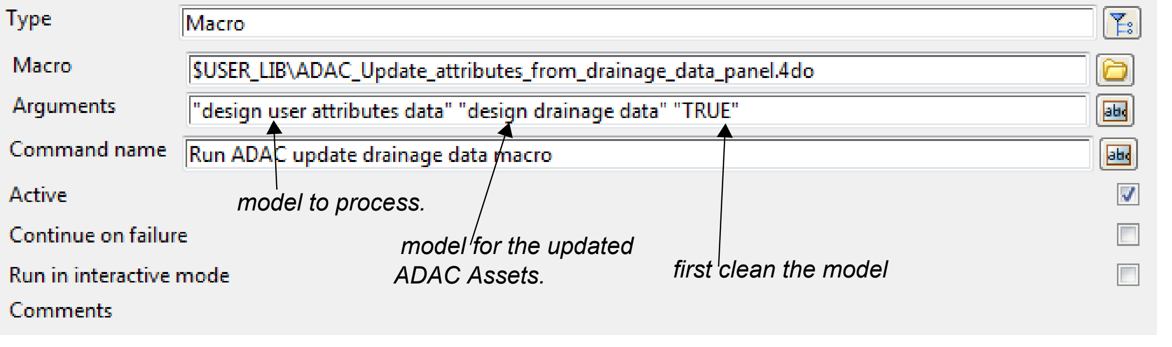
This is achieved by running the 12dPL (macro)

$LIB\ADAC_update_from_drainage_data_panel.4do

which looks at all the drainage and sewer strings in the model produced in the previous step and if the pits and pipes have been marked as ADAC Assets, then the string is copied and any relevant ADAC pits and pipes in the strings updated from the pits and pipes properties of the12d string itself.

The copied string is added to the model **design drainage data**.

Only ADAC Assets are added to the model **design drainage data.**



The model **design drainage data** is on the view called **design drainage data** and a fit is done on the view.

Note - this 12d PL program is described in more detail in 10.4.9.3.6.3 Set ADAC Attributes from Drainage & Sewer Data

Continue to the next section 10.5.2.2.5 Update ADAC Elements from 12d Created Attributes on the String - Design or return to 10.5.2.2 ADAC Design Base Chain or 10.5.2 Design to ADAC Chains .

10.5.2.2.5 Update ADAC Elements from 12d Created Attributes on the String - Design

Some of the values for ADAC elements can be taken from User attributes that 12d options have placed on the string. For example, using the ADAC Common Editor panel documented in the section 10.4.9.2.1 Providing Extra Data for ADAC .

This is achieved by running the panel

ADAC User Attributes to ADAC Element

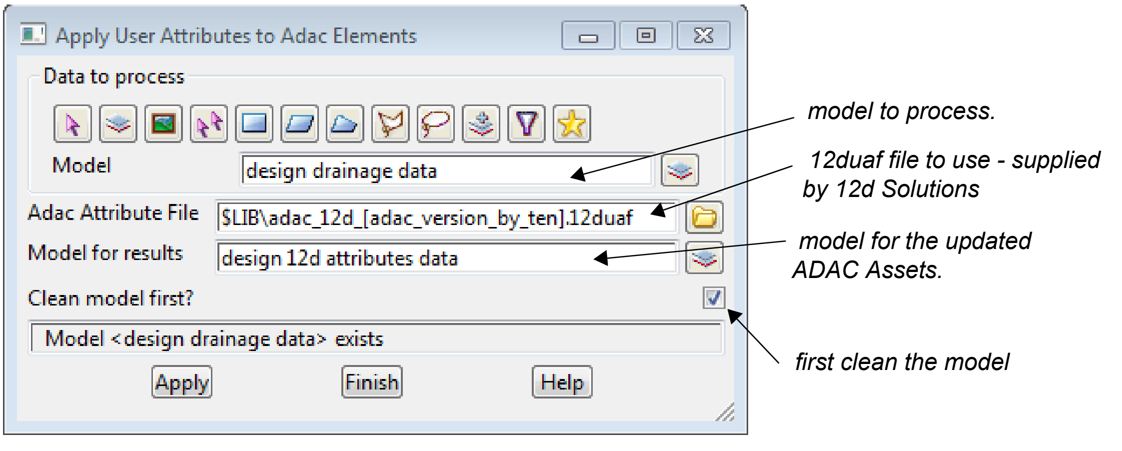
with a *12d Solutions* supplied *12duaf* file for the required version of ADAC.

(this is the option ADAC =>Utilities =>Apply User Attributes to ADAC elements).

The option looks at all the data in the model produced in the previous step and each string is copied and then any relevant ADAC elements updated from User attributes of the string according to the given *12duaf* file.

Note that these User attributes have been created by ***12d Model*** options that *12d Solutions* knows about and hence can provide the *12duaf* file.

The copied strings are added to the model **design 12d attributes data**.



The model **design 12d attributes data** is on the view called **design 12d attributes data** and a fit is done on the view.

Note - this option is described in more detail in 10.4.8.6 Apply User Attributes to ADAC Elements

Continue to the next section 10.5.2.2.4 Update ADAC Elements from Drainage/Sewer String Properties or return to 10.5.2.2 ADAC Design Base Chain or 10.5.2 Design to ADAC Chains .

10.5.2.2.6 Update ADAC Elements from User Created Attributes - Design

Some of the values for ADAC elements can be taken from attributes that users have placed on the string.

Because these User attributes are defined by the user, *12d Solutions* has no idea of what they are so the user must set up their own *12duaf* file that can be used to updated the appropriate ADAC elements from these user created User Attributes.

This user supplied *12duaf* file is placed in the users User_Lib.

The user supplied *12duaf* file is used by running the panel

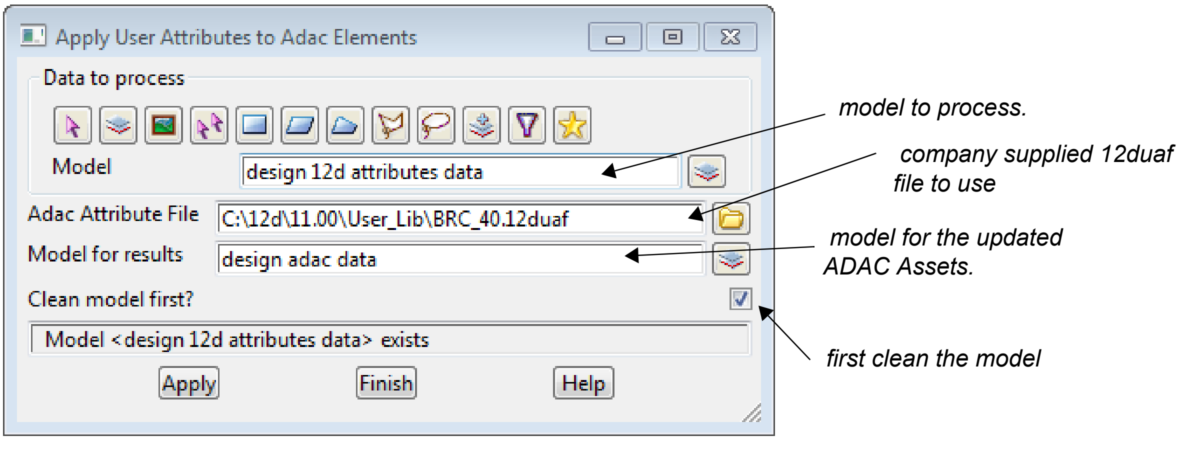
ADAC User Attributes to ADAC Element

with the user supplied 12duaf file for the required version of ADAC.

(this is the option ADAC =>Utilities =>Apply User Attributes to ADAC elements).

The option looks at all the data in the model produced in the previous step and each string is copied and then any relevant ADAC elements updated from User attributes of the string according to the given *12duaf* file.

The copied strings are added to the model **design user attributes data**.



The model **design user attributes data** is on the view called **design string properties data.**

Note - this option is described in more detail in 10.4.8.6 Apply User Attributes to ADAC Elements

Continue to the next section 10.5.2.2.7 Update ADAC ObjectId - Design or return to 10.5.2.2 ADAC Design Base Chain or 10.5.2 Design to ADAC Chains .

10.5.2.2.7 Update ADAC ObjectId - Design

From the *ADAC XML Schema, the* **Objectid**

> *Represents a place for an object identifier, usually generated by the data creation software. Also useful as a placeholder for record ID generated by back-end databases or GIS*
> *The ObjectId is permitted to be nil because the capturing system may not have the capacity to generate one. If features are exported from a GIS or Asset Management system, however, it is highly recommended to carry them out into this element.*

Every string in ***12d Model*** has a unique identifier called a UID, so ***12d Model*** creates a unique ObjectId by:

(a) for drainage and sewer strings, creating ObjectIds for

(i) each pit/manhole. The ObjectId is made up of the string UID, the pit/manhole vertex index and information about the to help connect the string together.

(ii) each pipe. The ObjectId is made up of the string UID, the pipe segment index and information about which pits are at the ends of the pipe.

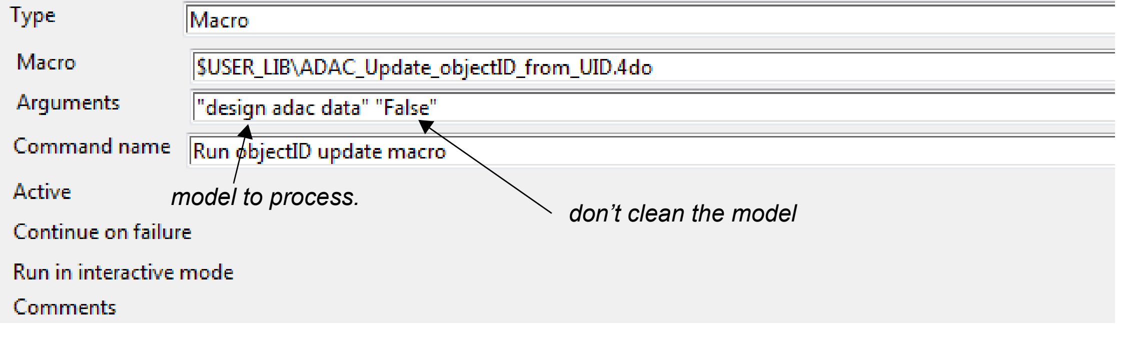
This is only relevant for designers and not surveyors.

(b) for all other strings, setting the ObjectId to the string UID.

The *ObjectId* is created by running the 12dPL (macro)

$LIB\ADAC_update_ObjectId_from_UID_panel.4do

The 12dPL looks at all the strings in the model produced in the previous step, **design adac data,** and updates the string's own ADAC ObjectId attribute. So unlike the previous sections, the string is not copied.



The model **design adac data** is on the view called **design ready for adac.**

Note - this 12d PL program is described in more detail in 10.4.9.3.6.5 Set ADAC ObjectId from String UID .

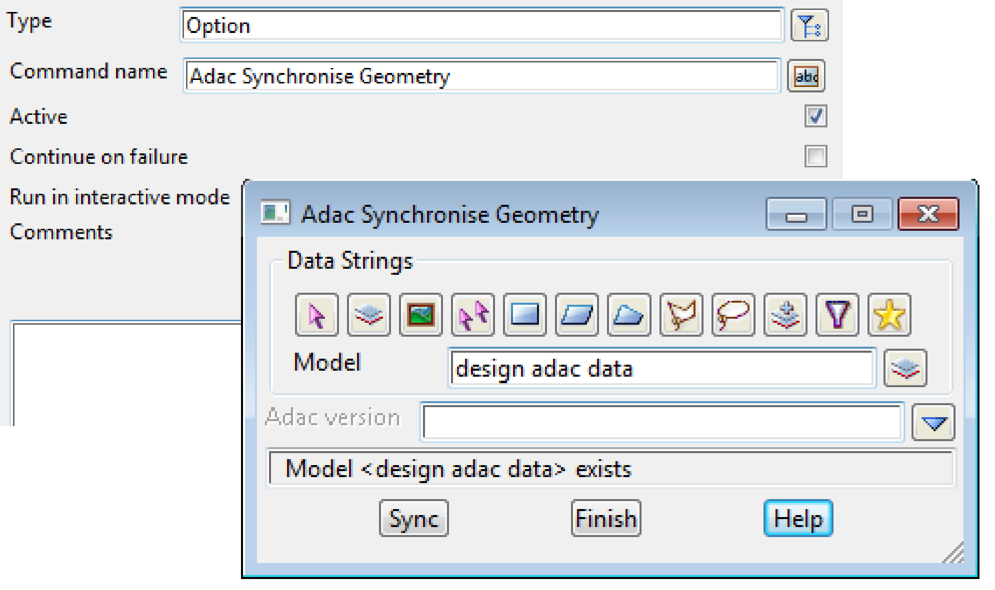
Continue to the next section 10.5.2.2.8 Update ADAC Geometry - Design or return to 10.5.2.2 ADAC Design Base Chain or 10.5.2 Design to ADAC Chains .

10.5.2.2.8 Update ADAC Geometry - Design

The final step is for every ADAC Asset, updating its ADAC Geometry attributes from the string geometry.

This is done by running in the chain, the option 12d

File I/O =>ADAC =>Utilities =>Sync geometry



The model **design adac data** is on the view called **design ready for adac** and a fit is done on the view**.**

Note - this 12d PL program is described in more detail in 10.4.8.4 Sync Geometry

Return to 10.5.2.2 ADAC Design Base Chain or 10.5.2 Design to ADAC Chains .

10.6 Setting Up for ADAC

This section is only for the one or two people in a company who are **setting up** the **ADAC procedures** in the company.

Other users should probably avoid reading it.

See

10.6.1 Setting Up Map Files for ADAC

10.6.2 What Data Prep is Needed for ADAC

10.6.3.2 Setting Up Your User ADAC Menu

10.6.4 Setting Up ADAC Templates

10.6.5 Setting Up Your User Keys

10.6.1 Setting Up Map Files for ADAC

For a ***12d Model*** string to represent an ADAC Asset, it must have

(a) string geometry that matches the ADAC Geometry for the ADAC Asset

(b) as part of its string attributes, the ADAC attribute Group for the particular ADAC Asset.

Picking each string and giving it the correct ADAC attributes for an ADAC Asset can be done using the **ADAC =>Create asset** option and although templates can be used to speed up the process, it is still very time consuming and hence slow.

So in ***12d Model***, a ***12d Map File*** is used to automatically give the appropriate ADAC Asset attributes to strings using the *Attributes* section of the ***12d Map File***.

To do this you need to be able to identify each ADAC Asset by a combination of the ***string name*** and the ***string attributes***.

This process is usually much easier for surveyors because when picking up in the field, you could easily set up coding system with a unique string name for each ADAC Asset.

For designers the process can be more difficult and they may need changes to their string naming convention, or some data preparation steps. On the other hand, designers already have most of the information for the ADAC Assets Sewerage>MaintenanceHoles>MaintenanceHole, Sewerage>NonPressurePipes>NonPressurePipe, StormWater>Pits>Pit and StormWater>Pipes>Pipe as part of their drainage and sewer strings and we'll be able to use that without manual intervention.

First we'll look at ADAC in general and then follow on with sections on setting up the ADAC ***12d Map File***.

See

10.6.1.1 Know What ADAC XML Is

10.6.1.2 Know What Your Client Wants in the ADAC XML File

10.6.1.3 How the ADAC Map File is Used

10.6.1.4 Creating the ADAC Attributes for Map Files

10.6.1.5 Notes On Creating the ADAC Attribute Structure

10.6.1.6 Setting Up the Map File Selection Criteria

10.6.1.7 More on Creating the ADAC Map Files

10.6.1.1 Know What ADAC XML Is

There is no magic way of being able to set up a **Map File** for ADAC without knowing what the ADAC Assets actually are, what key elements they contain and what Geometry they require.

For example, if you need **WaterSupply>Pipes>Pipe** in the ADAC XML file, then it is critical to know that a **WaterSupply>Pipes>Pipe** can only be a polyline with straight segments. So no arcs.

Or an **OpenSpace>BoatingFacilities>BoatingFacility**, which has **Type** choices of *Jetty*, *Pier*, *Ramp* or *Spillways*, can only be a single **Point**.

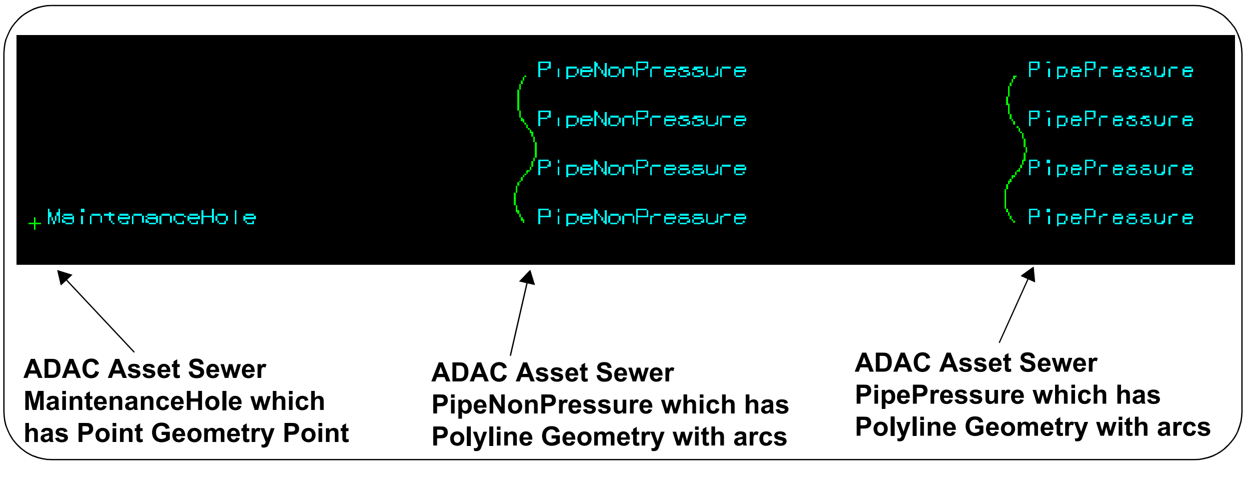
Or that a **Transport>RoadEdges>RoadEdge** must have a **Type** and it can only be one of B1, B2, B3, B4, B5, SM1, SM2, SM3,SM4,SM5, M1, M2, M3, M4, M5, M6, ER1, ER2, ER3, ER4, ER5, INV660, INV90o0, Bitumen and Concrete (as per DMR drawing 1033 - now TMR).

In all cases, any variations from the ADAC Schema will make it an invalid ADAC XML file.

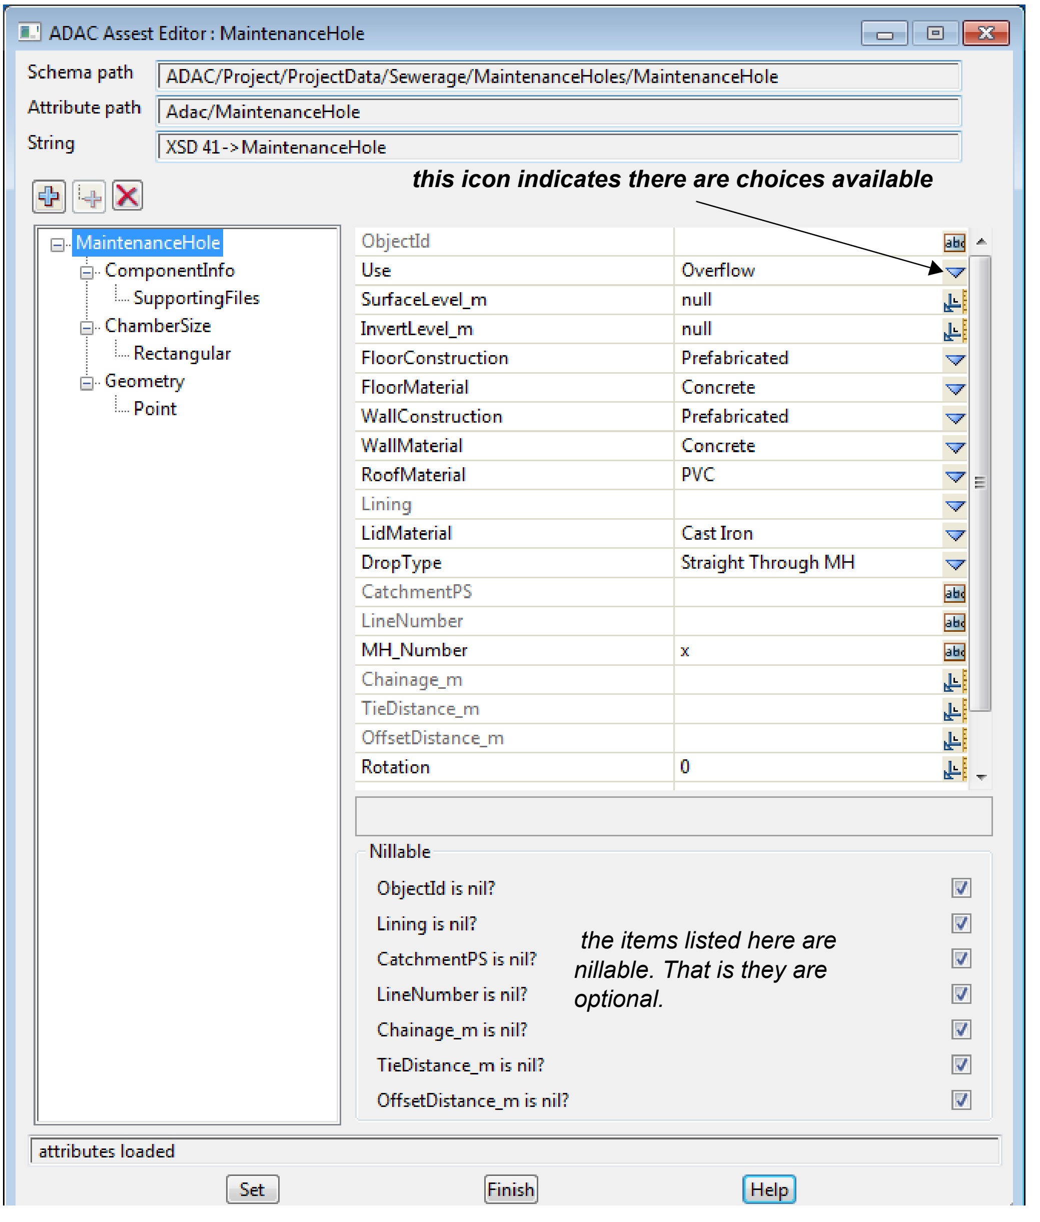
The authorised version of **ADAC Asset Design and As Constructed Schema Help File** (for Version 4.1.0 or Version 4.0.0) is controlled by the **IPWEA** and available on their web site www.engicom.com.au/products/adac2/. This is read to learn what the ADAC Assets all are.

To help in the learning process, a very useful **12d** tool is the option **XSD to Model** which takes a given version of the *ADAC XML Schema* XSD and for **each ADAC Asset** in the **XSD**, creates a green super string with the short ADAC Asset name as its string name, for it string geometry an example of the Geometry in the XSD for the ADAC Asset, and in its string attributes, an ADAC group with default values for each of the ADAC element in the ADAC Asset in the XSD. See 10.4.8.3 XSD to Model .

For example, the first three strings in that model are:



The 12d string geometry shows graphically what type of Geometry is allowed for that ADAC Asset, and editing any of the strings with the ADAC Edit will display the entire ADAC element structure for the ADAC Asset and see what choices are available, which elements, whether elements are nillable, *etc.*



Continue to the next section 10.6.1.2 Know What Your Client Wants in the ADAC XML File or return to 10.6.1 Setting Up Map Files for ADAC .

10.6.1.2 Know What Your Client Wants in the ADAC XML File

The next step is to find out for the Authority you are supplying the ADAC XML file to:

(a) exactly which ADAC Assets you have to supply in the ADAC XML file

(b) for each ADAC Asset, what Types/Uses are wanted

(c) for an ADAC Asset, exactly which elements of the asset they want

(d) for an ADAC Asset and a compulsory (not nillable) element they do not want, what default value can you put in for it.

(e) what exactly are the coordinates in the Geometry.

From this you may discover that you only have a small subset of ADAC Assets, and an even smaller subset of the elements of those ADAC Assets, to worry about.

Now that you know exactly what ADAC Assets you need to provide, and what specific elements inside those ADAC Assets, you are ready to set up a 12d Map File to apply to your strings to mark them as particular ADAC Assets.

Continue to the next section 10.6.1.3 How the ADAC Map File is Used or return to 10.6.1 Setting Up Map Files for ADAC .

10.6.1.3 How the ADAC Map File is Used

In *12d ADAC*, the ***12d Map File*** (or just ***Map File***) is the major method to create an *ADAC Asset* group of attributes for a string (the process referred to as **marking** the string with an *ADAC Asset*).

The power of this method is that once the ***Map File*** has been set up to mark all the required strings as *ADAC Assets*, it runs on any number of strings with no manual intervention.

And once set up, the ***Map File*** is used for every job without modification.

In ***12d Model 11,*** a new section called **Attributes** was added to the **Map File** and the **12d Map Create/File** panel has a section called **Attributes** which is used to create *String*, *Vertex* and *Segment* attributes for a string.

As with the other sections of the **12d Map Create/File** panel, for each of *Attributes>String*, *Attributes>Vertex* and *Attributes>Segment*, there is a grid.

And for each row in the grid, criteria to check strings being processed against.

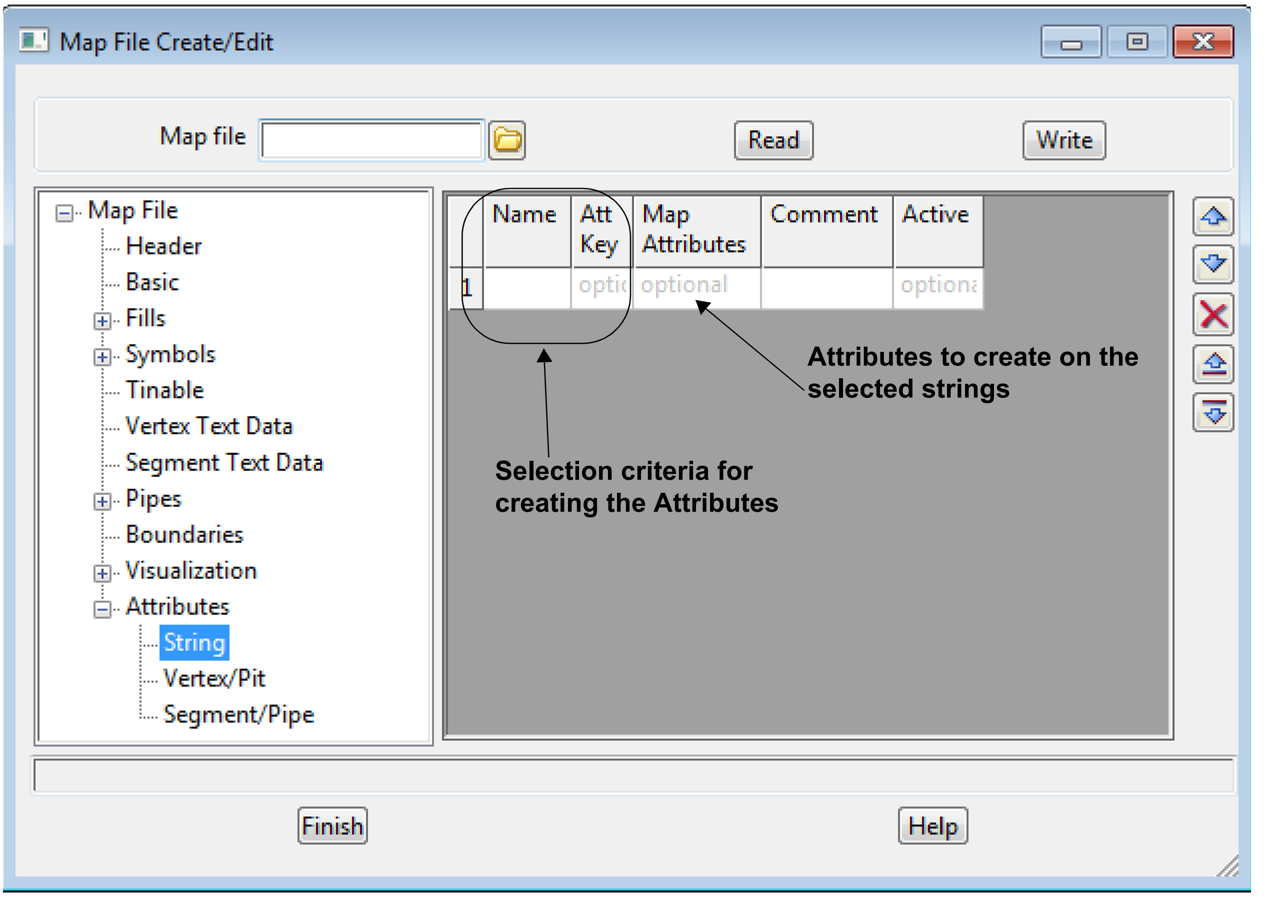
If the criteria are satisfied by a string, then the **Attributes** in the **Map Attributes** column are applied as string/vertex/segment attributes to that string. The next string is then processed.

Once a match to the criteria for a row is made, no more rows of the grid are checked against for that string and the processing starts again for the next string.

The selection criteria for creating *String*, *Vertex* or *Segment* attributes are all different.

(a) Creating String attributes

The selection criteria for creating **String** attributes is by **string name** and **string attributes**.



Apart from drainage and sewer strings, this is the only way strings are marked with and *ADAC Asset* by a ***Map File***.

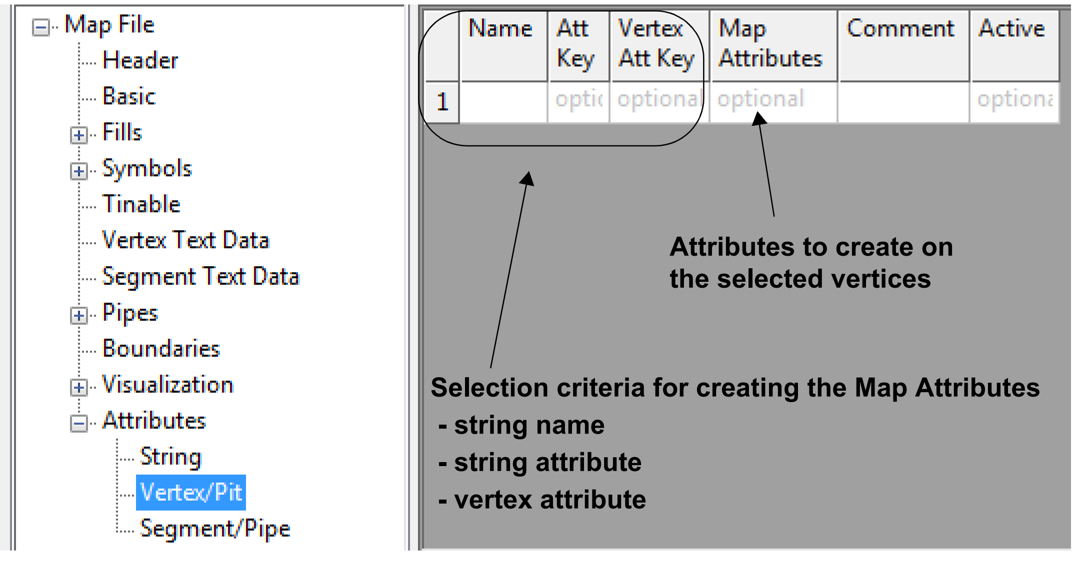
The string names are those created during the Design process, or for Surveyors from the field codes when a survey is reduced in ***12d Model***.

String attributes can be added by ***12d Model*** options, 12dPLs (macros), by hand, or picked up in the field by surveyors and brought in the by the survey reduction

(b) Vertex Attributes

The selection criteria for creating **Vertex** attributes is by **string name**, **string attributes** and **vertex attributes**.

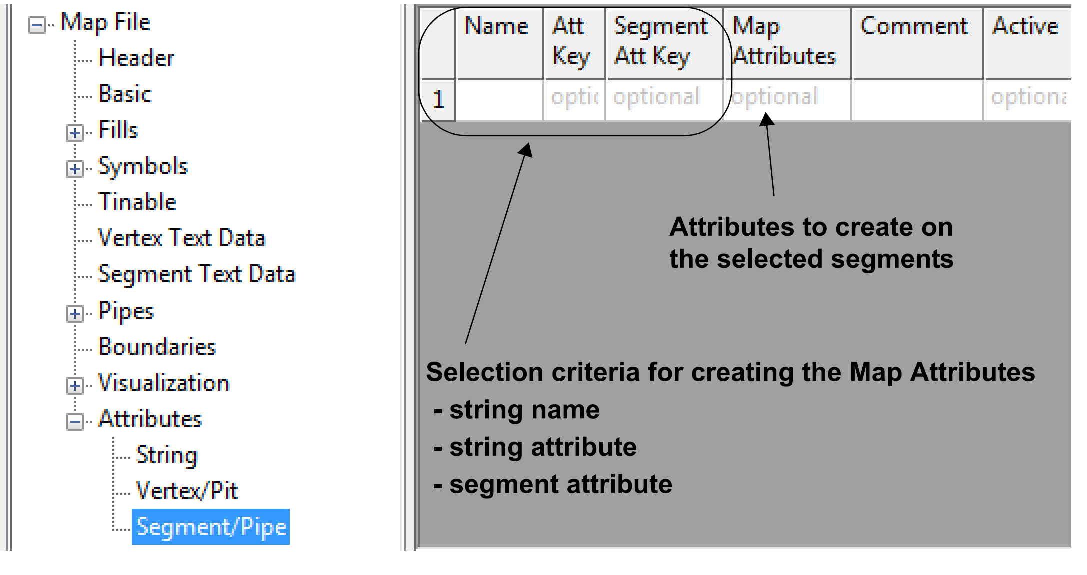
In *12d ADAC*, this is only used for processing drainage and sewer strings. Their vertices are often referred to as pits or maintenance holes.



(c) Segment attributes

The selection criteria for creating **Segment** attributes is by **string name**, **string attributes** and **segment attributes**.

In *12d ADAC*, this is only used for processing drainage and sewer strings. Their segments are often referred to as **pipes**.



So there are two distinct things that need to be looked at when using a ***Map File*** to mark strings as ADAC Asset:

(a) How to set up the ADAC attributes to go in the **Map Attributes** section of the ***Map File*** that will be applied to a string once it passes the section criteria.

See 10.6.1.4 Creating the ADAC Attributes for Map Files

(b) How to set up the selection criteria to uniquely determine the ADAC Asset that the string belongs to.

See 10.6.1.6 Setting Up the Map File Selection Criteria

Continue to the next section 10.6.1.4 Creating the ADAC Attributes for Map Files or return to 10.6.1 Setting Up Map Files for ADAC .

10.6.1.4 Creating the ADAC Attributes for Map Files

The common thing to each of the *Attributes>String*, *Attributes>Vertex* and *Attributes>Segment* grids is that they need sets of ADAC Asset attributes to go in the **Map Attributes** column for each row of the grids.

So we now look at how to best create those ADAC Asset attributes.

You will have noticed when looking at the *ADAC XML Schema Help* File, that its structure is very complex, especially with nillability being used.

And this means that the attribute structure required to replicate the *ADAC Schema* faithfully inside ***12d Model*** must also be very complex and definitely not the sort of thing you want to do by hand.

So ***12d Model*** has two powerful tools that simplify the process of creating the ADAC attributes so that the user never has to know the details of how they are stored inside ***12d Model***.

1. XSD to Map File

The option

File I/O =>ADAC =>Utilities =>XSD to Map File

takes the user specified version of the *ADAC XML Schema* XSD and creates a **Map File** with an ADAC group of attributes in the *Attributes>String section* for each ADAC Asset (see 10.4.8.2 XSD to Map File for more details on how the option works).

Although attribute and attribute substructures can be edited, copied, deleted, *etc.* in the *Attributes>String* section of the **Map File**, it is cumbersome when you are dealing with such a complex attribute structure like ADAC.

Also, as a user, you don't want to learn the complex details of how ***12d Model*** is holding the ADAC data just so that you can make modifications to it.

So although this method is very direct, it is **NOT** recommended.

2. Using XSD to Model and ADAC strings to Map File

At first this method may appear more roundabout but it is much more powerful and needs no knowledge of how the ADAC Attributes are stored in ***12d Model***.

First the option

File I/O =>ADAC =>Utilities =>XSD to model

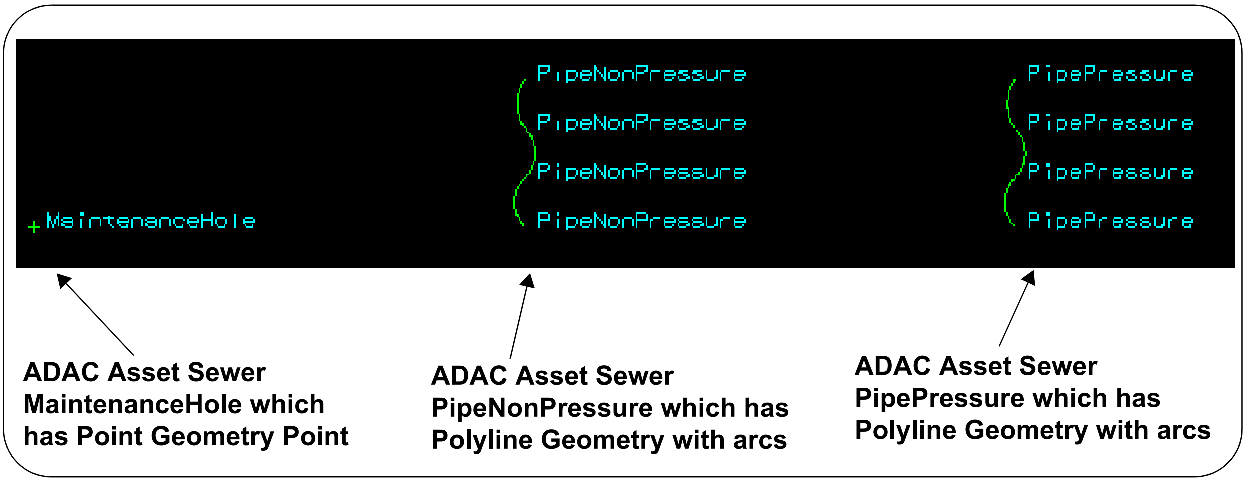
is used to take a user specified version of the *ADAC XML Schema* XSD and produces a model with a 12d string for each of the ADAC Assets (so sixty eight strings) and each string has

(a) a set of ADAC attributes that are typical for that ADAC Asset

(b) the appropriate string geometry that is allowed for the ADAC Asset Geometry.

See 10.4.8.3 XSD to Model for more information.

For example, running the **XSD to model** option for ADAC XML version 4.1.0 Schema, creates a **model** containing sixty-eight strings and the first three strings in that model are:



You can create an ADAC ***12d Map File*** from this model by using the option

File I/O =>ADAC =>Utilities =>ADAC strings to Map File

and you'll get exactly the same ***Map File*** that the option **XSD to Map file** produced.

But what we will be doing is creating **new** ADAC Assets in the model by **making a copy of one of the sixty eight**, and then using the **ADAC =>Edit header/asset** option to bring up the **Edit ADAC** panel (10.4.3 Edit ADAC Header/Asset) and make changes to the copied ADAC Asset.

The benefit of using this editor is that it is totally driven by the *ADAC XML Schema* and so knows all about the ADAC structures and all the ADAC elements.

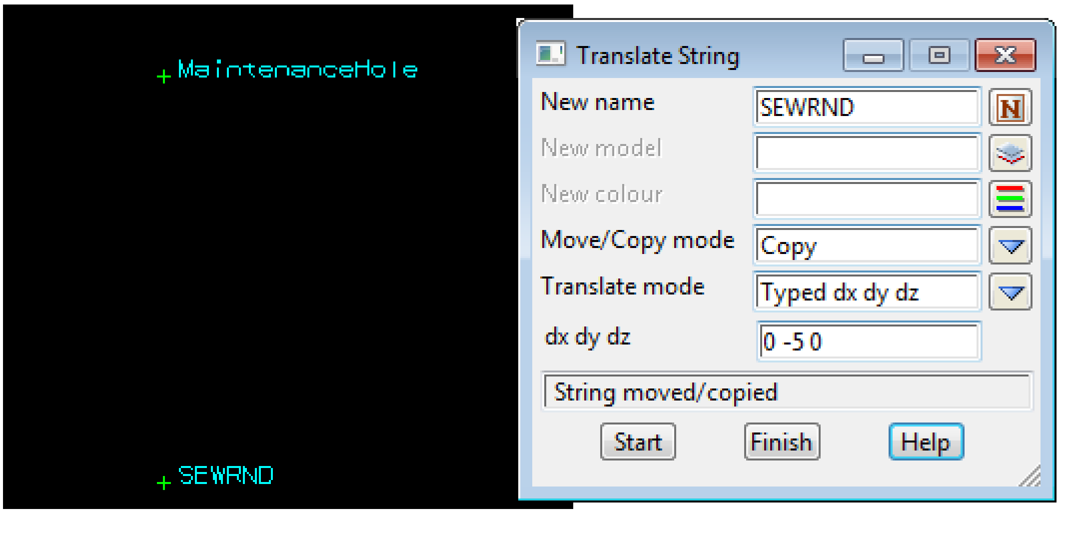
When you run **ADAC Strings to Map File**, each ADAC string creates an entry in either the *Attributes>String*, *Attributes>Vertex/Pit* or *Attributes>Segment/Pipe* section of the ***Map File*** (see 10.4.8.1 ADAC Strings to Map File).

As an example, the **Sewerage>MaintenanceHoles>MaintenanceHole** created in the model has a rectangular chamber and **Use** is *Overflow.* So we want to create a new MaintenanceHole that has a circular chamber with **Use** as *MaintenanceHole*.

The first step is to copy and translate the existing *Maintenancehole* using

Strings =>Strings edit =>Translate

so it isn't on top of the original one, and give the copied string the name SEWRND.

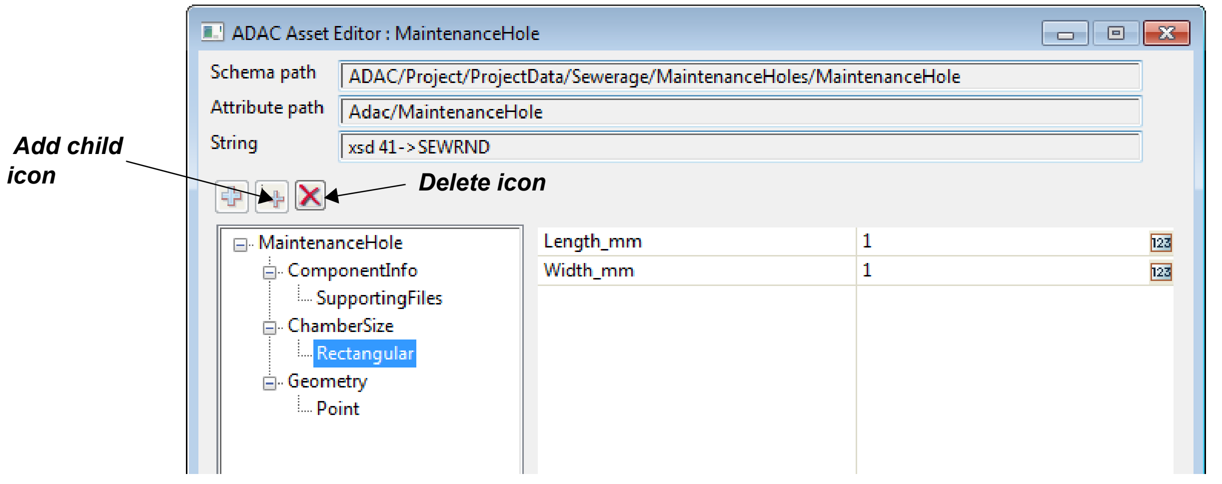


Edit the string SEWRND with the **ADAC =>Edit header/asset** option, and because SEWRND is an ADAC Asset, the **ADAC Asset Editor** for *Sewerage>MaintenanceHoles>MaintenanceHole* is brought up.

Of course because it is a copy, the ADAC attributes are all identical to the string *MaintenanceHole* which had a *Rectangular* chamber.

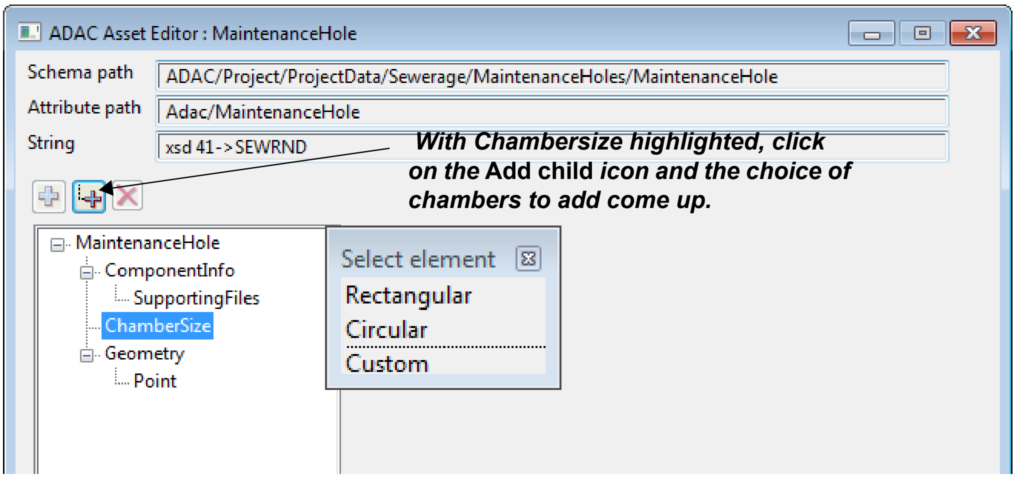
To change from *Rectangular* to *Circular* chamber, you need to highlight *Rectangular* and then click on the **Delete** icon.

-



Then click on the **Add Child** icon and select *Circular* from the **Select Element** panel that pops up.

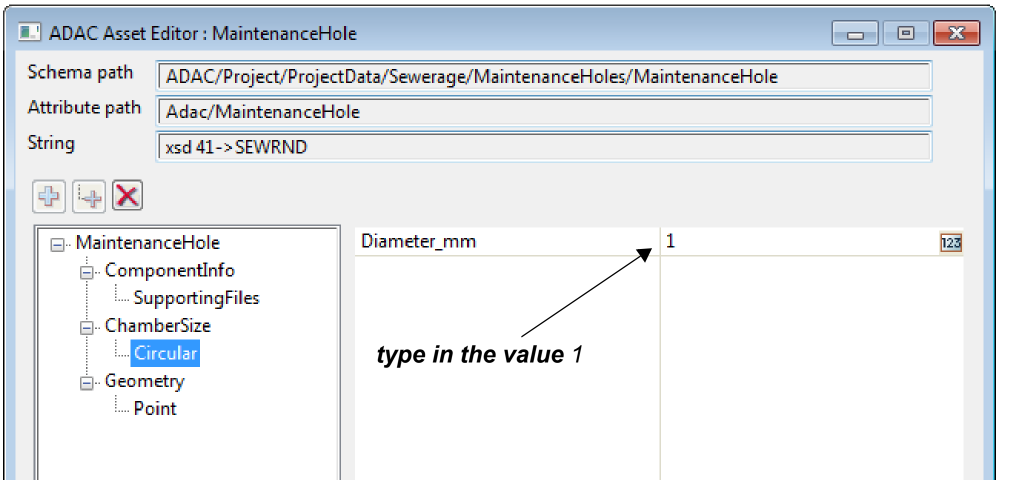
-



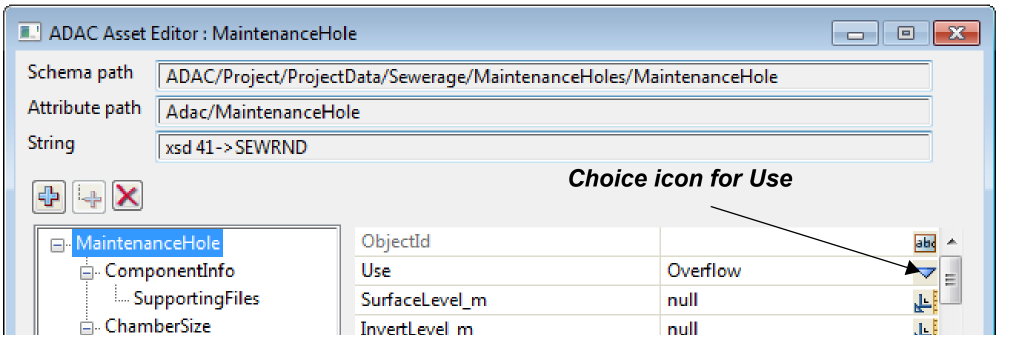
A *Circular* chamber is then added.

A *Circular* chamber has only the one value *Diameter_mm* and type in a value 1.

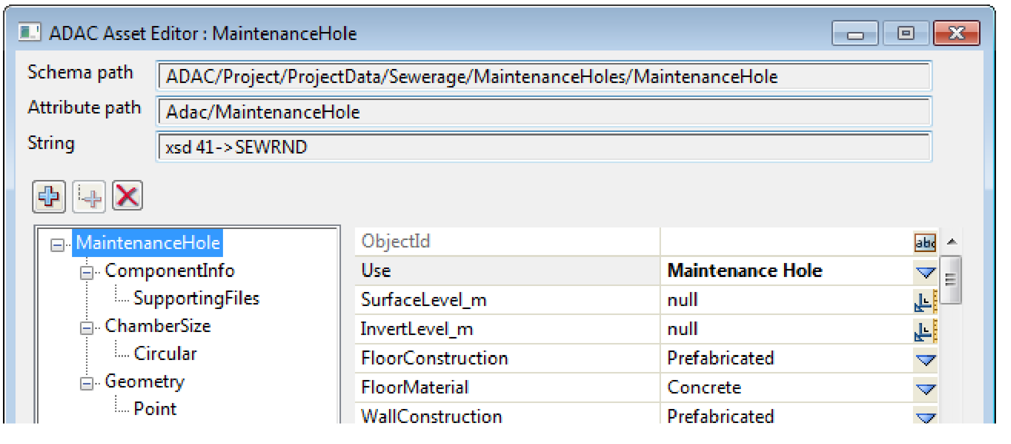
Note that the *ADAC Schema* says that *Diameter_mm* is a positive integer, so you must have a valid value in the field or you get an error message when you move to another node.



Similarly, click on the node **MaintenanceHole** and you'll get the first level of ADAC attributes for **MaintenanceHole** displayed on the right hand side, and you'll see that **Use** is one of them with the value *Overflow*.



Click on the **Choice** icon for **Use** and choose *MaintenanceHole* from the list.

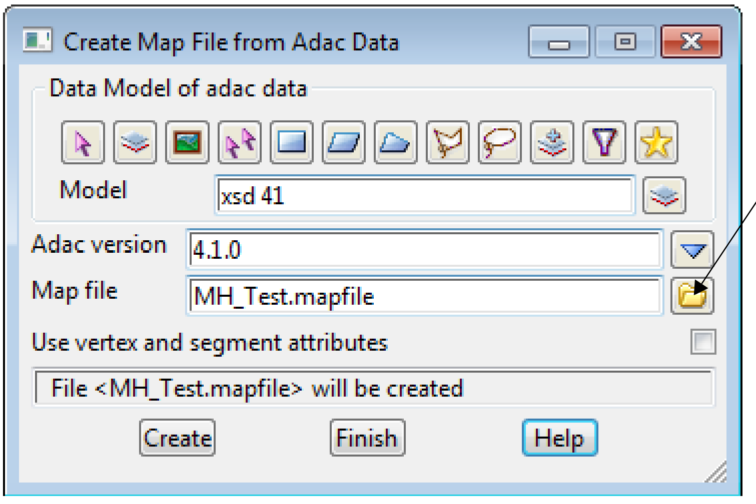


Clicking on **Set** will save the new ADAC attributes to SEWRND.

We will now run the option

File I/O =>ADAC =>Utilities =>ADAC strings to Map File

and select the model containing the SEWRND string, the Map file name as **MH_Test** and the tick box **Use vertex and segment attributes** not ticked:

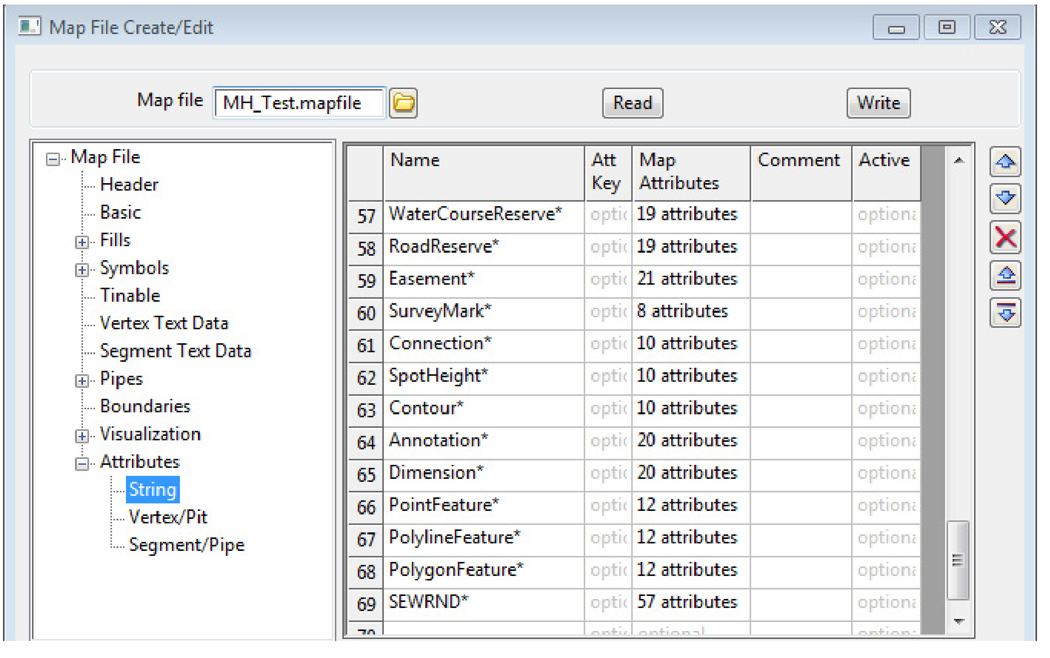


Clicking **Create** produces the ***Map File*** *MH_Test.mapfile*.

Don't click on **Finish**.

After creating the ***Map File,*** clicking on the folder icon to the right of the **Map file** field and selecting **Open** will bring up the ***Map File*** *MH_Test* in the **Map File Create/Edit** panel.

Click on ***Attributes>String*** and scroll to the bottom of the grid and you'll see the entry for SEWRND.



Note: the grid is filled in the order that the strings are added to the model and SEWRND was the last one added. If needed, the row can be moved up by clicking on the **up** arrow icon on the right hand side.

This ***Map file*** is now set up with ADAC Asset attributes in the **Map Attributes** column.

Note

If this map file is applied to a string starting with **SEWRND** then the string will be given the ADAC Asset attributes for **Sewerage>MaintenanceHoles>MaintenanceHole** and it has a circular chamber and **Use** *MaintenanceHole*.

Continue to the next section 10.6.1.5 Notes On Creating the ADAC Attribute Structure or return to 10.6.1 Setting Up Map Files for ADAC .

10.6.1.5 Notes On Creating the ADAC Attribute Structure

1. Although the process just outlined produced an entry in the ***Map File*** for SEWRND, the **more important thing** is that it **created** an **ADAC Attributes structure** in the *Map Attributes* column.

   And we had total control over what was in the ADAC attribute structure simply by using the **ADAC Editor** to set the attributes up exactly as we wanted them without ever needing to know how the attribute structure is stored in ***12d Model***.

   So this is the process we suggest for creating all the ADAC Attribute structures, even if they are never used with the string name you used to create them.

   Permanently keep the model (or models) of the strings with their Attribute Structures so they can be used to generate new ***Map Files*** at any time, and as examples to copy when you are creating new Attribute Structures in the future.

2. In the example we only created a ***Map File*** with an *Attributes>String* section, but the panel **Create Map File from ADAC Data** can also produce entries in the *Attributes>Vertex/Pit* and *Attributes>Segment/Pipe* section for special ADAC strings (see 10.4.8.1 ADAC Strings to Map File).

   However, the important thing is that the ***ADAC Attribute structure*** has been created for a *MaintenanceHole.* It can then be copied and pasted to other **Map Attributes** columns as required.

Continue to the next section 10.6.1.6 Setting Up the Map File Selection Criteria or return to 10.6.1 Setting Up Map Files for ADAC .

10.6.1.6 Setting Up the Map File Selection Criteria

There are three ways we select strings for ADAC in the Attributes section of the ***Map File***.

(a) Use the **string name** only

This is for not for drainage and sewer strings.

See 10.6.1.6.1 Using String Names to Select Strings

(b) Using the **string name** and/or a **string attribute**

This is for not for drainage and sewer strings.

See 10.6.1.6.2 Using String Name and/or String Attributes to Select Strings

(c) For drainage and sewer strings only

Using vertices and segments of the drainage and sewer strings and **vertex names** and **segment names**.

See 10.6.1.6.3 Using Vertices and Segments - Drainage/Sewer Strings

10.6.1.6.1 Using String Names to Select Strings

This is only for strings that are not Drainage or Sewer strings

See 10.6.1.6.1.1 Designers' Approach

See 10.6.1.6.1.2 Surveyor Approach - Using Survey Codes in the Field

10.6.1.6.1.1 Designers' Approach

The first question to ask, for a string that is not a drainage or sewer string, is:

for a string in the design, is the **string name** enough to uniquely identify it as a particular ADAC Asset, or even better, identify it as a particular ADAC Asset and one of its choices for **Type** (or **Use**)?

For example, the string name **Kerb** is enough to identify it as being a **Transport>RoadEges>RoadEdge** but it would not be enough to identify it as a **RoadEge** of **Type B1** as opposed to being Type **B2** or Type **Bitumen**.

The easiest way of overcoming that problem is to have a **different string name** for each **RoadEdge** and **Type** that is required.

For example, **EB** for RoadEdge of type **Bitumen** (a common one), **EB1** for RoadEdge of Type **B1** and so on.

So where ever possible, try and adopt a string naming convention that has a unique name for each of the ADAC Assets of a particular **Type** (or **Use**) that are required by the Authority.

The **Map File** already created works for this situation - just have a model with a string of each of the names and the attributes that go with it and the **ADAC Strings to Map File** option will create the **Map File**.

What if that is not possible and the string naming convention cannot be changed?

For example, the one string name **Kerb** is used for **all** the **RoadEdge** of **Type** B1, B2, B3, SM1, *etc.*

In that case, it would be necessary to use the **string name and** a **User string attribute**, or **just a User string attribute**. See 10.6.1.6.2 Using String Name and/or String Attributes to Select Strings

10.6.1.6.1.2 Surveyor Approach - Using Survey Codes in the Field

Once you know exactly what ADAC Assets, and what parts of those ADAC Assets, you need information on, can you code the information in the field so that once it is read into ***12d Model***, a ***Map File*** using the string name and if that is not enough, string attributes, to determine which ADAC Asset the string represents?

This assignment is often much easier for surveyors because you may be able to easily add extra field codes to distinguish the different ADAC Assets. And you will know what geometry is required for the ADAC Asset, even though in other circumstances you would have picked it up another way.

For example, for **OpenSpace>BoatingFacilities>BoatingFacility**, it only can have a single **Point**. So if all you are giving is ADAC XML, you only have to pick up **one** point.

Also think about the code being able to determine what the ADAC Asset is, but it may provide more information about the ADAC Asset.

In the **OpenSpace>BoatingFacilities>BoatingFacility** example, a compulsory element is **Type** with the choices of *Jetty*, *Pier*, *Ramp* or *Spillways*.

You could set up your codes so not did you know it was a BoatingFacility but also what **Type**.

For example, the codes could be

BFJ is an **OpenSpace>BoatingFacilities>BoatingFacility** of **Type** *Jetty*.

BFP is an **OpenSpace>BoatingFacilities>BoatingFacility** of **Type** *Pier*.

BFR is an **OpenSpace>BoatingFacilities>BoatingFacility** of **Type** *Ramp*.

BFS is an **OpenSpace>BoatingFacilities>BoatingFacility** of **Type** *Spillway*.

The **Map File** already created works for this situation - just have a model with a string of each of the names and the attributes that go with it and the **ADAC Strings to Map File** option will create the **Map File**.

What if that is not possible and the string naming convention can not be changed?

For example, the one string name **Kerb** is used for **all** the **RoadEdge** of **Type** B1, B2, B3, SM1, *etc.*

In that case, it would be necessary to use the **string name and** a **User string attribute**, or **just a User string attribute**. See 10.6.1.6.2 Using String Name and/or String Attributes to Select Strings

10.6.1.6.2 Using String Name and/or String Attributes to Select Strings

A string has three types of *User* defined attributes

(a) string attributes - there is one set of these for the whole sting

(b) vertex attributes - there is a set for each vertex

(c) segment attributes - there is a set for each segment.

However **only string attributes** are used by the ADAC ***Map File***.

User string attributes can be created by ***12d Model*** options, 12PLs (macros), manually, or if you are a surveyor, by picking them up in the field.

See

10.6.1.6.2.1 Entering User Attributes in the Field
10.6.1.6.2.2 Running a 12d Option or 12dPL that Produce User Attributes
10.6.1.6.2.3 Manually Entering User Attributes
10.6.1.6.2.4 Using the Name and Att Key in the ADAC Map File

10.6.1.6.2.1 Entering User Attributes in the Field

As well as using field codes, a surveyor may also have the capability of picking up attributes in the field.

An example of when attributes are useful is when picking up a **WaterSupply>Pipes>Pipe** - its diameter may be entered as an attribute.

Or when picking up a **Sewerage>MaintenanceHoles>MaintenanceHole**, which can only have a **Point** for its **Geometry**, you could enter the width and length as attributes.

Note that some other survey software can only produce vertex attributes. So if any of those attributes are to be used with the ***Map File***, a method must be found to turn them into string attributes.

If you can do field pick ups with attributes, even if the attributes are not used with the ***ADAC Map File***, they may be very useful in the step *Update ADAC Elements from User Attributes* that is further along in the ADAC chain. See 10.5.1.2.5 Update ADAC Elements from User Created Attributes on the String - Survey .

Continue to the next section 10.6.1.6.2.2 Running a 12d Option or 12dPL that Produce User Attributes or return to 10.6.1.6.2 Using String Name and/or String Attributes to Select Strings .

10.6.1.6.2.2 Running a 12d Option or 12dPL that Produce User Attributes

Any ***12d Model*** options that create *User Attributes* will be document with what those *User attributes* are.

For example, 10.4.9.2.3 Generate ADAC Road Edge Types splits a string into user defined chainage ranges and adds a User string attribute named **RoadEdge_Type** for each chainage range. That is, the 12dPL spits the Kerb into distinct parts, each with the same name Kerb but each part having a *User string attribute* called *RoadEdge_Type* which has only one of the RoadEdge **Types** as its value.

So this is a method for transcending the problem of having only the single string name of **Kerb**.

Hopefully any 12dPLs (macros) that you use are also documented, and in that it describes how the 12dPL works and what User string attributes it sets.

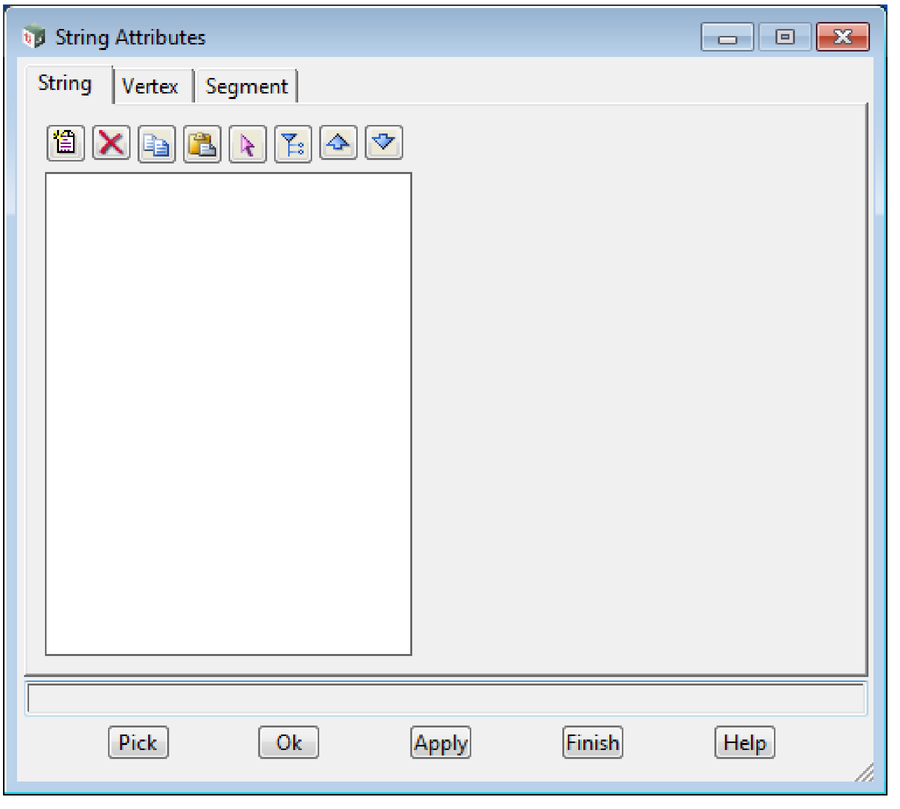
Continue to the next section 10.6.1.6.2.3 Manually Entering User Attributes or return to 10.6.1.6.2 Using String Name and/or String Attributes to Select Strings .

10.6.1.6.2.3 Manually Entering User Attributes

If you are adding a *User string attribute* manually, (or wanting to display existing attributes for the string), pick the option

Strings =>Properties =>Attributes

This brings up the **Strings Attributes** panel



Click on **Pick** and then select the string to add attributes to. Any existing string, vertex or segment attributes are displayed by clicking on the **String**, **Vertex** or **Segment** tabs.

With **String Attributes**, User string attributes of virtually any name and value can be created to distinguish between Types of an *ADAC Asset.*

But this is a very manual process.

If you need to do it regularly, then it is best to write a small 12d PL (macro) that lets you pick a string, asks for the value for the attribute and then updates the string attribute. This will save lots of time and errors.

User string attributes are used to uniquely identify the type of *ADAC Asset* that a string represents, but they are also very useful for supply values for elements inside an ADAC Asset as well. See 10.5.1.2.5 Update ADAC Elements from User Created Attributes on the String - Survey and 10.5.2.2.6 Update ADAC Elements from User Created Attributes - Design .

Continue to the next section 10.6.1.6.2.4 Using the Name and Att Key in the ADAC Map File or return to 10.6.1.6.2 Using String Name and/or String Attributes to Select Strings .

10.6.1.6.2.4 Using the Name and Att Key in the ADAC Map File

The ***Map File*** that is created with the option ***ADAC Strings to Map File*** automatically creates a ***Map File*** for matching the string name against the **Name** in the ***Map File***.

But when using a **string name** AND a **string attribute**, or **just a string attribute,** then you need to use both the **Name** column and the **Att Key** (Attribute key) column in the grid for the *Attributes>String* of the ***Map File***.

Luckily, there is a way of setting up an ADAC string so that the **ADAC string to Map File** option creates both the **Name** column **and** the **Att Key** column entries - you simply need to add the required **Att Key** attribute with its type and value as the **string attribute** of the **ADAC string**.

So creating the row of the ***Map File*** when the criteria involves a **string name** and a **string attribute** is a two step process.

Step 1.Create the required ADAC attribute structure

This has already been described in the section 10.6.1.4 Creating the ADAC Attributes for Map Files .

Step 2.Edit the ADAC string and add the Att Key criteria

Here we take the **ADAC string** produced in *Step 1* and manually edit it with the **Strings Attributes** panel and add the required string attribute that will be copied to the **Att Key** column, and hence used as part of the criteria for selecting a string.

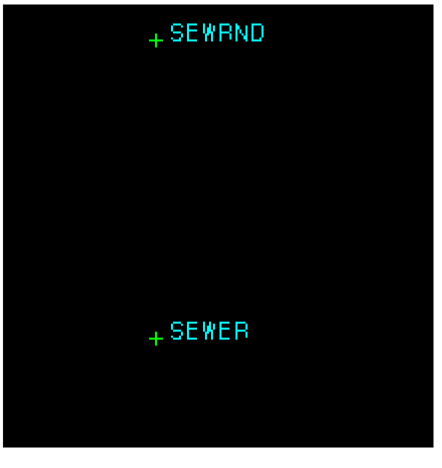
To explain the process of adding a string attribute that becomes an **Att Key**, we will build on the previous example and

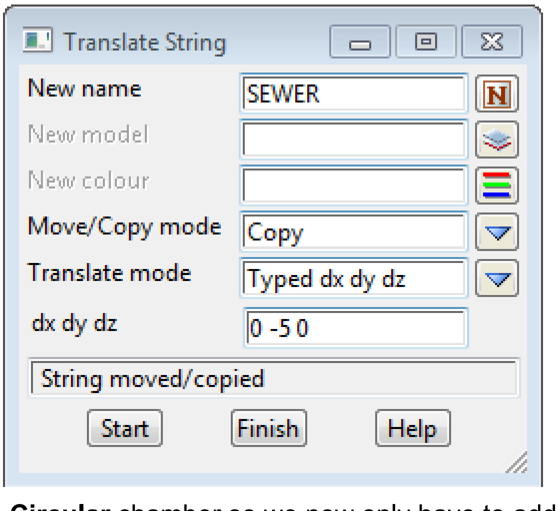
Instead of having a **string name** SEWRND to indicate the *Sewerage>MaintenanceHoles>MaintenanceHole* has a circular chamber, we only have the **nondescript name** SEWER and a **string attribute** called **Chamber** which has the text value of **Circular** or **Rectangular**.

To do the **Circular** case, copy and translate the existing ADAC *Sewerage>MaintenanceHoles>MaintenanceHole* called ***SEWRND*** using the option

Strings =>Strings edit =>Translate

and name the copied string **SEWER**.



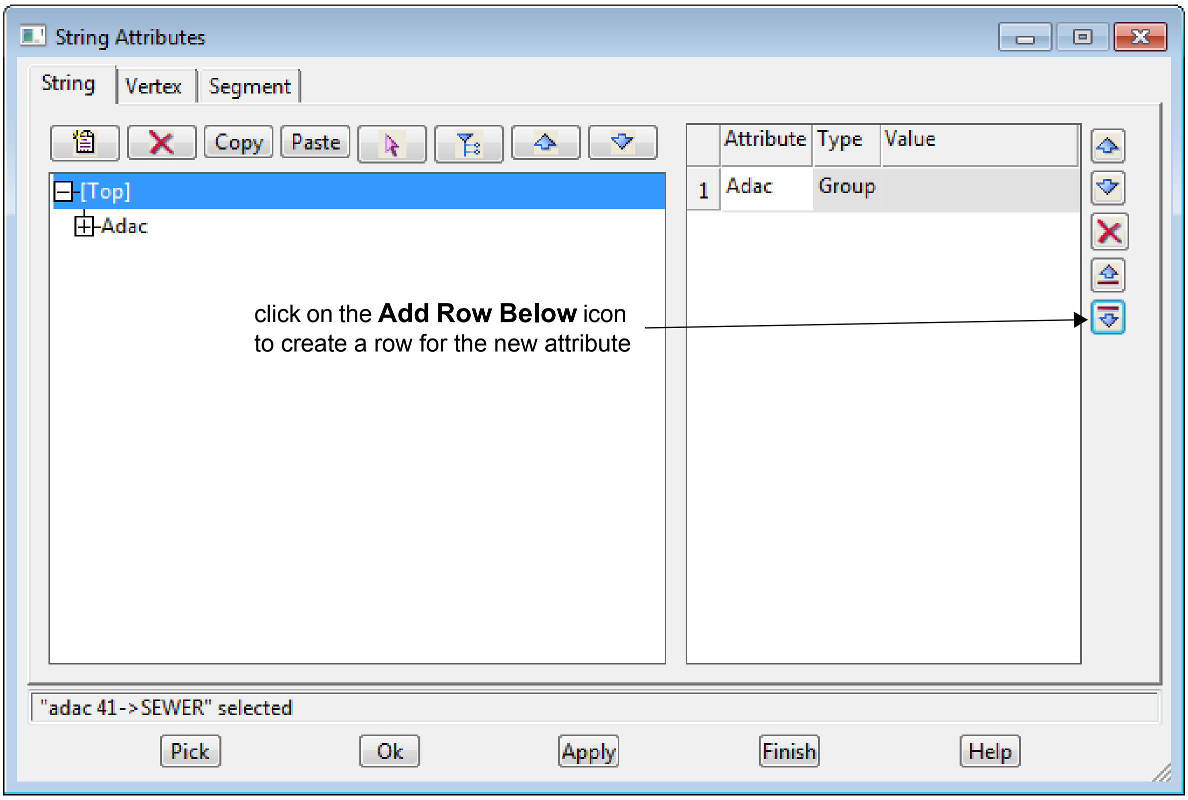


The ADAC string SEWER already has a **Circular** chamber so we now only have to add the text string attribute **Chamber** with the value **Circular**.

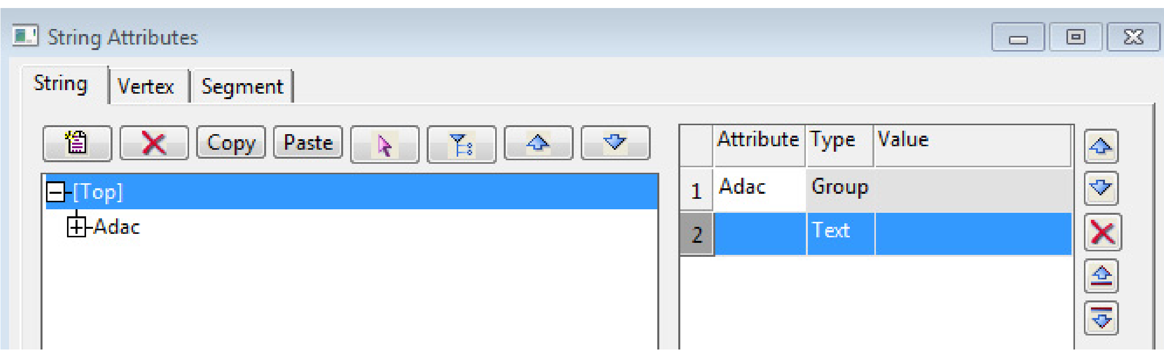
So the add attributes to the SEWER string, bring up **String Attributes** panel selecting the option

Strings =>Properties =>Attributes

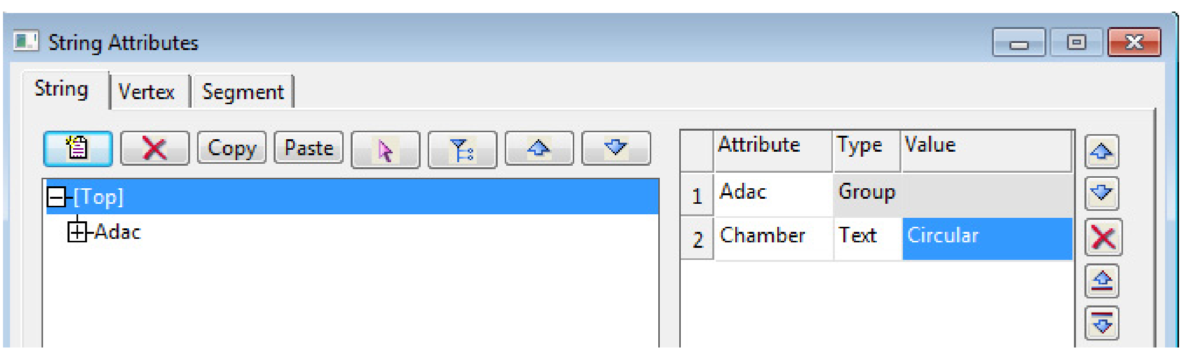
Click on **Pick** and select the string SEWER.



Highlight the node **[Top]** and then click on the **Add Row Below** icon to create a new row to use for the attribute **Circular**.



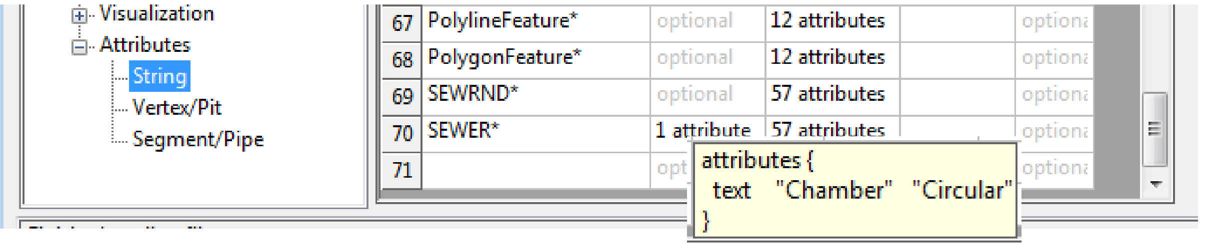
Type in the attribute name **Chamber** and the value **Circular** and then click on the **Apply** button **twice** to add the attribute to the string.



To create the ***Map File,*** we repeat the process used in 10.6.1.4 Creating the ADAC Attributes for Map Files which is to run the option

File I/O =>ADAC =>Utilities =>ADAC strings to Map File

to create the ***Map File*** and then open the ***Map File*** and go to the bottom of the *Attributes>String* grid and hover over the **Att Key** column to see that the attribute Chamber is defined.



So this ***Map File*** will select any string with the string name starting with SEWER and with a text attribute called **Chamber** with the value **Circular**, and give it the ADAC attributes for a *Sewerage>MaintenanceHoles>MaintenanceHole* with a Circular chamber.

As an alternative to having the attribute Chamber as part of the ADAC string SEWER, it is possible to add the Att Key values into the ***Map File*** by hand. So **Step 2** would be replaced by:

Step 2'.Edit the Map File and add the Att Key criteria

Here we take the **Map File** produced in *Step 1* and manually edit it with the **Map File Create/Edit** panel and add the required **Att Key** in for the string attribute that is to be used as part of the criteria for selecting a string. This will now be described.

The problem with this approach is this that if the Map File is generated again from the ADAC strings, any manual edits such as in Step 2' will be lost and have to be repeated, or some other more complicated strategy employed such a keeping ADAC strings that require an **Att Key** for identification in a **separate** model.

So it is recommended NOT to use **Step 2'** but to use **Step 2** where a string attribute is added to the to the ADAC string.

Continue to the next section 10.6.1.6.3 Using Vertices and Segments - Drainage/Sewer Strings or return to 10.6.1.6 Setting Up the Map File Selection Criteria .

10.6.1.6.3 Using Vertices and Segments - Drainage/Sewer Strings

The Designers drainage and sewer strings are unique in that they hold data for four different ADAC Assets and the four *ADAC Assets* are known straight away.

1. Each **pit** of a Drainage string is a *StormWater>Pits>Pit*.
2. Each **pipe** of a Drainage string is a *StormWater>Pipes>Pipe*
3. Each **pit (maintenance hole)** of a Sewer string is a *Sewerage>MaintenanceHoles>MaintenanceHole*.
4. Each **pipe** of a Sewer string is a *Sewerage>PipesNonPressure>PipeNonPresssure.*

So for drainage or sewer string, each **vertex** and each **segment** of the string needs to be marked as a *ADAC Asset*. Consequently, unlike all the other strings for ADAC, the ***Attributes>Vertex*** and ***Attributes>Segment*** sections of the ***Map File*** are used.

Unfortunately a ***Map File*** doesn't know the difference between a drainage and a sewer string as it is an internal property of the string so just before the ***Map File*** is applied in the *Design Chain*, the 12dPL *Create_or_delete_temporary_sewerage_attribute_panel* is run and for each drainage and sewer string, it creates a **string attribute** called **sewertype** of type Integer with the value **0** if it is a **drainage string**, or **1** if it a **sewer** string.

Being a **string attribute**, the attribute **sewertype** CAN be used in a ***Map File***.

So when going through drainage and sewer strings, if it is a

(i) vertex with an integer string attribute **sewertype** of value **1** then it is a *Sewerage>MaintenanceHoles>MaintenanceHole*

(ii) vertex with an integer string attribute **sewertype** of value **0** then it is a *StormWater>Pits>Pit*

(iii) segment with an integer string attribute **sewertype** of value **1** then it is a *Sewerage>PipesNonPressure>PipeNonPresssure*.

(iv) segment with an integer string attribute **sewertype** of value **0** then it is a *StormWater>Pipes>Pipe*.

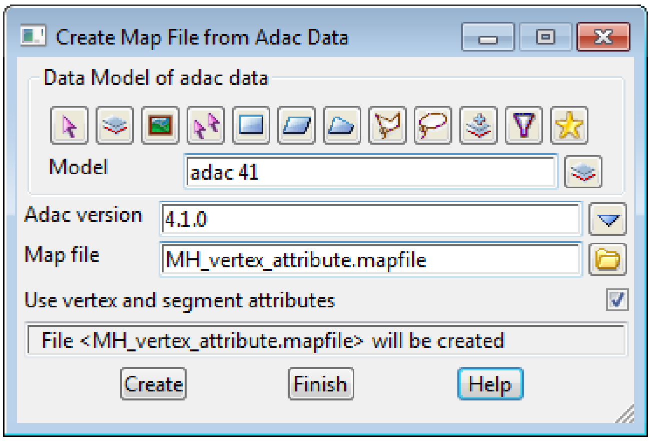
Important Note - Actually a ***Map File*** can't tell the difference between ANY string types, so the presence of a **string attribute** called **sewertype** with value **0** or **1** can be used in a ***Map File*** to select only a sewer string or a drainage string.

Knowing this we can now set up the *Attributes>Vertex* and *Attributes>Segment* sections of the ***Map File*** to mark the vertices and segments of drainage and sewer strings as ADAC Assets

So far we have only used the option

File I/O =>ADAC =>Utilities =>ADAC strings to Map File

to create rows in the *Attributes>String* section of the ***Map File*** but if we click on the tick box **Use vertex and segment attributes** in the **Create Map File from ADAC Data** panel,



then

the ADAC attributes for ADAC *Sewerage>MaintenanceHoles>MaintenanceHole's* and ADAC *StormWater>Pits>Pit's* will be placed in the *Attributes>Vertex/Pit* section of the ***Map File*** with the **Att Key** set with the appropriate **sewertype** attribute value

and

the ADAC attributes for ADAC *Sewerage>PipesNonPressure>PipeNonPressure's* and ADAC *StormWater>Pipes>Pipe's* will be placed in the *Attributes>Segment/Pipe* section of the ***Map File*** with the **Att Key** set with the appropriate **sewertype** attribute value

(For more information on **Use vertex and segment attributes** in the **Create Map File from ADAC Data** panel see 10.6.1.4 Creating the ADAC Attributes for Map Files)

A string attribute on the ADAC Asset with also go through as a Vertex Att Key or Segment Att Key, and the string name is written as a comment.

For examples of the vertex and the segment cases, see

10.6.1.6.3.1 Setting Up the Attributes>Vertex Section of the Map File
10.6.1.6.3.2 Setting Up the Attributes>Segment Section of the Map File
10.6.1.6.3.3 Bonuses for Drainage and Sewer Strings

10.6.1.6.3.1 Setting Up the Attributes>Vertex Section of the Map File

The strings for ADAC Assets that create an entry in the *Attributes>String* section of the ***Map File*** use the string **name** and **Att Key** as a method of deciding which strings have the ***Map Attributes*** applied to them.

But the ADAC strings for *Sewerage>MaintenanceHoles>MaintenanceHole* or *StormWater>Pits>Pit* which create an entry in the *Attributes>Vertex/Pit* section of the ***Map File***, already have the **Name** column set to * and the **Att Key** is used with **sewertype** to select only drainage or sewer strings.

So the only part of the *Attributes>Vertex/Pit* row left help to differentiate between different types of maintenance holes/pits, is the **Vertex Att Key**.

Luckily the vertices of ***12d Model*** drainage and sewer string usually have a text **Vertex attribute** called **pit_type**, or some other vertex attributes set during creation, and these can be used to select **Map Attributes** that are more appropriate to that vertex.

With that in mind, the **Create Map File from ADAC Data** panel with **Use vertex and segment attributes** ticked **on**, copies the string attribute of the ADAC Asset *Sewerage>MaintenanceHoles>MaintenanceHole* or *StormWater>Pits>Pit*, to the **Vertex Att Key**.

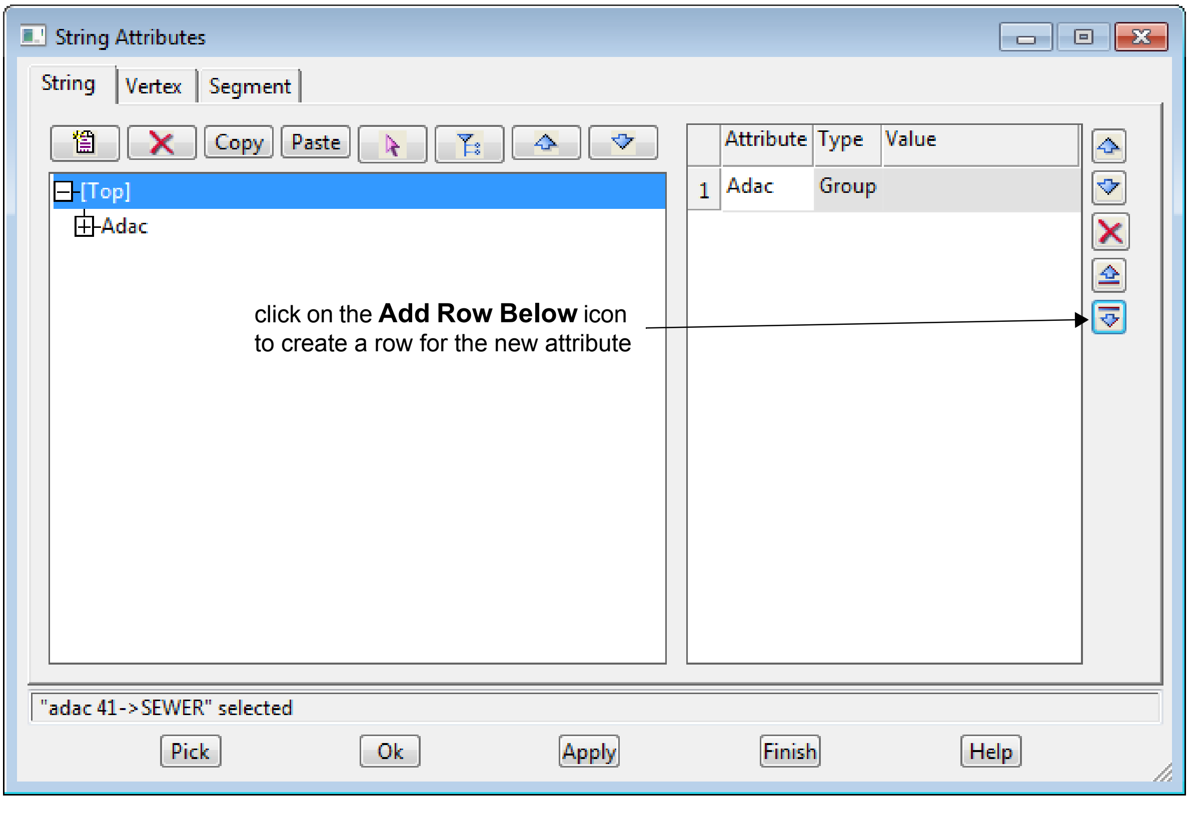
Note: To allow the user to identify which *ADAC Asset* string creates a particular row in the *Attributes>Vertex/Pit* grid, the string **name** is copied into the **Comment** column.

For example, if you wanted the *ADAC Attribute* group on the string SEWER to be applied only to vertices of a sewer string with the **pit_type** attribute equal to **B3**, we would use the **String Attributes** panel to create a text string attribute called **pit_type** with value **B3**.

To add attributes to the SEWER string, bring up **String Attributes** panel by selecting the option

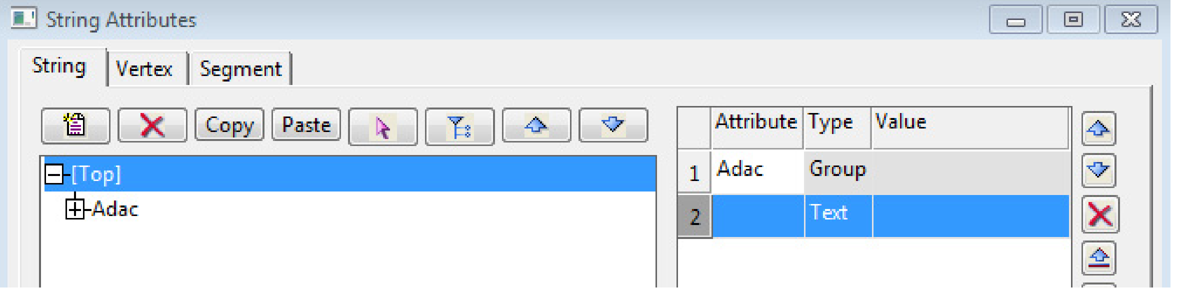
Strings =>Properties =>Attributes

Click on **Pick** and select the string SEWER.

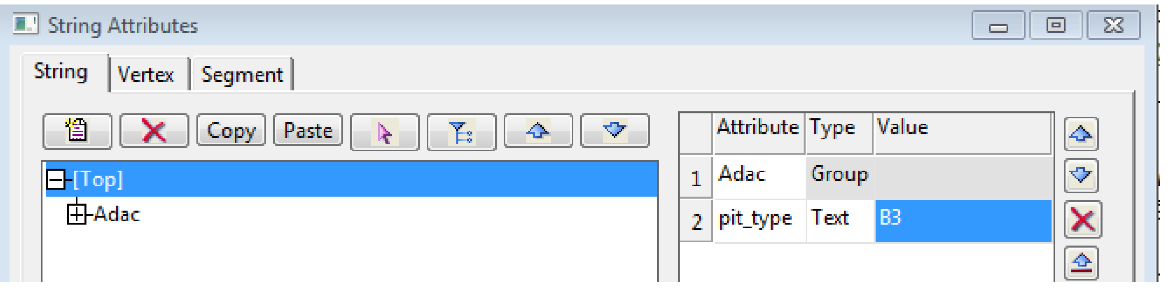


For the **String** tab, highlight the node **[Top]** and then click on the **Add Row Below** icon to create a new row to use for the attribute **pit_type**.

Note: if there are other first level attributes other than ADAC, highlight delete them.



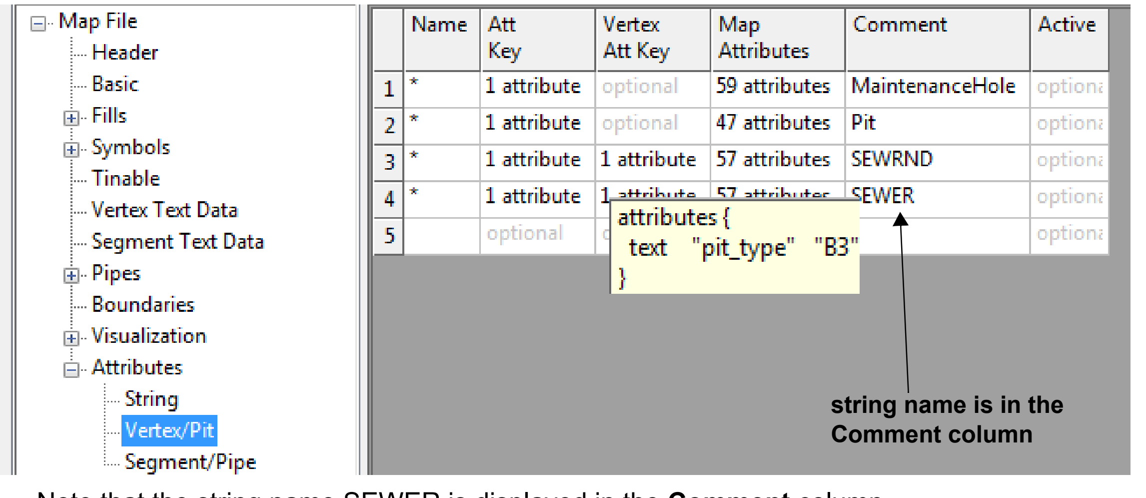
Type in the attribute name **pit_type** and the value **B3** and then click on the **Apply** button **twice** to add the attribute to the string.



To create the ***Map File,*** we repeat the process used in 10.6.1.4 Creating the ADAC Attributes for Map Files which is to run the option

File I/O =>ADAC =>Utilities =>ADAC strings to Map File

to create the ***Map File*** and then open the ***Map File*** and go to the bottom of the *Attributes>Vertex* grid and hover over the **Vertex Att Key** column to see that the attribute **pit_type** is defined.



Note that the string name SEWER is displayed in the **Comment** column.

So this combination of **Name**, **Att Key** and **Vertex Att Key** in the ***Map File*** will select the vertex of any sewer string with a text attribute called **pit_type** with the value **B3**, and give it the ADAC attributes in the **Map Attributes** column.

The ADAC Asset attributes for a **pit** on a **drainage** string are set up the same way except that the value for **sewertype** is **0** and the ADAC Asset attributes to use are those of a *StormWater>Pits>Pit*.

Continue to the next section 10.6.1.6.3.2 Setting Up the Attributes>Segment Section of the Map File or return to 10.6.1.6.3 Using Vertices and Segments - Drainage/Sewer Strings .

10.6.1.6.3.2 Setting Up the Attributes>Segment Section of the Map File

The strings for ADAC Assets that create an entry in the *Attributes>String* section of the ***Map File*** use the string **name** and **Att Key** as a method of deciding which strings have the ***Map Attributes*** applied to them.

But the ADAC strings for *Sewerage>PipesNonPressure>PipeNonPressure* or *StormWater>Pipes>Pipe* which create an entry in the *Attributes>Segment/Pipe* section of the ***Map File***, already have the **Name** column set to ***** and the **Att Key** is used with **sewertype** to select only drainage or sewer strings.

So the only part of the *Attributes>Segment/Pipe* row left help to differentiate between different types of pipes, is the **Segment Att Key**.

Luckily the segments of ***12d Model*** drainage and sewer string usually have a text **Segment attribute** called **pipe_type**, or some other segment attributes set during creation, and these can be used to select **Map Attributes** that are more appropriate to that segment.

With that in mind, the **Create Map File from ADAC Data** panel with **Use vertex and segment attributes** ticked **on**, copies the string attribute of the ADAC Asset *Sewerage>PipesNonPressure>PipeNonPressure* or *StormWater>Pipes>Pipe*, to the **Segment Att Key**.

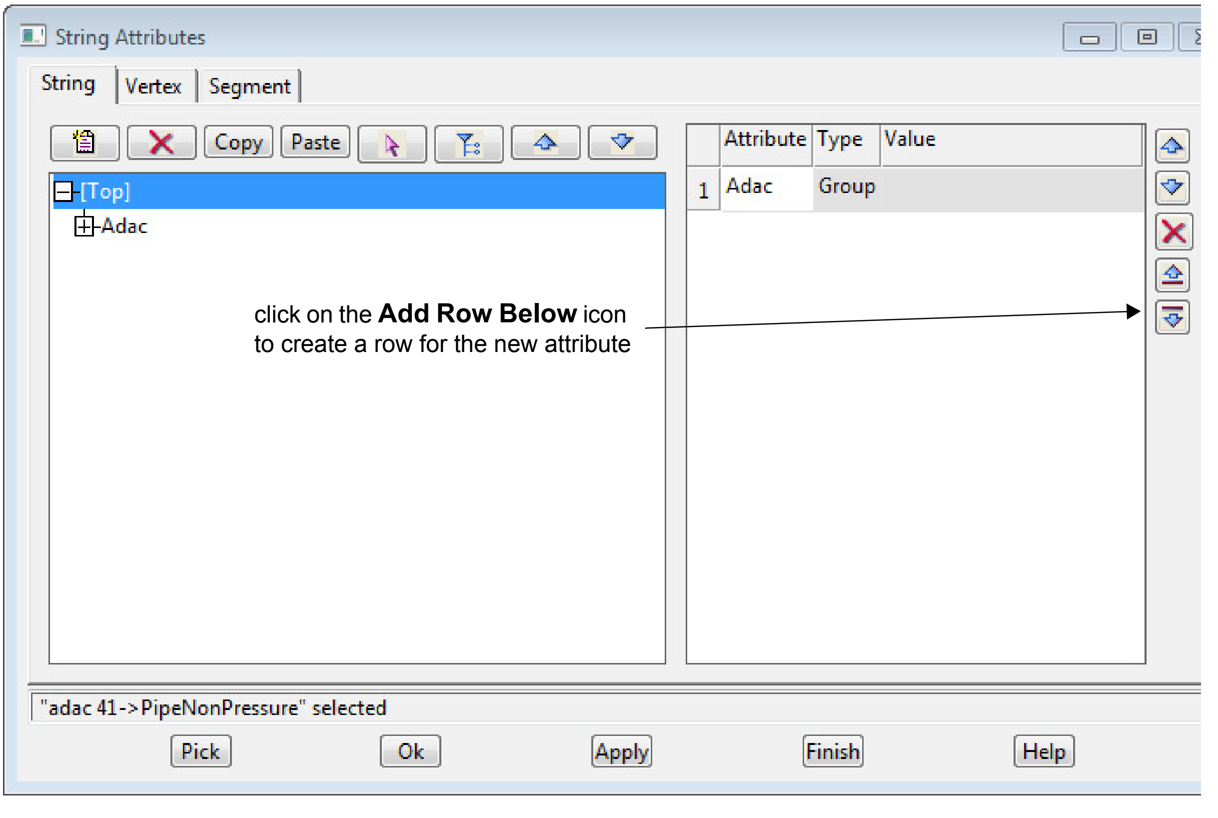
Note: To allow the user to identify which *ADAC Asset* string creates a particular row in the *Attributes>Segment/Pipe* grid, the string **name** is copied into the **Comment** column.

For example, if you wanted the *ADAC Attribute* group on the string called **PipeNonPressure** to be applied only to segments of a sewer string with the **pipe_type** attribute equal to **P3**, we would use the **String Attributes** panel to create a text string attribute called **pipe_type** with value **P3**.

To add attributes to the **PipeNonPressure** string, bring up **String Attributes** panel by selecting the option

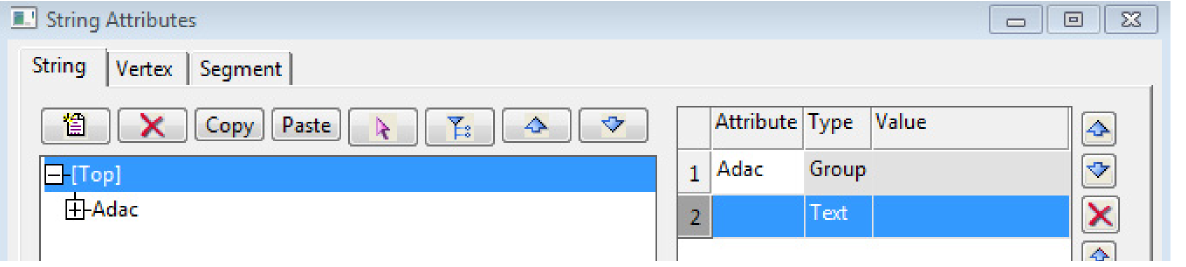
Strings =>Properties =>Attributes

Click on **Pick** and select the string **PipeNonPressure**.

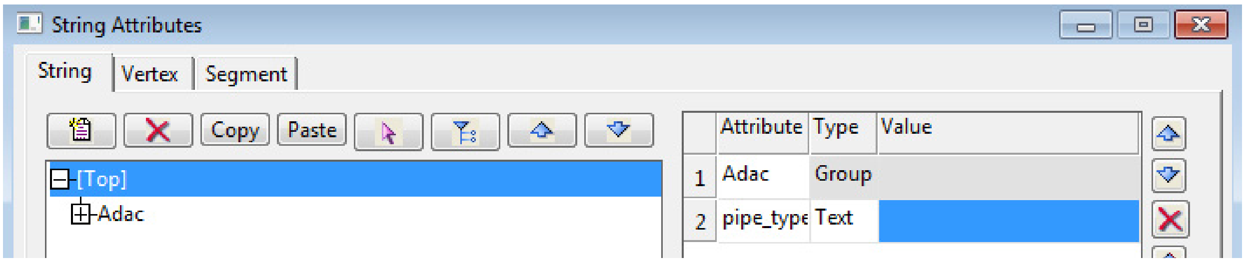


For the **String** tab, highlight the node **[Top]** and then click on the **Add Row Below** icon to create a new row to use for the attribute **pipe_type**.

Note: if there are other first level attributes other than ADAC, highlight delete them.



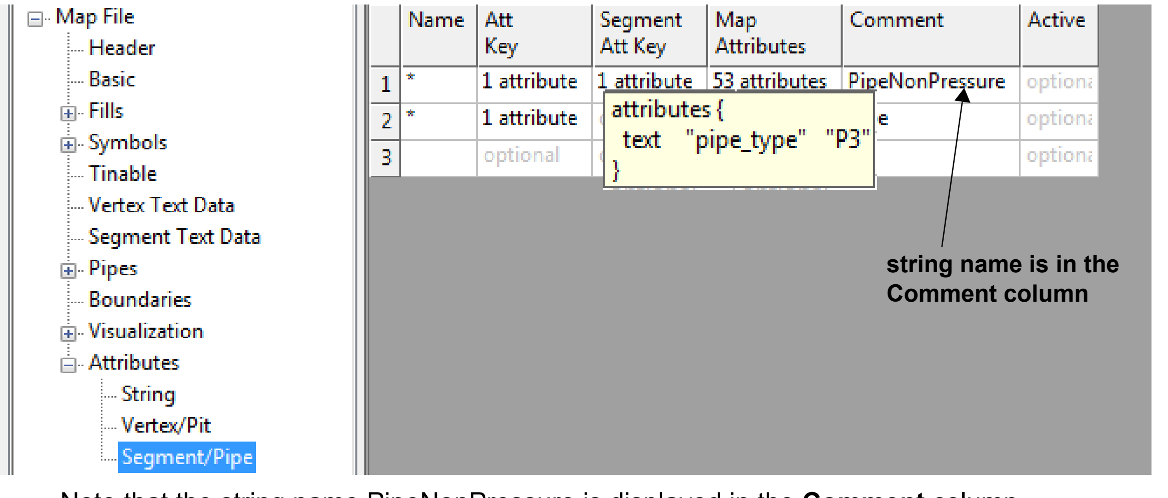
Type in the attribute name **pipe_type** and the value **P3** and then click on the **Apply** button **twice** to add the attribute to the string.



To create the ***Map File,*** we repeat the process used in 10.6.1.4 Creating the ADAC Attributes for Map Files which is to run the option

File I/O =>ADAC =>Utilities =>ADAC strings to Map File

to create the ***Map File*** and then open the ***Map File*** and go to the bottom of the *Attributes>Segment* grid and hover over the **Segment Att Key** column to see that the attribute **pipe_type** is defined.



Note that the string name PipeNonPressure is displayed in the **Comment** column.

So this combination of **Name**, **Att Key** and **Segment Att Key** in the ***Map File*** will select the segment of any sewer string with a text attribute called **pipe_type** with the value **P3**, and give it the ADAC attributes in the **Map Attributes** column.

The ADAC Asset attributes for a **pipe** on a **drainage** string are set up the same way except that the value for **sewertype** is **0** and the ADAC Asset attributes to use are those of a *StormWater>Pipes>Pipe*.

Continue to the next section 10.6.1.6.3.3 Bonuses for Drainage and Sewer Strings or return to 10.6.1.6.3 Using Vertices and Segments - Drainage/Sewer Strings.

10.6.1.6.3.3 Bonuses for Drainage and Sewer Strings

An ADAC bonus for designers with drainage and sewer strings is that each pit and pipe already has most of the values needed for the ADAC Assets.

For example, a sewer string pit (maintenance hole) knows if the chamber is rectangular or circular, and in both cases, what the dimensions of the chamber and the invert level and the surface level are. The pit name usually contains the MH_Number and the string name is the LineNumber.

Also from its *pit type*, the **Use** and most of the other elements of the ADAC Asset *Sewerage>MaintenanceHoles>MaintenanceHole* are known.

Similarly for a sewer string pipe, and the pits and pipes of a drainage string.

And a further bonus is that many of the extra attribute values **do not** have to be the values set for the *ADAC Asset* set by the ***Map File*** because later on in the Design chain, the *12dPL* ***ADAC_Update_attributes_from_drainage_data_panel.4do*** is run and it updates as many of the ADAC elements for the asset as possible.

For example, it doesn't matter if the ***Map File*** marked a vertex as having a Circular chamber or a Rectangular chamber because the *12dPL* ***ADAC_Update_attributes_from_drainage_data_panel.4do*** will look at the **actual** chamber type of the pit and update the *ADAC Asset* attributes on the pit with the proper chamber type and size.

For more information on ***ADAC_Update_attributes_from_drainage_data_panel.4do***, see 10.5.2.2.4 Update ADAC Elements from Drainage/Sewer String Properties .

Continue to the next section 10.6.1.7 More on Creating the ADAC Map Files or return to 10.6.1.6.3 Using Vertices and Segments - Drainage/Sewer Strings or 10.6.1.6 Setting Up the Map File Selection Criteria .

10.6.1.7 More on Creating the ADAC Map Files

In the examples, many of the ADAC Asset values were set by the ***Map File***, but others were not and they need to be set in the steps in the *Design* and *Survey* chains that occur after the ***Map File*** has been applied.

Good procedures and some **data preparation before** running the *Design* or *Survey* chains, will mean that most of the values will be set by the chains and any manual filling in of the missing values by using the **ADAC Editor** will be avoided.

How values such as *Diameter_mm* are set will vary from Asset to Asset, but they can also vary within the ‘same Asset.

For example, for a surveyor picking up *MaintenanceHoles*, they can come prefabricated in standard sizes with known Chamber type and sizes. In fact almost all of the elements for the *MaintenanceHole* would be known - FloorConstruction, FloorMaterial, WallConstruction, WallMaterial, RoofMaterial, LidMaterial. Similarly for Pipes.

So if the surveyor had a special code (string name) for each of the standard *MaintenanceHoles* or *Pipes*, then the ADAC Asset attributes for them can be set up with all the known standard values. Then using the special string name in the ***Map File*** means that all the values are already set correctly just by applying the ***Map File***.

Even if things are not totally standard, some attributes may have a certain value **most of the time**. If that is the case, the "most likely" value is the one that should be used in ADAC Asset in the ***Map File*** and then only the few that **vary** from the "most likely" value need to be modified at a later stage.

There may also be elements in an ADAC Asset that **the Authority is not interested in** so whatever value they are given by the ***Map File*** won’t have to be changed at any time.

Continue to the next section 10.6.2 What Data Prep is Needed for ADAC or return to 10.6.1 Setting Up Map Files for ADAC .

10.6.2 What Data Prep is Needed for ADAC

The Data Preparation that is needed on strings before they become ADAC Assets is different for each company. The options that are supplied are on the menu

File I/O =>ADAC =>User =>Data prep. See 10.4.9.2 Data Prep .

Continue to the next section 10.6.3 Setting up and Running ADAC Chains from the Menus or return to 10.6 Setting Up for ADAC .

10.6.3 Setting up and Running ADAC Chains from the Menus

The easiest way to run the ADAC *Survey* or *Design* chains with specific pvf files is to run them from a menu. This can be done in two ways:

(a) Running Specific Map and 12duaf files from Special areas

12d Model provides options on the walk right menu **Run 12d ADAC 4.1 Chains** to run ADAC *Survey* or *Design* chains for ADAC 4.1 with specially named Map and 12duaf files in either the working folder for the project (local), or User_Lib or Library.

See 10.6.3.1 Using the 12d Supplied Menu to Run ADAC Chains .

(b) Running Client Specific Map and 12duaf files

Once you are producing ADAC files for different Clients, you may need to produce different ADAC versions, or need different Map or 12duaf files.

For example you may need to use a different naming convention, or the information required in the ADAC assets is different.

For these situations, you can add your own options to **User Adac** menu.

The user options can run either the ADAC Base Survey or Design chains with specific chain pvf files.

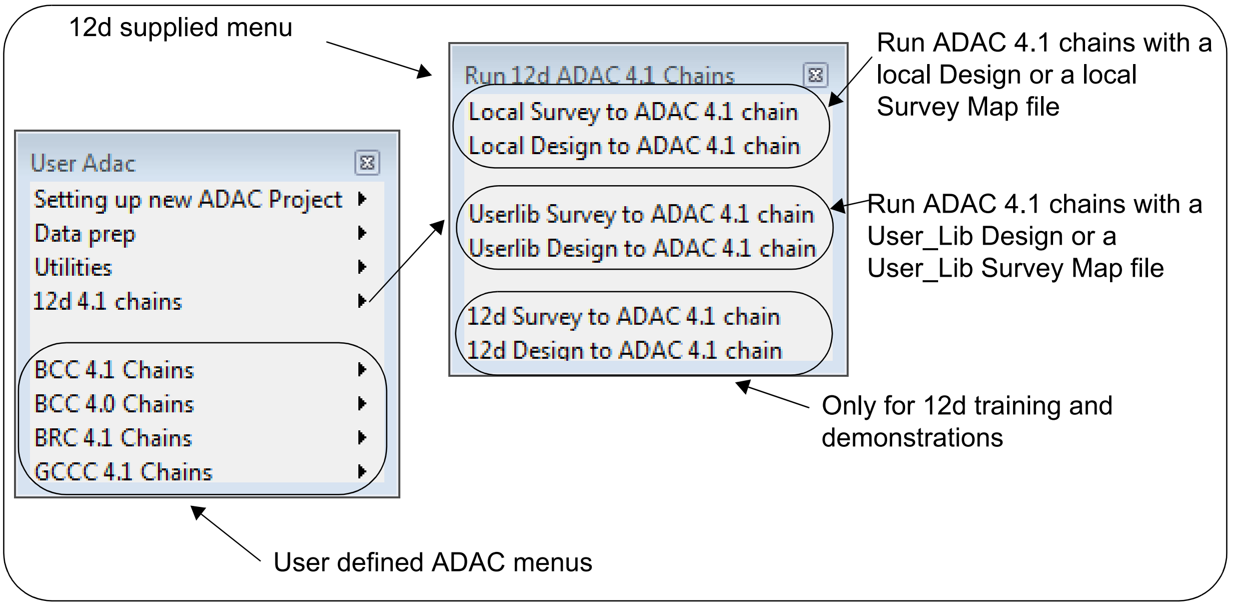
For information on setting up your own options on the **User ADAC** menu, see 10.6.3.2 Setting Up Your User ADAC Menu .

Or return to 10.6 Setting Up for ADAC .

10.6.3.1 Using the 12d Supplied Menu to Run ADAC Chains

12d Model provides options on the walk right menu **Run 12d ADAC 4.1 Chains** for the option **12d 4.1 chains** to run the base *ADAC Survey* or *Design* chains for ADAC 4.1 with specially named Map and *12duaf* files in either the **working folder** for the project (**local**) or **User_Lib**.

These options also use a **tin** called **ground** for surface levels.



(a) for the working folder for the project (local)

Local Survey to ADAC 41 chain runs *ADAC_Survey_Base* chain using the files from the **working folder for the project** (local):

ADAC_Local_Map_Survey_to_ADAC_41.mapfile

Local_41.12duaf *this file is optional*

Local Design to ADAC 41 chain runs *ADAC_Design_Base* chain using the files from the **working folder for the project (local)**:

ADAC_Local_Map_Design_to_ADAC_41.mapfile

Local_41.12duaf

Both options use the a **tin** called **ground** to get surface levels.

So to use the **Local** menu items you only need to create the two files and have them in the folder containing the project. This means that they are only available for that project.

(b) for User_Lib

Userlib Survey to ADAC 41 chain runs *ADAC_Survey_Base* chain using the files from the **USER_LIB** folder:

ADAC_Userlib_Map_Survey_to_ADAC_41.mapfile

Local_41.12duaf *this file is optional*

Userlib Design to ADAC 41 chain runs *ADAC_Design_Base* chain using the files from the **USER_LIB** folder:

ADAC_Userlib_Map_Design_to_ADAC_41.mapfile

Local_41.12duaf

Both options use a **tin** called **ground** to get surface levels.

So to use the **Userlib** menu items, you only need to create the two files and have them in the **User_Lib** folder. This means they can be used with any project.

Consequently you can use the **Userlib** options for any project and just set up **Local** ones for certain projects.

Continue to the next section 10.6.3.2 Setting Up Your User ADAC Menu or return to 10.6 Setting Up for ADAC .

10.6.3.2 Setting Up Your User ADAC Menu

To make it easy for your users to run the ADAC chains for either *Survey* or *Design*, or for different versions of ADAC, the easiest way is for the running of the options to be on a menu.

And since what is required could vary from Authority to Authority, and string naming conventions could differ between ***12d Model*** users, each user needs to set up there own ADAC menus.

The menu **ADAC User** can be modified by users so that is the one we will use.

To allow for all the variations, parametrised base ADAC Design and Survey chains are supplied in the ***12d Model*** Set_Ups folder (which most users do not have permission to access) and the variations required for all the different customer cases will be handled by passing parameter values through to these parametrised chains.

Placing the options on the **User ADAC** menu is done by setting up some folders and files in **User** which most users have access to.

To help explain things and the ease of setting up ADAC to work with multiple customers who may vary in what ADAC Assets they require in their ADAC XML files, we will set up a system to satisfy the following scenario:

You have three customers with the abbreviated names **BCC**, **BRC** and **GCCC**.

BRC started with ADAC 4.0 but are now moving to ADAC 4.1 and you have jobs in both versions. On some jobs you are providing BRC with Design ADAC XML files and on other jobs you providing BRC with Survey ADAC XML files.

BCC are using ADAC 4.1 only and you are providing them with Design and Survey ADAC XML files.

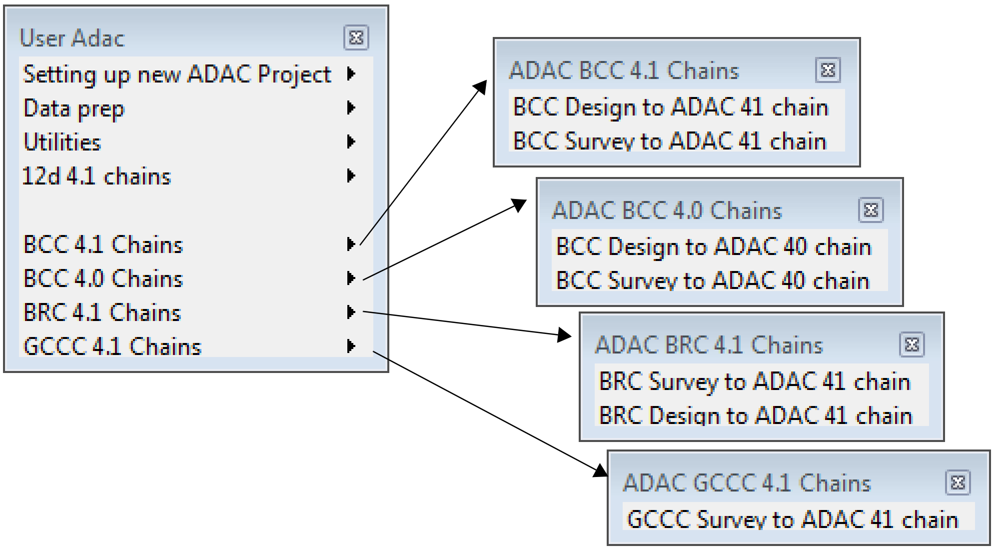
GCCC are using ADAC 4.1 only and at this stage and you are only providing them with Survey ADAC XML files.

Due to the nature of design and survey data, the 12d Map Files required for ADAC are always different. But for various reasons, the 12d Map files need to be different for each of the your customers as well.

Of course in real life your customers would never want something totally different but it is good for the scenario.

Note: If you are lucky enough that you can use the same configuration for all your customers (or you are an Authority that only has to supply itself) then you only need to set up the one subfolder and it is easiest to use your own abbreviated company name.

What we want to easily set up is an **User ADAC** menu with walk-rights:

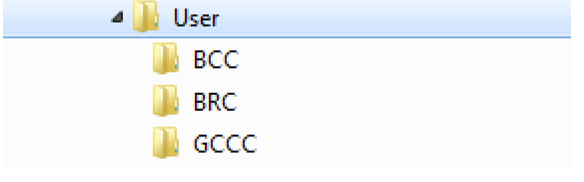


The steps to achieve this are:

(a) In the file ***usermenu.4d*** (which is usually in ***User***), add the following line at the top of the file.

#include "ADAC_customer_user_menu.4d"

(b) Create subfolders of **User** with the abbreviated name for each of your customers.



(c) Inside the subfolder (for example, inside **User\BCC**) there will be an appropriate **ADAC pvf** file

The ADAC **pvf** file is a ***parameter value file*** which is used in to pass parameters to both the *ADAC Design chain* and *ADAC Survey chain*.

In the ADAC **pvf** files themselves, there is five parameters that you have to set the values for:

(i) For the text parameter **company**, the Value which is the abbreviated company name. For example, **BCC**.

(ii) For the text parameter **adac_version_by_ten**, the Value **41** if you are generating ADAC 4.1.0 files, or **40** if you are generating ADAC 4.0 files.

(iii) user_attributes_conversion_type

(iv) For the text parameter **survey_finished_tin**, the name of a tin which is used to get some z-values for some tins in some macros.

(v) For the text parameter **design_finished_tin**. The name of a tin which may be used to get some z-values for some Assets in some macros

There are four other parameters in the **pvf** files, *survey_map_file*, *design_map_file*, *adac_attribute_file* and *adac_12d_attribute_file* but they are fully defined once company and adac_version_by_ten have values.

(vi) survey_map_file is

$USER_LIB\ADAC_[company]_Map_Survey_to_ADAC_[adac_version_by_ten].mapfile

(vii) design_map_file is
$USER_LIB\ADAC_[company]_Map_Design_to_ADAC_[adac_version_by_ten].mapfile

(viii) adac_attribute_file is
$USER_LIB\[company]_[adac_version_by_ten].12duaf

(ix) adac_attribute_file is
$LIB\adac_12d_[adac_version_by_ten].12duaf

To easily tell the different **pvf** files apart when you have them for different companies and ADAC versions, the **abbreviated company name** and the **adac_version_by_ten** are used in the name of the **pvf** file.

So for **company** with value **BCC** and adac_version_by_ten with value **41**, the **pvf** file is called

ADAC_BCC_41.pvf

And this **pvf** file must have the following contents:

```
<Chain_Parameters>
 <Text_Parameter>
  <Name>"company"</Name>
  <Comment>""</Comment>
  <Value>"BCC"</Value>
 </Text_Parameter>
 <Text_Parameter>
  <Name>"design_map_file"</Name>
  <Comment>""</Comment>

<Value>"$USER_LIB\ADAC_[company]_Map_Design_to_ADAC_[adac_version_by_ten].mapfile"<
/Value>
 </Text_Parameter>
 <Text_Parameter>
  <Name>"survey_map_file"</Name>
  <Comment>""</Comment>
<Value>"$USER_LIB\ADAC_[company]_Map_Survey_to_ADAC_[adac_version_by_ten].mapfile"<
/Value>
 </Text_Parameter>
 <Text_Parameter>
  <Name>"user_attributes_conversion_type"</Name>
  <Comment>""</Comment>
  <Value>"BCC"</Value>
 </Text_Parameter>
 <Text_Parameter>
  <Name>"design_finished_tin"</Name>
  <Comment>"ground"</Comment>
  <Value>""</Value>
 </Text_Parameter>
 <Text_Parameter>
  <Name>"survey_finished_tin"</Name>
  <Comment>""</Comment>
  <Value>"ground"</Value>
 </Text_Parameter>
 <Text_Parameter>
  <Name>"adac_version_by_ten"</Name>
  <Comment>""</Comment>
  <Value>"41"</Value>
 </Text_Parameter>
 <Text_Parameter>
  <Name>"adac_attribute_file"</Name>
  <Comment>""</Comment>
  <Value>"$USER_LIB\[company]_[adac_version_by_ten].12duaf"</Value>
 </Text_Parameter>
```

```
  <Text_Parameter>
    <Name>"adac_12d_attribute_file"</Name>
    <Comment>""</Comment>
    <Value>"$LIB\adac_12d_[adac_version_by_ten].12duaf"</Value>
  </Text_Parameter>
</Chain_Parameters>
```

The different **pvf** files can be created by copying the ***ADAC_BCC_41.pvf*** file and changing the **BCC** and **41** to what is needed. This can be done using a text editor, or the ***12d Model*** options

Utilities =>Chains => Parameters => Create or *Copy* or *Edit*.

So in the folder **User\BCC**, you need two pvf files - ***ADAC_BCC_41.pvf*** *and* ***ADAC_BCC_40.pvf***

In the folder **User\BRC**, you need the one pvf file - ***ADAC_BRC_41.pvf***

And in the folder **User\GCCC**, you need the one pvf file - ***ADAC_GCCC_41.pvf***.

(d) Inside each customer subfolder (for example, inside **User\BCC**) there must be a file called ***ADAC_customer_user_menu.4d*** which creates the walk right menus for that customer that go on your **User** menu.

In our example, **BCC** requires both **ADAC 4.1** and **ADAC 4.0** so two **walk** right menus are needed.

So in the folder **User\BCC**, the contents for

ADAC_customer_user_menu.4d

are:

```
Button "BCC 4.1 Chains" {
  Walk_Right "ADAC BCC 4.1 Chains"
}
Button "BCC 4.0 Chains" {
  Walk_Right "ADAC BCC 4.0 Chains"
}
```

the text on the menu will be **BCC 4.1 Chains**

and it has a walk right menu and the definition for the walk right menu is in a menu called **ADAC BCC 4.1 Chains**

BRC only required ADAC 4.1 so only one walk right menu is required. and ***ADAC_customer_user_menu.4d*** in the folder **User\BRC** is

```
Button "BRC 4.1 Chains" {
  Walk_Right "ADAC BRC 4.1 Chains"
}
```

the text on the menu will be **BRC 4.1 Chains**

and it has a walk right menu and the definition for the walk right menu is in a Menu called **ADAC BRC 4.1 Chains**

In the folder **User\GCCC**, the ***ADAC_customer_user_menu.4d*** file is almost identical to that for BRC that BRC is replaced by GCCC.

So now we need to define walk-right menus mentioned in the ***ADAC_customer_user_menu.4d*** files.

(e) Inside each customer folder, the walk right menus are defined in a file called ***ADAC_customer_walk_right_menu.4d***

The walk right menus contain the options that run the required ADAC Design and ADAC Survey chains.

In our example, **BCC** has tow walk right menus and they both need options to run Design and Survey chains.

So in the folder **User\BCC**, the contents of ***ADAC_customer_walk_right_menu.4d*** are

```
Menu "ADAC BCC 4.1 Chains" {                                    ADAC design chain
  Button "BCC Design to ADAC 41 chain" {
    Command "chain  -pvf $USER/BCC/ADAC_BCC_41.pvf  $LIB/ADAC_design_base.chain"
  }
  Button "BCC Survey to ADAC 41 chain" {
    Command "chain  -pvf $USER/BCC/ADAC_BCC_41.pvf  $LIB/ADAC_survey_base.chain"
  }
}                  pvf file for BCC and ADAC 4.1              ADAC survey chain

Menu "ADAC BCC 4.0 Chains" {
  Button "BCC Design to ADAC 40 chain" {
    Command "chain   -pvf $USER/BCC/ADAC_BCC_40.pvf   $LIB/ADAC_design_base.chain"
  }
  Button "BCC Survey to ADAC 40 chain" {
    Command "chain   -pvf $USER/BCC/ADAC_BCC_40.pvf   $LIB/ADAC_survey_base.chain"
  }
}
```

BRC only require ADAC 4.1 but do need both Design and Survey so only one walk right menu is required but it needs an option for Design and an option for Survey on it. So the ***ADAC_customer_walk_right_menu.4d*** in the folder **User\BRC** is

```
Menu "ADAC BRC 4.1 Chains" {                                    ADAC design chain
  Button "BRC Design to ADAC 41 chain" {
    Command "chain  -pvf $USER/BRC/ADAC_BRC_41.pvf  $LIB/ADAC_design_base.chain"
  }
  Button "BRC Survey to ADAC 41 chain" {
    Command "chain  -pvf $USER/BRC/ADAC_BRC_41.pvf  $LIB/ADAC_survey_base.chain"
  }
}                  pvf file for BRC and ADAC 4.1              ADAC survey chain
```

GCCC only require ADAC 4.1 and only need Survey so only one walk right menu is required with just the one option for Survey on it. So the ***ADAC_customer_walk_right_menu.4d*** in the folder **User\GCCC** is

```
Menu "ADAC GCCC 4.1 Chains" {
    Button "GCCC Survey to ADAC 41 chain" {
     Command "chain -pvf $USER/GCCC/ADAC_BRC_41.pvf $LIB/ADAC_survey_base.chain"
  }
}
```

pvf file for GCCC and ADAC 4.1

ADAC survey chain

(f) Finally the ***ADAC_customer_user_menu.4d***'s for each of the customers needs to be included in the **ADAC User** menu

This is done by having a file in the **User** folder called ***ADAC_customer_user_menu.4d***

(Aside: Yes this is the same name as in the customer folders. If it causes confusion then we will change it. Maybe it should have an s in it ***ADAC_customers_user_menu.4d***)

This is the file that was included in the **User** menu by the
    #include "ADAC_customer_usr_menu.4d "statement.

This file first includes all the walk right menus for the different customers on the **User ADAC** menu, and then includes the definitions of the walk right menus.

\

```
Menu "User Adac" {

#include "BCC\ADAC_customer_user_menu.4d"
#include "BRC\ADAC_customer_user_menu.4d"
#include "GCCC\ADAC_customer_user_menu.4d"

}

#include "BCC\ADAC_customer_walkright_menu.4d"
#include "BRC\ADAC_customer_walkright_menu.4d"
#include "GCCC\ADAC_customer_walkright_menu.4d"
```

places each walk right menu on the User ADAC menu

defines the walk right menus

Continue to the next section 10.6.4 Setting Up ADAC Templates or return to 10.6.3 Setting up and Running ADAC Chains from the Menus or 10.6 Setting Up for ADAC .

10.6.4 Setting Up ADAC Templates

When creating *ADAC Header* using the **ADAC =>Create Header**, or *ADAC Assets* using the **ADAC =>Create Asset** option, Templates can be used to automatically fill in many of the values of ADAC elements.

See

10.6.4.1 ADAC Header Templates

10.6.4.2 ADAC Asset Templates

10.6.4.1 ADAC Header Templates

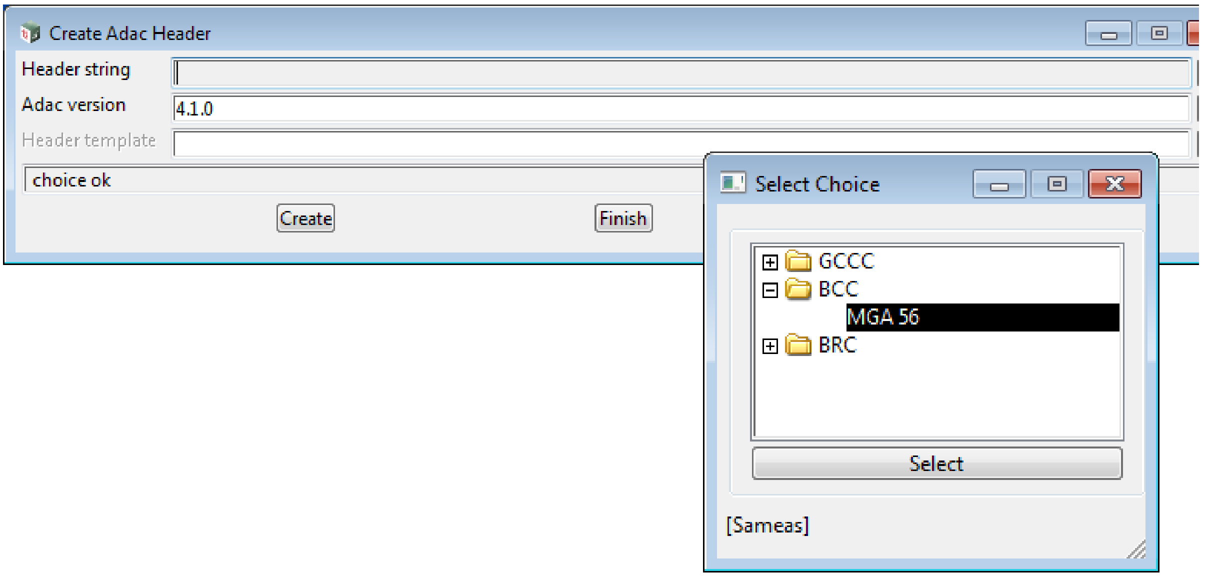
In most firms, many of the values in an *ADAC Header* would be the same for each new ADAC job.

For example, all your jobs could be in *MGA zone 56*, using the *Horizontal Datum GDA 94* and *Vertical Datum AHD*. Or you always have the three surveyor names in the *ADAC Header.*

To prevent having to reenter this data every time you create a new ADAC Header, users can create *ADAC Header* **Templates** with information for any new ADAC Header already filled in.

When you have *ADAC Header Templates*, the **Template** field pop up in the **Create ADAC Header** panel lists all your *ADAC Header* **Templates** for the selected **ADAC version**, as a folder structure.

When the new *ADAC Header* is created, it will have **all** the values from the selected *Header Template*.

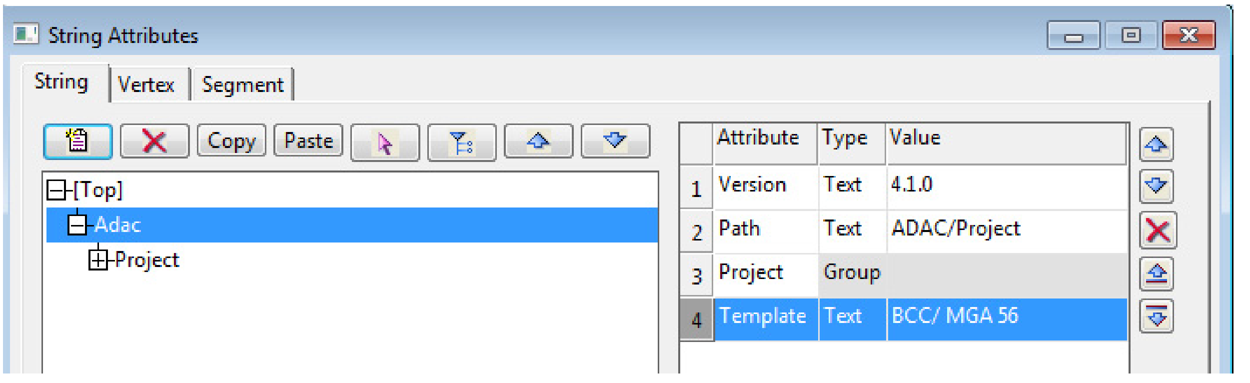


So for the new ***ADAC Header***, only those values not covered by the ***Header Template*** need to be entered.

To create an ***ADAC Header Template***, you

1. create an ***ADAC Header*** for the required *ADAC version*, and with the *ADAC values* that you want the *Header Template* to have
2. place it in the model ***ADAC Header Templates***
3. in the string attributes, add a **Text** attribute called **Template** into the **top** level of the ***ADAC attribute group***, with its value being the required folder structure for displaying the ***Header Template*** with the names for each folder level being separated by a forward slash (**/**).

For example, to have a ***Header Template*** called **MGA 96** and have it display in a folder called **BCC**, the value for the attribute **Template** is ***BCC/MGA 96***



To use the ***Header Templates*** in another project you can either:

(a) write the model ***ADAC Header Templates*** out as a 12da file and read it into new ADAC projects.

(b) have the model ***ADAC Header Templates*** in a project and share that project into your new ADAC projects.

(c) write the models ***ADAC Header Templates*** and ***ADAC Asset Templates*** out to the 12da file ***ADAC_Templates.4da*** and place the file in User_Lib.

The option:

ADAC =>User =>Setting up a new ADAC Project =>Read in templates from User_Lib

can then be used in any project to read *User_Lib\ADAC_Templates.4da* in, and hence the models ***ADAC Header Templates*** and ***ADAC Asset Templates*** into the new project.

See 10.4.9.1.3 Reading in Templates from User_Lib .

Continue to the next section 10.6.4.2 ADAC Asset Templates or return to 10.6.4 Setting Up ADAC Templates .

10.6.4.2 ADAC Asset Templates

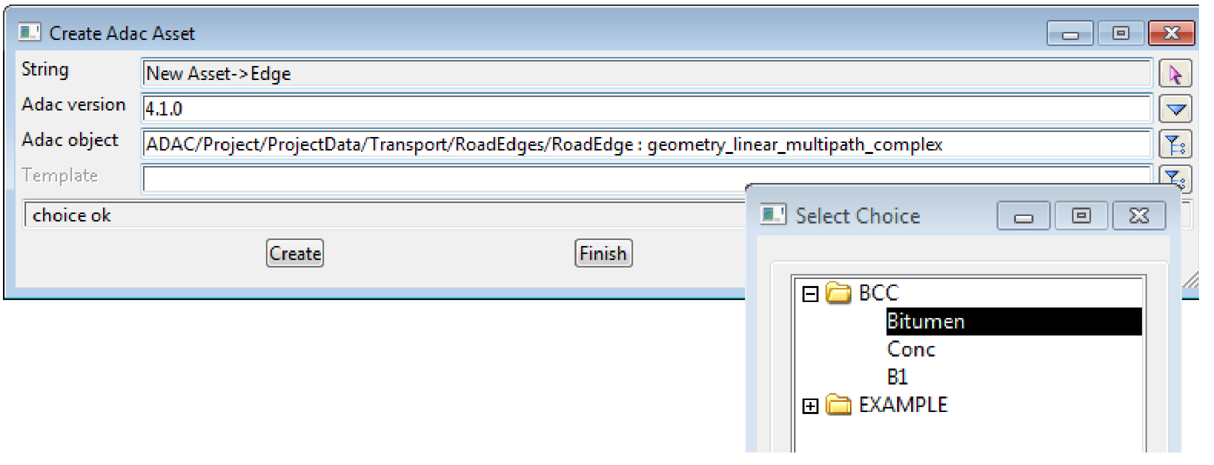
When creating *ADAC Assets* by hand, there would be some the values in an *ADAC Asset* that would be the same each time the *ADAC Asset* was use in ADAC job.

For example, a *Transport>RoadEdges>RoadEdge* with **Type *Bitumen*** and **Owner** *Council* may be regularly required.

To prevent having to reenter this data every time you create a new ADAC Asset, users can create *ADAC Asset* **Templates** with information for any new ADAC Asset already filled in.

When you have *ADAC Asset Templates*, the **Template** field pop up in the **Create ADAC Asset** panel, lists all your *ADAC Asset* **Templates** for the selected **ADAC version** and the selected *ADAC Asset,* in a folder structure.

When the new *ADAC Asset* is created, it will have **all** the values from the selected *Asset Template*.

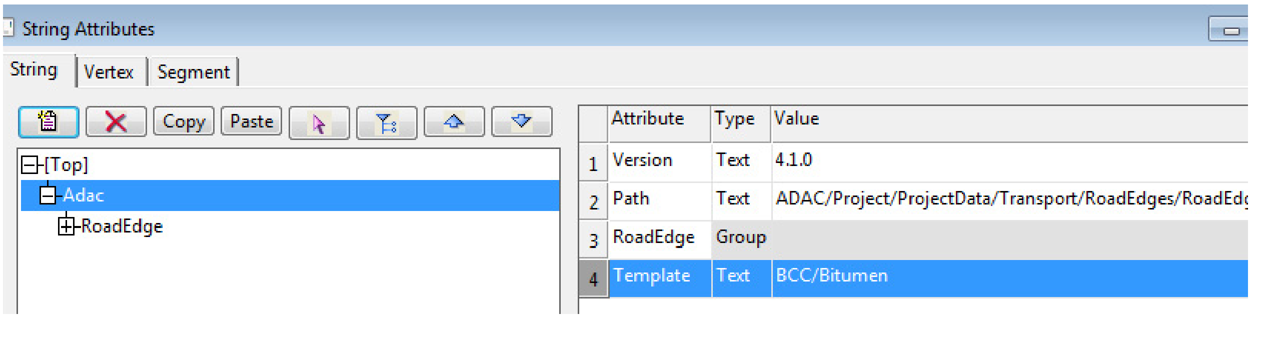


So for the new ***ADAC Asset***, only those values not covered by the ***Asset Template*** need to be entered.

To create an ***ADAC Asset Template***, you

1. create an ***ADAC Asset*** for the required *ADAC version*, and with the *ADAC values* that you want the *Asset Template* to have
2. place it in the model ***ADAC Asset Templates***
3. in the string attributes, add a **Text** attribute called **Template** into the **top** level of the ***ADAC attribute group***, with its value being the required folder structure for displaying the ***Asset Template*** with the names for each folder level being separated by a forward slash (**/**).

   For example, to have an ***Asset Template for a Road Edge*** called **Bitumen,** and have it display in a folder called **BCC**, the value for the attribute **Template** is ***BCC/Bitumen***



To use the ***Asset Templates*** in another project you can either:

(a) write the model ***ADAC Asset Templates*** out as a 12da file and read it into new ADAC projects.

(b) have the model ***ADAC Asset Templates*** in a project and share that project into your new ADAC projects.

(c) write the models ***ADAC Header Templates*** and ***ADAC Asset Templates*** out to the 12da file ***ADAC_Templates.4da*** and place the file in *User_Lib*.

The option:

ADAC =>User =>Setting up a new ADAC Project =>Read in templates from User_Lib

can then be used in any project to read *User_lib\ADAC_Templates.4da* in, and hence the models ***ADAC Header Templates*** and ***ADAC Asset Templates*** into the new project.

See 10.4.9.1.3 Reading in Templates from User_Lib .

Continue to the next section 10.6.5 Setting Up Your User Keys or return to 10.6 Setting Up for ADAC .

10.6.5 Setting Up Your User Keys

Two thing you will do regularly when doing ADAC work is to bring up the ADAC menu and to bring up the **String Attributes** panel.

So in the standard ***12d Model 11*** installation, the function keys are assigned so that:

Pressing **F12** brings up the **ADAC** menu.
Pressing **F8** brings up the **Strings Attributes** panel.

If you wish to change the use of functions keys then you can define the way you want the *function keys* to work.

For example, you may want

Press **F11** to bring up the **ADAC** menu.
Press **F12** to bring up the **String Attributes** panel.

In ***12d Model*** the actions of the function keys is controlled by ***userkeys.4d***. There may already be a copy in your **User** folder. If not, copy it over from the folder in ***Program Files***:

12d\12dmodel\11.00\set_ups.

Then just replace the existing lines for defining **f11** and **f12** with (lines preceded by **//** are comment lines).

// mod for f11

f11 panel "ADAC"

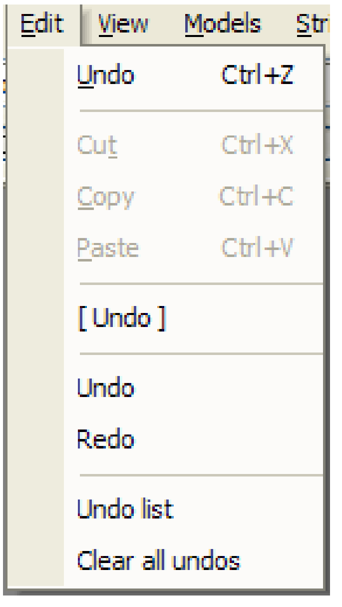
// mod for f12

f12 panel "String Attributes"

Return to 10.6 Setting Up for ADAC .

11 Edit

The **Edit** menu contains the **Undo** and **Redo** options.



Infinite **Undo** and **Redo** facilities have been implemented for many of the 12d Model options.

However, because much of the power of 12d Model comes from being able to leave options hanging and editing more than one string at a time, this made the standard concept of *Undo/ Redo* of limited benefit to 12d Model users.

Consequently, the following methodology has been adopted for **Undo** and **Redo** in 12d Model:

Independent undo and redo lists are maintained for each string being edited and these list are cleared once the editor is left.

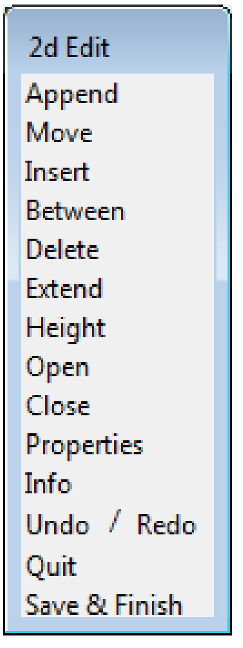
There is also a main undo/redo list which is used for all other options that can be undone. The main undo/redo lists are cleared when the 12d Model session is exited.

Please continue to the next section Undo and Redo for Editors.

11.1 Undo and Redo for Editors

Each editor contains its own **Undo/Redo** option on its **nd Edit** menu and whilst a string is being edited, the editor maintains its own undo/redo lists.

For example, for a 2d string, the **Undo/Redo** option is just above the **Quit** option.



As each edit is made to the string, the state of the string before the edit is added to the top of the string's **undo** list and the **redo** list is emptied.

If **undo** is selected from the **nd edit** menu, the last edit operation for that string will be **undone** and the undone operation added to the top of the string's **redo** list.

If another **undo** is selected before another edit is made to the string, what is now was last operation on the string will be **undone** (is was the second last operation before the previous undo) and the undone operation added to the top of the string's **redo** list.

If **redo** is selected from the **nd edit** menu, then the top operation on the **redo** list is redone, and the state of the string before the redo is added to the top of the undo list.

Hence edits for he string can be **undone** and **redone** whilst in the edit session for the string.

When the edit session is completed by selecting either **quite** or **finish** from the **nd edit** menu, the undo and redo lists for the edit session are deleted and the operations for the edit session can no longer be undone or redone.

Note

If more than one string is being edited at the same time, each string editor maintains its own undo/redo lists so that the undo/redo operations for the different strings do not get intertwined.

Hence if **undo** or **redo** is selected from a particular strings **nd edit** menu, the undo or redo applies **only** to the operations performed on that particular string, no matter what other **nd edit** options where performed on other strings.

Please continue to the next section Undo and Redo for other Options.

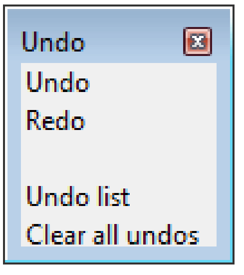
11.2 Undo and Redo for other Options

As well as the undo/redo lists maintained by the string editors, there is another set of undo/redo list maintained for all other options that support undo and redo. These are called the **main undo** and **redo** lists.

For a description of the undo in ***12d Model***, please go to the section Edit.

The **undo** option which controls the main undo/redo lists, is the on the Edit menu from the main menu.

If **undo** is selected from the **undo** menu, the last undoable option performed (apart from editor operation on strings) will be **undone** and the undone operation added to the top of the main **redo** list.



If another **undo** is selected before another undoable option is performed, what is now was last operation will be **undone** (is was the second last operation before the previous undo) and the undone operation added to the top of the main **redo** list.

If **redo** is selected from the **undo** menu, then the top operation on the main **redo** list is redone, and the state before the redo is added to the top of the undo list.

Hence many operations can be **undone** and **redone**.

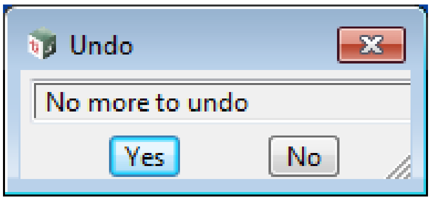
When the 12d Model session is completed by selecting either **exit** from the **12d Model** menu, the undo and redo lists for the session are deleted and the operations for the session can no longer be undone or redone.

For the option *Undo*, go to the section	Undo.
Redo	Redo
Undo list	Undo List
Clear all undos	Clear all Undos

For some restrictions on the Undo/Redos, please continue to the section Some Restrictions on Undo and Redo.

11.2.1 Undo

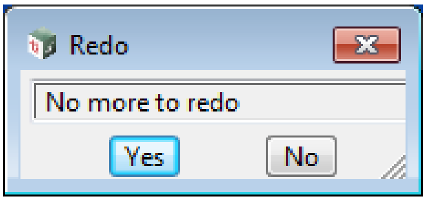
If **undo** is selected from the **undo** menu, the **undo** panel showing the last operation to *undo* is displayed.



For some restrictions on the Undo/Redos, please continue to the section Some Restrictions on Undo and Redo.

11.2.2 Redo

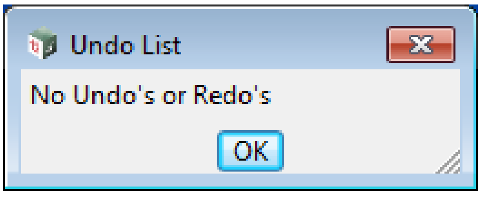
If **redo** is selected from the **undo** menu, the **redo** panel showing the last operation to *redo* is displayed.



For some restrictions on the Undo/Redos, please continue to the section Some Restrictions on Undo and Redo.

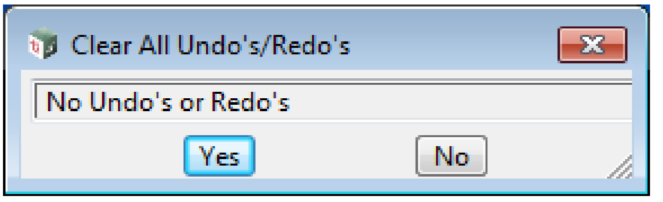
11.2.3 Undo List

If **undo list** is selected from the **undo** menu, a list of all the items on the undo list is displayed in the **undo list** panel.



11.2.4 Clear all Undos

Selecting **clear all undo** from the **undo** menu will bring up a clear all undo's/redo's **yes-no** panel.



If **yes** is selected, the main undo and redo lists will be cleared.

11.2.5 Some Restrictions on Undo and Redo

Undo and Redo are available for most of the **Strings** options and most of the **Utilities** options.

Undo is available for all **File=> Input** options but there are no Redos for these Undos.

Undo is available for all **Utilities=>Global** options that use the **Output** option with the Mode set to one of the three copy modes. There are no Redos with these Undos.

There are no Undos for **Models=>Delete** and **Models=>Clean**.

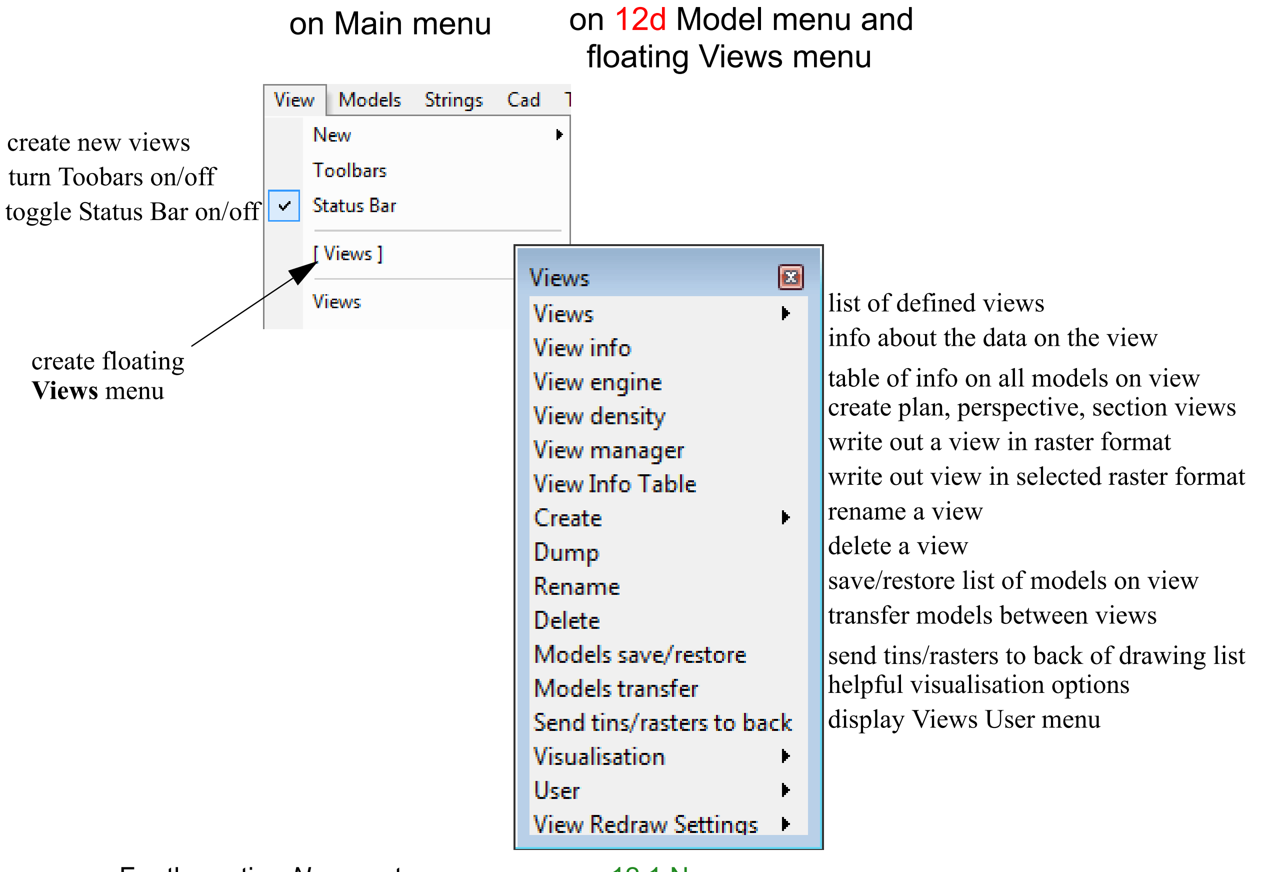
12 View

Position of menu: **View**

Views are the drawing display areas in 12d Model.

The **View** walk-right menu contains options to list existing views and create new views. The view drawing and manipulation options are in the **View** menus attached to each view.

The **Views** walk-right menu is

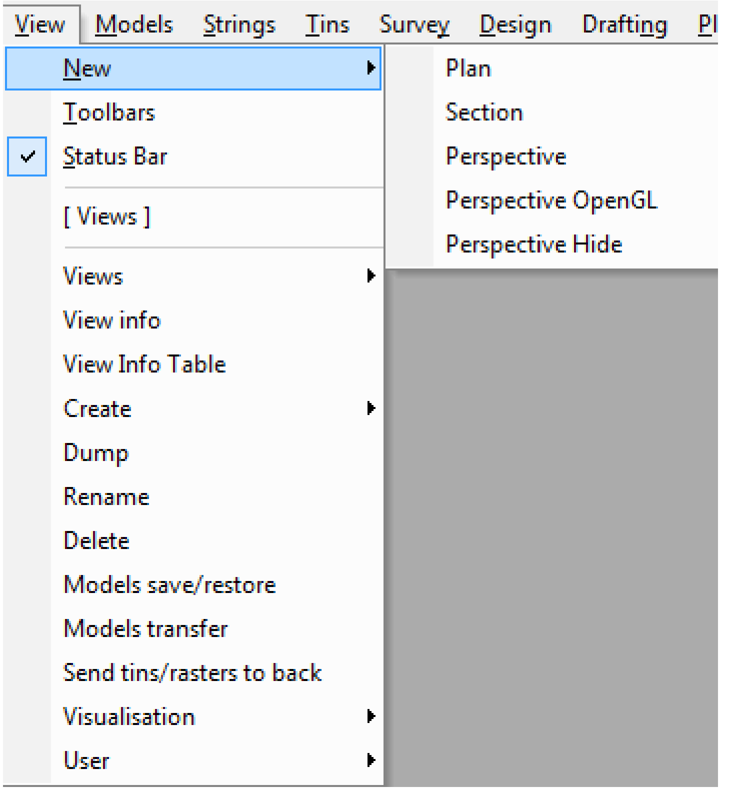


For the option *New*, go to 12.1 New
Toolbars 12.2 Toolbars
Status bar Status Bar
Views 12.3 Views
View info 12.4 View Info
View info table 12.5 View Information Table
Create 12.6 Create
Dump 12.7 Dump
Rename 12.8 Rename
Delete 12.9 Delete
Models save/restore 12.10 Models Save/Restore
Models transfer 12.11 Models Transfer
Send tins/rasters to back 12.12 Send Tins/Rasters to Back
Visualisation 12.13 Visualisation
View Redraw Settings ALG??

12.1 New

Position of option on menu: **View =>New**

The **New** walk-right menu provides options to create views of type *Plan*, *Section*, *Perspective*, *Perspective OpenGL* and *Perspective Hide.*

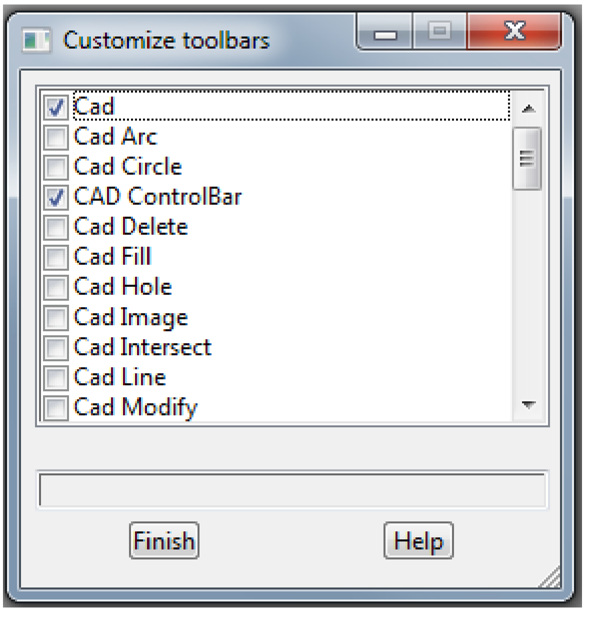


After selecting one of the options, a new view of the appropriate type with the next sequential view number is created in the Views Area.

12.2 Toolbars

Position of option on menu: **View =>Toolbars**

Clicking on **Toolbars** brings up the **Customize Toolbars** panel



Clicking the tick on/off for a given toolbar or controlbar in the *Toolbars* list turns the toolbar or controlbar on/off.

Status Bar

Position of option on menu: **View =>Status Bar**

Toggles the *Status Bar* on/off.

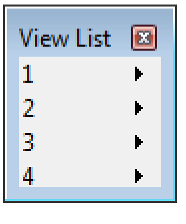
For more information please see 4.3.8 Status Bar.

12.3 Views

Position of option on menu: **View =>Views**

The **Views** walk-right menu provides a list of the all the views defined in this session of 12d Model.

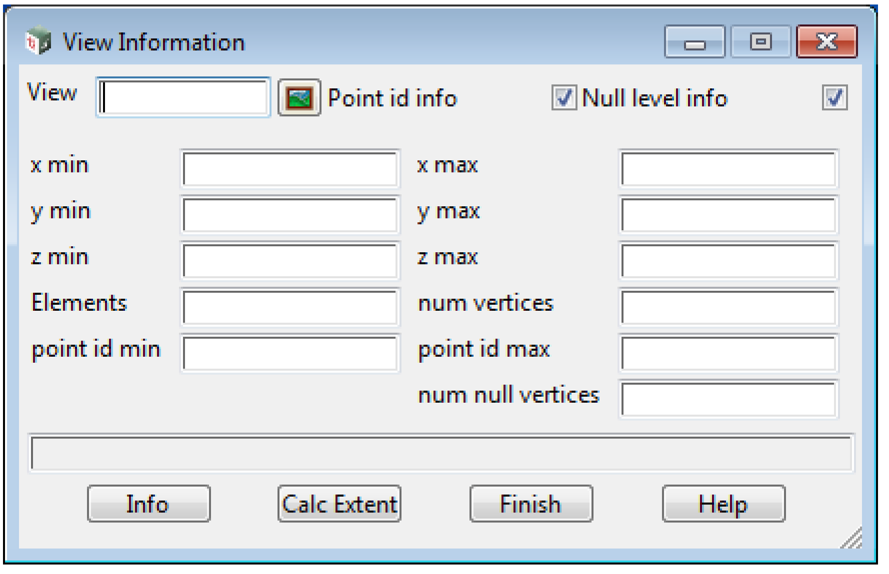
For each view in the list, a further walk-right menu lists all the models added to that view.



12.4 View Info

Position of option on menu: **View =>View Info**

Selecting **View info** fires up the **View information** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	input		available views

input the name of the view to get information about

Point id info	tick box	tick	

if ticked, the Point id min *and* Point id max *fields are shown on the panel and when the* **Info** *button is pressed, their values calculated for the data on the view.*
If not ticked, the Point id min *and* Point id max *fields are not shown on the panel.*

Null level info	tick box	tick	

if ticked, the Num null vertices *field is shown on the panel and when the* **Info** *button is pressed, the value calculated for the data on the view.*
If not ticked, the he Num null vertices *field is not shown on the panel.*

xmin/ymin/zmin, xmax/ymax/zmax output

returns the limits of all the models on the view

Point id min/max output

minimum/maximum integer point id in the model

Elements output

returns the number of elements in all the models on the view

Num vertices output

returns the number of points in all the models on the view

Point id min output

the minimum Point id for the data on the view.

Point id max output

the maximum Point id for the data on the view.

Num null vertices output

returns the number of null vertices in all the models on the view

Info button

get the information for the view given in the view field.

Calc Extent button

recalculate the x, y, z bounding box for the models on the view given in the view field.

How to Use the Panel

The view information for the view given in the view field is retrieved and placed in the appropriate panel fields when the view name is entered into the view field from the pop-ups, or a <enter> is entered after entering the view name into the view field, or on selecting the **info** button.

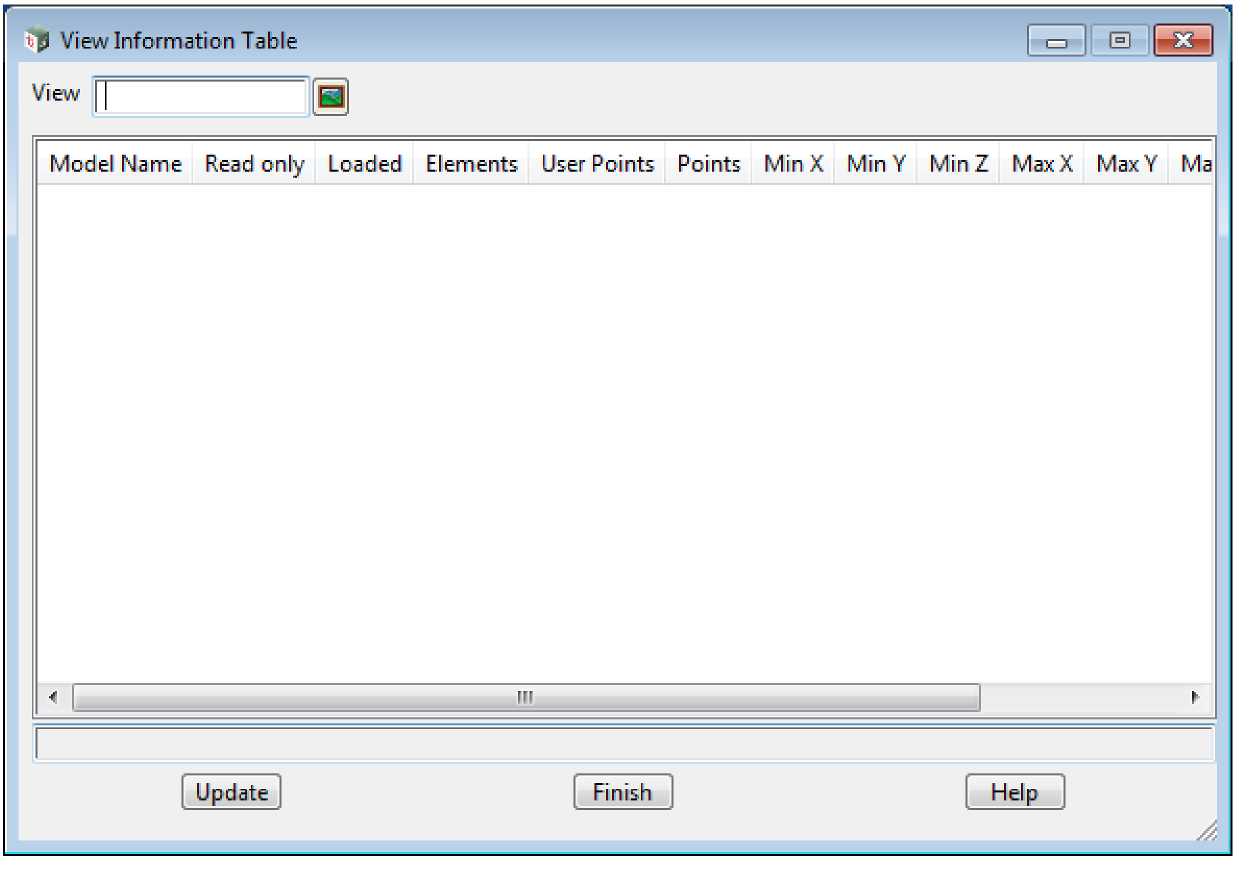
12.5 View Information Table

Position of option on menu: **View =>View info table**

The **View information table** option displays the minimum and maximum x, y and z values for every model on the view, and by double-clicking on a model name in the list, brings up a String Information Table that lists all the strings in that model (see 13.3 Model Information Table).

The models and minimum and maximum columns can be sorted into ascending or descending order by using bringing up the **sort** menu on the column header fields.

Selecting **View info table** fires up the **View Information Table** panel.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box		available views
the name of the view to list all the models for			
Model	column		**sort** menu
all the models in the view are listed in the model *column.*			
Read only	column		**sort** menu
Loaded	column		**sort** menu
*if no, in this current opening of the project, the model has not yet been fully loaded into **12d Model**.*			
Min X, Min Y, Min Z **Max X, Max X, Max Z**	columns		**sort** menu
the minimum/maximum values for the model are displayed in the columns			

Created/Updated columns dates

dates the model was first created/updated

Update button

recalculate the minimum/maximum information in the table.

Notes

1. This is a scrolling panel. If there is too much information to fit into the table, then the scrolling arrow on the right hand side of the table must be used to display the extra information.
2. The grid can be sorted by any of the columns.

12.6 Create

Position of menu: **View =>Create**

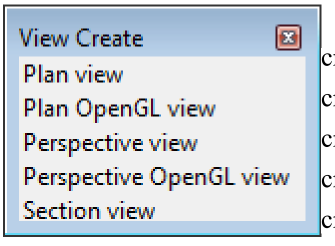
The floating **Create** menu item operates in two ways.

First, if **Create** itself is activated (by clicking LB when **Create** is highlighted), the **New View** panel appears. The **New View** panel can be used to create plan, perspective and sections views.

Secondly, the **Create** walk-right brings up a the **View Create** menu. This walk-right menu has separate options for creating plan, perspective and section views.

The Main menu option **View** => **Create** will only work the second way

The **Create** walk-right menu is



create a plan view
create a plan OpenGL view
create a perspective view
create a perspective OpenGL view
create a section view

The **New View** panel obtained by clicking LB on the **Create** menu item and the three options on the **View Create** menu will now be described.

For the option *New view*, go to 12.6.1 New View

Plan view 12.6.2 Plan, Perspective and Section Views

Plan OpenGL view ALG??

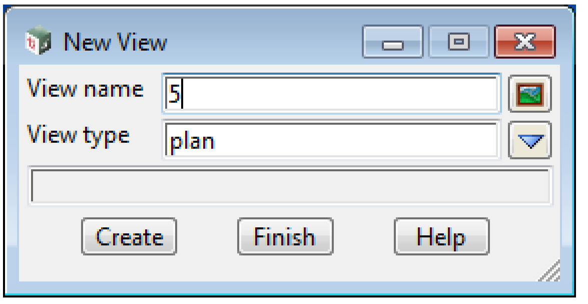
Perspective view 12.6.2 Plan, Perspective and Section Views

Perspective OpenGL view 12.6.2 Plan, Perspective and Section Views

Section view 12.6.2 Plan, Perspective and Section Views

12.6.1 New View

On selecting the **Create** option, the **New View** panel is displayed.



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View name	view box	next view number	

name of the new view to be created.

View type	choice box	plan	plan, persp, section, persp openGL

type of the view to be created. There are three types of views - plan, perspective, perspective openGL and sections views.

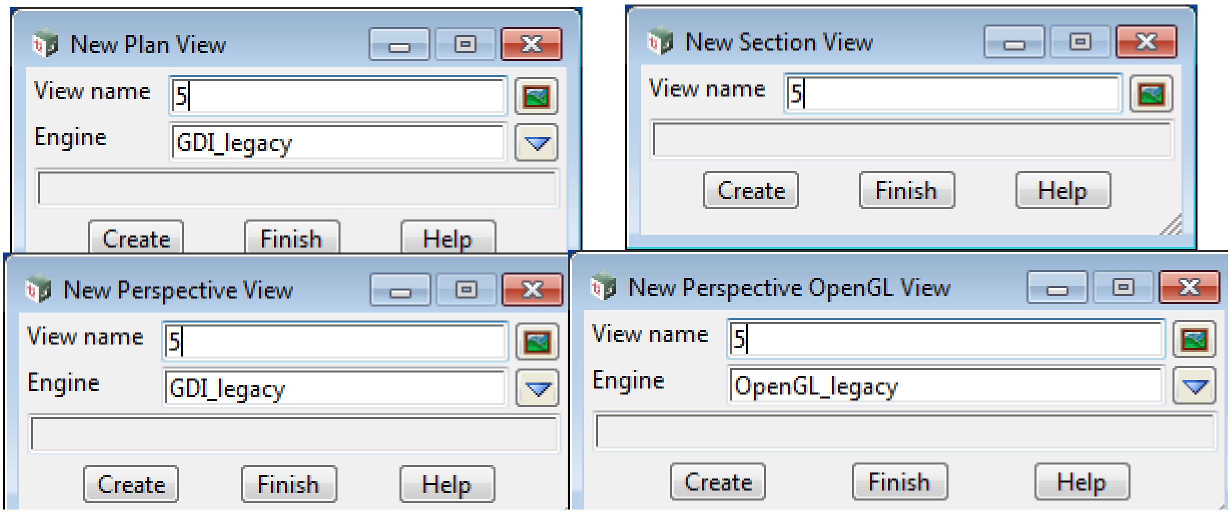
Create	button

after selecting this button, a new view of the name and type given in the panel is created in the Views Area. The panel then disappears.

12.6.2 Plan, Perspective and Section Views

Position of option on menu: **View =>Create =>Plan/Perspective/Perspective OpenGL/Section view**

On the **Plan/ Perspective/Perspective OpenGL/Section view** option, the **New Plan/Perspective/ Perspective OpenGL/ Section view** panel is displayed.



The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up
View name	input	next view number	

name of the new plan/perspective/section view to be created.

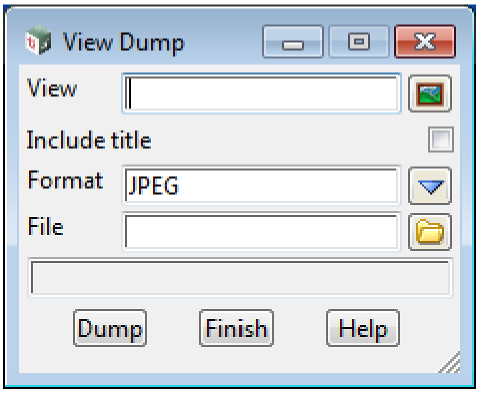
Create	button		

after selecting this button, the new view of the specified name is created in the Views Area. The panel then disappears.

12.7 Dump

Position of option on menu: **View =>Dump**

This option is used to write the view out in a user selected raster format. The option is identical to the **Dump** option on the **View System** menu.



The fields and buttons used in this panel have the following functions.

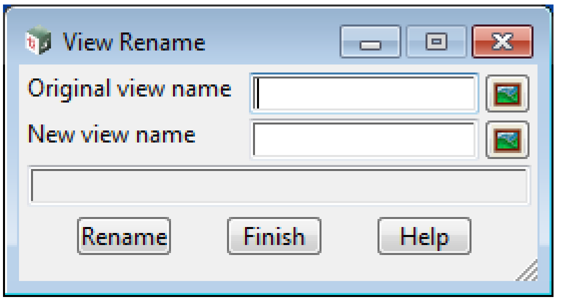
Field Description	Type	Defaults	Pop-Up
View	view box		available views
name of the view to be dumped			
Include title	tick box		
if ticked, include the view title area in the dump			
Format	choice box	jpeg	bmp, gif, jpeg, jpeg 2000, png, tga
format of the dump of the view			
File	file box		
name of the file for the dump of the view			
Dump	button		
dump the view in the given format			

12.8 Rename

Position of option on menu: **View =>Rename**

This option renames an existing view.

Selecting **Rename** brings up the **View Rename** panel:



The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Original view name	view box		available views
current name of the view			
New view name	view box		available views
new name for the view			
Rename	button		
rename the view			

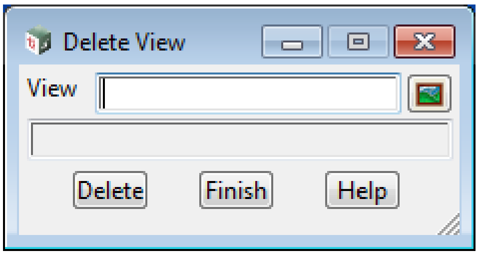
12.9 Delete

Position of option on menu: **View =>Delete**

This option deletes an existing view.

Since the easiest method to delete a view is to use the **[X]** in the top right hand corner of the view, the *Delete View* option is mainly used in rare cases such as when the view is not responding due a graphics card problem.

Selecting **Delete** brings up the **Delete View** panel:



The fields and buttons used in this panels have the following functions.

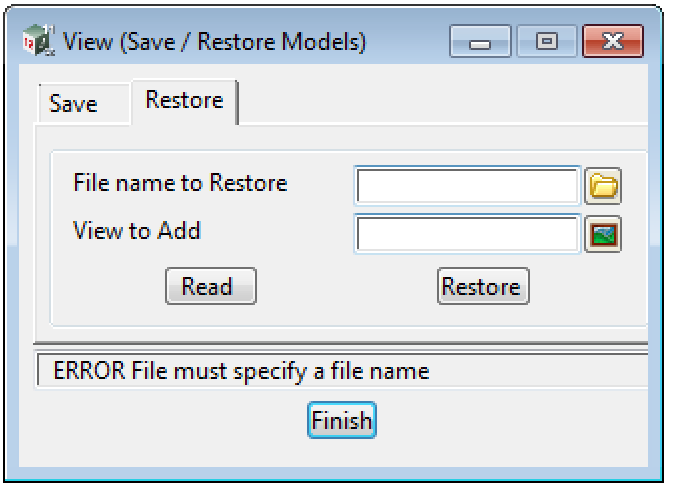
Field Description	Type	Defaults	Pop-Up
View	view box		available views
name of the view to delete			
Delete	button		
delete the view			

12.10 Models Save/Restore

Position of option on menu: **View =>Models save/restore**

This option is used to write out a list of models on the view and also to read in a list of models and add them to a given view.

On selecting the **Models save/restore** option, the **View save/restore models** panel is displayed.



The fields and buttons used in this panels have the following functions.

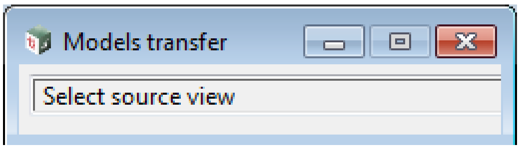
Field Description	Type	Defaults	Pop-Up
Save tab	tab		
File name for save	file		*.vml files
file for model list.			
View to save	view		available views
view to write out list of model for.			
Save	button		
after selecting this button, the names of all the model on the view are written out to the file.			
Restore tab	tab		
File name to restore	file		*.vml files
file of model list.			
View to add	view		available views
view to add the models in the model list to.			
Read	button		
read the list of models.			
Restore	button		
add the models in the list just read in to the given view.			

12.11 Models Transfer

Position of option on menu: **View =>Models transfer**

This option is used to add all the models on one view to a different view.

Selecting **Models transfer** brings up the **Models Transfer** panel:



The user is then asked to click in the view to get the models from (source view) and then to select the destination view where the models are to be added to.

Note - if the destination view is a new view, click on **Fit** first to give the new view a valid co-ordinate system.

12.12 Send Tins/Rasters to Back

Position of option on menu: **View =>Send tins/rasters to back**

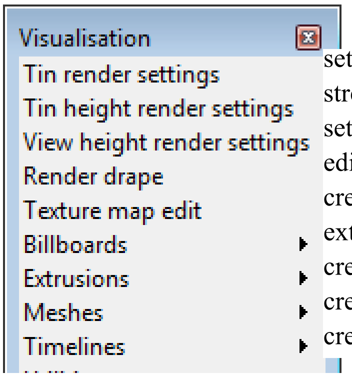
This option is used to send tins and rasters to the back of the drawing list.

12.13 Visualisation

Position of menu: **View =>Visualisation**

This is a chargeable module which uses the Perspective OpenGL view to create realistic 3d pictures using raster drapes, bitmaps and extrusions along super strings.

The **Visualisation** walk-right menu is



sets textures for tins
stretches an image of a tin using a height range
set rasters for draping on
edit texture map file
creating/edit/place billboards
extrusions
create/place meshes
create/run timelines
create clouds, fences, forests etc

For *Tin render settings*, go to 12.13.1 Tin Render Settings

Tin height render settings 12.13.2 Tin Height Render Settings

Render drape 12.13.3 Render Drape

Texture map edit 12.13.4 Texture Map Edit

Billboards 12.13.5 Billboards

Extrusions 12.13.6 Extrusions

Meshes 12.13.9 Meshes

Timelines 12.13.10 Timelines

Utilities 12.13.35 Utilities

12.13.1 Tin Render Settings

Position of option on menu: **View =>Visualisation =>Tin render settings**
Position of option on menu: **Tins =>Edit =>Render settings**

For a tin added to a Perspective OpenGL view with Shade ticked on, the triangles of the tin can be displayed as solid colour or various degrees of transparency depending of the Blending value for the tin which can vary between 1 and 0. If Blending is 1 the tin is opaque and triangles display as a solid colour, and Blending of 0 means the triangles are totally transparent.

A tin can be *one sided* and only viewable from above, or *two sided* and viewable from above or below.

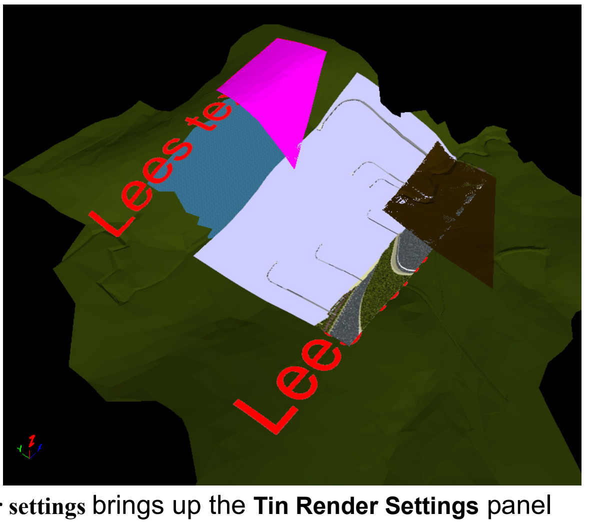
Rasters, such as photos, can also be associated with a tin and when the tin is displayed in a Perspective OpenGL view with the shade turned on, the rasters are draped onto the tin wherever the triangles are still the base colour.

For triangles that are not the base tin colour, textures can be applied to the triangle using a **Texture mapping** file where the triangle colour is the index into the mapping file.

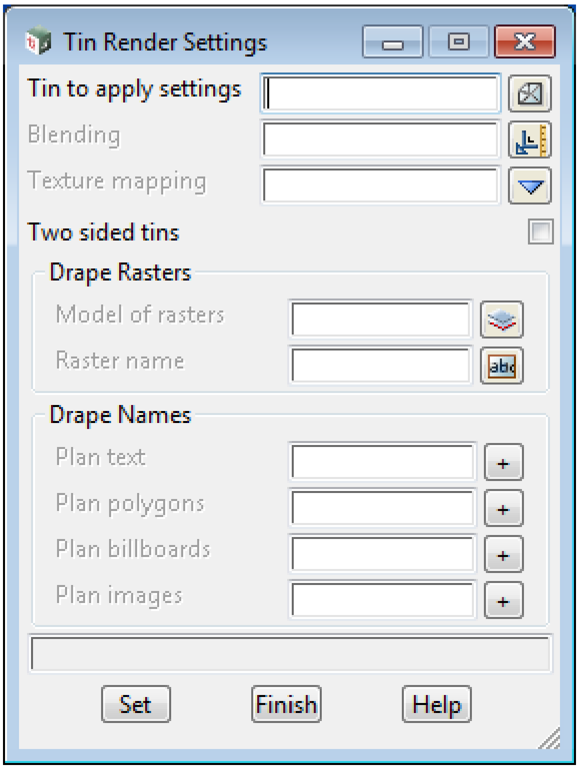
Finally text, filled polygons, text, billboards and images in models added to any Perspective OpenGL view that the tin is on can also be attributed so that they can be draped and displayed on the tin.

All these properties are known as ***Tin Render Settings*** and are set using this option.

IMPORTANT NOTE: the ***Visualisation*** module is required for the *Tin Render Settings* to be used on a Perspective OpenGL view.



Selecting **Tin render settings** brings up the **Tin Render Settings** panel



The fields and buttons used in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin to apply settings	tin box		available tins

name of the tin to apply/modify the Tin Render Settings. Any existing Tin Render Settings of the tin are loaded into the appropriate panel fields so that they can be modified.

Blending input

Blending control the level of transparency of the tin.
***0** means the tin is totally transparent (and hence invisible) and **1** means that the tin is opaque (non-transparent) and can't be seen through at all.*

If blank, then the Blending value defaults to 1 and the tin is opaque (non-transparent).

Texture mapping texture mapping file box

*if non blank, the name of the set of colour-to-texture mappings that is defined in the file **textures_maps.4d.** The Texture Mapping set defines for a colour, what texture from the **textures.4d** file is applied to the triangles of the tin that have been coloured this colour (and the colour in no the base tin), rather than applying any raster to those triangles.*

Two sided tins tick box

if ticked, the tin is visible when viewed from both above and below. For example, the tin used for the bottom of a bridge needs to be two-sided.
If non-tick, then the tin is one sided and only shows when viewed from above.

Drape Rasters

Model of rasters model box available models

if not blank, the model of ortho-rectified rasters to be associated with the tin and draped onto the tin when the tin is on a Perspective OpenGL view. The raster images will only be draped onto triangles that have the base tin colour.

Raster name input

if non blank, the name of an ortho-rectified raster to be associated with the tin (and hence draped onto the tin when the tin in on an Perspective OpenGL view).

Drape Names

WARNING WHEN USING DRAPE NAMES
Because draped text, billboards, images and textures can all occur at the same (x,y) value and hence have the same z-value at that point, there are certain ordering rules controlling what you see.

*First the **model** containing the **tin** needs to be brought to the **FRONT** of the view using **Perspective OpenGL View Menu: Models =>Models to front**.*

Then textures using the tin colour and the Texture mapping file will be drawn first, draped text will be next, then draped polygons and draped images fight it out.

Plan text

*if not blank, when the tin is on a Perspective OpenGL view, then for all super strings in models also added to that view, all **vertex text** that is using a **true type font** are draped onto the tin.*

Plan polygons

*when the tin is on a Perspective OpenGL view, then for all super strings in models also added to that view, if a super string in the model has an Integer string attribute with this name then it is draped onto the tin and if the value of the attribute is zero (0) the super string is draped and coloured using the strings fill colour, or if the value is one (1), a texture is draped onto the tin and the fill colour is used as the **reference** to the* **Texture mapping** *file given in the* Texture mapping *field, to specify which texture to drape.*

*The Integer string attribute name and value can be set using the option **View =>Visualisation =>Render drape** (see* 12.13.3 Render Drape*) or by setting an Integer string attribute of the required name and value using the option **Strings =>Properties =>Attributes** (see* 14.12.8 Attributes*).*

Plan billboards

when the tin is on a Perspective OpenGL view, then for all super strings in models also added to that view, if a super string in the model has an Integer string attribute with this name and any value, all horizontal billboards (i.e. have Vertical *turned off) are draped onto the tin.*

The Integer string attribute with this name can be set using the Drape name *field in the option **View =>Visualisation=>Billboards =>Add/Remove (ss) (**see* 12.13.5.2 Add and Remove Billboard from Super String*) or by setting an Integer string attribute of the required name using the option **Strings =>Properties =>Attributes** (see* 14.12.8 Attributes*).*

Plan images

when the tin is on a Perspective OpenGL view, then for all super strings in models also added to that view, if a super string in the model has an Integer string attribute with this name and any value, all images on the super string are draped onto the tin.

*The Integer string attribute of this name is set using the option **Strings =>Properties =>Attributes** (see* 14.12.8 Attributes*).*

Set button

apply the data in the panels fields to the tin.

12.13.2 Tin Height Render Settings

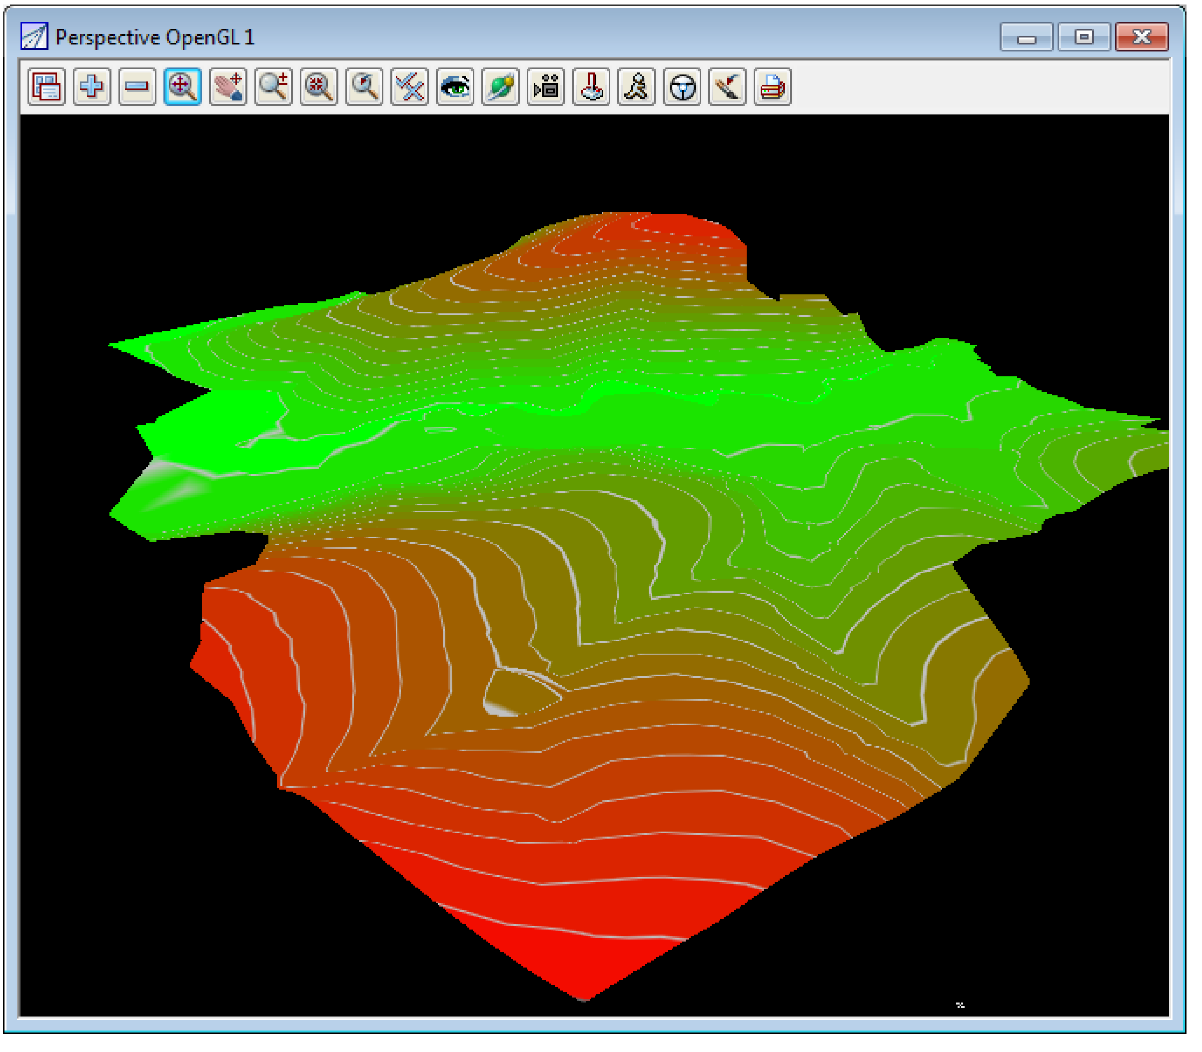
Position of option on menu: **View =>Visualisation => Tin height render settings**

For a tin (that is not a super tin) the *Tin Height Render Setting* option sets the a texture map and parameters that can be stretched over the specified height range.

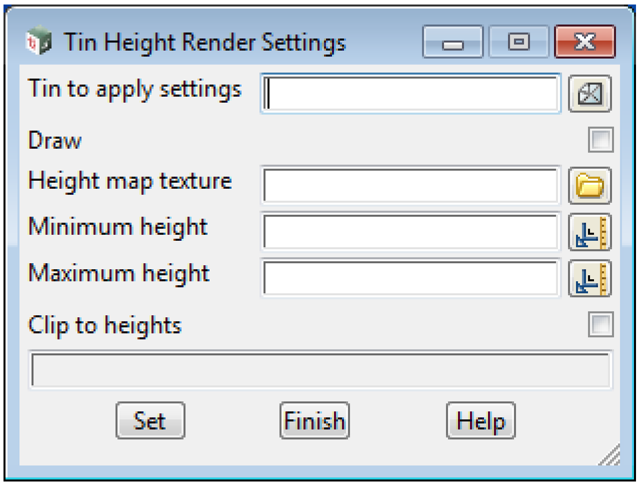
To see the effect, the tin must be on a *Perspective OpenGL* view with *Shade* ticked on, and you have the **Visualisation** module.

Notes

1. this only displays when you have the **Visualisation** module.
2. This option does not work for a Super Tin.



Selecting **Tin height render settings** brings up the **Tin Height Render Settings** panel:



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Tin to apply settings	tin box		available tins

the tin to apply the height texture map to. This can then be toggle on/off with the Draw *tick box.*

Draw	tick box	not ticked	

*if **ticked**, the height texture map will be applied to the tin when it is on an Perspective OpenGL view.*

*If **not ticked**, the height texture map is **not** applied to the tin. However the height texture map is still associated with the tin and* Draw *can be ticked back on at any time.*

Height map texture	file box		.bmp, png file

the texture map to stretched over the height range given in the Minimum height *and* Maximum height *fields.*

The texture map is a bitmap that is one pixel high by n pixels wide, usually with a colour gradation going from left to right. The bitmap is stretched over the minimum and maximum height with the left side of the texture map being at the minimum height and the right side of the texture map being at the maximum height.

For example, the file Height_map_texture.bmp from Library.

Minimum height	measure box		available measures

the minimum height to stretch the height map texture over.

Maximum height	measure box		available measures

the maximum height to stretch the height map texture over.

Clip to heights	tick box	not ticked	

*if **ticked**, the tin is only displayed where the height map texture is applied. That is, the tin is only displayed between the* Minimum height *and the* Maximum height.

*If **not ticked**, the tin is displayed over the entire range of the tin.*

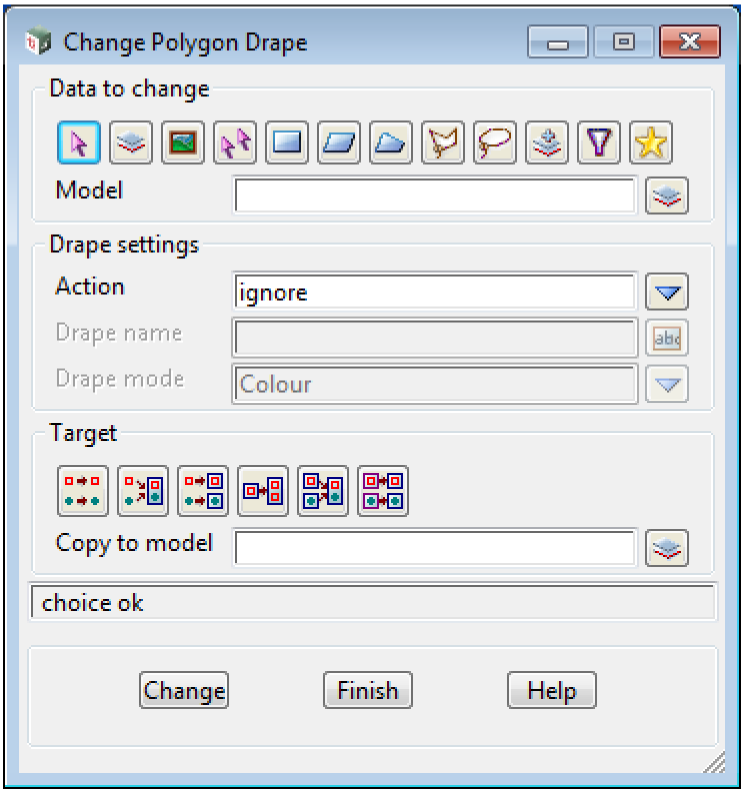
Set	button		

set the values in the panel for the tin given in Tin to apply settings.

12.13.3 Render Drape

Position of option on menu: **View =>Visualisation => Render drape**

Selecting **Render drape** brings up the **Change Polygon Drape** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to be processed.

Action	choice box	ignore	set, clear, ignore

*if **set**, for each selected polygon, an Integer string attribute is created with the atttribute name* Drape name *and the value of the attribute is*

0 if Drape mode *is* **Colour** *and*

1 if Drape mode *is* ***Colour to texture.***

*If **clear**, for each selected polygon the Integer string attribute with name* Drape name *is removed.*

*If **ignore**, nothing is done.*

Drape name

*name of the Integer attribute that is set for the string. The attribute name is used to identify these polygon in the **View->Visualisation->Tin Render Settings*** 16.6.7 Render Settings *(see* Plan polygons *in the Drape Names section)*

Drape mode	choice box		Colour, Colour to texture

if Colour *- the fill colours of the selected polygons are used for the drape*

If Colour to texture *- the fill colours of the selected polygons are used to reference the texture in the **Texture Mapping** file*

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target .

Target info input

extra information required for the target.

Change button

process the selected strings.

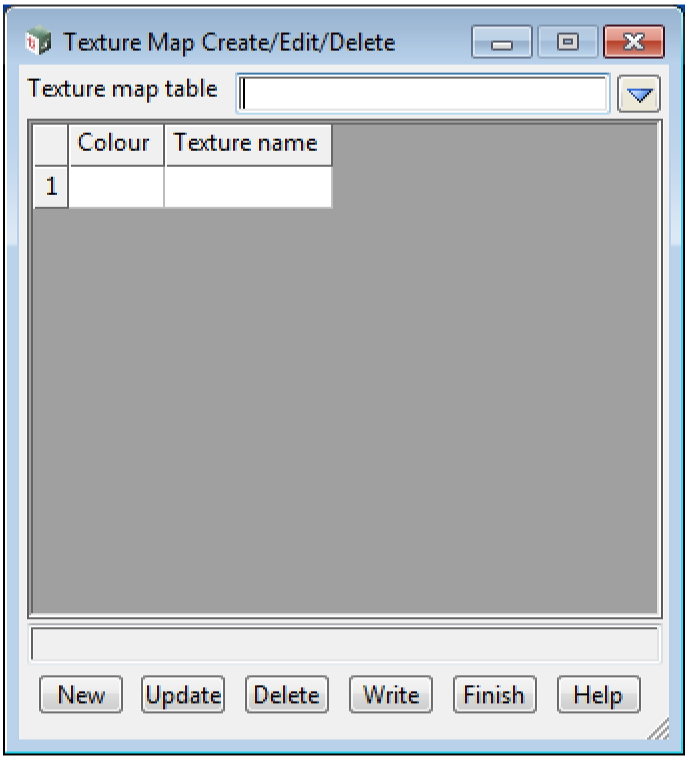
12.13.4 Texture Map Edit

Position of option on menu: **Visualisation =>Texture map edit**

This option edits the texture mapping file (texture_map.4d) which contains the *texture map tables* that can be applied to the coloured triangles of a tin in renderings.

Each texture map table must have a unique name.

On selecting the **Text map edit** option, the **Texture Map Create/Edit/Delete** panel is displayed.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Texture map table

name of the texture map table inside the texture map file.

Colour colour box available colours

colour to apply the texture to.

Texture name texture box available textures

texture to apply to all triangles with the specified colour

New button

to create a new texture map table, click on the **New** *button and then type the texture map table name into the* Texture map table *field. Then start filling in the* Colour *and* Texture name *columns.*

Update button

update the given Texture map table *with the values in the* Colour *and* Texture name *columns.*

Delete button

Delete the texture map table named in the Texture map table *field.*

Write button

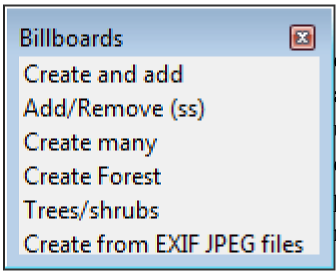
write out the texture map information to the texture map file, texture_map.4d.

12.13.5 Billboards

Position of menu: **View =>Visualisation =>Billboards**

The billboard options plane an image onto a rectangular billboard. this can be used to display background scenes, signs etc.

The **Billboard** walk-right menu is



create a billboard and add an image to it
add/remove a billboard to the vertices of a super string
use images to create entries in the billboards.4d file
create a forest within a polygon
place a billboard tree/shrub
read in JPEG files which include EXIF and GPS information

For the option *Create and add, go to* 12.13.5.1 Create and Place Billboard.
Add/Remove (ss) 12.13.5.2 Add and Remove Billboard from Super String
Create many 12.13.5.3 12D - Billboard Signs Create
Create forest 12.13.5.4 Create Forest
Trees/shrubs 12.13.5.5 Trees/Shrubs as Faces and Billboards
Create from EXIF JPEG files 12.13.5.6 Create Billboards from EXIF JPEG Files

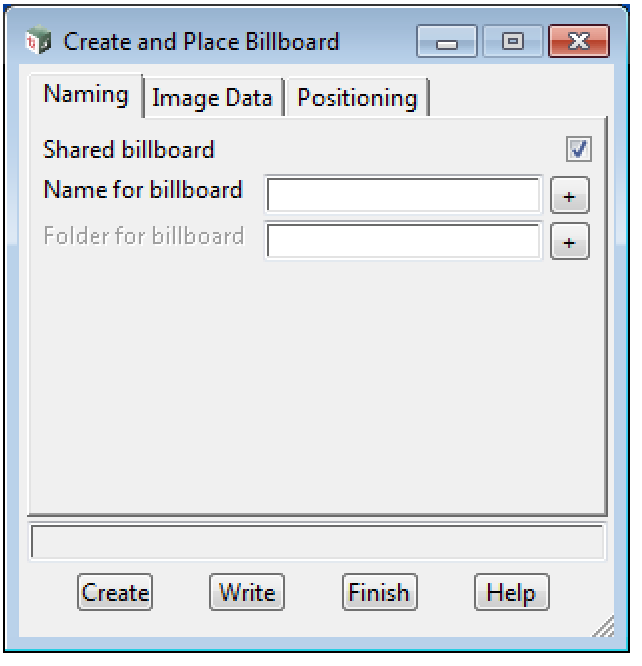
12.13.5.1 Create and Place Billboard

Position of option on menu: **View =>Visualisation => Billboards =>Create and add**

This option defines a billboard (its size and position, the image on the billboard, *etc.*) and adds it to a super string and can **also** add it to the file *billboards.4d* which is used by other options.

The option **always** creates a super string with the billboard on it, so if you just wanted to add a billboard definition to the *billboards.4d* file, then use this option which creates a super string with the billboard, but then **delete** the created super string.

On selecting the **Create and add** option, the **Create and Place Billboards** panel is displayed.



The fields and buttons used in this panels have the following functions.

Field Description	Type	Defaults	Pop-Up
Naming tab	**tab**		
Shared billboard	tick box	ticked	

*if **ticked**, the information about the billboard is added to the billboards.4d file and then when the super string is created, it only references the required billboard information from the billboards.4d file. Note: the* **Write** *button needs to be clicked to write out the billboards.4d file with the new billboard definition. If **not ticked**, all the information about the billboard is saved with the super string and nothing is written to, or used from the billboards.4d file.*

Name for billboard billboard box

the name of the billboard to use in the billboards.4d file. This must be unique amongst all the billboard names in the billboards.4d file.

Folder for billboard text box

the billboard folder in which to place the billboard named above. This is just a grouping mechanism for all the billboard names. If the Folder does not exist in the billboards.4d file, it will be created.

Image Data tab **tab**

Image file file box

name of the file containing the image to place on the billboard

Alpha file file box

currently not supported

Image polygon polygon box

this polygon is used to crop the image. The billboard origin (0,0) is at the centre of the image and the world size of the image is determined by the Width *and* Height *fields below. The Image polygon must also be drawn with the same (0,0) reference and in world units.*

Number of fans integer box

the billboard can consist of multiple copies of the image rotated equally around 180 degrees of the z-axis at x=0. This is mainly used for trees so that you see a tree no matter which direction you look from.
If Number of fans *= 1, then the image is used on both sides of the billboard.*
If Number of fans i*s left blank, then the image is used on one side of the billboard and the side is given the colour specified in the* Colour *field on the Positioning tab.*

Width measure box

the width in world units for the billboard (before the billboard it is cropped by any Image polygon).

Height measure box

the height in world units for the billboard (before the billboard is cropped by any Image polygon).

Positioning tab **tab**

Model model box

model for the created super string with the billboard.

Coordinate measure box

the (x,y,z) coordinate of the vertex of the super string which has the billboard placed on it.

Colour colour box

the colour used for the back of a billboard when Number of fans is left blank. Note if number of fans is 1 or more then the same image is used on both sides of the blades of the fan.

Billboard type choice box Vertical Vertical, Threed, Plan

*if **Vertical**, the string is placed vertically (upright) and nothing else is needed.*
*If **Threed**, a grid for entering Factor, Rotate and Offset values is displayed and these are used to control the position of the billboard in 3d.*
*If **Plan**, the billboard is a horizontal billboard and will draw on a Plan view. A billboard must be a Plan (or Horizontal) billboard when using* Drape names *for* **Plan billboards** *in the* **Tin Render Settings panel** *to drape horizontal billboards onto a tin (see* 12.13.1 Tin Render Settings*).*

Angle measure box

the angle the billboard is rotated in the (x,y) plane. Angle is measured counterclockwise in degrees in 4.17.1 HP Notation *with zero along the x-axis.*

Offset x, Offset y, Offset z

x/y/z distance to place the billboard away from the super string vertex.

Buttons at Bottom

Create button

creates the super string with the billboard on it.

Write button

writes out the new billboards.4d file.

12.13.5.2 Add and Remove Billboard from Super String

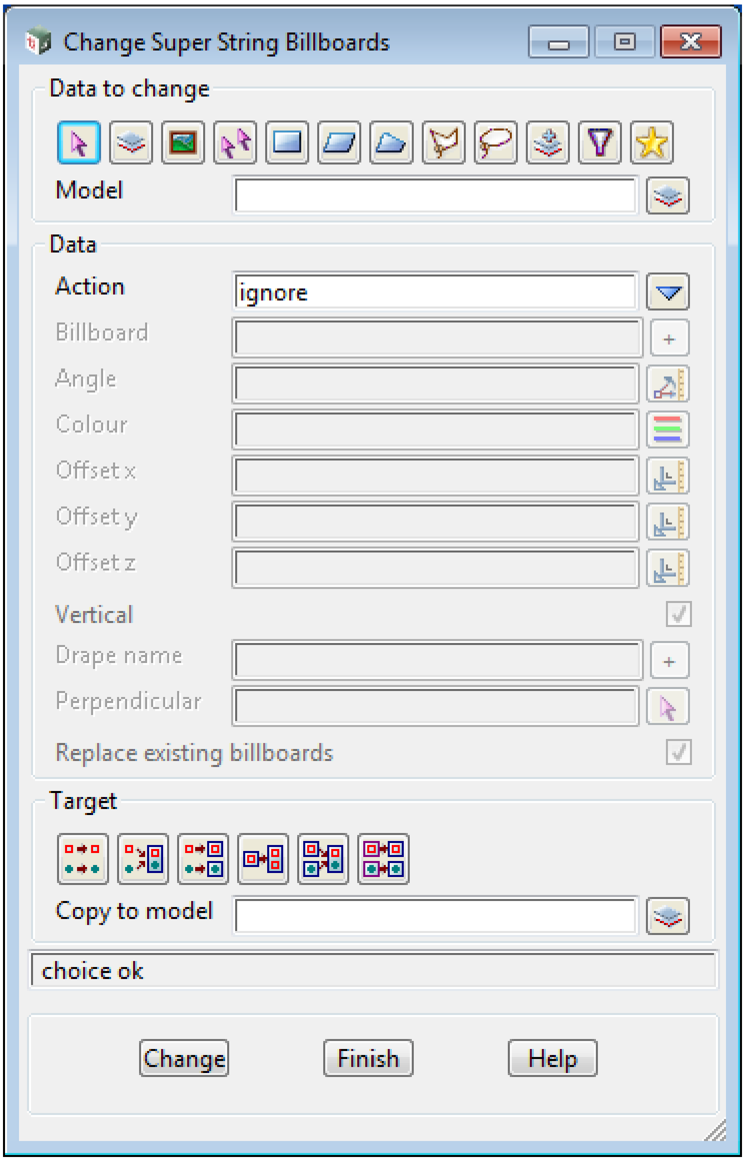
Position of option on menu: **View =>Visualisation => Billboards =>Add/Remove (ss)**

Each vertex of a super string can have its own billboard.

A billboard consists of an image and a width and height.

The ***Add/remove from super string*** option places a selected billboard either in a vertical plane or as a plan image at a user given distance from each vertex of a super string. The image it at a given angle or perpendicular to a selected string. An example could be the image on a stop sign which is in the vertical plane.

Selecting **Add/Remove (ss)** brings up the **Change Super String Billboard** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to be processed.

Action choice box ignore set, clear, ignore

*if **set**, the billboard is placed at each vertex in the super string.*
*If **clear**, the billboard information at each vertex is cleared.*
*If **ignore**, nothing is done to the billboard information.*

Billboard billboard box

billboard to be used.

Angle angle box

angle to rotation the billboard - positive is counter clockwise. This is ignored if Perpendicular *is used.*

Colour colour box

colour for the back of the billboard.

Offset x, Offset y, Offset z

x/y/z distance to place the billboard away from the super string vertex.

Vertical tick box

*if **ticked**, the string is placed vertically and nothing else is needed.*
*If **not ticked**, the billboard is a horizontal billboard and will draw on a Plan view. This is also needed when using* Drape names *for* **Plan billboards** *in the* **Tin Render Settings panel** *to drape horizontal billboards onto a tin (see* 12.13.1 Tin Render Settings*).*

Drape name input

if Vertical is not ticked, then this field can be modified.
If not blank, an Integer string Attribute is created with this name. The Drape name *is used in the* **Tin Render Settings panel** *(see* 12.13.1 Tin Render Settings*) for draping horizontal billboards onto a tin.*

Perpendicular string select box

if a string is selected, then the billboard is placed on the line going through the vertex and perpendicular to the selected string. Angle *is ignored.*

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

Target info input

extra information required for the target.

Change button

process the selected strings.

12.13.5.3 12D - Billboard Signs Create

Position of option on menu: View =>Visualisation =>Billboards =>Create Many

This option takes images and creates entries in the billboards.4d file.

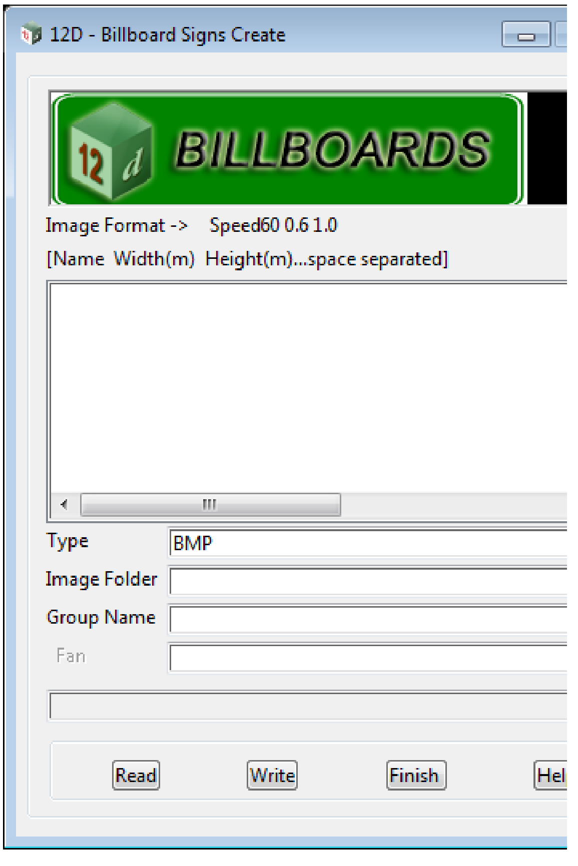
Note that it does not create a super string with a billboard on it.

The option requires that you rename your images in the appropriate format:

Name Width (m) Height (m) -> space separated.

For example, "sign 20 5.jpg" creates a billboard with the name "sign" which is 20 units wide and 5 units high.

Selecting **Create Many** displays the **12D - Billboard Signs Create** panel:



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Type	choice box	JPG	BMP, JPG, PNG,TGA, ALL

Type of image files to read in.

Image Folder file box

Browse to a dedicated folder. File names are used to create the billboard name, width and height, e.g. sign 20 5.jpg *creates a billboard with the name* sign *20 units wide and 5 units high.*

Group Name text box

The billboard group to add the selected images to.

Fan number box

*If **not blank**, the number of extra fans to add to the billboard.*
*If **blank**, no extra fans will be added to the billboard.*

Read button

Loads all the images of the specified type into 12d and adds them to the Group specified in the billboards.4d file. If the Group does not exist it is created.

Write button

Appends the new group to the billboards.4d file. You must restart 12d load the new billboards.4d file.

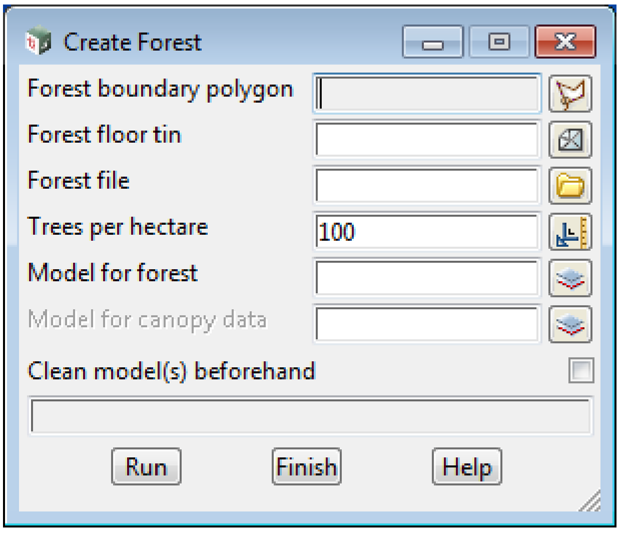
12.13.5.4 Create Forest

Position of option on menu: **Visualisation =>Billboards =>Create forest**

Create forest creates randomly placed trees and shrubs in a selected polygon.

The forest make up is controlled by a user defined forest file which gives the types and distribution of trees, and variation in size and spread.

Selecting **Create forest** displays the **Create Forest** panel



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Forest boundary polygon	string select		

polygon to create the forest within

Forest floor tin	tin box		available tins

tin to use for the z-value for the base of the trees

Forest file	file box		.forests files

file to give the make up of the forest. For more information, go to 7.6.14 Forest File

Trees per hectare	input		

density of the forest given by the number of trees per hectare

Model for forest	model box		available models

model to place the trees in

Model for canopy data	model box		available models

*if **non blank**, points are created for the tops of the trees in the forest. These can be used to triangulated to give a top of trees tin.*

Clean model (s) beforehand	tick box		

*if **ticked**, the forest and forest canopy models are cleaned before the option is run*

Run	button		

run the option

12.13.5.5 Trees/Shrubs as Faces and Billboards

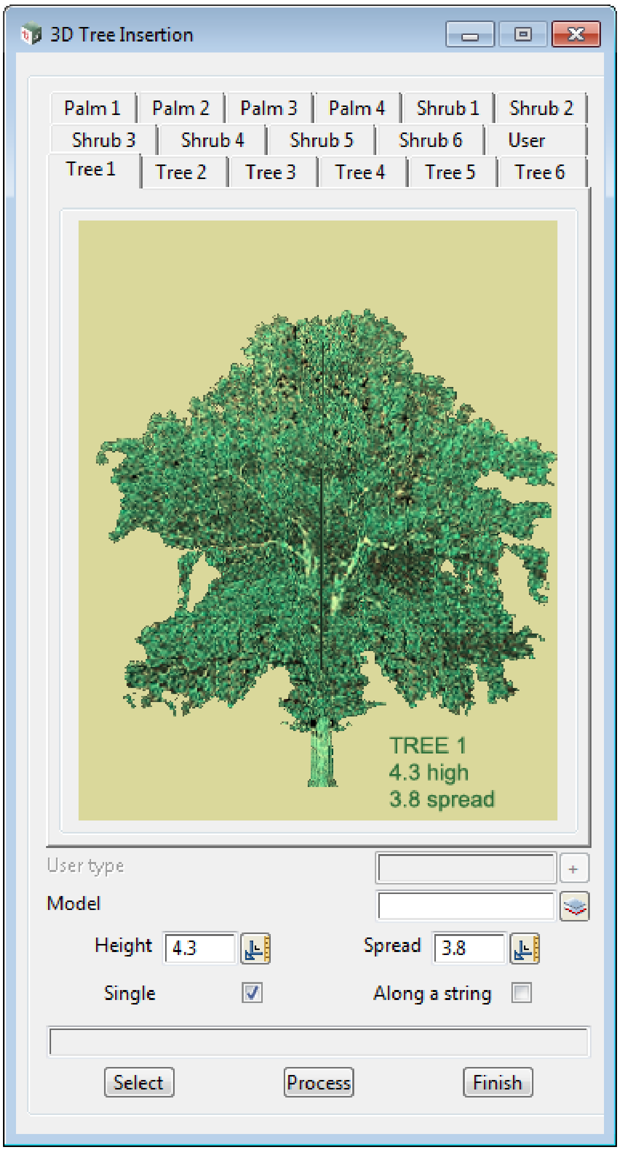
Position of option on menu: View =>Visualisation => Billboards =>Trees/shrubs

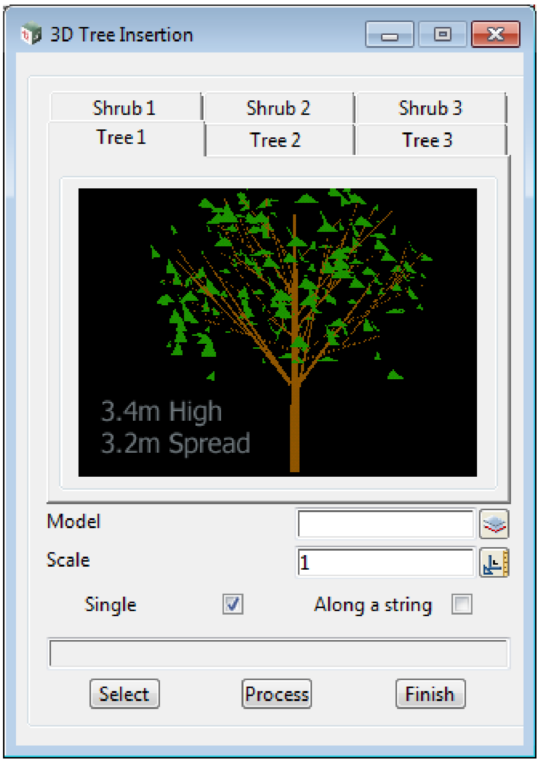
Position of option on menu: View =>Visualisation => Utilities =>Trees/shrubs faces

The **Trees/shrubs - faces** option inserts the trees and shrubs as face elements. This means that each tree may consist of hundreds or thousands of faces.

The **Trees/shrubs** option inserts the images of trees and shrubs as a fanned billboard. This means that each tree consists of only one points.

On selecting the **Trees/shrubs** option, the **3D Tree Insertion** panel is displayed and on selecting the **Trees/shrubs faces** option, the **3D Tree Insertion - Faces** panel is displayed.





The fields and buttons used in these panels have the following functions.

Field Description Type Defaults Pop-Up

Tree and Shrub tabs

click on the tab to display the type of tree/shrub to be inserted. The picture shows the tree height and spread.

Model model box available models

model to add the tree/shrub to.

Height and Spread real value varies measures

parameters for scaling

Single radio button

if ticked then the tree is placed at the selected position.

Along a string radio button

if ticked then the tree is placed along a string. When the string is selected then a **Tree Interval** *panel is brought up to specify how the trees are placed along the string.*

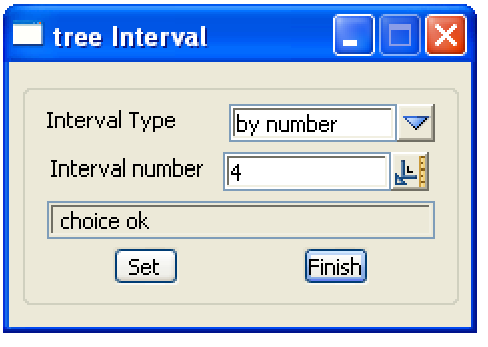
Select button

select the string or position for the tree.

Process button

insert the trees/shrubs.

Tree Interval



This panel is for specifying how often the trees/shrubs are to be inserted along the string.

Field Description	Type	Defaults	Pop-Up
Interval type	choice box	by number	by number by distance by special chg file by vertex

if ***by number****: an* Interval number *field is displayed on the panel and the tree is inserted that many times along the string.*

if ***by distance****: an* Interval distance *field is displayed on the panel and the tree is inserted with that distance separation along the string.*

if ***by special chg file****: a* Special chg file *field is displayed on the panel and the tree is inserted along the string at the chainages given in the file.*

if ***by vertex****: the tree is inserted at every vertex of the string.*

Set button

set the parameters for tree interval to those in the panel.

12.13.5.6 Create Billboards from EXIF JPEG Files

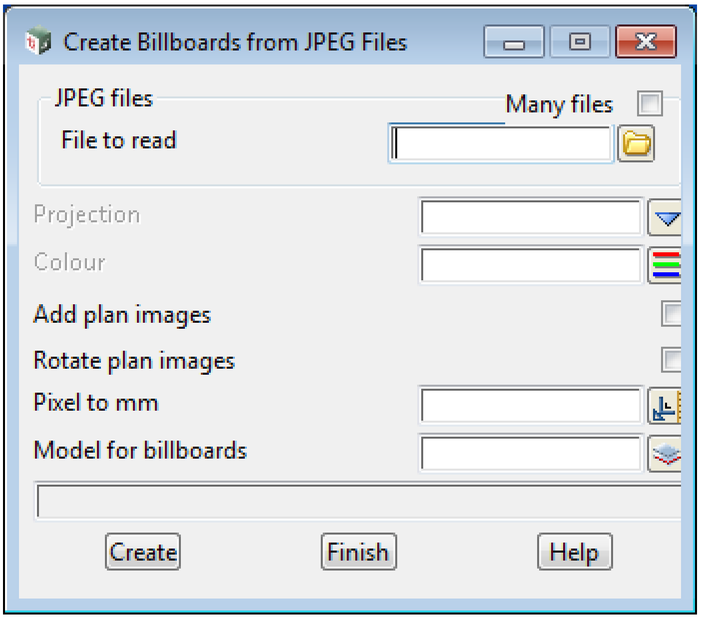
Position of option on menu: **View =>Visualisation => Billboards =>Create from EXIF JPEG Files**

This option reads in JPEG files which must include EXIF and GPS information. This information is then used to create and position a billboard with the image on the billboard.

If a Projection is selected by the user, then it is used to convert the lat/long of the GPS values to the XYZ co-ordinates. If no Projection is given, then the co-ordinates are left as lat/long.

Note: EXIF is short for Exchangeable Image File, a format that is a standard for storing interchange information in digital photography image files using JPEG compression. Almost all new digital cameras use the EXIF annotation, storing information on the image such as shutter speed, exposure compensation, F number, what metering system was used, if a flash was used, ISO number, date and time the image was taken, white balance, auxiliary lenses that were used and resolution.

Selecting **Create from EXIF JPEG Files** brings up the **Create Billboards from JPEG Files** panel.



The fields and buttons in this panel have the following functions.

Field Description	Type	Defaults	Pop-Up

JPEG files

Advanced	tick box	not ticked	

clicking **Advanced** *brings up a grid to allow the user to enter many JPEG files.*

File to read	file box		available *.jpg files

the JPEG files to read in and create images from. The JPEG file must include EXIF and GPS information, which is used to position the image. If Projection *is not blank, then it is used to convert the lat/long of the GPS values to the XYZ co-ordinates. If* Projection *is blank, then the co-ordinates are left as lat/long.*

Projection	choice box		

if a Project Projection is set, then it is placed in the Projection *field. This can be changed to any other projection. The projection is used to convert the lat/long of the GPS values to the XYZ co-ordinates. If no projection is set, then the co-ordinates are left as lat/long.*

Colour	colour box		available colours

*if **not blank** and* **Add plan images** *is not ticked, then this colour is used for the back of the billboard. If **blank**, the colour is white.*

Add plan images tick box not ticked

*if **ticked**, plan images are created instead of billboards.*

Rotate plan images tick box not ticked

*if **ticked** and* **Add plan images** *is ticked, the rotate value from the EXIF will be used to rotate the image.*

Pixel to mm measure box

the units for images are pixels (width and height). The pixel width and height of the image are multiplied by the **Pixel to mm** *(mm being millimetres) value to give width and height size in world unit (metres) which is needed when inserting the image.*

Model for billboards model box

the model for the image to be inserted into.

Create button

*when all the fields have been entered, the **Create** button creates images from the selected files.*

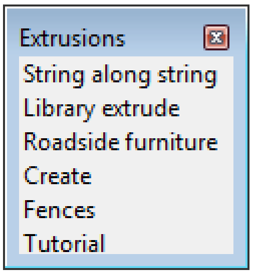
12.13.6 Extrusions

Position of menu: **View =>Visualisation =>Extrusions**

In it basic form, an extrusion is taking a cross-section and pushing it (extrude it, or sweep it) along a string to create a 3d object. For example, a circle extruded along a string creates a pipe. For more information, go to the section 12.13.7 Defining Extrudes and Extrusions.

There is a library of extrusions read in for the project, usually stored in the file extrusions.4d.

The **Extrusions** walk-right menu is



extrude along s string
add/remove a extrusion for a super string
insert roadside furniture
create a complicated extrusion
extrude fences along strings
tutorial on creating complicated extrusions

For the option String along string, go to	12.13.8.1 String Extrude
Library extrude	12.13.8.2 Change Library Extrude
Roadside furniture	12.13.8.3 Roadside Furniture
Create	12.13.8.4 Create Group Extrusions
Fences	12.13.35.3 Fences
Tutorial	12.13.8.5 Tutorial to Create Group Extrusions

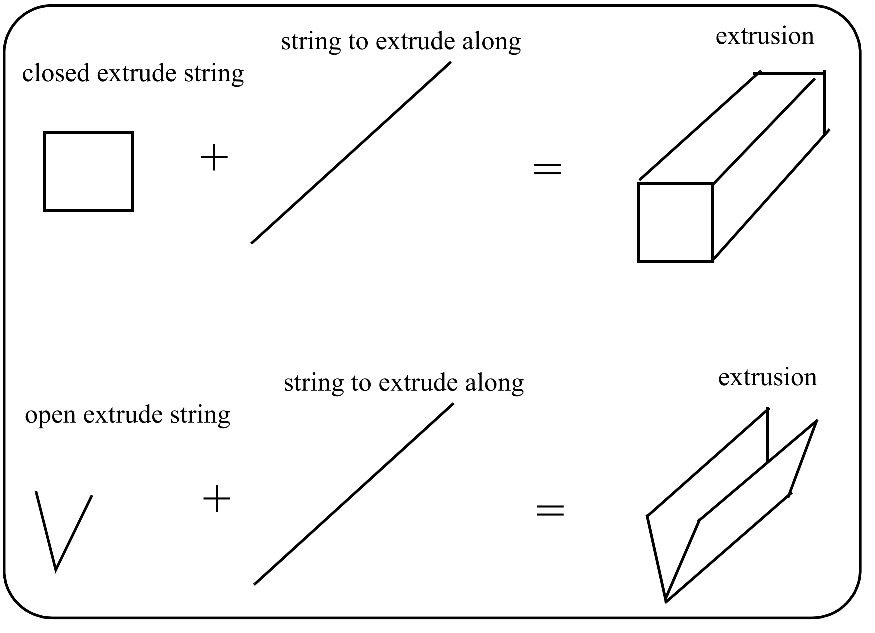
More information on extrudes is found in the section 12.13.7 Defining Extrudes and Extrusions

12.13.7 Defining Extrudes and Extrusions

In it basic form, an extrusion is simply taking a cross-section and pushing it (extrude it) along a string to create a 3d object. For example, a circle extruded along a string creates a pipe.

The string that is pushed along the string is called the ***extrude***.

Note: this is also know as a Sweep or Swept Path.

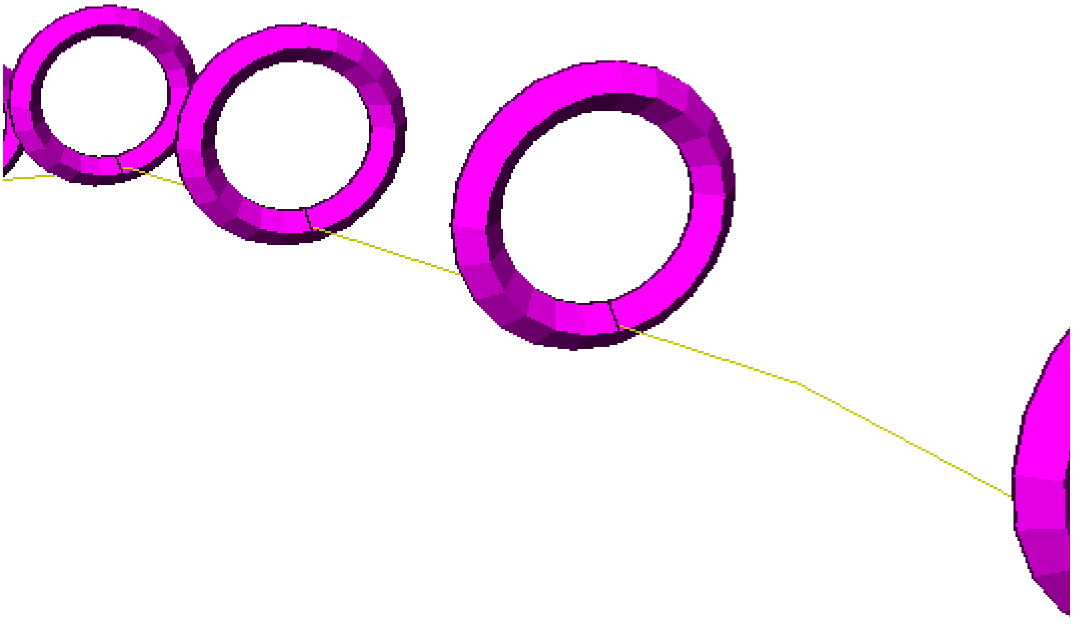


Only the (x,y) co-ordinates of the string used as the extrude are used and that gives the shape of the cross section with the ((0,0) point being the point where the string being extruded along sit.

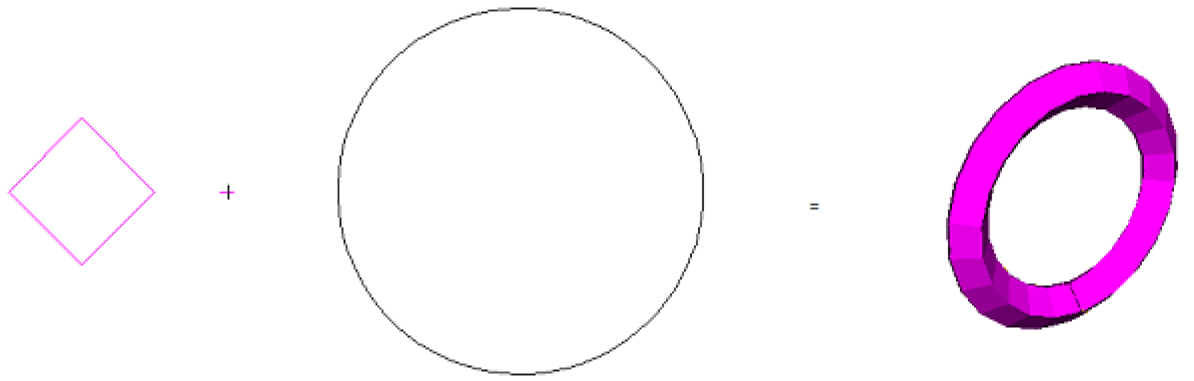
So the (x,y) co-ordinates of the extrude are being taken as (offset, height) in the plane perpendicular to the string being extruded along. So extrudes are normally defined around (0,0) in the (x,y) plane.

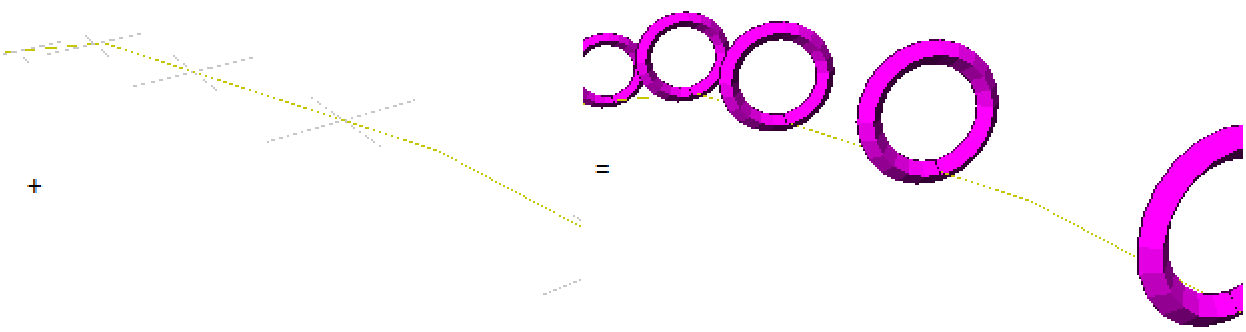
Interval extrude

The interval extrude can be seen as a series of string extrudes applied along the string at a specified interval distance. Here is a example of a 'Ring' interval extrude:



This extrude is defined by a diamond being extruded along a circle, and finally being instanced along the super string at the specified interval.





The extrusions.4d fragment defining this extrude is:

```
interval_extrude {

  name      "Vertical Ring"
  colour    true
  mirror_x  false

  interval   4.0

  factor_x   1.0
  factor_y   1.0
  factor_z   1.0

  rotate_x   0.0
  rotate_y   90.0
  rotate_z   0.0

  offset_x   0.0
  offset_y   0.0
  offset_z   0.0
```

```
    at_grade   false

    path {

// the string that the extrude is drawn along

      name      "circle path"
      breakline line
      colour    white
      style     1
      closed    1

      data_3d {         // note must be defined with x,y,z data
        0 0.0 0.0
        1 0.0 0.0
      }
      radius_data {
        0.5
        0.5
      }
      interval {
        chord_arc   0.005
        distance    -999
      }
    }
    data {

// the shape of the extrude

      name      "path data"
      breakline line
      colour    magenta
      style     1
      closed    1

      data_2d {
        -0.1  0.0
         0.0  0.1
         0.1  0.0
         0.0 -0.1
      }
      interval {
        chord_arc   0.001
        distance    -999
      }
    }
  }
```

TODO: define group extrude:

A group extrude is a combination of string and interval extrudes.

12.13.8 3D Transformations

This transformation consists of factor (scale), rotation, and offset (translation) for x, y, and z. Transformations are always applied in the following order

rotate, factor, offset	about the axes	z, y, x

rotate z	occurs in the x-y plane (plan rotation)
rotate y	occurs in the x-z plane (slope rotation)
rotate x	occurs in the y-z plane (super-elevation rotation)
factor z	
factor y	note: factors are commutative (any order is the same)
factor x	
offset z	
offset y	note: offsets are commutative (and order is the same)
offset x	

Note that the rotations about each axis are in the ***local*** coordinate system of the object being rotated. So after each rotation, the axes are also rotated.

12.13.8.1 String Extrude

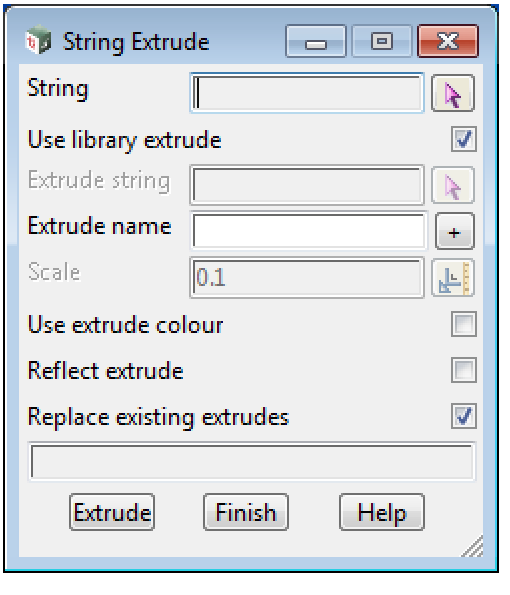
Position of option on menu: **View =>Visualisation => Extrude along string**

The **String along string** option extrudes a selected super string along a super string.

It can also be used to extrude a library extrude along string. But if a library extrude is to be applied to many strings, the Library Extrude option is more appropriate (12.13.8.2 Change Library Extrude)

More information on extrudes is found in the section 12.13.7 Defining Extrudes and Extrusions

On selecting the **Extrude** option, the **String Extrude** panel is displayed.



The fields and buttons in this panel have the following functions.

Field Description Type Defaults Pop-Up

String string select

super string to extrude along

Use library extrude tick box

if ticked, an existing extrusion is selected from the extrusion library. The extrude from the library is selected in the Extrude name *field.*
If not ticked, the Extrude string and Scale panel fields are used.

Extrude name extrude box

select the name of the extrude to use from the extrude library.

Extrude string string select

if a library extrude is not being used, then a string is selected to define the extrusion shape.

Scale real value input 0.1

value to multiply the extrude string co-ordinates by.

Use extrude colour tick box

if ticked, the placement uses the information in the grid on the panel.
if no ticked, then the string segment colour is used for the extrusion.

Reflect extrude tick box

if ticked, the extrude is reflected in the local y axis before it is applied.

Replace existing extrudes tick box

if ticked, all existing extrudes are cleared before the new one is applied.

Extrude button

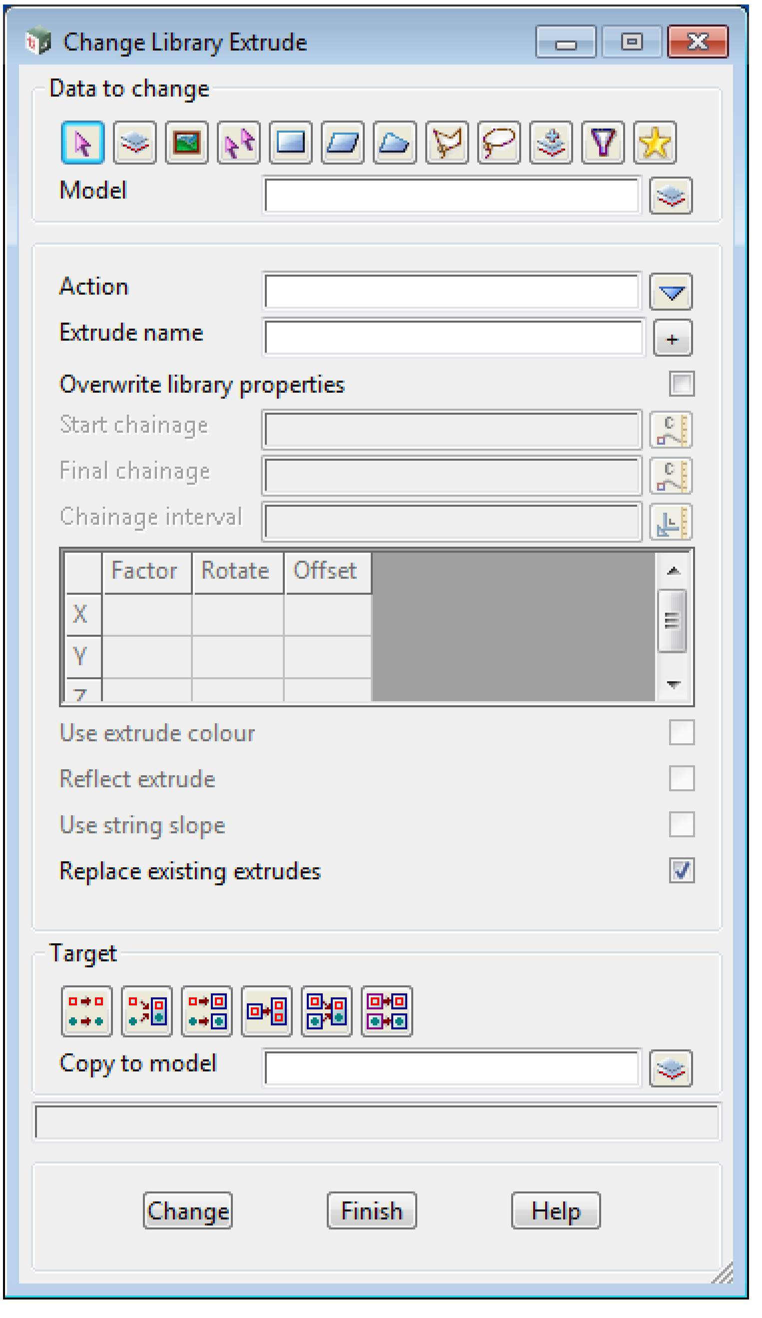
Create the extrusion.

12.13.8.2 Change Library Extrude

Position of option on menu: **Visualisation =>Library extrude**

This option can apply an extrusion from the extrusions library, extrusions.4d, to a super string, or change the extrusion applied to a super string, or remove an extrusion from a super string.

Selecting **Library extrude** brings up the **Change Library Extrude** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Data source type		Model	

data selection type - for a full description go to 4.19.3 Data Source.

Data source	input		

source of data to be processed.

Action choice box set, clear

*if **clear**, all existing extrusions are removed from the selected super strings. The only other fields to be filled in is the* Target.
*If **set**, a library extrude is applied to the selected super strings.*

Extrude name extrude box list of extrusions

extrude to be applied to the super strings.

Overwrite library properties tick box

if ticked, the placement of the extrude uses the information in the grid on the panel.
If not ticked, the placement properties are taken from the extrude in the library.

Start/end chainage chainage box

start/end chainage for applying the extrusion.

Start/end chainage chainage box

start/end chainage for applying the extrusion. If blank, use the strings start/end.

Chainage interval

for an interval extrude only - interval to use for the extrude.

Grid of X,Y,X against Factor, Rotate, Offset

placement information for applying the extrude.

Use extrude colour tick box

if ticked, the placement uses the information in the grid on the panel.
if no ticked, then the string segment colour is used for the extrusion.

Reflect extrude tick box

if ticked, the extrude is reflected in the local y axis before it is applied.

Replace existing extrudes tick box

if ticked, all existing extrudes are cleared before the new one is applied.

Target type

Data target type - where to put the processed strings. For a full description go to 4.19.4 Data Target.

Target info input

extra information required for the target.

Change button

process the selected string

12.13.8.3 Roadside Furniture

Position of option on menu: **View =>Visualisation => Extrusions =>Roadside furniture**

This option is for inserting extruded objects that have been supplied by 12D Solutions Pty Ltd.

It includes street lights, log barriers, park bench, posts and columns, walls, timber fences, guard rails, sighs etc.

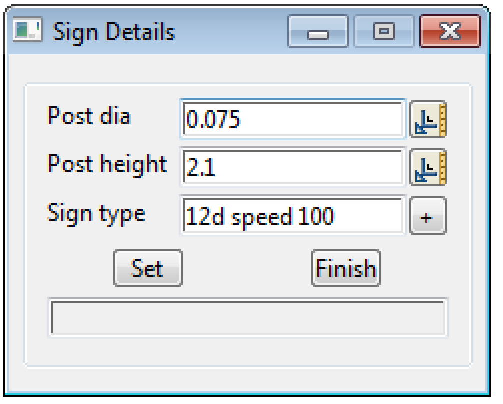
The list of items that can be inserted is being continuously upgraded by 12D Solutions.

Selecting **Roadside furniture** brings up the **Roadside Furniture** panel.

Clicking on the tabs brings up the information required for that piece of roadside furniture.

For all the tabs other than Park Bench, Street Light and Guard Rail, once a tab had been selected, moving the cursor over the picture brings up a special panel for the extra information required.

For example, for the Sign tab, moving the cursor over the picture brings up the Sign Details panel:



New 12D Ascii

This option is similar to the others e.g. Street Light, but allows the user to create their own features and place them in the same manner as the others on the panel.

Specifications for an ascii file*:*

The stem of the ascii file name, the model name in the ascii file and the stem of the bitmap name showing the picture of the object...... "MUST" be the same e.g. File: User Street Light.12da Model: User Street Light   Bitmap: User Street Light.bmp

Bitmap size to be 345W x 250H pixels

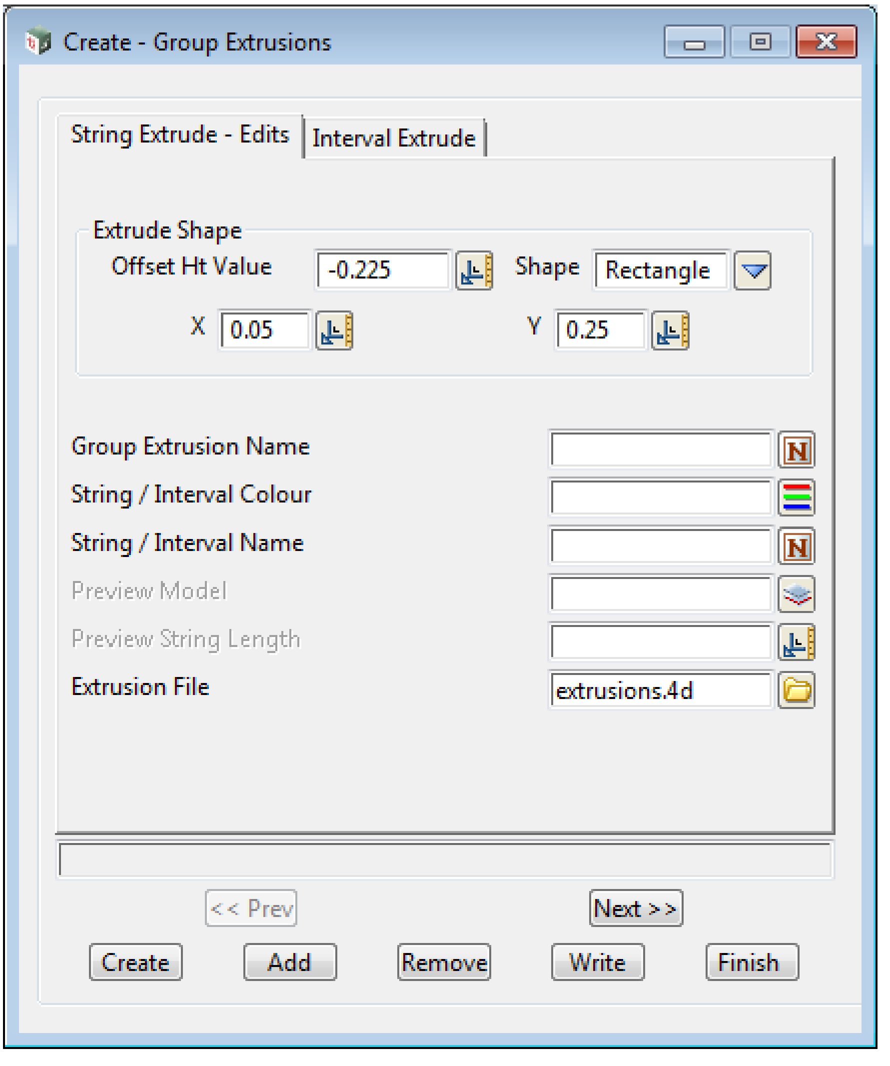
Place the 12da file and the bitmap in your User_Library

12.13.8.4 Create Group Extrusions

Position of option on menu: **View =>Visualisation => Extrusions =>Create**

The **Create** option creates groups extrusions and saves then to the extrusions.4d file.

Selecting **Create** brings up the **Create - Group Extrusions** panel.

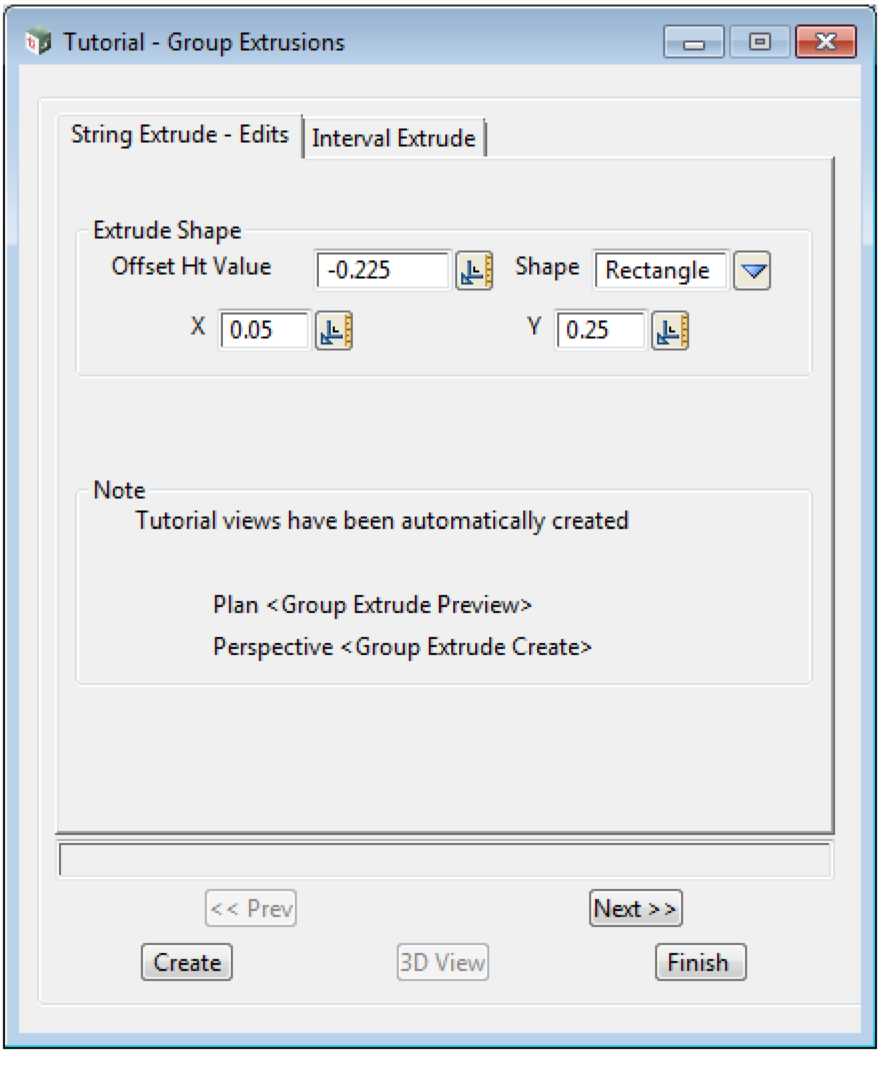


12.13.8.5 Tutorial to Create Group Extrusions

Position of option on menu: **View =>Visualisation => Extrusions =>Tutorial**

The **Tutorial** option demonstrates how to creates groups extrusions and will also create groups extrusions.

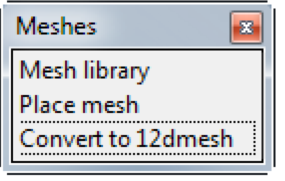
Selecting **Tutorial** brings up the **Tutorial - Group Extrusions** panel.



12.13.9 Meshes

Position of menu: **View =>Visualisation =>Meshes**

The **Meshes** walk-right menu is



For the option Mesh library go to 12.13.9.1 Mesh Library
Place Mesh 12.13.9.3 Place a Mesh
Convert to 12dmesh 12.13.9.4 Convert to 12dMesh Format

12.13.9.1 Mesh Library

Position of option on menu: **View =>Visualisation =>Meshes =>Mesh Library**

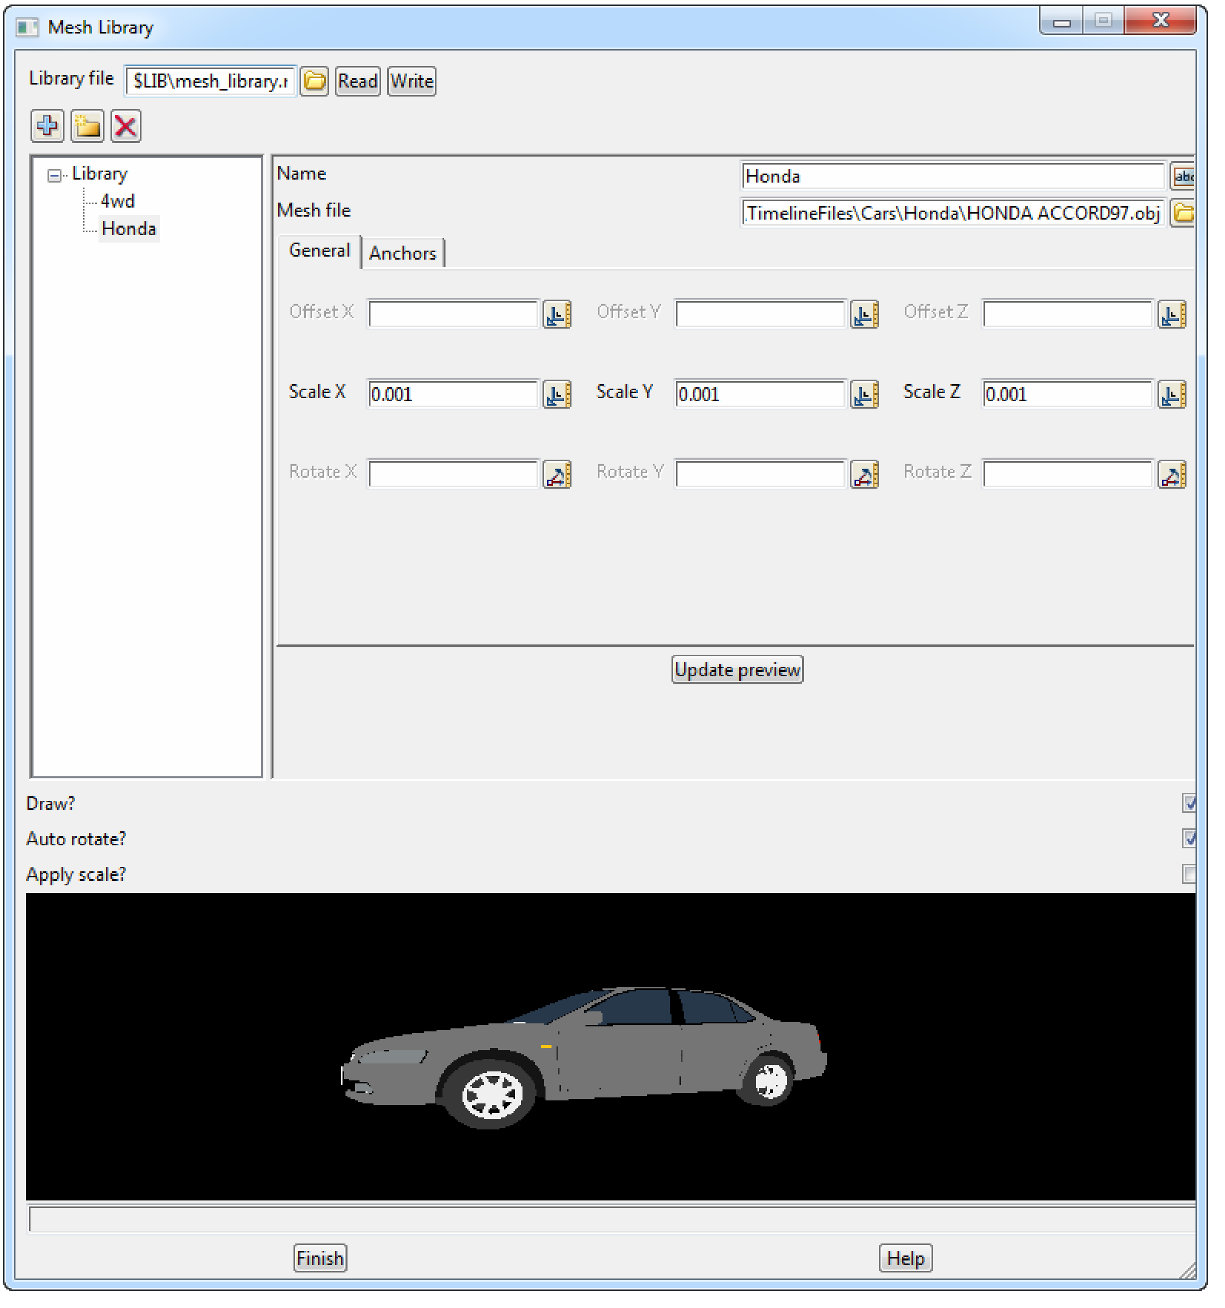
Position of option on menu: **View =>Visualisation =>Timelines =>Mesh Library**

The **Mesh Library** allows you to predefine meshes and the standard transformations required to get them into a world co-ordinate system. As meshes may come from a variety of packages that use arbitrary scales, rotations or offsets, this may be necessary.

It can also be used to define anchors, to anchor a mesh to the tin. This can be useful to get your mesh to conform to a terrain, such as a vehicle running down a road.

The mesh can then be written to the mesh library file, mesh_library.4d

Selecting **Mesh Library** brings up the **Mesh Library** panel.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Library file file

the mesh library file to read/write

Read button

reads a mesh library file

Write button

writes a mesh library file

+ (Add) button

adds a new mesh

Folder (Create Folder)

Creates a new folder for categorising meshes

Delete

Deletes a mesh or folder

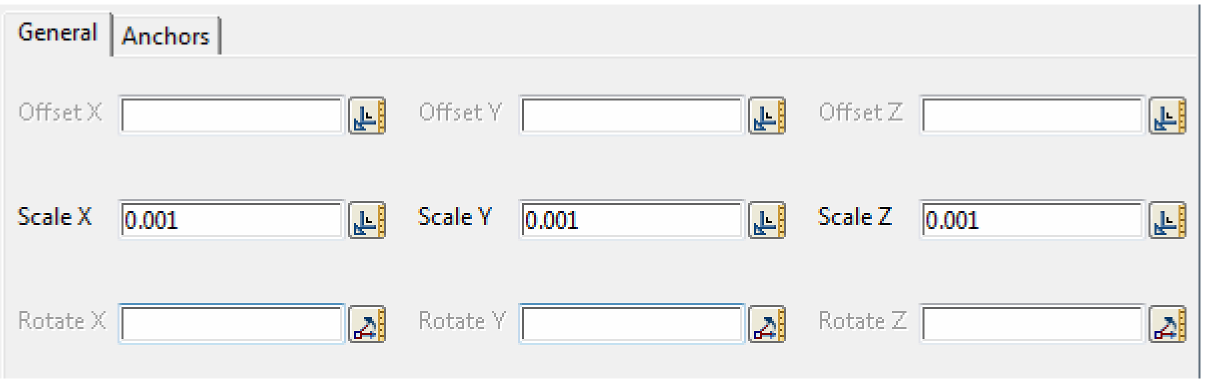
Name

the name of the current mesh

Mesh file

the mesh file, in OBJ format

General tab



Offset x

an optional offset along the x axis to apply

Offset y

an optional offset along the y axis to apply

Offset z

an optional offset along the z axis to apply

Scale x

an optional scale to apply to the x scale of the object

Scale y

an optional scale to apply to the y scale of the object

Scale z

an optional scale to apply to the z scale of the object

Rotate x

an optional rotation around the x axis

Rotate y

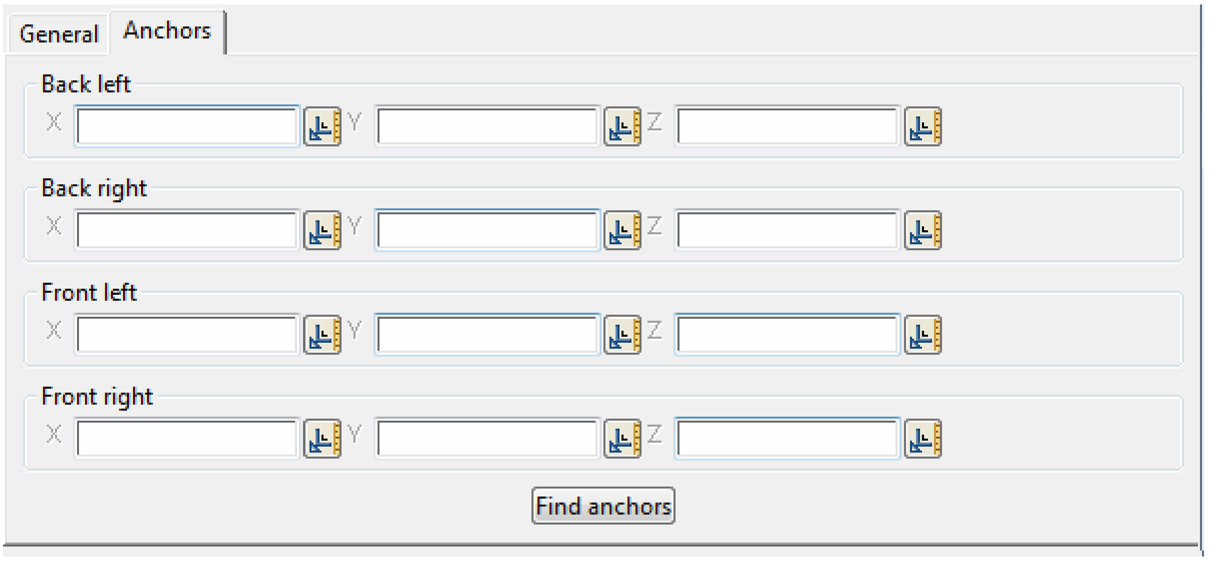
an optional rotation around the y axis

Rotate z

an optional rotation around the z axis

Anchors tab

The **Anchors** tab is used to define anchors, for anchoring a mesh to a tin. To do this, you must define four anchors, at each corner of the mesh.



Back left

defines the co-ordinates of the back left point of the mesh

Back right

defines the co-ordinates of the back right point of the mesh

Front left

defines the co-ordinates of the front left point of the mesh

Front right

defines the co-ordinates of the front right point of the mesh

Find anchors button

*As you may not know the co-ordinates, you may use the **Find Anchors** button to see a list of a number of the lowest points on the mesh. For more information see* 12.13.9.2 Find Anchors

Update Preview button

updates the preview based on the transformation settings

Draw? tick box

whether or not to draw the mesh in the viewer at the bottom

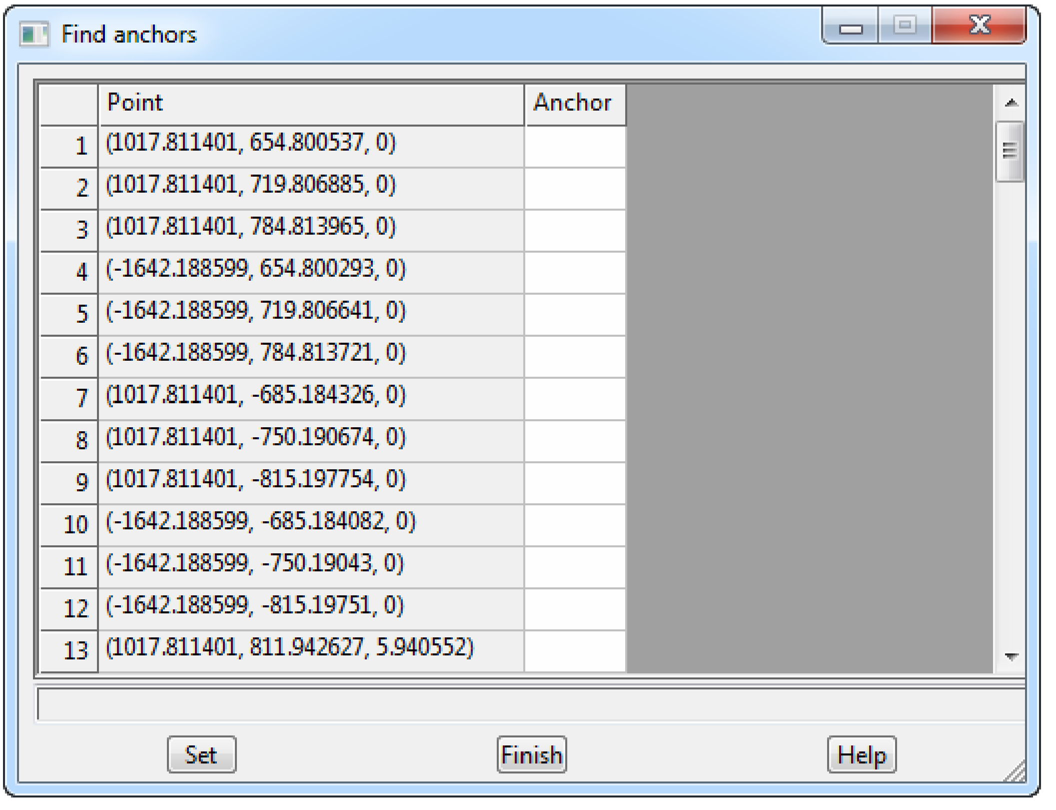
Auto rotate? tick box

whether or not to automatically rotate the mesh

Auto scale? tick box

whether or not to scale the mesh based on supplied transformations

12.13.9.2 Find Anchors



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Point

a known anchor point

Anchor

the anchor to set. You only need to set four anchors.

Set button

sets the anchor points

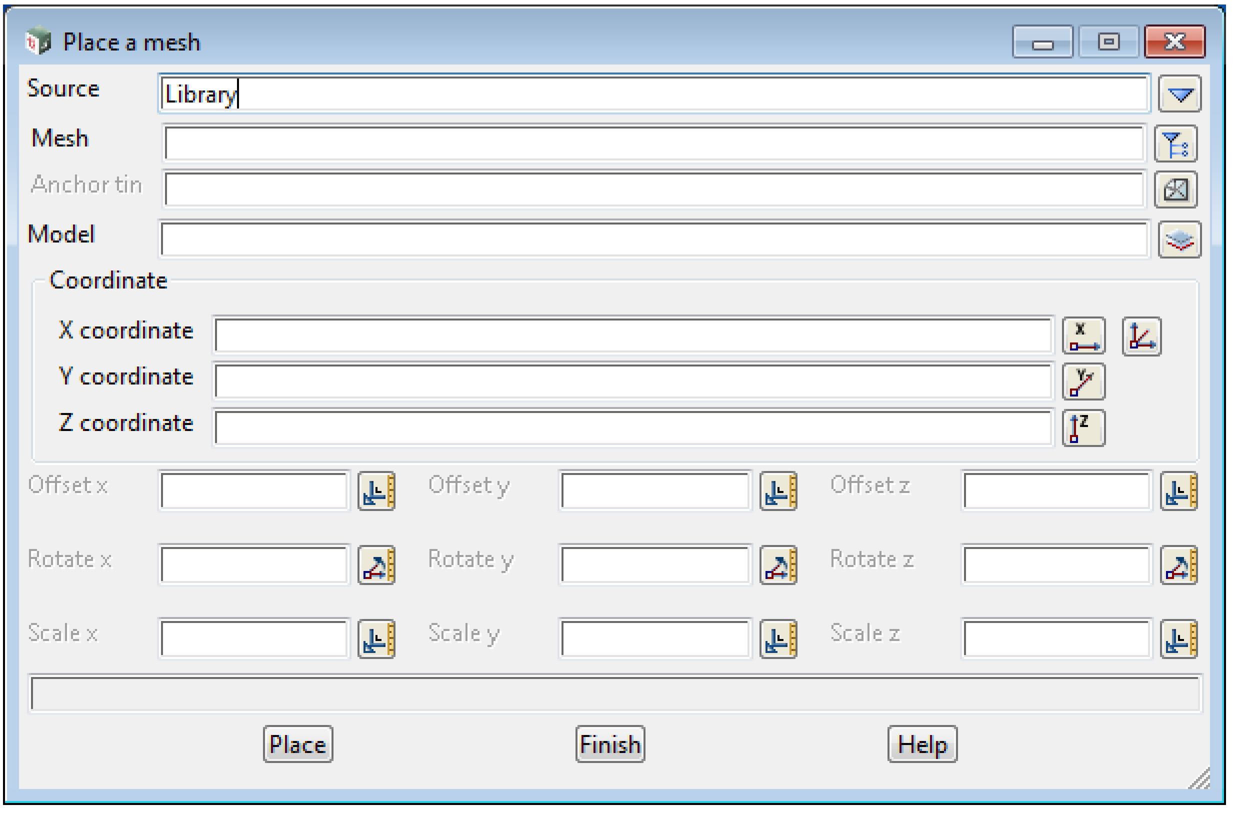
When you select a row, the preview on the 12.13.9.1 Mesh Library will show a symbol to indicate where that co-ordinate is located.

12.13.9.3 Place a Mesh

Position of option on menu: **View =>Visualisation =>Meshes =>Place a mesh**

This panel allows you to place a mesh as the vertex of a super string.

Selecting **Place a mesh** brings up the **Place a mesh** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Source	choice box		Library, File

Whether the mesh comes from the Mesh Library or a separate file

if Sources is Library:

Mesh

the name of the mesh (from the mesh library) to place

Anchor tin

an optional tin to anchor the mesh to

if Source is File:

Mesh file

the file (containing the mesh definition) to use

Model	model box		

the model to place the mesh in

Coordinate

the co-ordinate to place the mesh at

Offset x

an optional offset along the x axis to apply

Offset y

an optional offset along the y axis to apply

Offset z

an optional offset along the z axis to apply

Scale x

an optional scale to apply to the x scale of the object

Scale y

an optional scale to apply to the y scale of the object

Scale z

an optional scale to apply to the z scale of the object

Rotate x

an optional rotation around the x axis

Rotate y

an optional rotation around the y axis

Rotate z

an optional rotation around the z axis

Place button

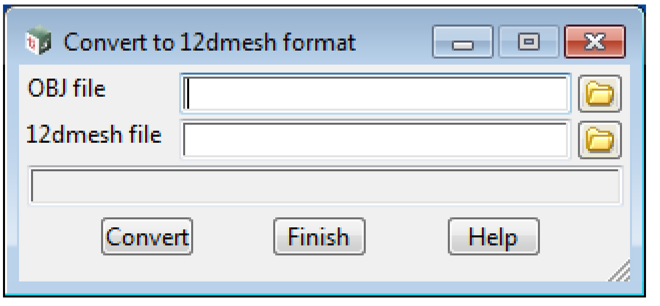
places the mesh

12.13.9.4 Convert to 12dMesh Format

Position of option on menu: **View =>Visualisation =>Meshes =>Convert to 12dmesh**

This option converts most files in OBJ format to the 12dmesh format.

Selecting **Convert to 12dmesh** brings up the **Convert to 12dmesh format** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
OBJ file	file box		available *.obj files

the OBJ file to convert to 12dmesh format.

12dmesh file	file box		available *.12dmesh files

the name of the new .12dmesh file.

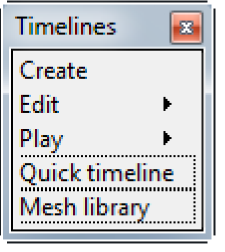
Convert	button		

converts the OBJ file.

12.13.10 Timelines

Position of menu: **View =>Visualisation =>Timelines**

The **Timelines** walk-right menu is



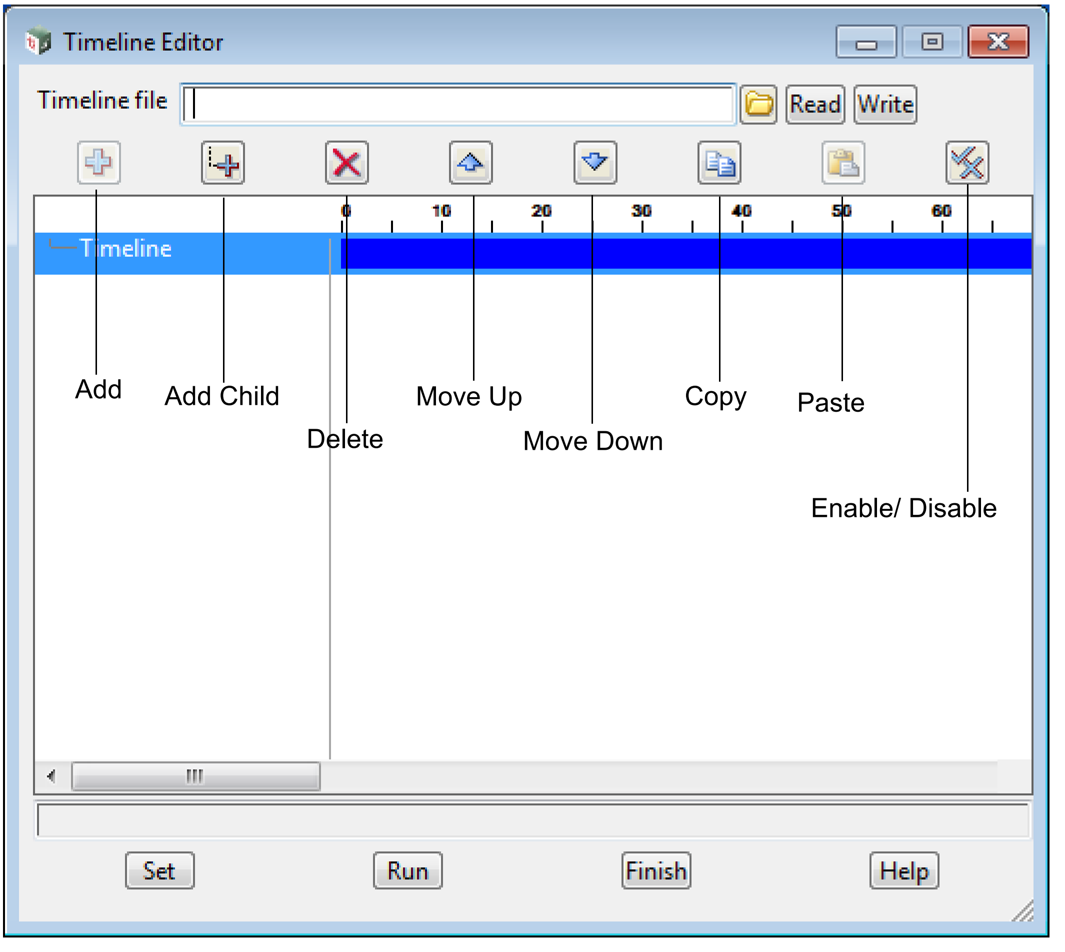
For the option *Create* go to [12.13.10.1 Timeline Editor](#)
Edit [12.13.30.1 Edit a Timeline](#)
Play [12.13.30.2 Play a Timeline](#)
Quick timeline [12.13.34.1 Quick Timeline Create](#)
Mesh library [12.13.9.1 Mesh Library](#)

12.13.10.1 Timeline Editor

Position of menu: **View =>Visualisation =>Timelines => Create**

This is the main **Timeline Editor**. The left side shows the tree of timelines. The right side shows the time, in seconds, during which any given timeline will be active.To edit a timeline, simply double click it.

Selecting **Create** brings up the **Timeline Editor** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Timeline file	file		
the timeline file to edit			
Read	button		
reads the supplied timeline file			
Write	button		
writes the current timeline file			
Add	button		
adds a new timeline at the current level			
Add Child	button		
adds a child to the current timeline			
Delete	button		
deletes the current timeline			
Move Up	button		
moves the current timeline up			
Move Down	button		
moves the current timeline down			

Copy button

copies the current timeline

Paste button

pastes the last copied timeline

Enable / Disable button

enables or disables the current timeline

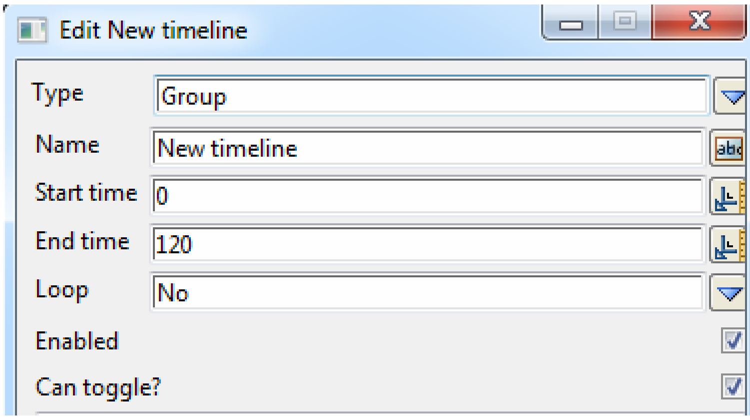
Set button

sets the current timeline details

Run button

runs the current timeline

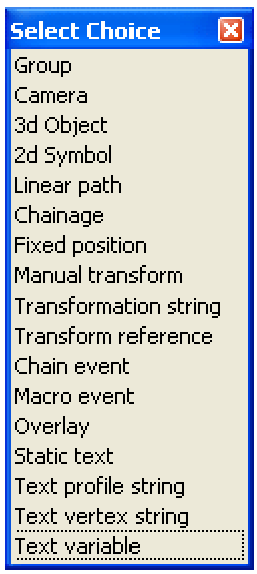
12.13.11 Timeline Common Fields and Buttons



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Type choice box



Sets the type of timeline to edit. For more information on each Type, see 12.13.12 Edit Timeline Types

Name

the name of the timeline

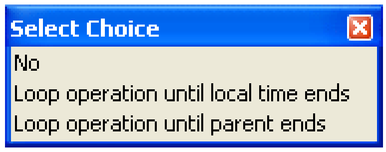
Start Time

the time this timeline should start playing

End Time

the time this timeline should stop playing

Loop choice box



the loop mode to apply for this timeline

No *- no looping*

Loop operation until local time ends *- if the operation of the timeline takes less time than the supplied duration, you may nominate for it to repeat the operation until the end time is reached*

Loop until parent ends *- loop this timeline until the parent time completes*

Enabled tick box

whether or not it is enabled

Can Toggle? tick box

whether or not this timeline can be toggled on or off during playback

Set button

sets the details for the timeline

12.13.12 Edit Timeline Types

For Group, go to	12.13.13 Group Timeline

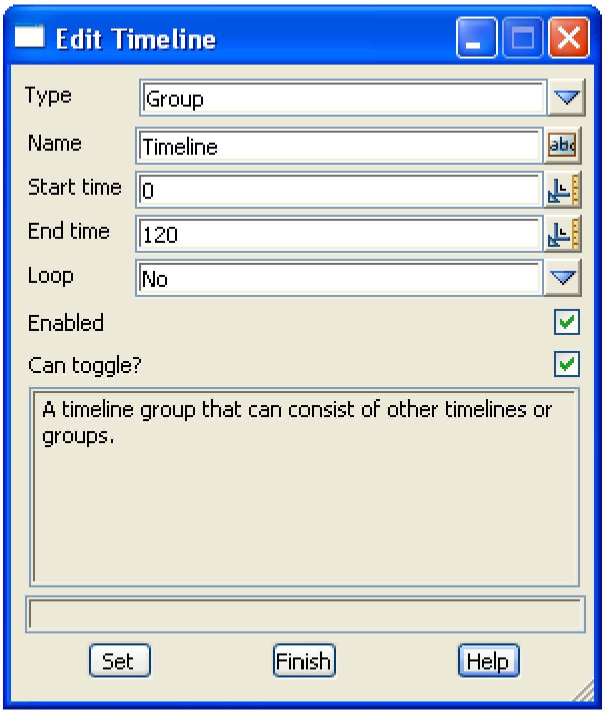
12.13.13 Group Timeline

The editor for a group timeline, which consists of other timelines.



The fields and buttons used in the panel have the following functions.

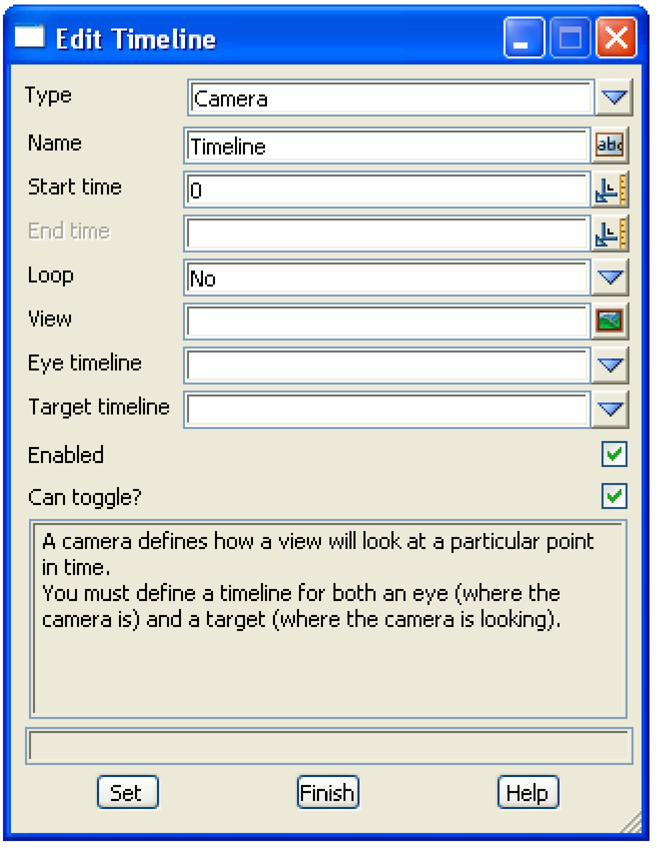
Field Description Type Defaults Pop-Up

There are no fields other than common fields and buttons.For more information on common fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.14 Camera Timeline

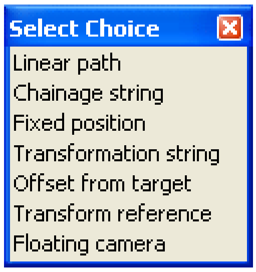
The **Camera Timeline** directs a perspective view where to look at a given time. It is defined by two other timelines - an **eye** and a **target**. There are several different types of timelines available for both **eye** and **target**. When the details are set, two children timelines will be created, one for the **eye** and one for the **target**.

The details for how the **eye** and **target** should behave should be accessed through these two children timelines.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View	view box		
the view to control			
Eye timeline	choice box		
the type of eye timeline			



Linear Path *- See* 12.13.18 Linear Path Timeline

Chainage String *- See* 12.13.19 Chainage Timeline

Fixed Position *- See* 12.13.20 Fixed Position Timeline

Transformation String *- See* 12.13.22 Transformation String Timeline

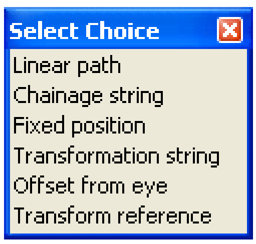
Offset from Target *- Offsets the eye from the target. See* 12.13.21 Manual Transform Timeline

Transform Reference *- See* 12.13.23 Transform Reference Timeline

Floating Camera *- See* 12.13.15 Floating Eye Timeline

Target timeline choice box

the type of target timeline



Linear Path *- See* 12.13.18 Linear Path Timeline

Chainage String *- See* 12.13.19 Chainage Timeline

Fixed Position *- See* 12.13.20 Fixed Position Timeline

Transformation String *- See* 12.13.22 Transformation String Timeline

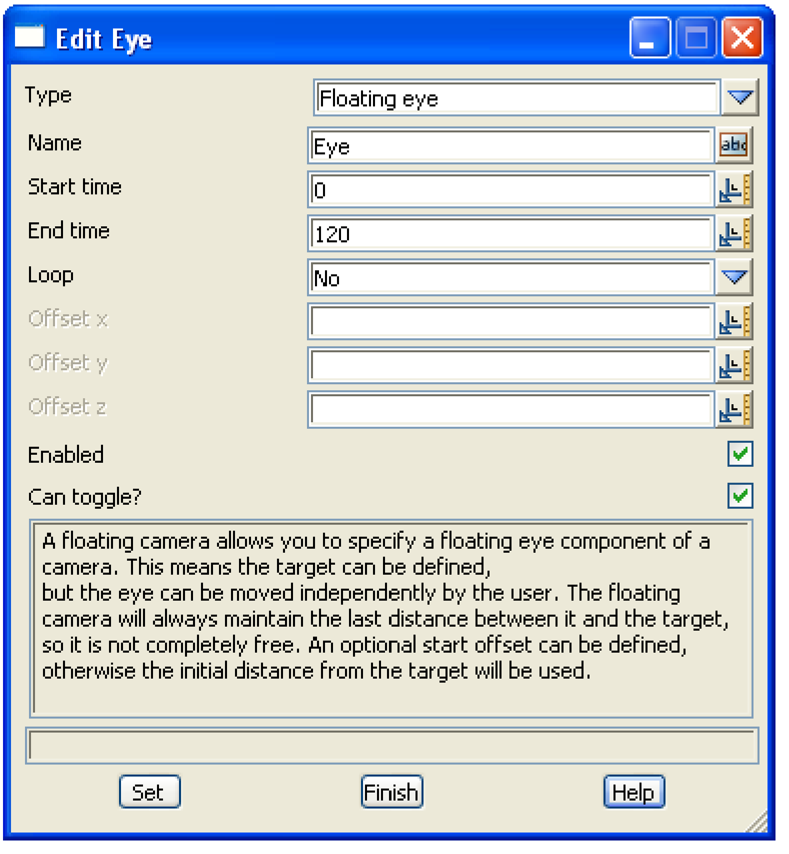
Offset from eye *- Offsets the target from the eye. See* 12.13.21 Manual Transform Timeline

Transform Reference *- See* 12.13.23 Transform Reference Timeline

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.15 Floating Eye Timeline

A **Floating Eye** allows the camera to be fixed on a known target, but the user can retain control over the position of the eye. The **Floating Eye** is a camera type. It can only be accessed by first setting the eye type of a camera to **Floating Camera**.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Offset x

an optional x offset from the target. If not set, the current x offset from the target will be used.

Offset y

an optional y offset from the target. If not set, the current y offset from the target will be used.

Offset z

an optional z offset from the target. If not set, the current y offset from the target will be used.

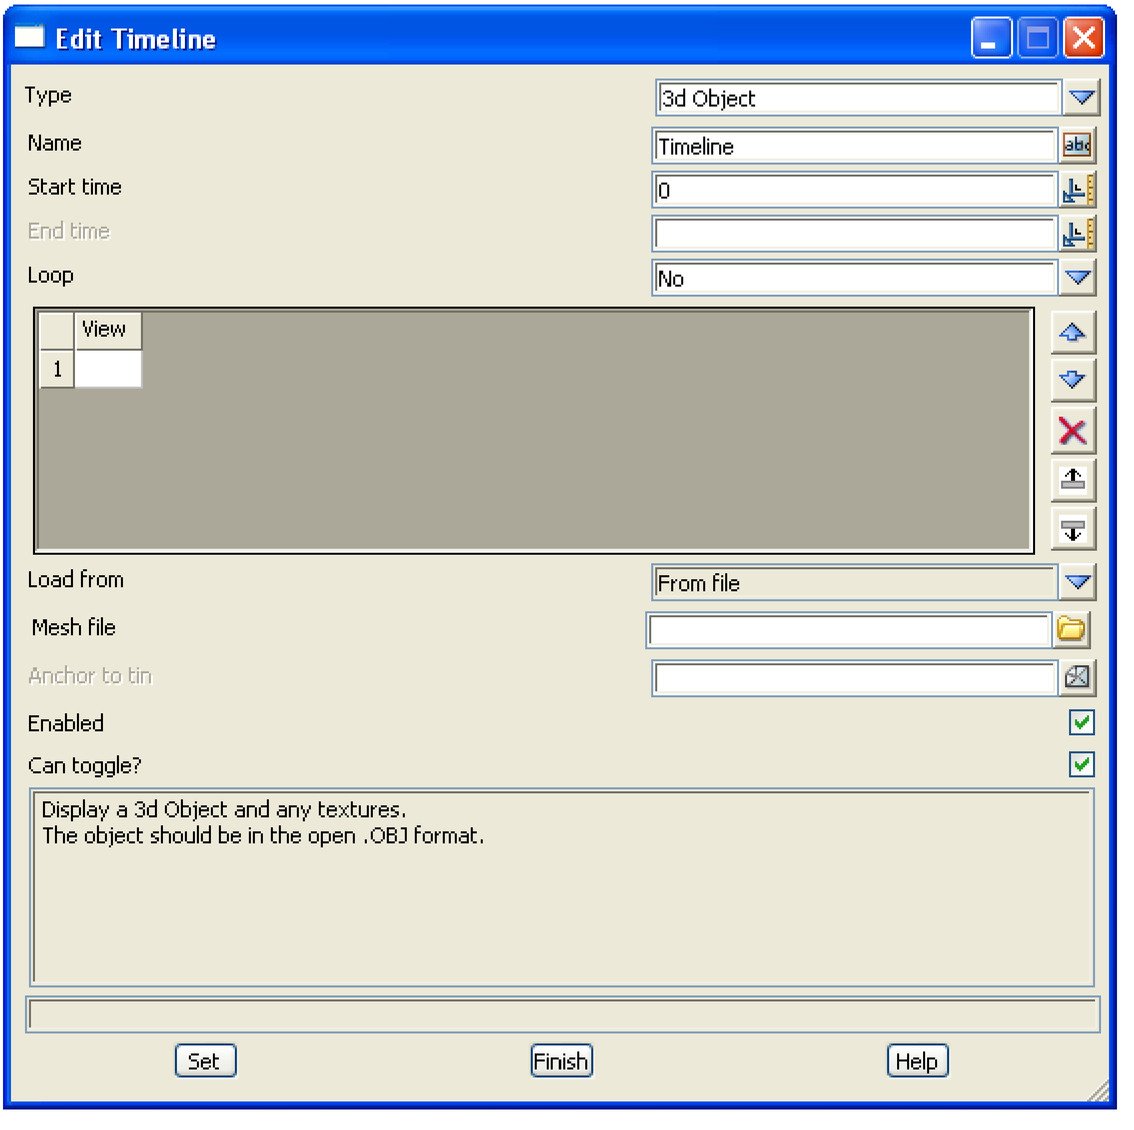
For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.16 3d Object Timeline

The **3d Object Timeline** draws a 3d object on any number of views at a given time. A 3d object may include a mesh from another package, in the OBJ (Alias Wavefront) format.

Creating a **3d Object Timeline** will create two sub timelines automatically - the initial transformation and other transformations.

Initial transformations should be used to convert your mesh into world co-ordinates, as meshes may come from a number of packages with arbitrary scale, offsets or rotations.

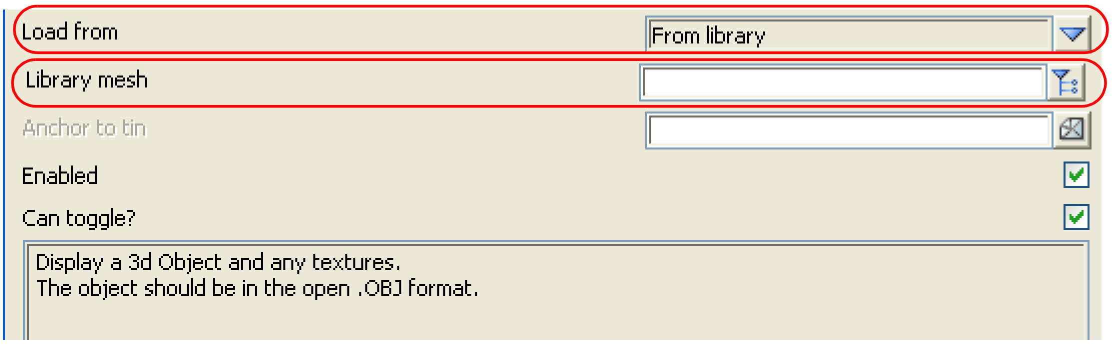


The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
View Grid			
the list of OpenGL perspective views to draw on			
Load From	choice box		From library, From file
whether to load from a known file or the library			
Mesh file	file		
when loading from file, the mesh file to use			

Anchor to tin

a tin to anchor the mesh to - useful for vehicles on terrain. Note that this will only work for a library mesh that has anchor points defined.



Library mesh

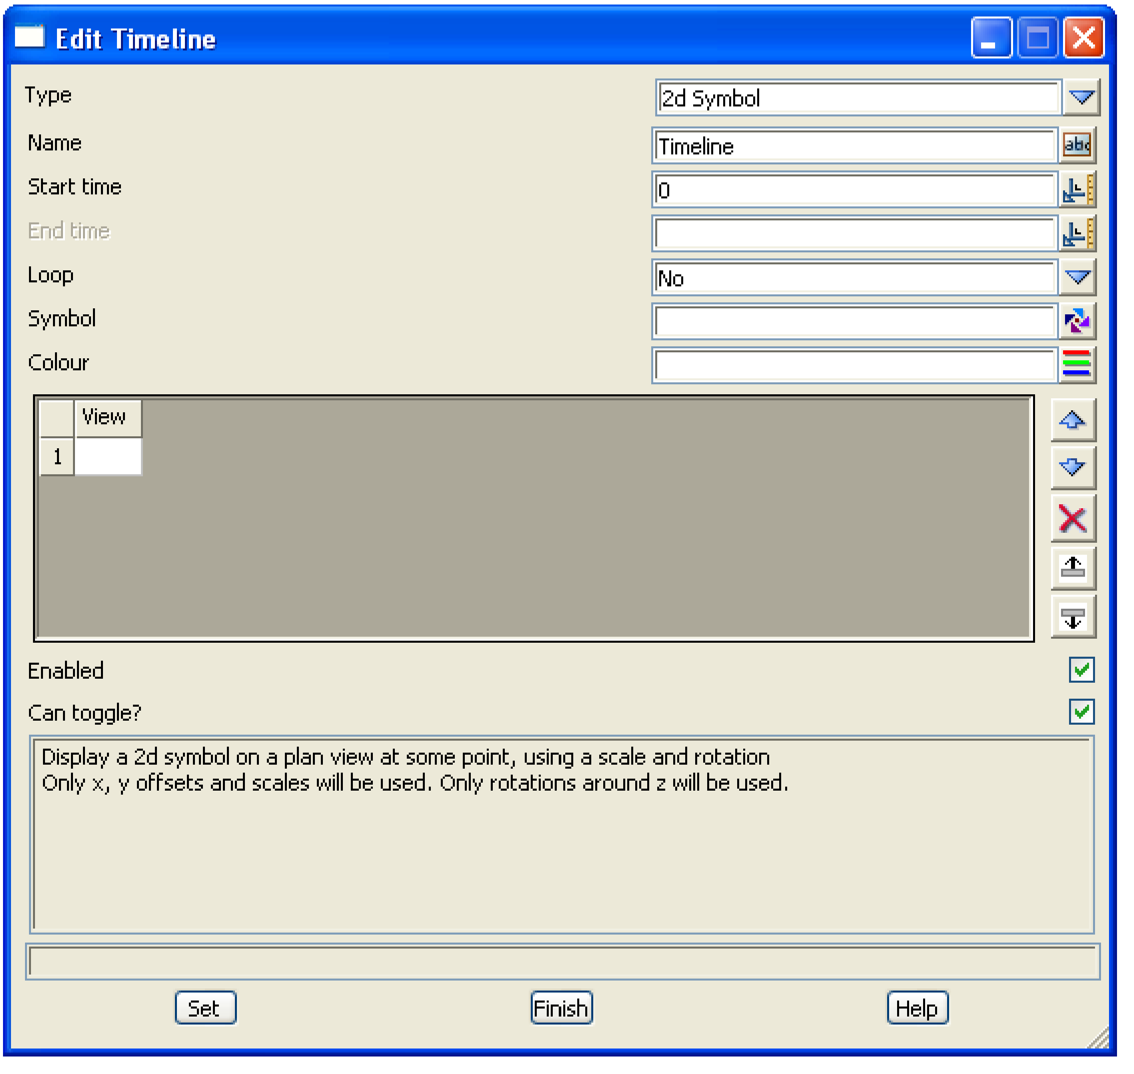
*this field is displayed when **From Library** is selected from the **Load From** choice box.*

when loading from a library, the mesh to use

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.17 2d Symbol Timeline

This allows you to define the settings for drawing a 2d symbol on a number of plan views.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Symbol symbol box

the symbol to draw

Colour colour box

the colour for the symbol

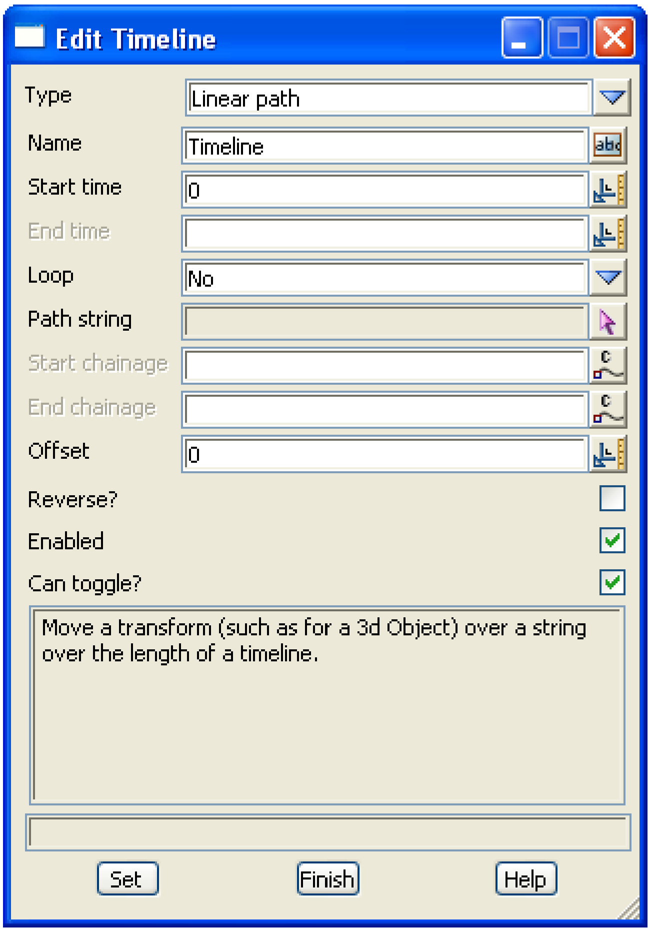
View grid

the list of plan views to draw the symbol

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.18 Linear Path Timeline

This editor defines the settings for a **Linear Path Timeline**. A **Linear Path Timeline** returns the position and direction on a string linearly, to fit the amount of time supplied.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Path string string select

the string to follow

Start chainage

the optional start chainage

End chainage

the optional end chainage

Offset

an offset from the path string

Reverse? tick box

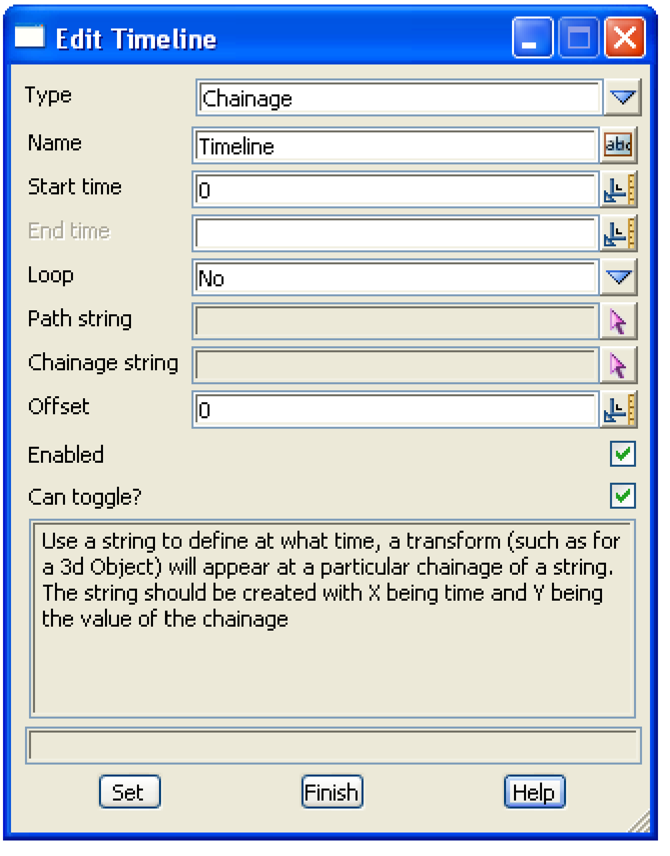
whether or not to reverse the direction (start at end)

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.19 Chainage Timeline

This editor allows you to define the settings for a **Chainage Timeline**. The **Chainage Timeline** follows a string or path by querying another string that defines the chainage to use at a given time. For the **Chainage Timeline**, the chainage string should be defined with X being time and Y being the chainage.

The **Chainage Timeline** will return the position and direction at the current chainage of the path string.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Path string	string select		

the string to follow

Chainage string	string select		

the string that defines what chainage to use at what time

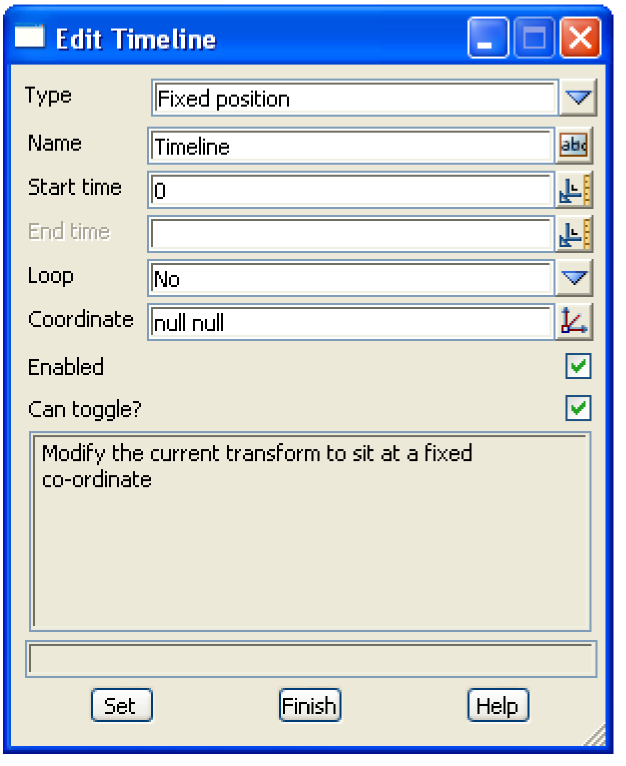
Offset	input		

an offset from the path string

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.20 Fixed Position Timeline

This editor allows you to define the settings for a **Fixed Position Timeline**. A **Fixed Position Timeline** will always return the supplied position.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

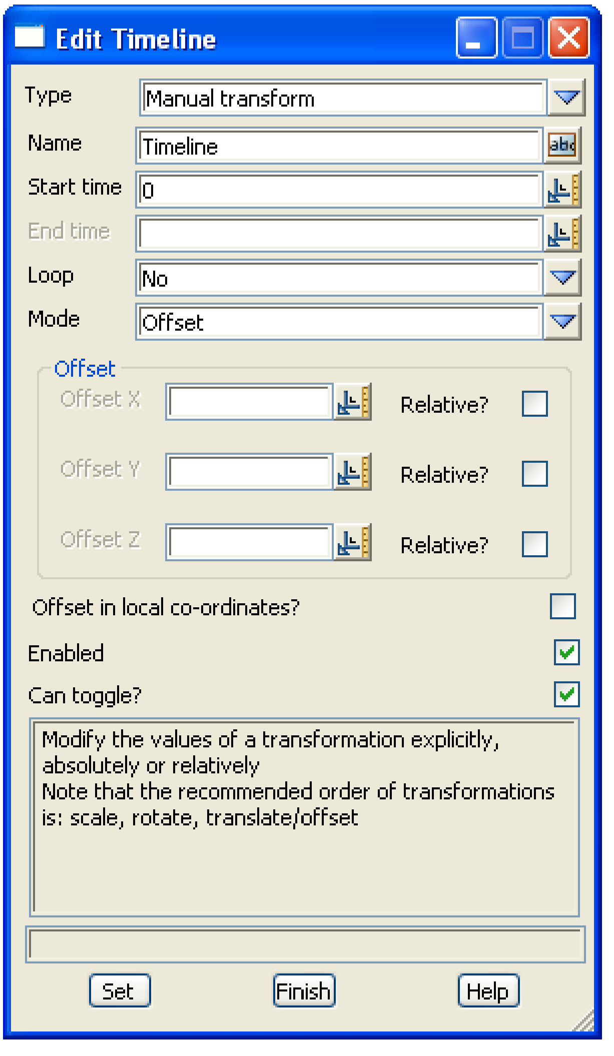
Coordinate

the coordinate of the fixed position

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.21 Manual Transform Timeline

This editor defines the settings for a **Manual Transform Timeline**. A manual transform is either an offset, rotation or scale on the current transformation being applied to a timeline.

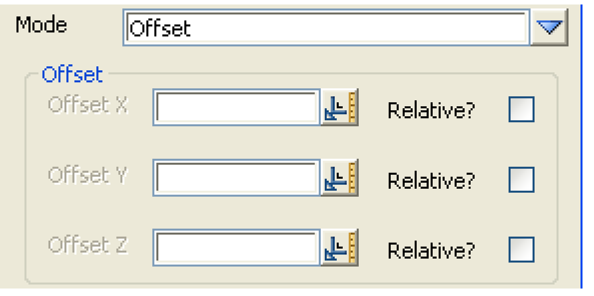


The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	choice box		Offset, Rotate, Scale

the mode of transformation: offset, rotate or scale

Offset defines the parameters for an offset transformation



Offset X

the optional offset to x

Relative? tick box

whether or not Offset X is a relative or absolute offset

Offset Y

the optional offset to y

Relative? tick box

whether or not Offset Y is a relative or absolute offset

Offset Z

the optional offset to z

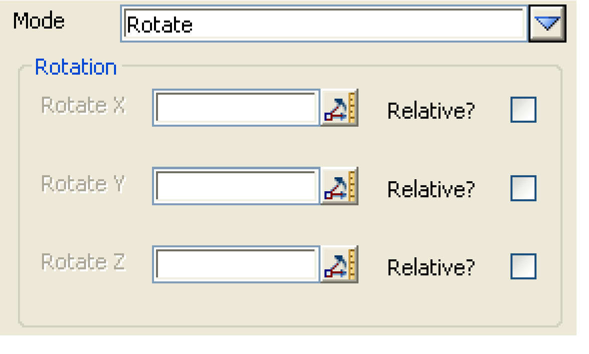
Relative? tick box

whether or not Offset Z is a relative or absolute offset

Offset in local co-ordinates tick box

whether or not the offset should be applied before or after the transformation to local co-ordinates

Rotate defines the parameters for a rotation transformation



Rotate X

the optional rotation around the x axis

Relative? tick box

whether or not the X rotation is relative or absolute

Rotate Y

the optional rotation around the y axis

Relative? tick box

whether or not the Y rotation is relative or absolute

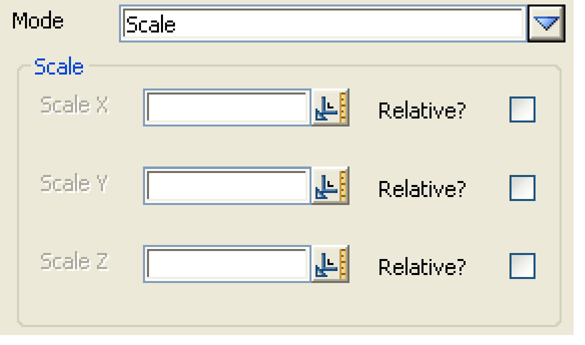
Rotate Z

the optional rotation around the z axis

Relative? tick box

whether or not the Z rotation is relative or absolute

Scale defines the parameters for a scaling transformation



Scale X

the optional x scale

Relative? tick box

whether or not the x scale is relative

Scale Y

the optional y scale

Relative? tick box

whether or not the y scale is relative

Scale Z

the optional z scale

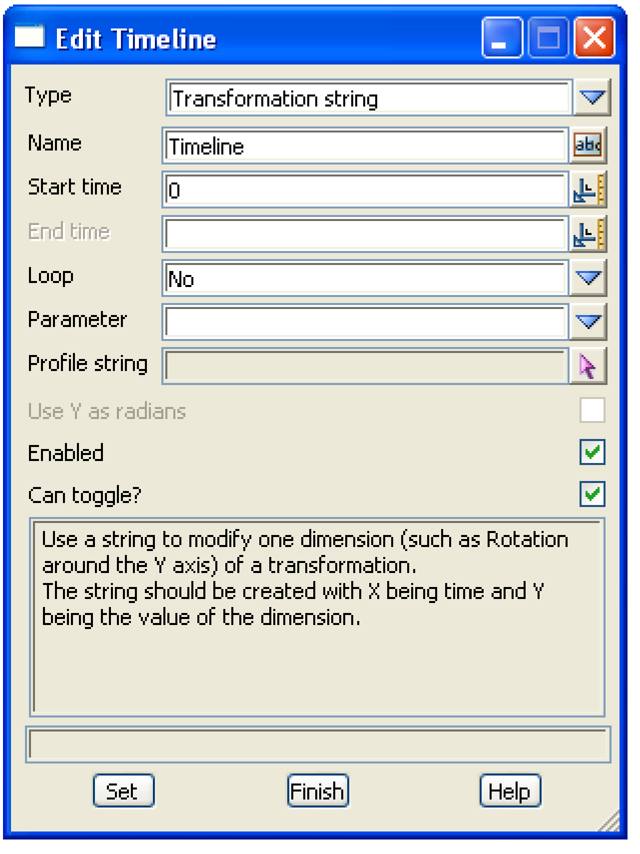
Relative? tick box

whether or not the z scale is relative

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.22 Transformation String Timeline

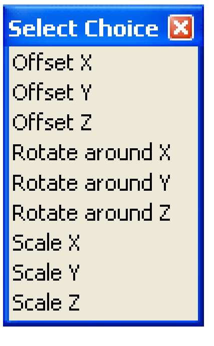
The **Transformation String Timeline** modifies one parameter of a transformation, based on a profile string. The profile string should be created such that x is time and y is the value of the parameter.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Parameter	choice box		

the parameter to update.



Options are: Offset X, Offset Y, Offset Z, Rotate around X, Rotate around Y, Rotate around Z, Scale X, Scale Y, Scale Z

Profile string	string select		

the profile string to use to modify the parameter

Use Y as Radians tick box

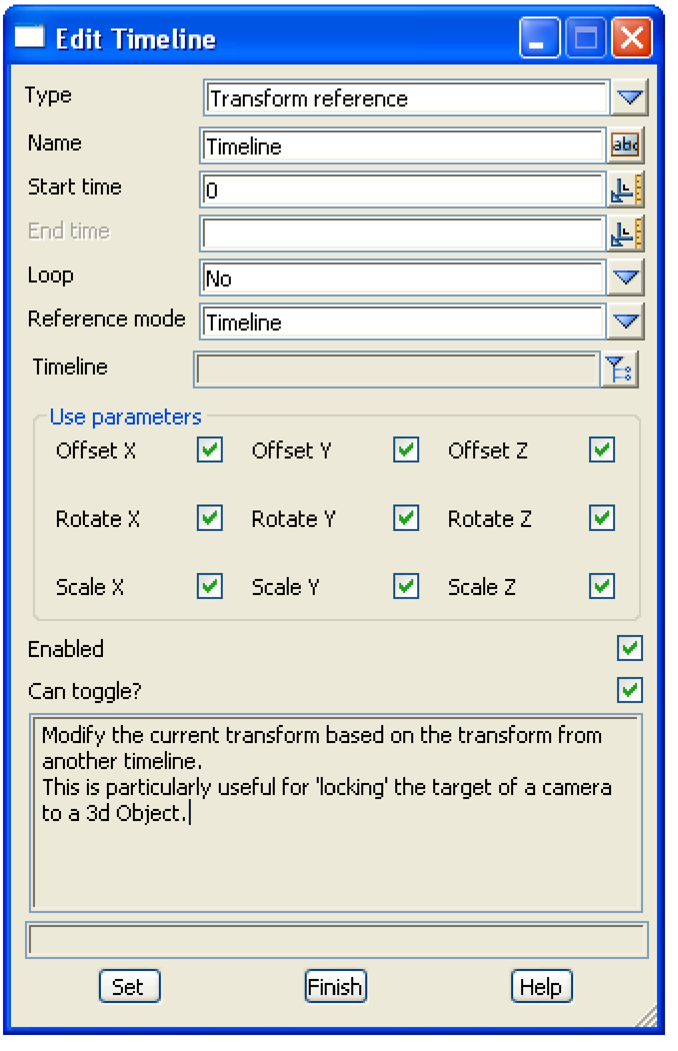
enabled when the parameter is a rotation parameter.

if ticked, the value of Y will be considered to be radians rather than degrees.

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.23 Transform Reference Timeline

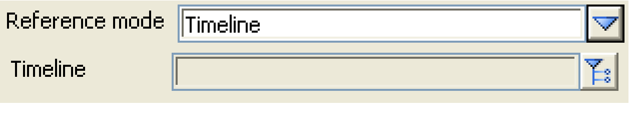
This editor defines the settings for a **Transform Reference Timeline**. A **Transform Reference Timeline** uses the transformation as supplied by another timeline. It is useful, for example, to make the target of a camera follow a vehicle, as it will return all the transformations from the reference timeline.



The fields and buttons used in the panel have the following functions.

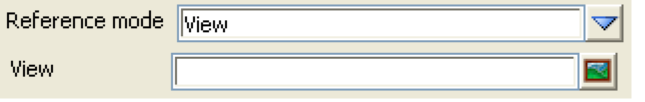
Field Description	Type	Defaults	Pop-Up
Reference mode	choice box		Timeline, View

whether to reference another timeline or a view



Timeline

*the timeline to reference, if **Reference mode** is set to **Timeline***



View

*the view to reference, if **Reference mode** is set to **View***

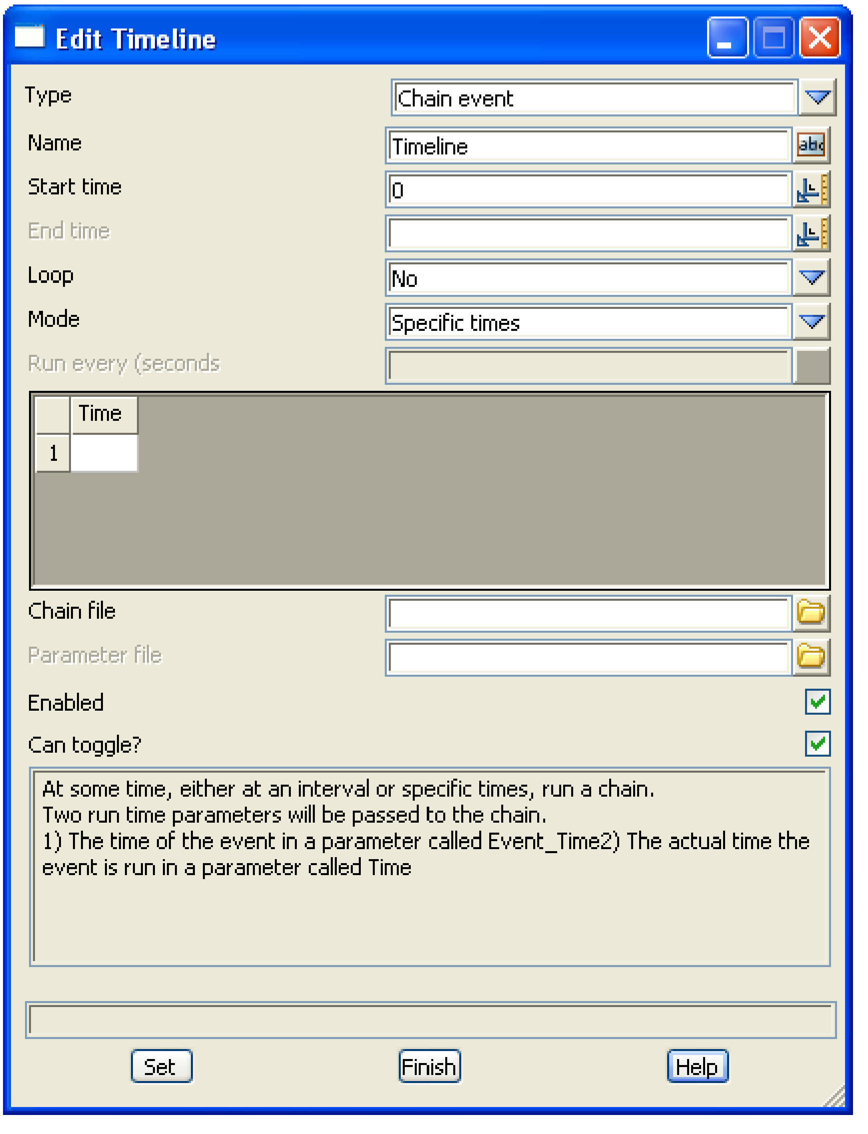
Use Parameters

defines which of the parameters to use from the transformation

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.24 Chain Event Timeline

This allows you to define the settings for a **Chain Event Timeline.** A **Chain Event Timeline** runs a chain at discrete intervals or specific times.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	choice box		Specific times, On interval

the mode - either specific times, or on an interval

Run every (seconds)

*if mode is set to **On Interval**, the interval, in seconds, between runs of the chain*

Time Grid

*if mode is set to **Specific times**, the list of times, in seconds, the chain should be run*

Chain file	file		

the chain file to run

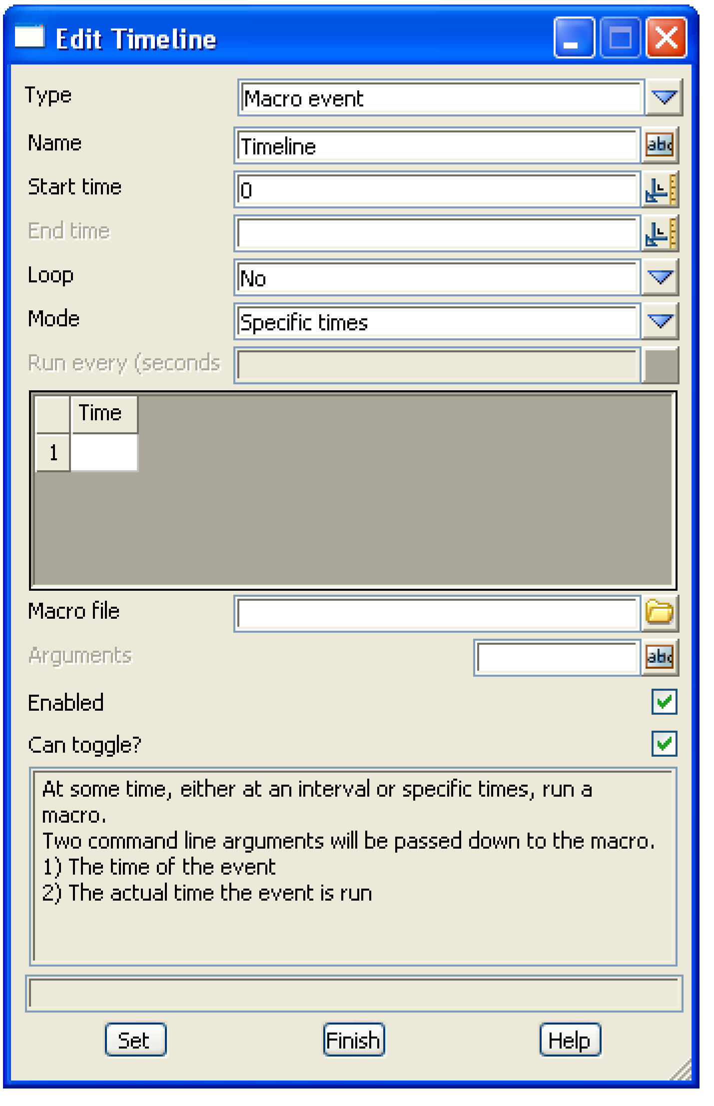
Parameter file	file		

the optional parameter file to pass to the chain

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.25 Macro Event Timeline

This allows you to define the settings for a **Macro Event Timeline**. A **Macro Event Timeline** runs a macro at discrete intervals or specific times.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Mode	choice box		Specific times, On interval

the mode - either specific times, or on an interval

Run every (seconds)

*if mode is set to **On interval**, the interval, in seconds, between runs of the macro*

Time Grid

*if mode is set to **Specific times**, the list of times, in seconds, the macro should be run*

Macro file file

the macro file to run

Arguments

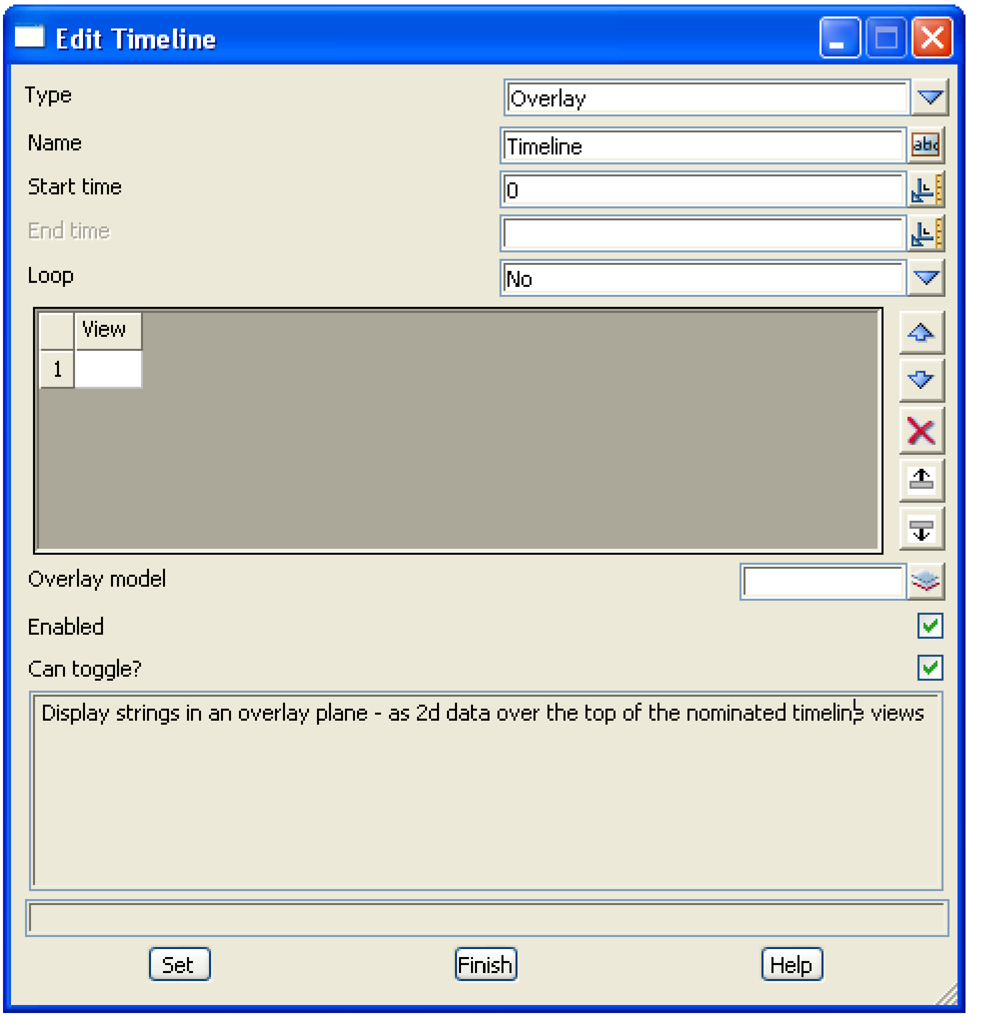
the optional arguments to pass to the macro

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.26 Overlay Timeline

This editor defines the setting for an **Overlay Timeline**. An **Overlay Timeline** draws a model as an overlay, or on a 2 dimensional plane, on top of a number of perspective views. Any children timelines will also appear in the overlay plane.

An **Overlay Timeline** is quite useful for showing diagnostic or other information.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

View Grid

the set of views to draw the overlay plane on

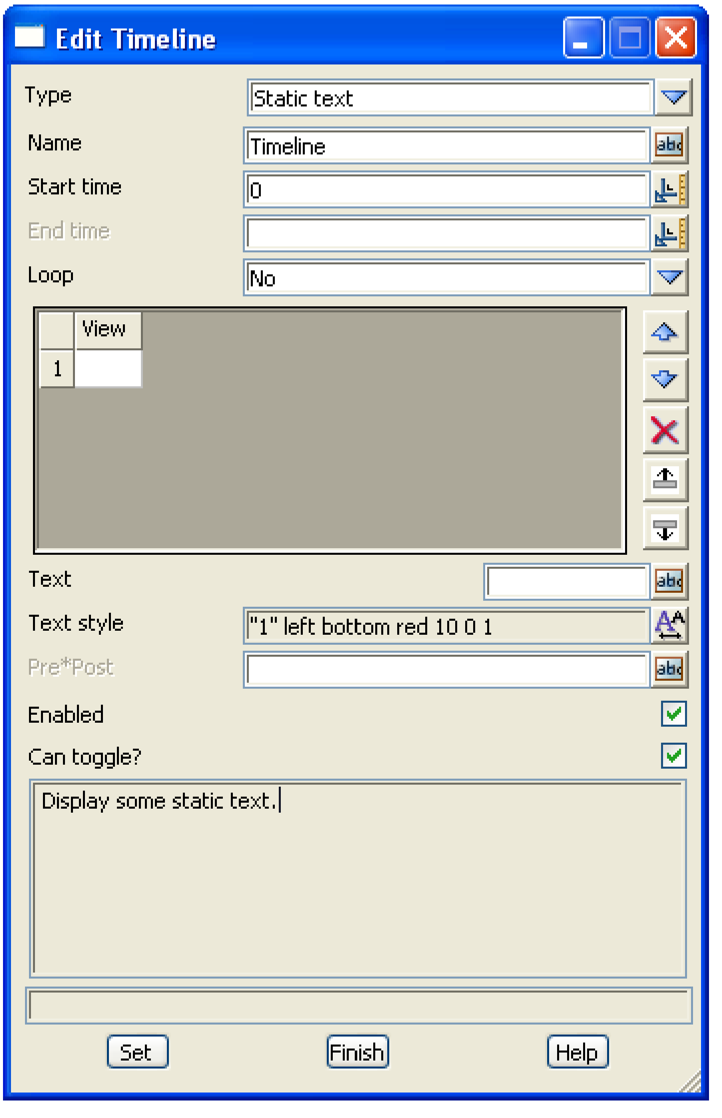
Overlay model model box

the model to draw as an overlay plane

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.27 Static Text Timeline

This editor edits the settings for a **Static Text Timeline**. A **Static Text Timeline Draws** user defined text on a perspective view.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

View Grid

the list of perspective views to draw on

Text

the text to draw

Text style

the style of the text

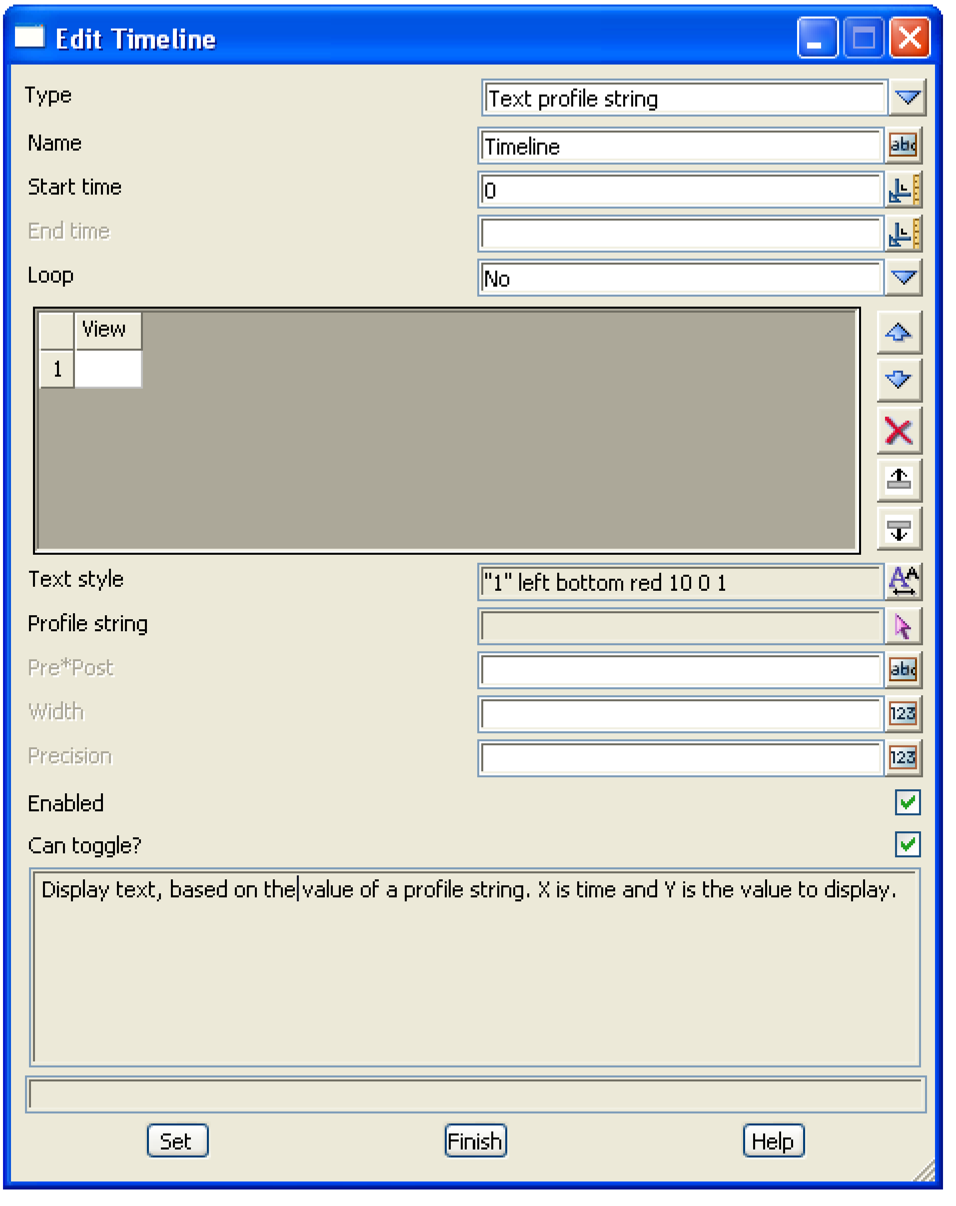
Pre*Post

*an optional pre*post to apply to the text*

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.28 Text Profile String Timeline

This edits the settings for a **Text Profile String Timeline**. A **Text Profile String Timeline** displays text as defined by a profile string, at each time step in the timeline. The profile string should be created with X being time and Y being the value to display.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

View grid

the list of OpenGL views to draw text on

Text style

the style of the text

Profile string string select

the profile string to use

Pre*Post

*an optional Pre*Post to be applied to the text*

Width

an optional width of the text

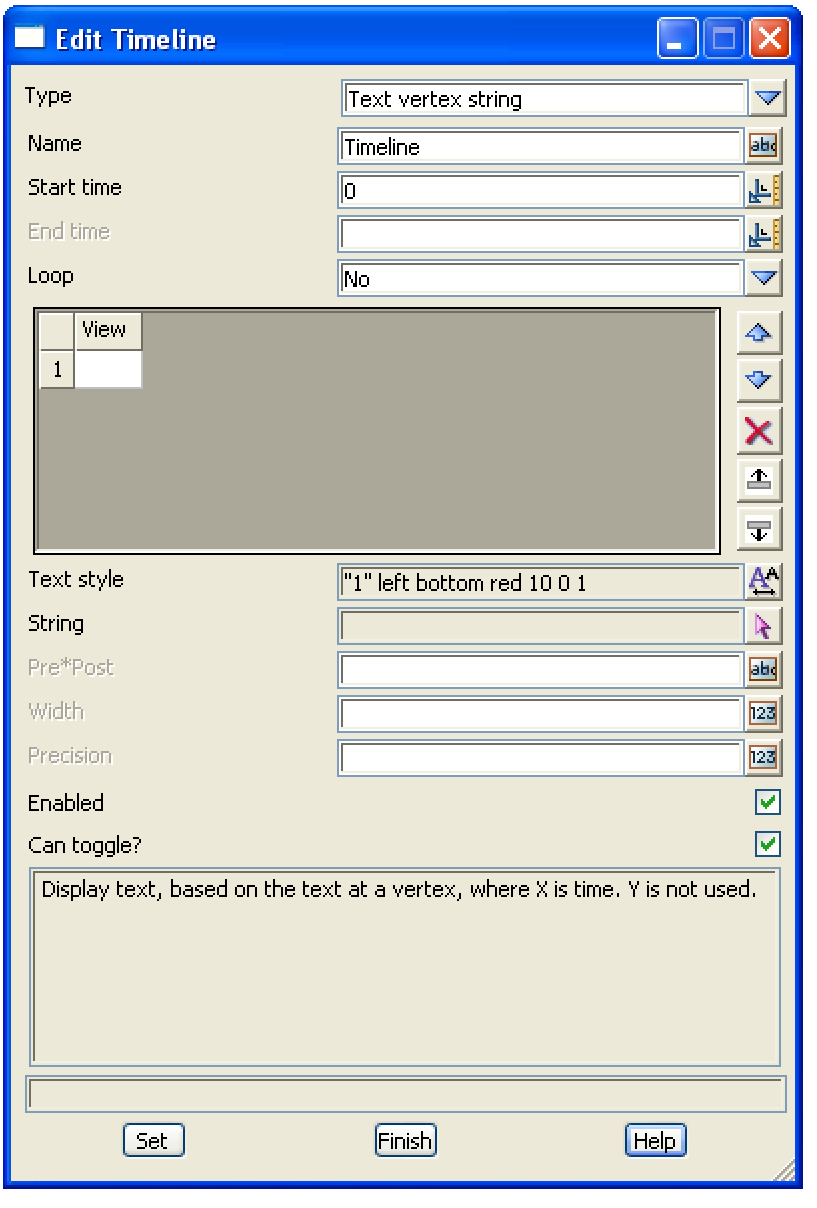
Precision

an optional precision for the text - used when displaying variables of type Real

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.29 Text Vertex String Timeline

This editor allows you to define the settings for a **Text Vertex String Timeline**. A T**ext Vertex String Timeline** draws the text on the vertex of a supplied profile string at the given time. The string should be created such that X is time.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

View Grid

the list of OpenGL views to draw the text on

String string select

the string to draw

Text style

the style of the text

Pre*Post

*an optional Pre*Post to be applied to the text*

Width

an optional width of the text

Precision

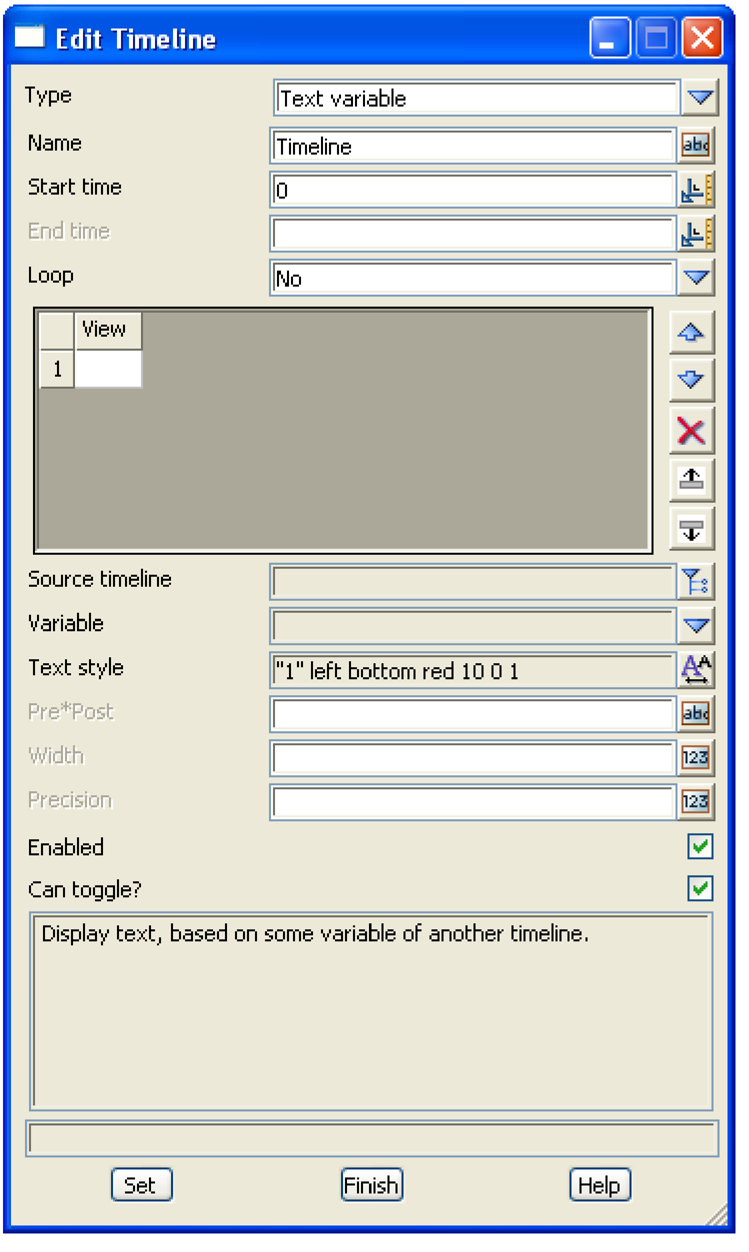
an optional precision for the text - used when displaying variables of type Real

For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.30 Text Variable Timeline

This edits the settings for a **Text Variable Timeline**. A **Text Variable Timeline** displays text on a number of OpenGL perspective views, by specifying a variable or property of another timeline.

Each timeline publishes a number of variables or properties that can be used - such as start time, end time or other context specific items.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

View grid

the list of OpenGL views to draw the text on

Source timeline

the timeline whose variable you wish to draw as text

Variable choice box

the variable to be drawn

Text style

the style of the text

Pre*Post

*an optional Pre*Post to be applied to the text*

Width

an optional width of the text

Precision

an optional precision for the text - used when displaying variables of type Real

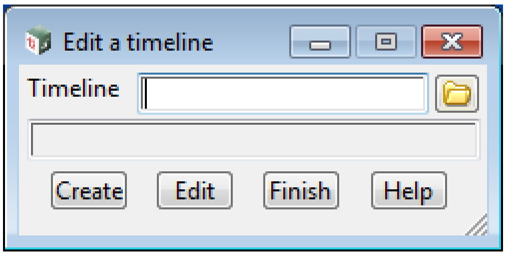
For all other fields and buttons please see 12.13.11 Timeline Common Fields and Buttons.

12.13.30.1 Edit a Timeline

Position of option on menu: **View =>Visualisation =>Timelines => Edit**

This panel creates a new timeline file or edits an existing one.

Selecting **Edit** brings up the Edit a timeline panel.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Timeline file

the file to edit or create

Create button

creates the new file

Edit button

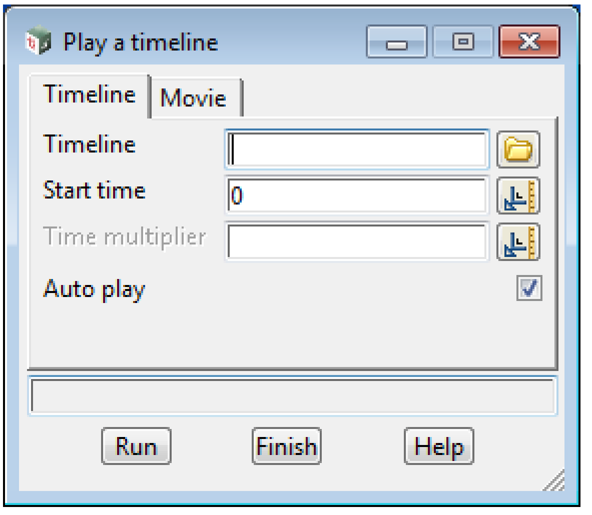
edits an existing timeline file

12.13.30.2 Play a Timeline

Position of option on menu: **View =>Visualisation =>Timelines => Play**

This panel plays a timeline file.

Selecting **Play** brings up the **Play a timeline** panel.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up

Timeline tab

Timeline file

the timeline file to run

Start time

the time at which to start playing the file

Time multiplier

an optional multiplier (for example, setting this to 2 would run the timeline at 2x, meaning each second would take half a second to play)

Auto play tick box

whether or not to start playing the timeline when it is run

Movie tab

Create movie? tick box

if ticked, a movie is generated

Movie file file box available *.avi files

name of the movie file

Record whole application tick box

if ticked, the whole application will be recorded, rather than just a selected view

View view box

(only if Record whole application *is not ticked) the view of which to record the movie*

Frames per second number box 10

the number of frames per second

Buttons at bottom

Run button

runs the timeline

12.13.31 Timeline Playback Control Bar

The timeline playback control bar appears when a timeline is running. It offers playback controls while the timeline runs.

The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Restart

Restarts the timeline

Step back

Steps back by the nominated time step (the input box on the right)

Play / Pause /

Plays or pauses the playback of the timeline

Stop

stops running the timeline

Step forward

Steps forward by the nominated time step (the input box on the right)

Time multiplier

*Sets the time multiplier. For more information on the **Change Timeline Multiplier** panel, please see* 12.13.32 Change Timeline Multiplier

Interactive camera

Defines interactive cameras at runtime

*For more information on the **Timeline Camera** panel, please see* 12.13.34 Timeline Camera

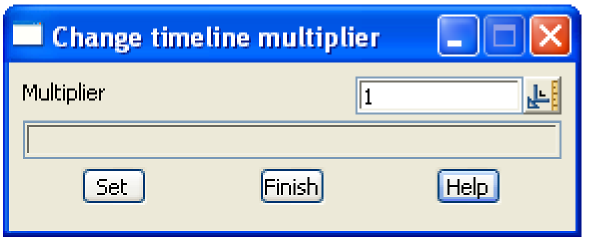
Toggle

*Toggles timelines enabled state on or off. For more information on the **Enable/ Disable Timelines** panel, please see* 12.13.33 Enable / Disable Timelines

12.13.32 Change Timeline Multiplier

This sets the current time multiplier for the timeline. For example, setting this to 2 would run the timeline at 2x, meaning each second would take half a second to play.

Clicking  on the **Timeline Playback Control Bar** brings up the **Change timeline multiplier** panel**.**



The fields and buttons used in the panel have the following functions.

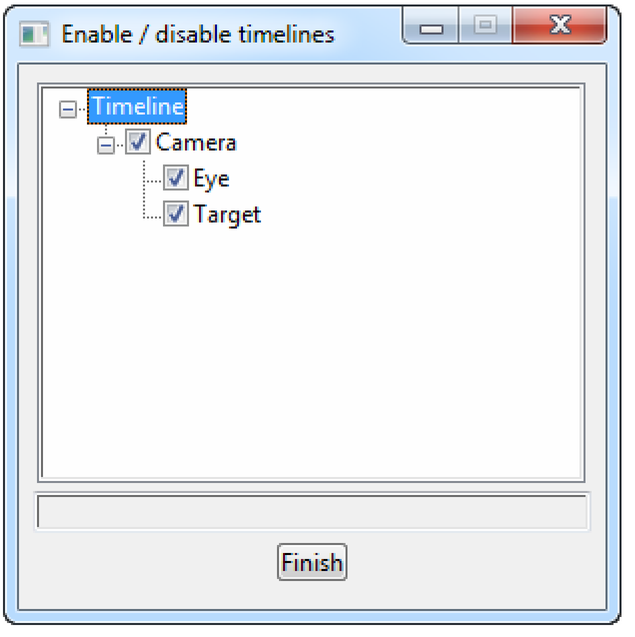
Field Description	Type	Defaults	Pop-Up
Multiplier	input		
the multiplier to apply			
Set	button		
sets the multiplier			

12.13.33 Enable / Disable Timelines

This panel provides a list of the timelines currently running and allows you to enable or disable them quickly. They can only be enabled or disabled if they are set to **Can toggle?**. Note that if you disable a parent, all child timelines will also be disabled.The **Can toggle?** tick box is found on the editor for each timeline.

To disable, simply tick off the required timeline and vice versa to enable them again.

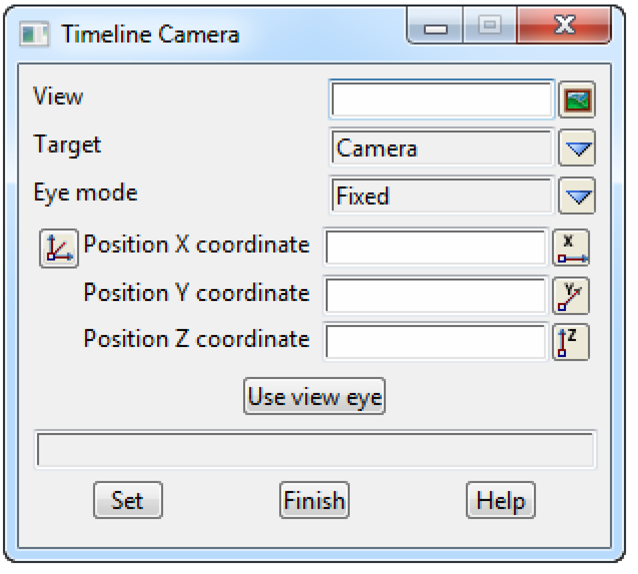
Clicking  on the **Timeline Playback Control Bar** brings up the **Enable/ disable timelines** panel.



12.13.34 Timeline Camera

This panel allows you to define cameras for a supplied view during run time.

Clicking on the **Timeline Playback Control Bar** brings up the **Timeline Camera** panel.



The fields and buttons used in the panel have the following functions.

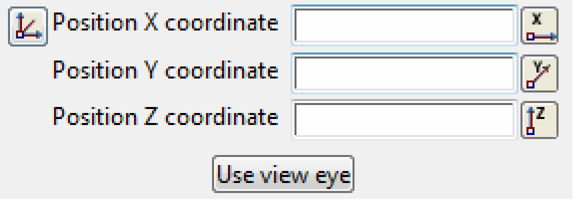
Field Description	Type	Defaults	Pop-Up
View	view box		
Target	choice box		
Eye Mode	choice box		Fixed, Offset, Floating

View — *the perspective view to control*

Target — *a target timeline to reference*

Eye Mode — *the mode for the eye of the camera, either fixed, offset or floating*

Fixed



Position X coordinate

the x coordinate of the fixed eye

Position Y coordinate

the y coordinate of the fixed eye

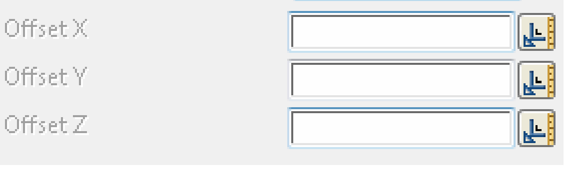
Position Z coordinate

the z coordinate of the fixed eye

Use view eye *button*

loads the eye settings from the supplied view

Offset



Offset X

the x offset of the eye from the target

Offset Y

the y offset of the eye from the target

Offset Z

the z offset of the eye from the target

Floating

Floating mode sets the timeline camera into a floating mode. This means the camera will be set to a fixed target, but the user will retain control over the camera. When started, the camera will start at the current offset from the target.

Set button

Creates and sets the details for the camera

12.13.34.1 Quick Timeline Create

Position of option on menu: **View =>Visualisation =>Timelines => Quick timeline**

This option creates a timeline along a selected Drive String, with the choice of a set of vehicles and/or a floating camera.

An optional Start and End chainage can be entered to limit the length of travel.

Enter a speed for the drive and an anchor tin for the four tyre anchor points of the vehicles.

The Calc Time button will calculate, in seconds, the travel time Duration at the selected speed.

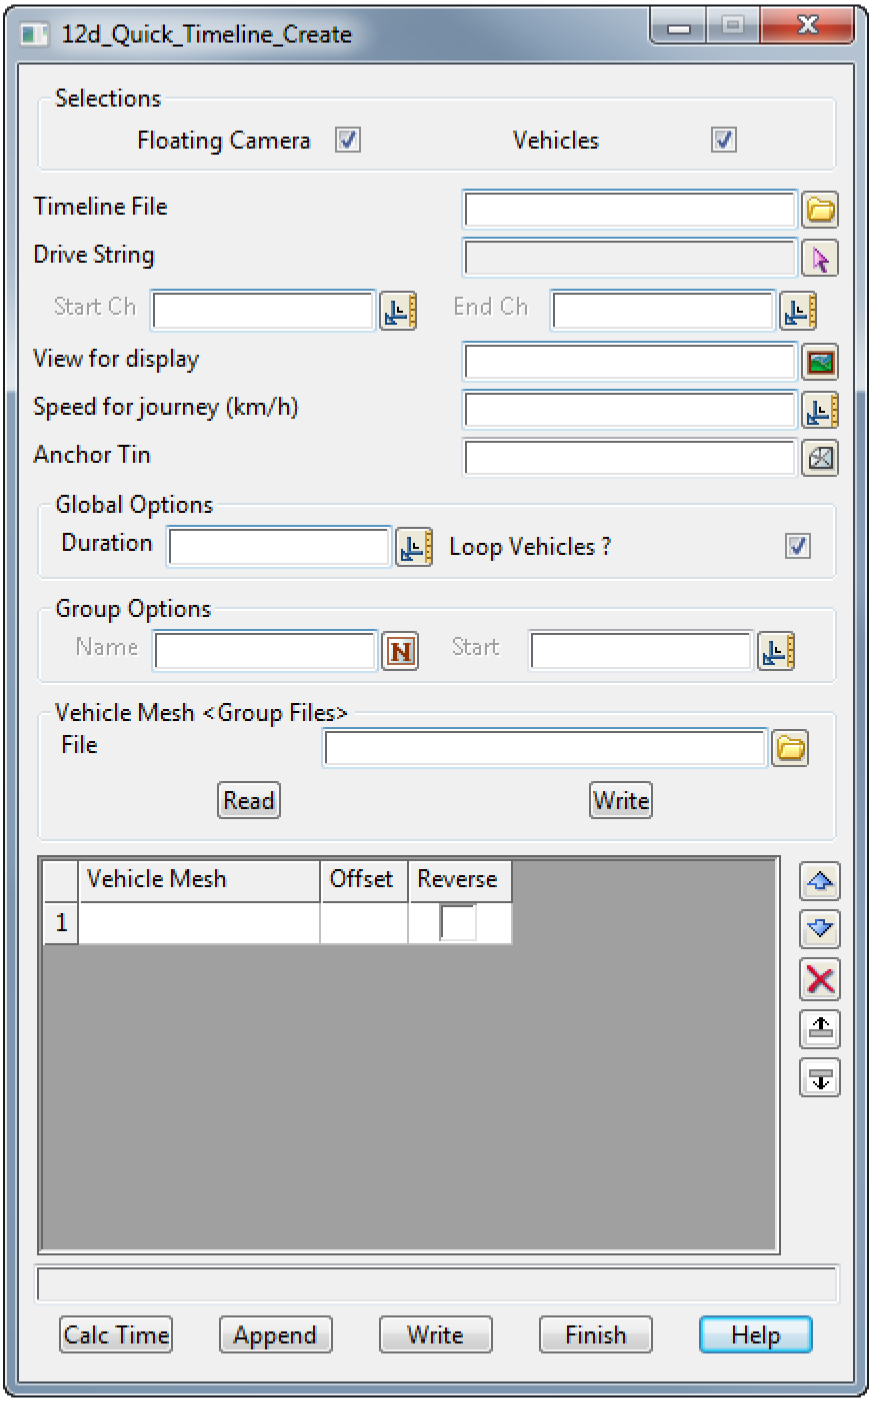
Vehicles are defined as meshes and can be Grouped together under a Name and a start time (in seconds)....optional.

Upon completing your selections (Drive String, Speed, Vehicles etc).... Save the selection using the Append button, and Write the file out.

Note: More than one Drive string and set of vehicles can be selected, appended and finally all written out in the same timeline file. Depending on the location of your drive string selection and its direction, you may have to enter an offset for the vehicles, and/or tick Reverse.

Once the timeline is written, it can be played under **View=>Visualisation=>Timelines=>Play**

Selecting **Quick timeline** brings up the 12d Quick timeline create panel.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Selections

Floating Camera tick box ticked

A floating camera allows you to specify the floating eye component of a camera.

The target is defined as the Drive String, but during the playing of the timeline, the eye can be moved independently by the user (e.g. using the Orbit).

Vehicles tick box ticked

Ticking this option on turns on appropriate fields for setting up timelines for vehicles.

Timeline File file box available files

If non-blank, entry used as timeline file name.

Drive String string select

If selected, string is used as timeline drive string and timeline duration can be calculated.

If non-blank, entry used as timeline file name.

Start Ch real

If non-blank, entry used as start of timeline...optional.

End Ch real

If non-blank, entry used as end of timeline...optional.

View for display view box available views

If non-blank, entry used to play back the timeline (an Open GL Perspective View is required).

Speed for journey (km/h) real

If non-blank, entry used to calculate the timeline duration in seconds.

Anchor Tin tin box

If non-blank, entry used as the location for the four vehicle tyre points.

Global Options

Duration real

If non-blank, entry used as timeline length (can be calculated initially via the Calc Time button).

Loop Vehicles? tick box ticked

If ticked, the set of vehicles will be replayed during the timeline.

Group Options

Name name box

If non-blank, entry used for the grouping of the vehicles under that name and can be toggled off during the playing of the timeline...optional.

Start real

If non-blank, entry used for start time of the group (in seconds)...optional.

Vehicle Mesh <Group Files>

File file box

If non-blank, entry used for populating the grid selection of vehicle meshes.

Refer library for standard examples.

Read button

Reads in the file above and populates the vehicle grid.

Write button

Writes out the data currently in the vehicle grid to the file.

Vehicle Mesh Grid:

Vehicle Mesh

Vehicle choices (can be viewed under **View=>Visualisation=>Meshes=>Mesh library**

Offset Real

If non-blank entry used for offset from drive string

Reverse tick box not ticked

If ticked, vehicles will run in the opposite direction to the drive string direction.

Calc Time button

Calculates the time of travel in seconds using the Drive String and Speed of journey.

Append button

One or more timelines (Drive String, speed, vehicle etc) can be appended, before finally being written out to the timeline file.

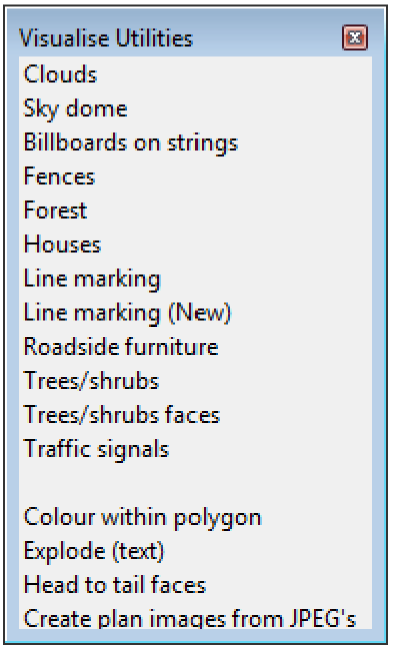
Write button

After appending, the Timeline File is written out.

12.13.35 Utilities

Position of menu: **View =>Visualisation =>Utilities**

The **Utilities** walk-right menu is



create box of clouds as background
create sky dome of clouds as background
change billboards on super strings
inserting fences
create forest
insert houses
create strings for line marking

insert fences, guard rails, signs, walls etc.
insert trees and shrubs as billboards
insert trees and shrubs as faces

colour within a polygon
explode text into vectors so it can be draped onto surface

create plan images from JPEG files which include EXIF and GPS data

For the options, see

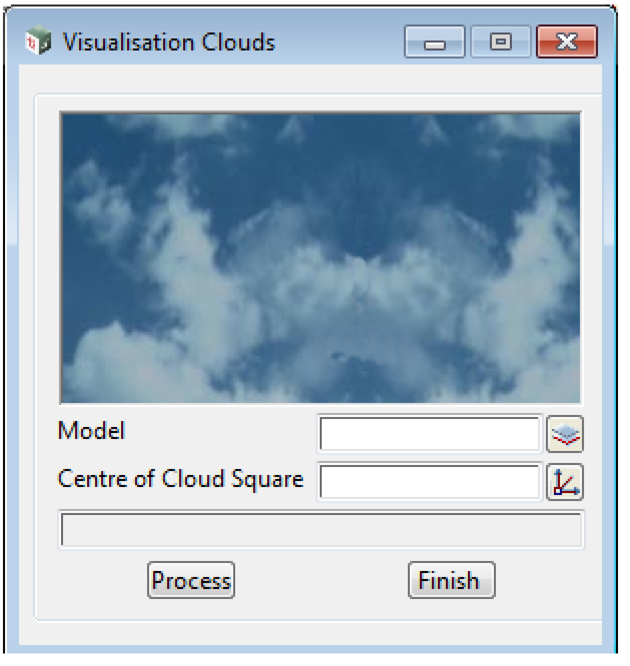
Clouds	12.13.35.1 Clouds
Sky dome	12.13.35.2 Sky dome
Billboards on strings	12.13.5.1 Create and Place Billboard
Fences	12.13.35.3 Fences
Forest	12.13.5.4 Create Forest
Houses	12.13.35.4 Houses
Line marking	12.13.35.5 Line Marking
Line marking (New)	12.13.35.6 Line Marking (New)
Roadside furniture	12.13.8.3 Roadside Furniture
Trees/shrubs billboards	12.13.5.5 Trees/Shrubs as Faces and Billboards
Trees/shrubs faces	12.13.5.5 Trees/Shrubs as Faces and Billboards
Traffic signals	12.13.35.7 Traffic Lighting Placement
Colour within polygon	16.8.2 Colour Within Polygon
Explode (text)	28.9.18 Explode Text
Head to tail faces	12.13.35.10 Head to tail faces
Create plan images from JPEG's	12.13.35.11 Create Plan Images from JPEG Files

12.13.35.1 Clouds

Position of option on menu: **View =>Visualisation =>Utilities =>Clouds**

This option is used to create a square box around the view with the cloud image on the inside of it. From within a scene, this will then appears as a sky with clouds as the background.

On selecting the **Clouds** option, the **Visualisation Clouds** panel is displayed:



The fields and buttons used in the panel have the following functions.

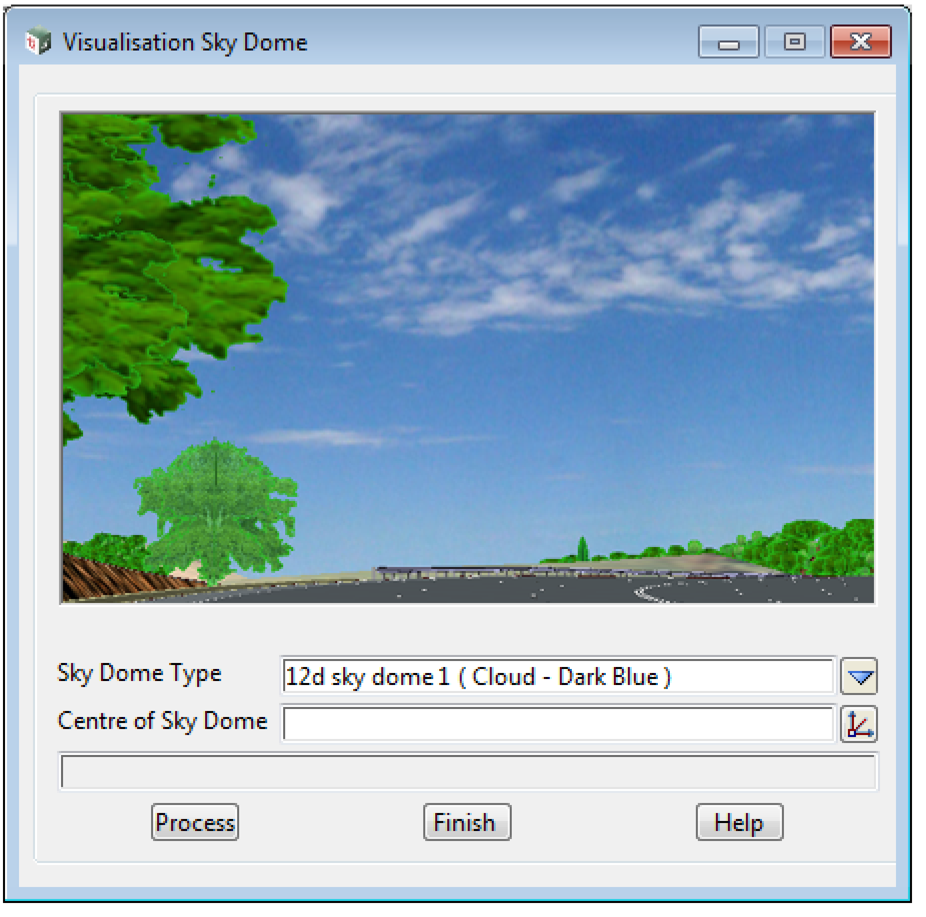
Field Description	Type	Defaults	Pop-Up
Model	model box		available models
model to place the cloud square in.			
Centre of cloud square	xyz box		position select
give the x y z co-ordinates for the centre of the cloud square.			
Process	button		
create the cloud square.			

12.13.35.2 Sky dome

Position of option on menu: **View =>Visualisation =>Utilities =>Sky dome**

This option reads in a 12da of a triangulation and a raster image to form a dome, that represents the sky.

On selecting the **Sky dome** option, the **Visualisation Sky Dome** panel is displayed:



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Sky Dome Type	choice box		Drop down selection available, with a preview above.

12d Sky Dome 1 (Cloud - Dark Blue)

12d Sky Dome 2 (Cloud - Haze)

12d Sky Dome 3 (Cloud - Light Blue)

12d Sky Dome 4 (Cloud - Snow Mtns)

12d Sky Dome 5 (Clear Sky)

Centre of Sky Dome	valid x,y,z		
Process	button		

Read in data from Library and translate to centre coords

Model Format

12d Sky Dome Data	(3 dimensional data for the triangulation)
12d Sky Dome Tin	(3 dimensional triangulation)
12d Sky Dome 1 Raster	(2 dimensional raster for the triangulation)

Note:

More than one sky type can be read in and used but the selected raster is then applied to the same tin.

To view the sky dome in the OpenGL perspective view, add the 1**2d Sky Dome Tin model** only to the view.

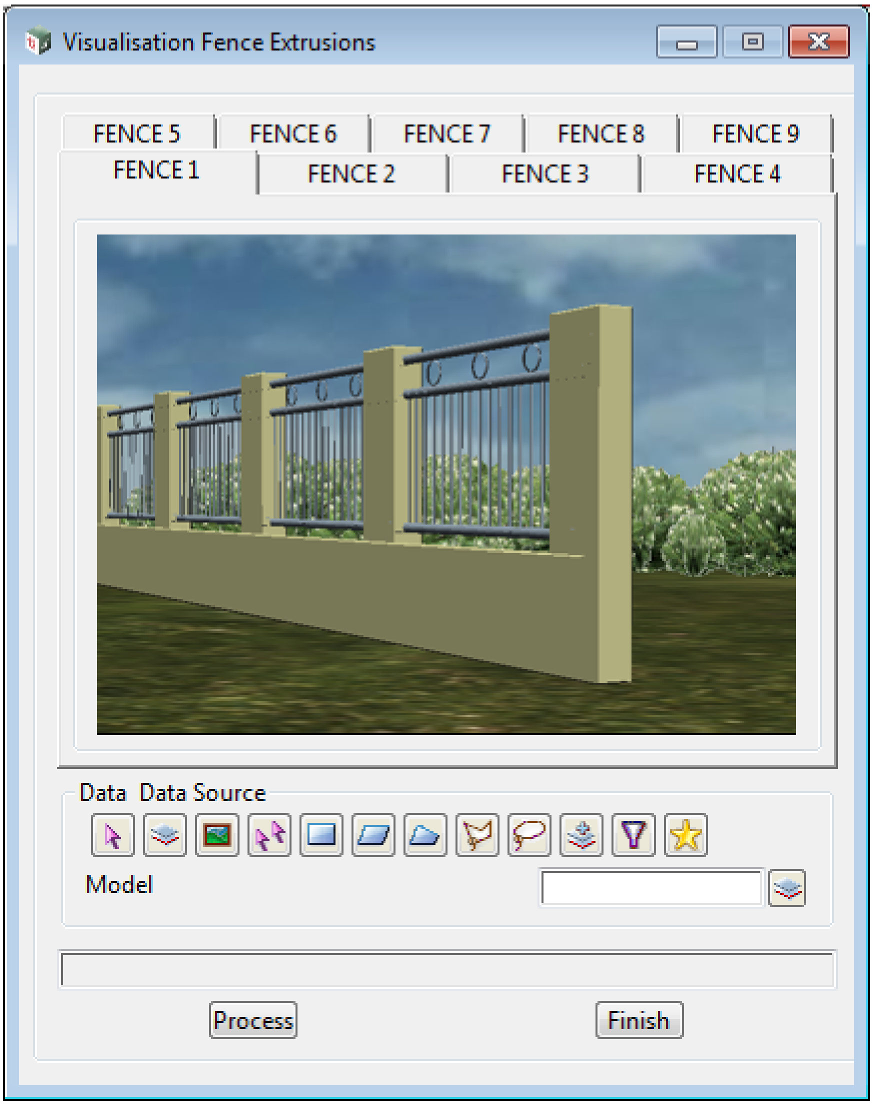
12.13.35.3 Fences

Position of option on menu: **View =>Visualisation => Extrusions =>Fences**

This option is for extruded 12d Solutions supplied fences along strings.

The list of fences is being continuously upgraded by 12d Solutions.

Selecting the **Fences** brings up the **Visualisation Fence Extrusions** panel.



The fields and buttons used in the panel have the following functions.

Field Description Type Defaults Pop-Up

Clicking on the tabs brings up the type of fence to be extruded along selected super strings.

Data source type Model

data selection type - for a full description go to 4.19.3 Data Source.

Data source input

source of super string to extrude fences along

Process button

apply the fence to the selected super strings

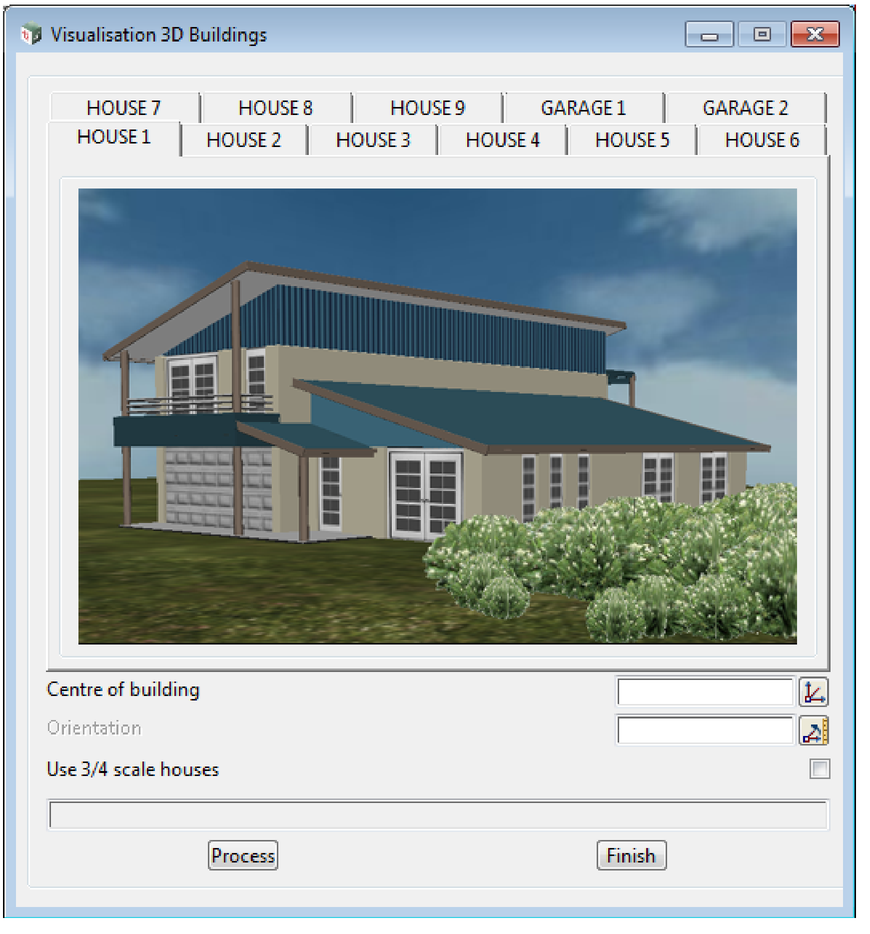
12.13.35.4 Houses

Position of option on menu: **View =>Visualisation => Utilities =>Houses**

This option is for inserting 12d Solutions supplied houses.

The list of houses is being continuously upgraded by 12d Solutions.

Selecting the **Houses** brings up the **Visualisation 3D Buildings** panel.



The fields and buttons used in the panel have the following functions.

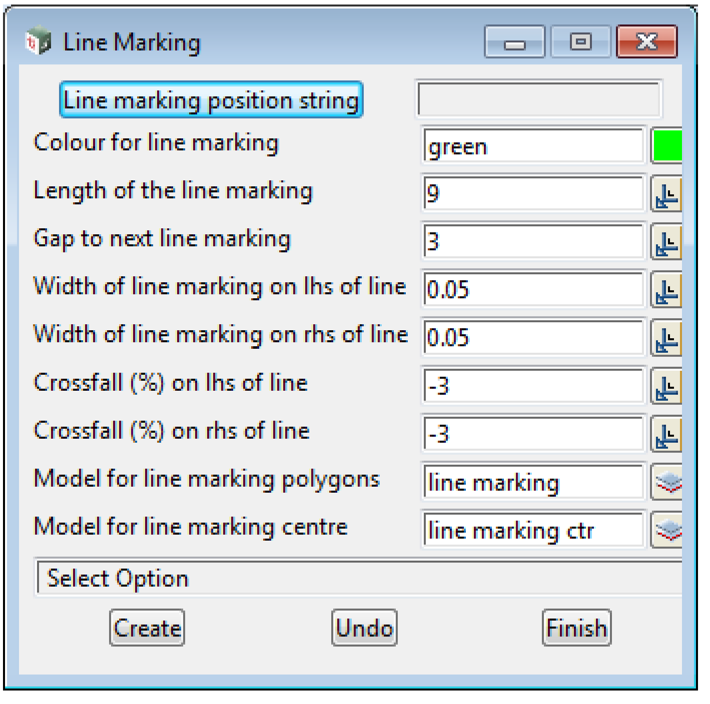
Field Description	Type	Defaults	Pop-Up
Clicking on the tabs brings up the type of house to be inserted.			
Centre of building	xyz box		position select
give the x y z co-ordinates for the centre of the base of the inserted building			
Orientation	angle box		angle select
give the angle to orient the building			
Process	button		
insert the selected building			

12.13.35.5 Line Marking

Position of option on menu: **View =>Visualisation =>Utilities => Line marking**

This option is used to create polygon data in 3d representing the line marking on a road. The polygons can then be included in the design tin for triangulating and the “Colour Triangles Within a Polygon” option used to colour the triangles for use in shades and renderings.

The line marking polygons created by the option represents a dashed line style centred around the selected line marking string marking the position of the dashed line. The length and separation of the dashed lines are user defined and the width of the dash is defined by a width to the left and a width to the right of the line marking string.



The fields and buttons used in this panel have the following functions:

Field Description	Type	Defaults	Pop-Up

line marking position stringstring select

select the string to define the position of the line marking on the road. The string will also provide z-values for use in creating the line marking.

Colour for line marking input box green available colours

colour for the line marking polygons.

Length of the line marking input box 9

length of each line mark dash.

Gap to next line marking input box 3

distance between the line marking dashes.

Width of line marking on lhs of line input box 0.05

width of the line marking on the left hand side of the line marking position string.

Width of line marking on rhs of line input box 0.05

width of the line marking on the right hand side of the line marking position string.

Crossfall (%) on lhs of line input box -3

cross fall for the part of the line marking on the left hand side of the line marking position string (so z-

values for the polygon can be calculated).

Crossfall (%) on rhs of line input box -3

cross fall for the part of the line marking on the right hand side of the line marking position string (so z-values for the polygon can be calculated).

Model for line marking polygons model box line marking available models

model for the polygons representing the line marking.

Model for line marking centre model box line marking ctr available models

model for a string with just the part of the line marking position string which is inside the line marking polygons.

Create button

run the option and create the line marking polygons.

Undo button

undo the last set of polygons created since the panel was up.

12.13.35.6 Line Marking (New)

Position of option on menu: **View =>Visualisation =>Utilities => Line marking (New)**

This option is made up of several parts.

1. Create line marking polygons:

The drop down menu has a list of linemarking definitions, that match the linestyles in 12d.

The length, gap and width values are used to create polygons along the strings selected.

Fill in the Linemarking model, colour and the optional tin (used to drape the polygons).

2. Apply Extrusions Only:

In this option extrusions are matched to linestyles, rather than producing individual polygons.

3. Pavement Arrows:

In this option polygons are created from the symbol definition.

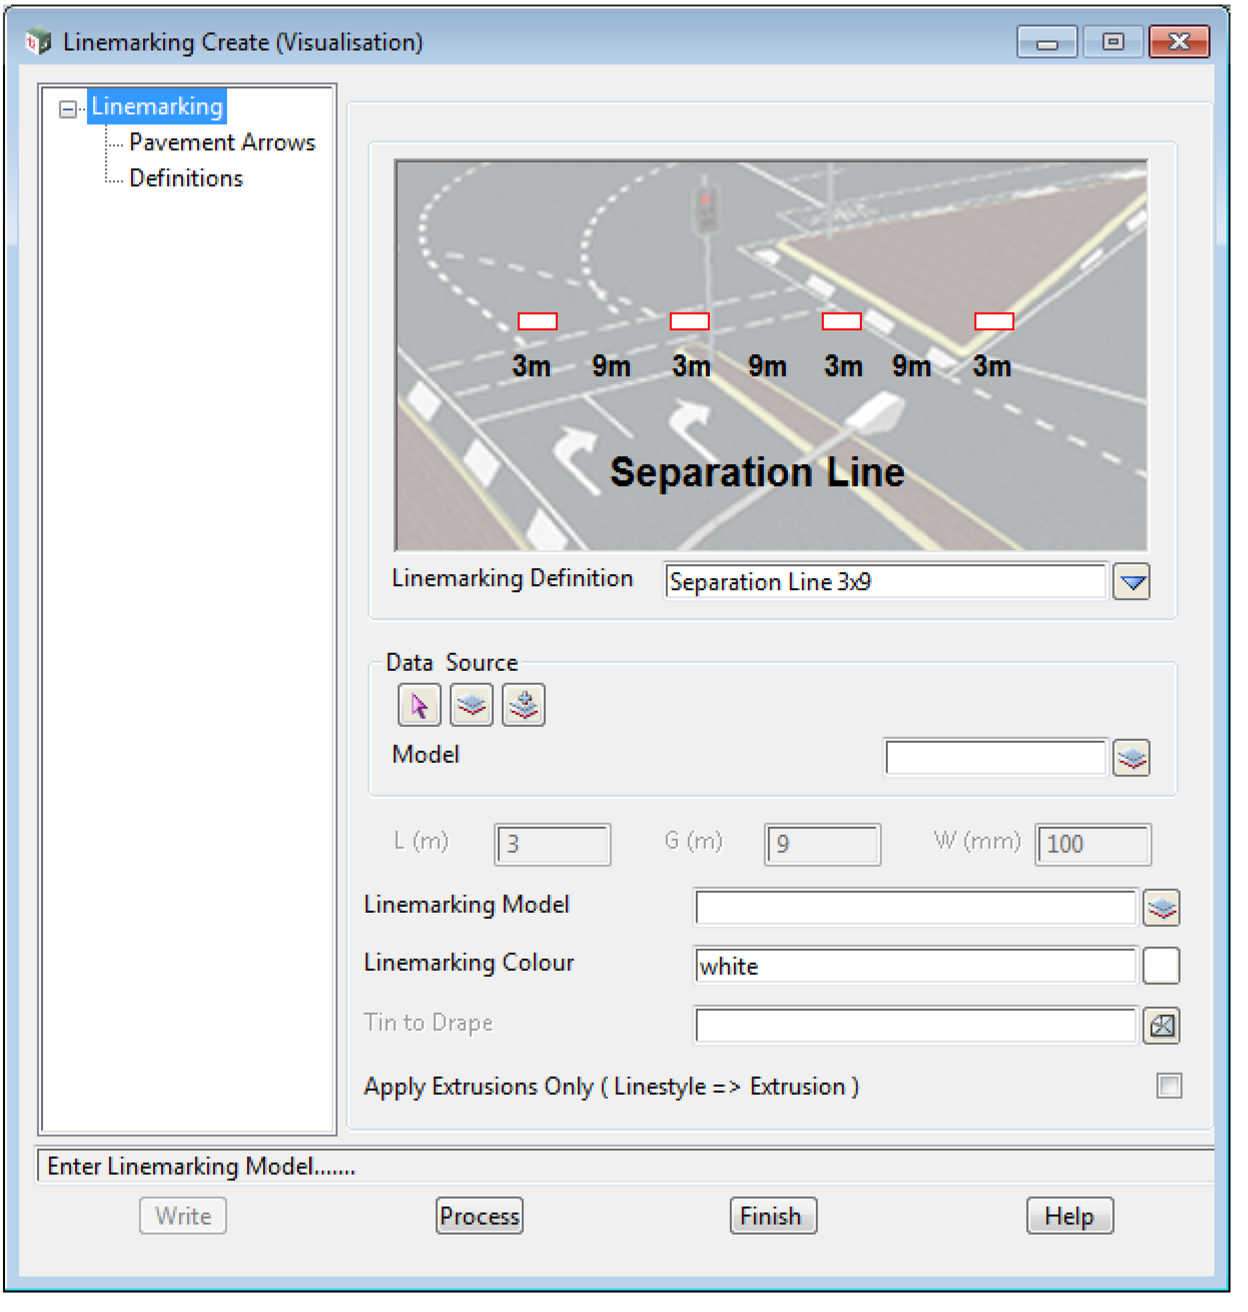
Single Arrows can be placed, using the **Dynamic Orientation** button to select an x,y point on screen.

Multiple Arrows:

Arrow Edge Line Reference	"Pick with direction" along a string
Arrow Spacing	Distance apart
Arrow Offset	Relative to the directional pick
Arrow Start Point	If you select a right turn lane string, picking with direction towards an intersection, then the start point would be at the intersection and subsequent arrows placed at the Arrow Spacing away from the intersection.

Selecting **Line marking (New)** brings up the **Linemarking Create (Visualisation)** panel.

.



The fields and buttons used in the panel have the following functions.

Field Description	Type	Defaults	Pop-Up
Linemarking Menu			
Linemarking Definition	choice box	Separation Line 3x9	various
selected definition is displayed in draw box above			
Data source		Model	
data selection type - for a full description go to 4.19.3 Data Source.			
Linemarking Model	model box		select model
model name for linemarking			
Linemarking Colour	input	white	available colours

the colour of linemarking polygons or arrows

Tin to Drape input select tin

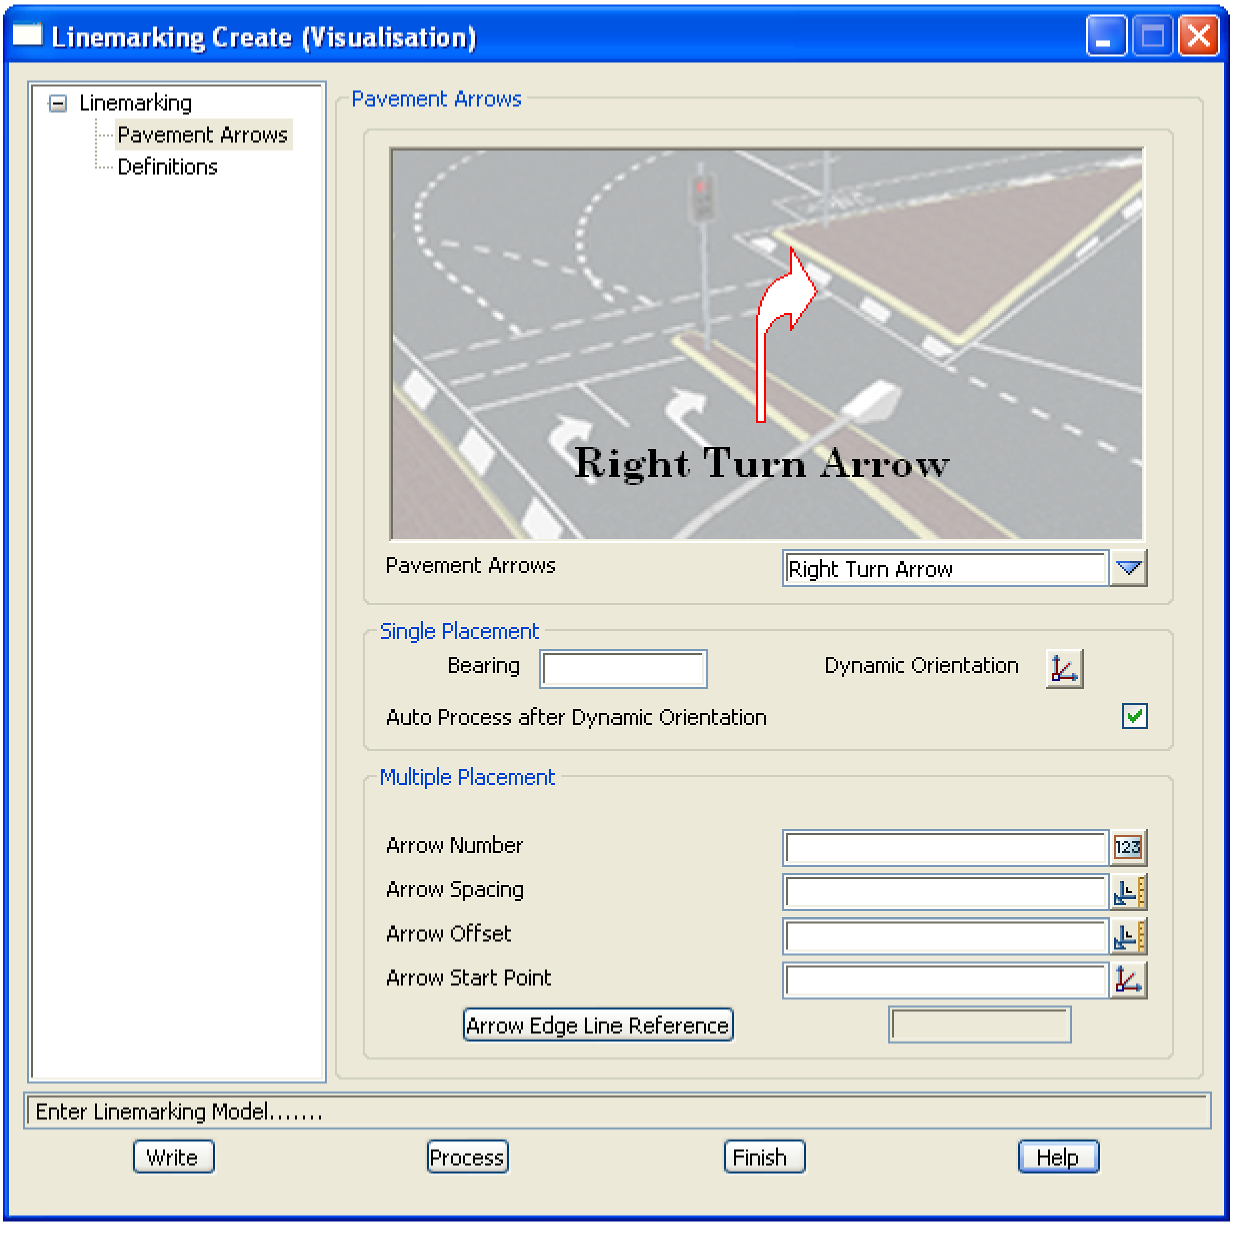
if non-blank, then the strings created are draped onto this tin

Box Offset input 10

Distance to place the IP Info boxes from the IP

Apply Extrusions Only (Linestyle => Extrusion) tick box

If ticked, extrusions are matched to linestyles in the data source, rather than producing individual polygons



Field Description	Type	Defaults	Pop-Up

Pavement Arrows Menu

Pavement Arrows choice box Right Turn Arrow various

selected arrow type is displayed in draw box above

Single Placement:

Bearing real

enter bearing if doing a single arrow placement, rather than dynamic

Dynamic Orientation xyz pick

select point, look for rotating arrow if auto process ticked on

Auto Process after Dynamic Orientation tick box

If ticked, auto rotation activated after insertion point is accepted

Multiple Placement:

Arrow Number integer

number of arrows required

Arrow Spacing measures box At Point, Point to Point, String from Point, String to Point)

interval distance along arrow edge string to place arrows

Arrow Offset measures box At Point, Point to Point, String from Point, String to Point)

offset from arrow edge string

Arrow Start Point xyz pick
